THOM. IOHNSON.

TO THE RIGHT HONORABLE HIS SINGVLAR GOOD LORD AND MASTER, SIR WILLIAM CECIL KNIGHT, BARON OF Burghley, Maſter of the Court of Wards and Liueries, Chancellor of the Vniuerſitie of Cambridge, Knight of the moſt noble Order of the Garter, one of the Lords of her Maieſties moſt honorable Priuy Councell, and Lord high Treaſurer of *England*.

AMong the manifold creatures of God (right Honorable, and my ſingular good Lord) that haue all in all ages diuerſly entertained manv excellent wits, and drawne them to the contemplation of the diuine wiſdome, none haue prouoked mens ſtudies more, or ſatisfied their deſires ſo much as Plants haue done, and that vpon iuſt and worthy cauſes: For if delight may prouoke mens labor, what greater delight is there than to behold the earth apparelled with plants, as with a robe of embroidered worke, ſet with Orient pearles, and garniſhed with great diuerſitie of rare and coſtly iewels? If this varietie and perfection of colours may affect the eye, it is ſuch in herbs and floures, that no *Apelles*, no *Zeuxis* euer could by any art expreſſe the like: if odours or if taſte may worke ſatisfaction, they are both ſo ſoueraigne in plants, and ſo comfortable, that no confection of the Apothecaries can equall their excellent vertue. But theſe delights are in the outward ſences: the principall delight is in the minde, ſingularly enriched with the knowledge of theſe viſible things, ſetting forth to vs the inuiſible wiſedome and admirable workmanſhip of almighty God. The delight is great, but the vſe greater, and ioyned often with neceſſity. In the firſt ages of the world they were the ordinarie meate of men, and haue continued euer ſince of neceſſarie vſe both for meates to maintaine life, and for medicine to recouer health. The hidden vertue of them is ſuch, that (as *Pliny* noteth) the very bruite beaſts haue found it out: and (which is another vſe that he obſerues) from thence the Dyars tooke the beginning of their Art. Plin. l. 8. ca. 27. Ibid. li. 22. c. 3.

Furthermore, the neceſſary vſe of theſe fruits of the earth doth plainly appeare by the great charge and care of almoſt all men in planting and maintaining of gardens, not as ornaments onely, but as a neceſſarie prouiſion alſo to their houſes. And here beſide the fruit, to ſpeake againe in a word of delight, gardens, eſpecially ſuch as your Honor hath, furniſhed with many rare Simples, do ſingularly delight, when in them a man doth behold a flouriſhing ſhew of Sommer beauties in the midſt of Winters force, and a goodly ſpring of floures, when abroad a leafe is not to be ſeene. Beſides theſe and other cauſes, there are many examples of thoſe that haue honored this ſcience: for to paſſe by a multitude of the Philoſophers, it may pleaſe your Honor to call to remembrance that which you know of ſome noble Princes, that haue ioyned this ſtudy with their moſt important mat-

Plut. de Diſcr. adul & amic. Plin. lib. 25. cap. 2.

ters of ſtate: *Mithridates* the great was famous for his knowledge herein, as *Plutarch* noteth. *Euax* alſo King of Arabia, the happy garden of the world for principall Simples, wrot of this argument, as *Pliny* ſheweth. *Diocletian* likewiſe, might haue had his praiſe, had he not drowned all his honour in the bloud of his perſecution. To conclude this point, the example of *Solomon* is before the reſt, and greater, whoſe wiſedome and knowledge was ſuch, that hee was able to ſet out the nature of all plants from the higheſt Cedar to the loweſt Moſſe. But my very good Lord, that which ſometime was the ſtudy of great Philoſophers and mightie Princes, is now neglected, except it be of ſome few, whoſe ſpirit and wiſdome hath carried them among other parts of wiſedome and counſell, to a care and ſtudie of ſpeciall herbes, both for the furniſhing of their gardens, and furtherance of their knowledge: among whom I may iuſtly affirme and publiſh your Honor to be one, being my ſelfe one of your ſeruants, and a long time witneſſe thereof: for vnder your Lordſhip I haue ſerued, and that way employed my principall ſtudy and almoſt all my time, now by the ſpace of twenty yeares. To the large and ſingular furniture of this noble Iſland I haue added from forreine places all the varietie of herbes and floures that I might any way obtaine, I haue laboured with the ſoile to make it fit for plants, and with the plants, that they might delight in the ſoile, that ſo they might liue and proſper vnder our clymat, as in their natiue and proper countrey: what my ſucceſſe hath beene, and what my furniture is, I leaue to the report of them that haue ſeene your Lordſhips gardens, and the little plot of myne owne eſpeciall care and husbandry. But becauſe gardens are priuat, and many times finding an ignorant or a negligent ſucceſſor, come ſoone to ruine, there be that haue ſollicited me, firſt by my pen, and after by the Preſſe to make my Labors common, and to free them from the danger whereunto a garden is ſubiect: wherein when I was ouercome, and had brought this Hiſtory or report of the nature of Plants to a iuſt volume, and had made it (as the Reader may by compariſon ſee) richer than former Herbals, I found it no queſtion vnto whom I might dedicate my Labors; for conſidering your good Lordſhip, I found none of whoſe fauor and goodneſse I might ſooner preſume, ſeeing I haue found you euer my very good Lord and Maſter. Again, conſidering my duty and your Honors merits, to whom may I better recommend my Labors, than to him vnto whom I owe my ſelfe, and all that I am able in any ſeruice or deuotion to performe? Therefore vnder hope of your Honorable and accuſtomed fauor I preſent this Herball to your Lordſhips protection; and not as an exquiſite Worke (for I know my meanneſſe) but as the greateſt gift and chiefeſt argument of duty that my labour and ſeruice can affoord: whereof if there be no other fruit, yet this is of ſome vſe, that I haue miniſtred Matter for Men of riper wits and deeper iudgements to poliſh, and to adde to my large additions where any thing is defectiue, that in time the Worke may be perfect. Thus I humbly take my leaue, beſeeching God to grant you yet many dayes to liue to his glory, to the ſupport of this State vnder her Maieſtie our dread Soueraigne, and that with great encreaſe of honor in this world, and all fulneſſe of glory in the world to come.

Your Lordſhips moſt humble

and obedient Seruant,

IOHN GERARD.

LANCELOTVS BRVNIVS MEDICVS REGINEVS
IOHANNI GERARDO *Chirurgo peritiſſimo,*
& rei Herbariæ callentiſſimo S. P. D.

CVM ſingularum medicinæ partium cognitio atque intelligentia libero homine digna conſenda eſt; tum earum nulla vel antiquitate, vel dignitate, vel vtilitate, vel denique iucunditate, cum ſtirpium cognitione iure comparari debet. Antiquiſſimam eam eſſe ex eo liquet, quòd quum ceteræ medicinæ partes (ſicut reliquæ etiam artes) ab ipſis hominibus (prout eos dura preſſit neceſſitas) primum excogitatæ & inuentæ fuerunt: ſola herbarum arborumque cognitio ante hominem formatum condita, eidemque mòx creato ab ipſo mundi architecto donata videri poteſt. Cuius tanta apud antiqua ſecula exiſtimatio ac dignitas erat, vt & ipſius inuentionem ſapientiſſimo Deorum Apollini veteres tribuerint, & reges celeberrimi in ſtirpium viribus indagandis ſtudium laboremque ſuum conſumere, ſummæ ſibi apud poſteros laudi honorique futurum cenſuerint. Iam verò plantarum vtilitas, atq; etiam neceſſitas, adeò latè patet, vt eius imminſitatem nullius vel acutiſſimi hominis animus capere, nedum meus calamus exprimere queat. Stirpium enim complurimæ nobis in cibos, alimentumque cedunt: innumeræ aduerſus morbos remedia ſuppeditant: ex alijs domos, naues, inſtrumenta tam bellica quam ruſtica fabricamus: aliquot etiam earum veſtes noſtris corporibus ſubminiſtrant. In quibus ſingulis recenſendis diutiùs perſiſtere, hominis eſſet intemperantèr abutentis & otio & literis. Quantas autem, & quam varias voluptates ex ſtirpium ſiue amœnitate oculis capiamus, ſiue fragrantia naribus hauriamus, ſine ſumma inearum conditorem impietate inficiari non poſſumus. Adeò vt abſque ſtirpium ope & ſubſidio vita nobis ne vitalis quidem haberi debeat.

Quum igitur res plantaria reliquis omnibus medicinæ partibus antiquitate antecedat; dignitate, nulli cedat; vtilitate inſuper oblectationeque cæteras longè ſuperet, quis futurus eſt, adeo, aut inſenſatus vt non exploratum habeat, aut ingratus, ut non ingenuè agnoſcat, quanta vniuerſis Anglis commoda, quantaſque voluptates tuus mi *Gerarde* in ſtirpium inueſtigatione & cultu labor indefeſſus, ſtudium inexhauſtum, immenſique ſumptus hoc de ſtirpibus edito libro allaturi ſunt. Macte itaque iſta tua virtute, iſtoque de republica benè merendi ſtudio, & quod inſigni tua cum laude ingreſſus es virtutis gloriæque curriculum, eidem inſiſte animosè & gnauitèr, neq; à re plantaria promouenda prius deſiſtę, quam eam à te ad vmbilicum iam fermè productam ipſe plenè abſoluas atque perficias. Sic enim & tibi adhùc ſuperſtiti gloriam paries immortalem, & poſt obitum tantam tui nominis celebritatem relinques, vt tuarum laudum poſteros noſtros nulla vnquam captura ſit obliuio. Bene vale. Ex Aula Reginea Weſtm. ipſis Cal. Decemb. 1597.

MATTHIAS DE L'OBEL
IOHANNI GERARDO
felicitatem.

Authoris necessaria diligentia in stirpium sine Materiæ Medicæ cognitione commendatur.

QVum Londinum appuli, in sinu gauisus sum Gerarde amicissime, dum typographo formis excudenda Plantarum collectanea tua commissa vidi, de quibus summas, nulla die perituras laudes Anglia tibi Rei-herbariæ familiam vniuersam, medicatricis artis partem, antiquissimum, iucundissimum & vtilissimum studium, retegere cupido, debet. Priscorum enim Theophrasti, Dioscoridis, Plinij, & Galeni scripta, passim toto orbe pervulgata, tanquam fontes: Neotericorum autem, seu riuulos, Brunfelsij, Fuchsij, Tragi, Rellij, Matthioli, Dodonæi, Turneri, Clusij, Dalescampij, Camerarij, Tabernæmontani, Penæ, nostramque nouam methodum & ordinem, à Gramine & notioribus ad Triticea, generatim & specialim, materno idiomate, Anglicæ genti tuæ cultissimæ, Reipublicæ voluptabili commodo, reclusis; quò ipsa stimulata, herbarum delitias & hortorum suauissimum & amœnissimum cultum amplectetur, maximorum Imperatorum, Regum & Heroum tam priscorum quam nuperorum exemplo. Nec satis hoc tibi fuit; sed multò magis insuper præstitisti, quòd copiam multarum elegantissimarum plantarum in Anglia sponte nascentium ab alijs hactenus prætermissarum, historiam descripsisti, magna hoc studio captorum vtilitate & oblectamento: Singulas enim regiones peculiares quasdam plantas, quas in alijs non facilè reperias, gignere certum. Neque magni tibi fuit hac inspectione & è viuis Naturæ typis nosse; quippe qui diu herbas indigenas, inquilinas & peregrinas cum nuperrimè solo erumpentes & pullulantes, tum adultas, semineque prægnantes, hortulo tuo suburbano aluisti & fouisti: Exactum enim cognoscendarum ex figura aut facie superficiaria herbarum studium generatim consistit (Dioscoride teste) in frequenti & assidua, temporis omnis, inspectione. Sed alia est interioris & substantialis formæ plantarum, quæ oculis cerni non potest, solers cognitio; quam etiam, quantum potes percunctando, seniorum Græcorum Medicorum more, aperire conaris. Solebant autem antiqui suorum Medicaminum experimenta, in Reipublicæ vtilitatem, scriptis tabellis dare, quibus apud Ephesios templi syluaticæ Dianæ parietes vestiebantur. Compertum etiam est Hippocratem discendi cupidum, permultis regionibus peragratis, idem præstitisse, & in methodum commemorabiliorem restituisse & illustrasse. Melius enim est Reipublicæ quam nostris commodis prospicere. Non est igitur quod huius inuidiosæ procacis ætatis conuiciatores maledici Zoili scripta tua obtrectent: dedisti enim gratis quod potuisti, cætera doctioribus iudicijs relinquens; exortiuis & exoticis incompertarum pènè adhuc virium mangonizatis & lenocinijs allectis Floristarum floribus à Flora Dea meretrice nobili dictis, valetudini & vtilitati potius consulens, quam voluptati, valeri iussis. Nonnulli siquidem ex alijs libris herbarum transcriptores rapsodi, ignotis sibi viuis plantis ad medendum maximè necessarijs, assignant incertis, dubijs & suppositijs stirpibus aut simplicibus facultates legitimi simplicis medicamenti, maximo errore & summa periclitatione (vnum enim sæpe simplex compositionem ineptam reddit peruertit aut deprauat) quibus nec tutò nec temerè credendum; multoque etiam minus multis herbarum experimentis fallacibus, quibus etiam neque nisi notissimis morbis simplicibus, compositis & implicatis, eorundemque sæuissimis symptomatibus, vtendum, ne inoportunus earum vsus sæpius venenum quam remedium sit. Summo enim ægrotantium dispendio & exercitatissimorum Medicorum tedio periclitatores procaces, contemptis & neglectis artis institutionibus, Hippocratis & Galeni præceptis, per salutis discrimina & hominum strages medentium tentamenta agunt. Omitto, breuitatis ergò, vulgi opifices, textores sellularios, sordidissimos fabros, interpolatores, circulatores forenses & veteratores scutica dignos, qui professionibus & mechanicis artibus suis fastiditis, scelerato insaniæ lucro, se Medicos Theophrasteos, quem vix vnquam summis labris degustarunt, profitentur. Non inuenustè Syluius in huiusmodi hominis inuehit, dum ait, Quam quisque nouit artem, hanc exerceat vnam, atque excolat, & totus in ea versetur, &c. Et sub finem præfationis rursus ait, Faxit Deus vt quisque quam exerceat Artem, pernoscat, & Medicus nihil eorum quæ ad morbos citò & tutò curandos vtilia vel necessaria esse consueuerunt, ignoret. Prævalet Medicus vbi Pharmacopœi fides suspecta est, qui ipse simplicia & composita pernoscit; imò quam infamiæ notam imprudens inurit, dum ignarus horum simplicium medicamentorum, tanquam asinus quidam ad omnia Pharmacopœi rogata, auribus motis, velut annuit: quid quod illi sæpe etiam volens Pharmacopœus illudit. Absurdissimus est ac sæpè ridiculus qui medicinam facit, harum rerum ignarus; & Pharmacopœo ignorantiæ suspectum meritò se reddit. Plura si quis requirat apud Syluium, ibidem loci.

Præstigiosas popularium medicastrorum fallacias detegimus & inueteratos depulimus errores.

Initio prologi Pharmac. Præparand.

Medico

Medico quam plurima perſcrutanda, vt ſatis ſuperq; ad artem medicatricem perdiſcendam, annos paucos haudquaquam ſufficere, teſtantur ipſius experientiſsimi & Diuini ſenis verba vbi inquit; Ego enim ad finem Medicinæ non peruenì, etiamſi iam ſenex ſim. *Et ſtatim per initia Aphoriſmorum vitam breuem & artem longam pronunciauit. Quomodo ergo tuto medebuntur multi laruati Medici aut Medicaſtri tam repente creati, nulla Medicinæ parte, Medicamentorumve facultatibus perſpectis? Huiuſmodi adulatores, aſſentatores, dubitatores, rixatores, periclitatores & Gnathonicos paraſiſtratos hiſtrionibus qui in tragœdijs introducuntur ſimilimos fecit Hippocrates.* Epiſt. ad Democritum.

Quemadmodum enim illi (inquit) figuram quidem & habitum ac perſonam eorum quos referunt habent, illi ipſi autem vere non ſunt: Sic & Medici fama quidem & nomine multi, " re autem & opere valde pauci. *Itaque cum paulo ante Medicinam omnium artium præclariſſimam eſſe dixerit;* Verum propter ignorantiam eorum qui eam exercent, & ob vulgi ruditatem, qui tales pro Medicis iudicat & habet; iam eo res deueniſſe, vt omnium artium longe viliſſima cenſeatur. At vero hoc peccatum ob hanc potiſſimum cauſam committi videtur; ſoli namque Medicinæ nulla pœna in rebus-publicis ſtatuta eſt, præterquam ignominiæ. *Ne animam & famam laederit, aut illi inſignis ignominia inureretur ob huiuſmodi ardua & noxia diſcrimina, bonus ille & ſyncerus Dodonæus (quamvis multas herbas ex alijs & Fuchſio tranſcripſerit, cuius methodo vſus eſt, quemque inchoauerat, vt ipſemet mihi retulit, vernacula Germanica inferiori lingua vertere) vulgatiſſimis, notiſſimis ijſque paucis ex tot herbarum millibus, quinquagenis aut ſeptuagenis herbis quibus vtebatur, potius contentus fuit, quam innumeris ſibi ignotis periclitari: melius enim omnino medicamento carere, abſtinere, & naturæ committere, quam abuti. Vtinam huius noſtræ ætatis quamplures auſo potiti, medicinam factitantes, eo ſtudio, candore & voto mederentur: Illis id forſitan nequaquam euenerit, quod Philoſophis (Hippocrate defuncto) diſcipulis ſuis inexpertis & parum adhuc exercitatis medendo, id eſt necando (vt memoriæ traditum eſt) contingit: quamobrem ars Medica Athenis, Romæ & per vniuerſam Græciam centum & ſeptuaginta annis, interdicta et exul fuit. Merito igitur caute et tute agendum: Opiatis et Diagrediatis, Colocynthide, Tithymalis, Eſula, Lathyride, Mercurio, Stibio, & ſimilibus moleſtiſſimis ſimplicibus cum cautione vtendum: optimis ducibus & experientiſſimis ſenioribus præceptoribus adhærendum, quorũ ſub vexillis fidiſſime & tutiſſime rara & præclara, ob barbariem fere extincta, patrum & auorum remedia, maximo et priſtino artis ornamento et proximi vtilitate renouantur, et in vſum reuocantur; neglectis, ſpretis, et excluſis Empiricis verboſis, inuidioſis, ſuſpenſis, ambagioſis et exitioſis opinionibus, quibus Mundus immundus regitur et labitur; qui cum decipi velit, decipiatur: in cuius fallacias perappoſite finxit et cecinit olim hos verſiculos eruditiſsimus collega D. Iacobus Paradiſus nobilis Gandauenſis alludens ad nomen tanti verſutiſſimi herois Noſtradami Salonenſis Gallo-prouinciæ,* " Multi mallunt videri quam eſſe.

Noſtra-damus, cum verba damus, quia fallere noſtrum;
Et cum verba damus, nil niſi Noſtra-damus.

Vale. Londini ipſis Calendis Decemb. 1597

In GERARDI Botanologian

φιλόκηπον.

VLtimus ecce Gerardus: *at edit an optimus herbas?*
Quid ni? non notas sed dedit ille novas.
Ergo ne inuideas, videas cum nomen & omen
φυτολόγε, *mirum est ardua quantagerit.*
Οὕτως ἔστιν, κήπευτον, πάρτον, πολύχρηστ' ἔδει
Sic liber est promus, condus vt hortus erat.
Et γαῖαν ἀρδὼν cælumque solumq; subegit.
τῷ γ' ἀρὰ θεσπεσίως ἐμβέβακεν ὄχος.

ANTONIVS HVNTONVS.
Medicinæ candidatus.

Ad Iohannem Gerardum *Chirurgum Herbariumq; peritißimum.*

NVlla oculos hominum ſpecies magis allicit illa,
Quam præſtante manu duxit generoſus Apelles.
Nulla aures animoſque magis facundia, quam quæ
Se fuſam loquitur Ciceronis ab ore diſerti:
Hæc eadem hunc librum commendat cauſa, *Gerarde*,
Cui pro laude ſatis tali natum eſſe parente,
Artifices cui inter dextras pro numine, nomen
Nobilius reliquis herbæ, plantæq; magiſtris.
Illi etenim Europæ ſuccos, Aſiæque liquores
Quæque arentes olo ſitiens parit Africa, tractant:
Tu veterum inuentis noua conſuis omnia, ſi qua
Indus vterque dedit noſtram fotura ſalutem,
Sive aliunde vehit noſtras mercator ad oras,
Hoc ipſo vtilius. Quia quæ ſunt credita ſcriptis,
Illa manu expertus medico, & bene diues ab horto
Explorata diu mukumq; emittis in auras,
Quæ curent hominum languentia corpora, multi
Præſtantesq; viri docuere fideliter artem.
Sed ſi [illegible]uleris plantas, quem verba iuvabunt
Sic animo, ſic fronte minax. Io præſtia miles
Proſilit, at ſtricto cedit victoria ferro
Quæ tibi pro tanto cedit victoria ferro
Præmia perſoluet, Myrti lauriq; coronas?
Iſtam nouit edax mercedem abolere vetuſtas.
At tibi pro ſtudio impenſiſque laboribus iſtis,
Queis hominum curas ſertam tectamq; ſalutem,
Ille opifex rerum, cuſtoſq; authorq; ſalutis
Æterna ſtatuit frontem redimire corona.

G. Lannaus Medicus.

In hiſtoriam plantarum, Io. Gerardi *ciuis & Chirurgi Londinenſis*, M. Iacobi Ihonſtonij *Scoti Ballinerifæ Regij pagi portionarij* Epigramma.

DEſine, quæ vaſtis pomaria montibus Atlas
Clauſerat (Heſperij munera rara ſoli)
Auratis foliis auratos deſine ramos
Mirari, & ramis pendula poma ſuis.
Singula cum Domino periere, & Gorgone viſo
In montis riguit veſcera verſus Atlas.
Alcinoi perijt qui, cedat penſilis hortus,
Quem celebrat priſci temporis aura fugax:
Vna Gerardini ſpecies durabilis horti
Æterno famæ marmore ſculpta manet.
Hic quicquid Zephyrus produxit, quicquid & Eurus,
Antiquus quicquid & novus orbis habet,
Intulit in patriam naturamq; exprimit arte:
Sic nullo cedit terra Britanna ſolo.

Quod

Quod magis est Graium & Latium concludit in vno
Margine, & Anglorum iam facit ore loqui:
Sic erit æternum hinc vt viuas, horte *Gerarde*,
Cultoris studio nobilitate tui.

In Plantarum historiam, a solertissimo viro, Reiq; Herbariæ peritissimo, D. Iohanne Gerardo, *Anglice editam*
Epigramma.

EGregiam certè laudem, decus immortale refertis
Tu, socijq; tui, magnum & memorabile nomen
(Illustris DEVORAX) raptoribus orbis IBERIS
Deuictis classe Anglorum; Tuque (Dicasta
Maxime EGERTONE) veterem superans Rhadamanthum,
HEROVM merito [illegible], censendus in albo.
Nec laus vestra minor (sacræ pietatis alumni)
Qui mentes hominum diuina pascitis esca.
Ornatis Patriam cuncti, nomenq; Britannum
Augetis, vobisq; viam munitis ad astra.
Quin agite, in partem saltem permittite honoris
Phœbei veniant Vates, qui pellere gnari
Agmina morborum, humanæ insidiantia vitæ.
Huius & ingentes, serena fronte labores
ANGLO-DIOSCORIDIS, Patriæ, vestræq; saluti
Excipite exhaustos: paulum huc diuertite in HORTOS
Quos CHORTEIA colit, quos Flora exornat, & omnes
Naiades, & Dryades, Charites, Nymphæq; Britannæ.
Corporibus hic grata salus, animisq; voluptas.
Hic laxate animos: HABITAVIT NVMEN IN HORTIS.

Fran. Hering, Med. D.

Thomas Newtonus, Cestreshyrius, D. Io. Gerardo, *amico non vulgari*, S.

POst tot ab ingenuis conscripta volumina mystis,
Herbarum vires qui referare docent,
Tu tandem prodis Spartamq; hanc gnauiter ornas,
Dum reliquis palmam præripuisse studes.
Nec facis hoc, rutilo vt possis ditarier auro,
Nec tibi vt accrescat grandis acervus opum;
Sed prodesse volens, vestitos gramine colles
Perlustras, & agros, frondiferumq; nemus.
Indeq; Pæonias (apis instar) colligis herbas,
Inq; tuum stirpes congeris alueolum.
Mille tibi species plantarum, milleq; notæ;
Hortulus indicio est, quem colis ipse domi.
Pampineæ vites, redolens cedrus, innuba laurus,
Nota tibi, nota est pinguis oliua tibi.
Balsama, narcyssus, rhododaphne, nardus, amomum,
Saluia, dictamnus, galbana nota tibi.
Quid multis? radix, stirps, flos, cum cortice ramus,
Spicaq; cum siliquis est bene nota tibi.
Gratulor ergo tibi, cunctisq; (*Gerarde*) Britannis,
Namptwicoq; tuo gratulor, atq; meo.
Nam Cestreshyrij te ac me genuere parentes,
Tu meliore tamen sydere natus eras.
Macte animo, pergasq; precor, cœptumq; laborem
Vrge etiam vlterius. Viuitur ingenio.
Aurum habeant alij, gemmas, nitidosq; pyropos,
Plantas tu & flores scribe *Gerarde*. Vale.

Vere & ex animo tuus, Tho. Newton, *Ilfordensis*
in agro.

To

To the well affected Reader and peruſer of this *Booke, St. Bredwell Phyſition,* greeting.

Plin. Iun. in pan.

OPen is the campe of glorie and honour for all men, ſaith the younger Pliny: not onely men of great birth and dignitie, or men of office endued with publique charge and titles, are ſeene therein, and haue the garland of praiſe and preferment waiting to crowne their merits; but euen the common ſouldier likewiſe: ſo as he, whoſe name and note was erſt all obſcure, may by egregious acts of valour obtaine a place among the noble. The ſchoole of ſcience keepeth ſemblable proportion: whoſe amplitude, as not alwaies, nor onely, men of great titles and degrees, labour to illuſtrate; ſo whoſoeuer doth, may confidently account of, at the leaſt, his name to be immortall. What is he then that will denie his voice of gracious commendation to the Authors of this Booke: to euery one, no doubt, there is due a condigne meaſure. The firſt gatherers out of the Antients, and augmentors by their owne paines, haue alreadie ſpread the odour of their good names, through all the Lands of learned habitations. D. Prieſt, for his tranſlation of ſo much as Dodonæus, hath thereby left a tombe for his honorable ſepulture. M. Gerard comming laſt, but not the leaſt, hath many waies accommodated the whole worke vnto our Engliſh Nation: for this Hiſtorie of Plants, as it is richly repleniſhed by thoſe fiue mens labours laied together, ſo yet could it full ill haue wanted that new acceſſion he hath made vnto it. Many things hath he nouriſhed in his garden, and obſerued in our Engliſh fields, that neuer came into their pennes to write of. Againe, the greateſt number of theſe plants, hauing neuer been written of in the Engliſh tongue, would haue wanted names for the vulgar ſort to call them by: in which defect he hath bin curiouſly carefull, touching both old and new names to make ſupply. And leſt the Reader ſhould too often languiſh with fruſtrate deſire, to finde ſome plant he readeth, of rare vertue, he ſpareth not to tell (if himſelfe haue ſeene it in England) in what wood, paſture or ditch the ſame may be ſeene and gathered. Which when I thinke of, and therewithall remember, with what cheerefull alacritie, and reſolute attendance he hath many yeares tilled this ground, and now brought forth the fruit of it, whether I ſhould more commend his great diligence to attaine this skill, or his large bencuolence in beſtowing it on his countrie, I cannot eaſily determine. This booke-birth thus brought forth by Gerard, as it is in forme and diſpoſition faire and comely, euery ſpecies being referred to his likelieſt genus, of whoſe ſtocke it came: ſo is it accompliſhed with ſurpaſſing varietie, vnto ſuch ſpreading growth and ſtrength of euery lim, as that it may ſeeme ſome heroicall Impe of illuſtrious race, able to draw the eies and expectation of euery man vnto it. Somewhat rare it will be here for a man to moue a queſtion of this nature, and depart againe without ſome good ſatisfaction. Manifold will be the vſe both to the Phyſition and others: for euery man delighteth in knowledge naturally, which (as Ariſtotle ſaid) is in proſperitie an ornament, in aduerſitie a refuge. But this booke aboue many others will ſute with the moſt, becauſe it both plenteouſly miniſtreth knowledge, which is the food of the minde, and doth it alſo with a familiar and pleaſing taſte to euery capacitie. Now as this commoditie is communicated to all, and many ſhall receiue much fruit thereof, ſo I wiſh ſome may haue the minde to returne a benefit againe; that it might not be true in all that Iuuenall ſaith, Scire volunt omnes, mercedem ſoluere nemo: (i.) All deſire to know, none to yeeld reward. Let men think, that the perfection of this knowledge is the high aduancement of the health of man: that perfection is not to be attained, but by ſtrong indeuor: neither can ſtrong indeuor be accompliſhed without free maintenance. This hath not he, who is forced to labour for his daily bread: but if hee, who from the ſhort houres of his daily and neceſſarie trauell, ſtealing as it were ſome, for the publike behoofe, and ſetting at length thoſe pecces together, can bring forth ſo comely a garment as this, meet to couer or put away the ignorance of many: what may be thought he would do, if publicke maintenance did free him from that priuate care, and vnite his thoughts to be wholly intent to the generall good. O Reader, if ſuch men as this ſticke not to rob themſelues of ſuch wealth as thou haſte to inrich thee, with that ſubſtance thou wanteſt, detract not to ſhare out of thine aboundance to merit and encourage their paines: that ſo fluxible riches, and permanent ſciences, may the one become a prop vnto the other. Although praiſe and reward ioined as companions to fruitfull endeuors, are (in part) deſired of all men, that vndertake loſſes, labours, or dangers for the publique behoofe: becauſe they adde ſinewes (as it were) vnto reaſon, and able her more and more to refine her ſelfe: yet doe they not imbrace that honour in reſpect of it ſelfe, nor in reſpect of thoſe that conferred it vpon them, but

Simplic. comm. in Epict.

as

as hauing thereby an argument in themselues, that there is something in them worthy estimation among men: which then doubleth their diligence to deserue it more abundantly. Admirable and for the imitation of Princes, was that act of Alexander, who setting Aristotle to compile commentaries of the bruit creatures, allowed him for the better performance thereof, certaine thousands of men, in all Asia and Greece, most skilfull obseruers of such things, to giue him information touching all beasts, fishes, foules, serpents, and flies. What came of it? A booke written, wherein all learned men in all ages since do exercise themselues principally, for the knowledge of the creatures. Great is the number of those that of their owne priuate haue laboured in the same matter, from his age downe to our present time, which all do not in comparison satisfie vs. Whereas if in those ensuing ages there had risen still new Alexanders, there (certainely) would not haue wanted Aristotles to haue made the euidence of those things an hundred fold more cleered vnto vs, than now they be. Whereby you may perceiue the vnequall effects that follow those vnsutable causes of publike and priuate maintenances vnto labours and studies. Now that I might not dispaire in this my exhortation, I see examples of this munificence in our age to giue me comfort: Ferdinand the Emperor and Cosmus Medices Prince of Tuscane are herein registred for furthering this science of plants, in following of it themselues and becomming skilfull therein: which course of theirs could not be holden without the supporting and aduancing of such as were studious to excell in this kinde. Bellonius likewise (whom for honours cause I name) a man of high attempts in naturall science, greatly extolleth his Kings liberalitie, which endued him with free leisure to follow the studie of plants, seconded also herein by Montmorencie the Constable, the Cardinals Castilion and Lorraine, with Oliuerius the Chancellor; by whose meanes he was enabled to performe those his notable peregrinations in Italy, Africa and Asia: the sweet fruit whereof, as we haue receiued some taste by his obseruations, so we should plenteously haue been filled with them, if violent death by most accursed robbers had not cut him off. And as I finde these examples of comfort in forreine nations, so we are (I confesse) much to be thankfull to God, for the experience we haue of the like things at home. If (neuertheless) vnto that Physicke lecture lately so well erected, men who haue this worlds goods shall haue hearts also of that spirit, to adde some ingenious labourer in the skill of simples, they shall mightily augment and adorne the whole science of Physicke. But if to that likewise they ioine a third, namely the art of Chimicall preparation; that out of those good creatures which God hath giue n man for his health, pure substances may be procured for those that be sicke, (I feare not to say it, though I see how Momus scorneth) this present generation would purchase more to the perfection of Physicke, than all the generations past since Galens time haue done: that I say, nothing of this one fruit that would grow thereof, to wit, the discouering and abolishing of these pernitious impostures and sophistications which mount promising Paracelsians euery where obtrude, through want of a true and constant light among vs to discerne them by. In which behalfe, remembring the mournfull speech of graue Hippocrates; The art of Physicke truly excelleth all arts, howbeit, through the ignorance partly of those that exercise it, and partly of those that iudge rashly of Physitions, it is accounted of all arts the most inferiour: I say in like manner, the art of Chimistrie is in it selfe the most noble instrument of naturall knowledges; but through the ignorance & impiety, partly of those that most audaciously professe it without skill, and partly of them that impudently condemne that they know not, it is of all others most basely despised and scornfully rejected. A principall remedy to remoue such contumelious disgrace from these two pure virgins of one stocke and linage, is this that I haue now insinuated, euen by erecting the laboratory of an industrious Chimist, by the sweet garden of flourishing simples. The Physicke reader by their meanes shall not oncly come furnished with authorities of the Ancients, and sensible probabilities for that he teacheth, but with reall demonstrations also in many things, which the reason of man without the light of the fornace would neuer haue reached vnto. I haue vttered my hearts desire, for promoting first the perfection of my profession, and next by necessary consequence, the healthie liues of men. If God open mens hearts to prouide for the former, it cannot be but that the happy fruits shall be seene in the later. Let the ingenious learned iudge whether I haue reason on my side: the partiall addicted sect I shun, as men that neuer meane good to posteritie.

George

George Baker, *one of her Maieſties chiefe Chirurgions in ordinarie, and M. of the Chirurgions of the Citie of London, to the Reader.*

ARiſtotle, a Prince amongſt the Philoſophers, writing in his Metaphyſicks of the nature of mankind, ſaith, that man is naturally inclined and deſirous of ſcience. The which ſentence doth teach vs, that all creatures (being vertuouſly giuen) doe ſtriue to attain to perfection, and draw neare in what they can to the Creator; and this knowledge is one of the principall parts which doth concerne the perfection of vnderſtanding: for of the ſame doth follow, that all ſuch are generally inclined to know the meanes by the which they may conſerue their life, health, and reputation. And although it be neceſſarie for man to learne and know all ſciences, yet neuertheleſſe the knowledge of naturall philoſophie ought to be preferred, as being the moſt neceſſarie; and moreouer it doth bring with it a ſingular pleaſure and contentment. The firſt inuentor of this knowledge was *Chiron* the Centaure, of great renowne, ſonne to *Saturne* and *Phillyre*: and others ſay that it was inuented of *Apollo*: & others of *Eſculape* his ſon; eſteeming that ſo excellent a ſcience could neuer proceed but from the gods immortall, and that it was impoſſible for man to finde out the nature of Plants, if the great worker, which is God, had not firſt inſtructed and taught him. For, as *Pliny* ſaith, if any thinke that theſe things haue bin inuented by man, he is vngratefull for the workes of God. The firſt that we can learn of among the Greekes that haue diligently written of herbes, haue bin *Orpheus*, *Muſæus*, and *Heſiode*, hauing bin taught by the Ægyptians: then *Pythagoras* of great renowne for his wiſedom, which did write bookes of the nature of Plants, and did acknowledge to learne the ſame from *Apollo* and *Eſculape*. *Democrite* alſo did compoſe bookes of Plants, hauing firſt trauelled ouer all Perſia, Arabia, Ethiopia, and Egypt. Many other excellent ſpirits haue taken great pleaſure in this ſcience, which to accompliſh haue hazarded their liues in paſſing many vnknowne regions, to learne the true knowledge of *Elleborus*, and other Medicaments: of which number were *Hippocrates*, *Crateua*, *Ariſtotle*, *Theophraſt*, *Diocles Cariſtius*, *Pamphylus*, *Montius*, *Hierophile*, *Dioſcorides*, *Galen*, *Pliny*, and many others, which I leaue to name, fearing to be too long. And if I may ſpeake without partialitie of the Author of this book, his great paines, his no leſſe expences in trauelling far and neere for the attaining of his skill haue bin extraordinarie. For he was neuer content with the knowledge of thoſe ſimples which grow in thoſe parts, but vpon his propet coſt and charges hath had out of all parts of the world all the rare ſimples which by any means he could attaine vnto, not onely to haue them brought, but hath procured by his excellent knowledge to haue them growing in his garden, which as the time of the yeare doth ſerue may be ſeene: for there ſhall you ſee all manner of ſtrange trees, herbes, roots, plants, floures, and other ſuch rare things, that it would make a man wonder, how one of his degree, not hauing the purſe of a number, could euer accompliſh the ſame. I proteſt vpon my conſcience, I do not think for the knowledge of Plants, that he is inferiour to any: for I did once ſee him tried with one of the beſt ſtrangers that euer came into England, and was accounted in Paris the onely man, being recommended vnto me by that famous man Maſter *Amb.*

Pareus,

Pareus; and he being here was desirous to goe abroad with some of our Herbarists, for the which I was the meane to bring them together, and one whole day we spent therein, searching the rarest Simples: but when it came to the triall, my French man did not know one to his foure. What doth this man deserue that hath taken so much paines for his countrey, in setting out a booke, that to this day neuer any in what language soeuer did the like? First for correcting their faults in so many hundred places, being falsly named, mistaken the one for the other; and then the pictures of a great number of plants now newly cut. If this man had taken this paines in Italy and Germany, where *Matthiolus* did write, he should haue sped as well as he did: For (saith he) I had so great a desire euer to finish my Booke, that I neuer regarded any thing in respect of the publique good, not so much as to thinke how I should finish so great a charge, which I had neuer carried out, but that by Gods stirring vp of the renowned Emperour *Ferdinando* of famous memorie, and the excellent Princes had not helped mee with great sums of money, so that the Commonwealth may say, That this blessing doth rather proceed of them than from me. There haue been also other Princes of Almaine which haue bin liberal in the preferring of this Book, and the most excellent Elector of the Empire the Duke of Saxonie, which sent me by his Post much mony toward my charges: the liberalitie of the which and the magnificence toward me I cannot commend sufficiently. They which followed in their liberalitie were the excellent *Fredericke* Count Palatine of the Rhine, and the excellent *Ioachim* Marques of Brandeburg, which much supplied my wants: and the like did the reuerend Cardinall and Prince of Trent, and the Excellent Archbishop of Saltzperg, the Excellent Dukes of Bauare and Cleues, the duke of Megapolencis Prince of Vandalis, the State Republique of Noremberg, the liberalitie of whom ought to be celebrated for euer: and it doth much reioice me that I had the helpe and reward of Emperors, Kings, Electors of the Roman Empire, archdukes, Cardinalls, Bishops, Dukes and Princes, for it giveth more credit to our Labors than any thing that can be said. Thus far *Matthiolus* his owne writing of the liberalitie of Princes towards him. What age do we liue in here that wil suffer all vertue to go vnrewarded? Master *Gerard* hath taken more pains than euer *Matthiolus* did in his Commentaries, and hath corrected a number of faults that he passed ouer; and I dare affirme (in reuerence be it spoken to that Excellent man) that Master *Gerard* doth know a great number of Simples that were not knowne in his time: and yet I doubt whether he shall taste of the liberalitie of either Prince, Duke, Earle, Bishop, or publique Estate. Let a man excell neuer so much in any excellent knowledge, neuertheles many times he is not so much regarded as a Iester, a Boaster, a Quacksaluer or Mountebanke: for such kinde of men can flatter, dissemble, make of trifles great matters, in praising of this rare secret, or that excellent spirit, or this Elixer or Quintessence; which when it shall come to the triall, nothing shal be found but boasting words.

VALE.

To the courteous and well willing Readers.

ALthough my paines haue not been ſpent (curteous Reader) in the gracious diſcouerie of golden Mines, nor in the tracing after ſiluer veines, whereby my natiue country might be enriched with ſuch merchandiſe as it hath moſt in requeſt and admiration; yet hath my labour (I truſt) been otherwiſe profitably employed, in deſcrying of ſuch a harmleſſe treaſure of herbes, trees, and plants, as the earth frankely without violence offereth vnto our moſt neceſſarie vſes. Harmleſſe I call them, becauſe they were ſuch delights as man in the perfecteſt ſtate of his innocencie did erſt inioy: and treaſure I may well terme them, ſeeing both Kings and Princes haue eſteemed them as Iewels; ſith wiſe men haue made their whole life as a pilgrimage to attaine to the knowledge of them: by the which they haue gained the hearts of all, and opened the mouthes of many, in commendation of thoſe rare vertues which are contained in theſe terreſtriall creatures. I confeſſe blind Pluto is now adayes more ſought after than quicke ſighted Phœbus: and yet this duſty mettall, or excrement of the earth (which was firſt deepely buried leaſt it ſhould be an eye-ſore to grieue the corrupt heart of man) by forcible entry made into the bowels of the earth, is rather ſnatched at of man to his owne deſtruction, than directly ſent of God, to the comfort of this life. And yet behold in the compaſſing of this worldly droſſe, what care, what coſt, what aduentures, what myſticall proofes, and chymicall trials are ſet abroach; when as notwithſtanding the cheefeſt end is but vncertaine wealth. Contrariwiſe, in the expert knowledge of herbes, what pleaſures ſtill renewed with varietie? what ſmall expence? what ſecurity? and yet what an apt and ordinary meanes to conduct man to that moſt deſired benefit of health? Which as I deuoutly wiſh vnto my natiue countrey, and to the carefull nurſing mother of the ſame; ſo hauing bent my labours to the benefiting of ſuch as are ſtudiouſly practiſed in the conſeruation thereof, I thought it a chiefe point of my duty, thus out of my poore ſtore to offer vp theſe my far fetched experiments, together with mine owne countries vnknowne treaſure, combined in this compendious Herball (not vnprofitable though vnpoliſhed) vnto your wiſe conſtructions and courteous conſiderations. The drift whereof is a ready introduction to that excellent art of Simpling, which is neither ſo baſe nor contemptible as perhaps the Engliſh name may ſeeme to intimate: but ſuch it is, as altogether hath been a ſtudy for the wiſeſt, an exerciſe for the nobleſt, a paſtime for the beſt. From whence there ſpring floures not onely to adorne the garlands of the Muſes, to decke the boſomes of the beautifull, to paint the gardens of the curious, to garniſh the glorious crownes of Kings; but alſo ſuch fruit as learned Dioſcorides long trauelled for; and princely Mithridates reſerued as precious in his owne cloſet: Mithridates I meane, better knowne by his ſoueraigne Mithridate, than by his ſomtime ſpeaking two and twenty languages. But what this famous Prince did by tradition, Euax king of the Arabians did deliuer in a diſcourſe written of the vertues of herbes, and dedicated it vnto the Emperor Nero. Euery greene Herbariſt can make mention of the herbe Lyſimachia, whoſe vertues were found out by King Lyſimachus, and his vertues no leſſe eterniſed in the ſelfe ſame plant, than the name of Phydias, queintly beaten into the ſhield of Pallas, or the firſt letters of Ajax or Hyacinthus (whether you pleaſe) regiſtred in that beloued floure of Apollo. As for Artemiſia, firſt called Παρθενις, whether the title thereof ſprang from Ἄρτεμις, Diana her ſelfe, or from the renowned Queene of Caria, which diſcloſed the vſe thereof vnto poſteritie, it ſurmounteth as a monument to reuiue the memories of them both for euer. What ſhould we ſpeake of Gentiana, bearing ſtill the cogniſance of Gentius? or of diuers other herbes taking their denominations of their princely Inuentors? What ſhould I ſay of thoſe royall perſonages, Iuba, Attalus, Climenus, Achilles, Cyrus, Maſyniſſa, Semyramis, Diocleſian? but onely thus, to beſpeake their princely loues to Herbariſme, and their euerlaſting honors (which neither old Plinius dead, nor yong Lipſius liuing will permit to die?) Creſcent herbæ, creſcetis amores: creſcent herbæ, creſcetis honores. But had this wonted facultie wanted the authoriſement of ſuch a royall companie, King Solomon, excelling all the reſt for wiſdome, of greater royaltie than they all (though the Lillies of the field out-braued him) he only (I ſay) might yeeld hereunto ſufficient countenance and commendation, in that his lofty wiſedome thought no ſcorne to ſtoupe vnto the lowly plants. I liſt not ſeeke the

common

common colours of antiquitie, when notwithstanding the world can brag of no more antient Monument than Paradise and the garden of Eden: and the fruits of the earth may contend for seigniorie, seeing their mother was the first Creature that conceiued, and they themselues the first fruit she brought forth. Talke of perfect happinesse or pleasure, and what place was so fit for that as the garden place where Adam was set to be the Herbarist? Whither did the Poets hunt for their sincere delights, but into the gardens of Alcinous, of Adonis, and the Orchards of Hesperides? Where did they dreame that Heauen should be, but in the pleasant garden of Elysium? Whither do all men walke for their honest recreation, but thither where the earth hath most beneficially painted her face with flourishing colours? And what season of the yeare more longed for than the Spring, whose gentle breath enticeth forth the kindely sweets, and makes them yeeld their fragrant smells? who would therefore looke dangerously vp at Planets, that might safely looke downe at Plants? And if true be the old prouerbe, Quæ supra nos, nihil ad nos; I suppose this new saying cannot be false, Quæ infra nos, ea maximè ad nos. Easie therefore is this treasure to be gained, and yet pretious. The science is nobly supported by wise and Kingly Fauorites: the subiect thereof so necessary and delectable, that nothing can be confected either delicate for the taste, daintie for smell, pleasant for sight, wholesome for body, conseruatiue or restoratiue for health, but it borroweth the relish of an herbe, the sauour of a floure, the colour of a leafe, the iuice of a plant, or the decoction of a root. And such is the treasure that this my Treatise is furnished withall, wherein though myne Art be not able to counteruaile Nature in her liuely portraitures; yet haue I counterfeited likenes for life, shapes and shadowes for substance, being ready with the bad Painter to explaine the imperfections of my pensill with my pen, chusing rather to score vpon my pictures such rude marks as may describe my meaning, than to let the beholder to guesse at randome and misse. I haue here therefore set downe not onely the names of sundry Plants, but also their natures, their proportions and properties, their affects and effects, their increase and decrease, their flourishing and fading, their distinct varieties and seuerall qualities, as well of those which our owne Countrey yeeldeth, as of others which I haue fetched further, or drawne out by perusing diuers Herbals set forth in other languages, wherein none of my country-men hath to my knowledge taken any paines, since that excellent Worke of Master Doctor Turner. After which time Master Lyte a Worshipfull Gentleman translated Dodonæus out of French into English: and since that, Doctor Priest, one of our London Colledge, hath (as I heard) translated the last Edition of Dodonæus, and meant to publish the same; but being preuented by death, his translation likewise perished. Lastly my selfe, one of the least among many, haue presumed to set forth vnto the view of the world, the first fruits of these myne owne Labours, which if they be such as may content the Reader, I shall thinke my selfe well rewarded, otherwise there is no man to be blamed but my selfe, being a worke I confesse for greater Clerkes to vndertake: yet may my blunt attempt serue as a whetstone to set an edge vpon some sharper wits, by whom I wish this my course Discourse might be both fined and refined. Faults I confesse haue escaped, some by the Printers ouersight, some through defects in my selfe to performe so great a Worke, and some by meanes of the greatnesse of the Labour, and that I was constrained to seeke after my liuing, being void of friends to beare some part of the burthen. The rather therefore accept this at my hands (louing Countrey-men) as a token of my good will; and I trust that the best and well minded wil not rashly condemne me, although some thing haue passed worthy reprehension. But as for the slanderer or Enuious I passe not for them, but returne vpon themselues any thing they shall without cause either murmure in corners, or iangle in secret. Farewell.

From my House in Holborn within the Suburbs of London, this first of December, 1597.

Thy sincere and vnfeigned Friend,

IOHN GERARD.

TO THE READER.

Courteous READER,

THere are many things which I thinke needfull to impart vnto thee, both concerning the knowledge of plants in generall, as alſo for the better explaining of ſome things pertinent to this preſent Hiſtorie, which I haue here ſet forth much amended and enlarged. For the generall differences, affections, &c. of Plants, I hold it not now ſo fitting nor neceſſarie for me to inſiſt vpon them; neither doe I intend in any large diſcourſe to ſet forth their many and great vſes and vertues: giue me leaue onely to tell you, That God of his infinit goodneſſe and bountie hath by the *medium* of Plants, beſtowed almoſt all food, clothing, and medicine vpon man. And to this off-ſpring we alſo owe (for the moſt part) our houſes, ſhipping, and infinite other things, though ſome of them *Proteus* like haue run through diuers ſhapes, as this paper wereon I write, that firſt from ſeed became Flax; then after much vexation thred, then cloath, where it was cut and mangled to ſerue the Faſhions of the time: but afterwards rejected and caſt aſide, yet vnwilling ſo to forſake the ſeruice of man for which God had created it, againe it comes (as I may terme it) to the Hammer, from whence it takes a more noble forme and aptitude to be imployed to Sacred, Ciuill, Forreine and Domeſticke vſes. I will not ſpeake of the many and various obiects of delight that theſe preſent to the ſenſes, nor of ſundry other things, which I could plentifully in this kinde deliuer: but rather acquaint you from what Fountaines this Knowledge may be drawne, by ſhewing what Authours haue deliuered to vs the Hiſtorie of Plants, and after what manner they haue done it; and this will be a meanes that many controuerſies may be the more eaſily vnderſtood by the leſſe learned and judicious Reader.

Solomon. He whoſe name we firſt finde vpon record (though doubtleſſe ſome had treated therof before) that largely writ of Plants, was the wiſeſt of men, euen King *Solomon*, who certainely would not haue medled with this ſubiect, if he in his wiſedome had not knowne it worthy himſelfe, and exceeding fitting: Firſt for the honour of his Creator, whoſe gifts and bleſſings theſe are: Secondly for the good of his Subiects, whereof without doubt, he in this worke had a ſpeciall regard in the curing of their diſeaſes and infirmities. But this kingly worke being loſt, I will not inſiſt vpon it, but come to ſuch as are yet extant, of which (following the courſe of antiquitie) that of *Theophraſtus* firſt takes place.

Theophraſius. Now *Theophraſtus* ſucceeded *Ariſtotle* in the gouernement of the Schoole at Athens, about the 114 Olymp. which was ſome 322 yeares before Chriſt. He among many other things writ a Hiſtorie of Plants in ten bookes, and of the cauſes of them, eight bookes; of the former ten there are nine come to our times reaſonable perfect; but there now remain but ſix of the eight of the cauſes of Plants. Some looking vpon the Catalogue of the bookes of *Theophraſtus* his writing, ſet forth in his life, written by *Diogenes Laertius*, may wonder that they finde no mention of theſe bookes of Plants, amongſt theſe he reckons vp, and indeed I thought it ſomewhat ſtrange, and ſo much the more, becauſe this his life is ſet forth by *Daniel Heinſius* before his * Edition of *Theophraſtus*, and there alſo no mention neither in the Greeke nor Latine of thoſe workes. Conſidering this, I thinking to haue ſaid ſomething therof, I found the doubt was long ſince cleared by the learned *Cauſabone* in his notes vpon "*Laertius*, where *pag.* 331. for Περὶ φυτικῶν ἱστορίων, and φυτικῶν αἰτιῶν, hee wiſhes you to reade Περὶ φυτικῶν ἱστοριῶν and αἰτιῶν. Thus being certaine of the Authour, let mee ſay ſomewhat of the work, which though by the iniurie of time it hath ſuffered much, yet is it one of the chiefe pieces of Antiquitie, from whence the knowledge of Plants is

Luzd. Batau. 1613.

Excuſ. ab Henr. Steph. 1593.

to

to be drawne. *Theophraſtus* as he followed *Ariſtotle* in the Schoole, ſo alſo in his manner of writing, for according as *Ariſtotle* hath deliuered his *Hiſtoria Animalium*, ſo hath hee ſet forth this of Plants, not by writing of each *ſpecies* in particular, but of *their differences and nature, by their parts, affections, generations and life.* Which how hard a thing it was, hee tells you in his ſecond Chapter, and renders you this reaſon, *Becauſe there is nothing common to all Plants, as the mouth and belly is to other liuing creatures*, &c. Now by this manner of writing you may learne the generall differences and affections of Plants, but cannot come to the particular knowledge of any without much labour: for you muſt goe to many places to gather vp the deſcription of one Plant: neither doth hee (nor is it neceſſarie for any writing in this manner) make mention of any great number, and of many it may bee but once. His workes being in Greeke were tranſlated into Latine by *Theodore Gaza*, who did them but *Græca fide*, for he omitted ſome things, otherwhiles rendred them contrary to the minde of the Author: but aboue all, he tooke to himſelfe too much libertie in giuing of names in imitation of the Greeke, or of his owne inuention, when it had beene better by much for his Reader to haue had them in the Greeke, as when he renders Ἐλατήριον, *Agitatorium*, Ἡλιῶδες, *Solaris*, &c. The learned *Iulius Scaliger* hath ſet forth *Animaduerſiones* vpon theſe bookes, wherein he hath both much explained the minde of *Theophraſtus*, and ſhewed the errours of *Gaza*. Some ſince his time haue promiſed to do ſomething to this Author, as *Daniel Heinſius*, and *Spigelius*, but twentie yeares are paſt ſince, and I haue not yet heard of any thing done in this kinde by either of them. Thus much for *Theophraſtus*.

Theoph. Hiſt. pl. l. 1. cap. 1.

Σημεῖον δὲ πάντων ὅτι οὐθὲν κοινὸν ἔχουσιν ἅπαντα τὰ φυτὰ πρὸς ἄλληλα, &c.

Let me not paſſe ouer *Ariſtotle* in ſilence, though his bookes writ of this ſubiect were but two, and theſe according to the coniecture of *Iulius Scaliger* (who hath made a large and curious examination of them) haue either periſhed, or come to vs not as they were originally written by *Ariſtotle*, but as they haue been by ſome later man put into Greeke. Amongſt other things *Scaliger* hath theſe concerning thoſe two bookes: *Reor è textrina Theophraſti detracta fila quædam, ũſq; clavos additos, tametſi neque aureos, neque purpureos. Quod ſi protinus autorem tibi dari vis ad Arabum diligentiam propius accedit.* And afterwards thus: *Attribuere viri docti, alius alij, at quidem qui aliorum viderem nihil Planudem autorem facienti malim aſſentiri; extant enim illius alijs in libris ſimilis veſtigia ſemilatinietatis*, &c. Thus much for *Ariſtotle*, whom as you ſee I haue placed after his Scholler, becauſe there is ſuch doubt of theſe bookes carried about in his name, and for that *Scaliger* as you ſee thinks them rather taken out of *Theophraſtus*, than written by his Maſter.

Ariſtotle.

The next that orderly followes is *Pedacius Dioſcorides Anazarbeus*, who liued (according to *Suidas*) in the time of *Cleopatra*, which was ſome few yeares before the birth of our Sauiour. Now *Suidas* hath confounded * *Dioſcorides Anazarbeus* with *Dioſcorides Phacas*, but by ſome places in *Galen* you may ſee they were different men: for our Anazarbean *Dioſcorides* was of the Empericke ſect, but the other was a follower of *Herophylus* and of the Rationall ſect. He writ not only of Plants, but *de tota materia medica*; to which ſtudie hee was addicted euen from his childe-hood, which made him trauell much ground, and leade a militarie life, the better to accompliſh his ends: and in this he attained to that perfection, that few or none ſince his time haue attained to, of the excellencie of his worke, which is as it were the foundation and ground-worke of all that hath been ſince deliuered in this nature. Heare what *Galen* one of the excellenteſt of Phyſitions, and one who ſpent no ſmal time in this ſtudy, affirmes: But, ſaith he, the Anazarbean *Dioſcorides* in fiue bookes hath written of the neceſſarie matter of medicine, not onely making mention of herbes, but alſo of trees, fruits, " liquours and iuices, as alſo of all mineralls, and of the parts of liuing creatures: and in mine opinion he hath with the greateſt perfection performed this worke of the matter of Medicine: for although many before him haue written well vpon this ſubiect, yet none haue writ ſo well of all. Now *Dioſcorides* followes not the method of *Theophraſtus*, but treats of each kinde of herbe in particular, firſt giuing the names, then the deſcription, and then the place where they vſually grow, and laſtly their vertues. Yet of ſome, which then were as frequently knowne with them, as Sage, Roſemary, an Aſh or Oke tree are with vs, he hath omitted the deſcriptions, as not neceſſarie, as indeed at that time when they were ſo vulgarly knowne, they might ſeeme ſo to be: but now wee know the leaſt of theſe, and haue no certaintie, but ſome probable coniectures do direct vs to the knowledge of them. He was not curious about his words nor method, but plainely and truly deliuered that whereof he had certaine and experimentall knowledge, concerning the deſcription and nature of Plants. But the generall method he obſerued you may finde ſet forth by *Bauhine* in his Edition of *Matthiolus*, immediatly after the preface of the firſt booke, whereto I refer the curious, being too long for me in this place to inſiſt vpon. His

Dioſcorides.

Διοσκορίδης Ἀναζαρβεὺς ἰατρὸς ὁ φυσικὸς ἕτερος ἐστὶ παρὰ τὸν Φακᾶν Διοσκορίδην. *Suid.*

De ſimpl. med. facult. lib. 6. proem.

" Χυμῶν γένεσιν.

workes that haue come to vs are fiue bookes *de materia Medica*. One *de letalibus venenis, eorumq; præcautione et curatione*: another *de Cane rabido, deq; notis quæ morsus ictusve animalium venenum relinquentium sequuntur*: a third *De eorum curatione*. These eight bookes within these two last centuries of yeares haue been translated out of Greeke into Latine, and commented vpon by diuers, as *Hermolaus Barbarus, Iohannes Ruellius, Marcellus Virgilius*, &c. But of these and the rest, as they offer themselues, I shall say somewhat hereafter. There is also another worke which goes vnder his name, and may well be his. It is Ἰατρικὰ sive *de facile parabilibus*, diuided into two bookes, translated and confirmed with the consent of other Greeke Physitions, by the great labour of *Iohn Moibane* a Physition of Auspurge, who liued not to finish it, but left it to bee perfected and set forth by *Conrade Gesner*.

Pliny. The next that takes place is the laborious *Caius Plinius secundus*, who liued in the time of *Vespasian*, and was suffocated by the sulphureous vapours that came from mount Vesuvius, falling at that time on fire; he through ouermuch curiositie to see and finde out the cause thereof approching too nigh, and this was *Anno Domini*, 79. He read and writ exceeding much, though by the iniurie of time wee haue no more of his than 37. books *de Historia Mundi*. which also haue receiued such wounds, as haue tried the best skill of our Critickes, and yet in my opinion in some places require *medicas manus*. From the twelfth to the end of the twentie seuenth of these bookes he treats of Plants, more from what he found written in other Authors, than from any certaine knowledge of his owne, in many places following the method and giuing the words of *Theophrastus*, and in other places those of *Dioscorides*, though he neuer make mention of the later of them: he also mentions, and no question followed many other Authors, whose writings haue long since perished. Sometimes he is pretty large, and otherwhiles so briefe, that scarce any thing can thence be gathered. From the seuenteenth vnto the twentie seuenth he variously handles them, what method you may quickly see by his *Elenchus*, contained in his first book, but in the twenty seuenth hee handles those whereof hee had made no, or not sufficient mention, after an Alphabeticall order, beginning with *Æthyopis, Ageratum, Aloe*, &c. so going on to the rest.

Galen. Paulus. Aetius. I must not passe ouer in silence, neither need I long insist vpon *Galen*, *Paulus Ægineta*, and *Aetius*, for they haue only alphabetically named Plants and other simple Medicines, briefely mentioning their temperature and faculties, without descriptions (some very few, and those briefe ones, excepted) and other things pertinent to their historie.

Macer. The next that present themselues are two counterfeits, who abuse the World vnder feined titles, and their names haue much more antiquitie than the works themselues: the first goes vnder the title of *Æmilius Macer* a famous Poet, of whom *Ouid* makes mention in these verses:

Sæpe suas volucres legit mihi grandior æuo,
Quæq; nocet Serpens, quæ iuuat herba Macer.

Pliny also makes mention of this *Macer*: hee in his Poems imitated *Nicander*, but this worke that now is carried about vnder his name, is written in a rude, and somewhat barbarous verse, far different from the stile of those times wherein *Macer* liued, and no way in the subiect immitating *Nicander*. It seemes to haue beene written about 400 or 500 yeares agoe.

Apuleius. The other also is of an vnknowne Author, to whom the Printers haue giuen the title of *Apuleius Madaurensis*, and some haue been so absurdly bold of late, as to put it vnto the workes of *Apuleius*; yet the vncurious stile and method of the whole booke will conuince them of errour, if there were no other argument. I haue seene some foure manuscripts of this Authour, and heard of a fifth, and all of them seeme to bee of good Antiquitie: the figures of them all for the most part haue some resemblance each of other: the first of these I saw some nine yeares agoe with that worthy louer and storer of Antiquities, Sir *Robert Cotton*: it was in a faire Saxon hand, and as I remember in the Saxon tongue; but what title it carried, I at that time was not curious to obserue. I saw also another after that, which seemed not to be of any small standing, but carelesly obserued not the title. But since I being informed by my friend Master *Goodyer* (as you may finde in the Chapter of Saxifrage of the Antients) that his Manuscript which was very antient, acknowledged no such Author as *Apuleius*, I begunne a little to examine some other Manuscripts, so I procured a very faire one of my much honored friend Sr. *Theod. Mayern:* in the verie beginning of this is writ, *In hoc continentur libri quatuor medicinæ Ypocratis, Platonis Apolienſis vrbis de diuersis herbis; Sexti Papiri placiti ex Animalibus*, &c. A little after

in

in the ſame page at the beginning of a table which is of the vertues, are theſe words, *In primo libro ſunt herbæ deſcriptæ, quas Apolienſis Plato deſcripſit, &c.* and thus alſo he is named in the title of the Epiſtle or Proeme; but at the end of the worke is *explicit liber Platonis de herbis maſculinis*, &c. With this in all things agrees that of Mr. *Goodyer*, as he hath affirmed to me. Beſides theſe, I found one with Mr. *Iohn Tradeſcant*, which was written in a more ignorant and barbarous time, as one may coniecture by the title, which is thus at the very beginning. *In nomine domini incipit Herboralium Apulei Platonis quod accepit a Scolapio, & Chirone Centauro magiſtro.* Then followes (as alſo in the former, and in the printed bookes) the tract aſcribed to *Antonius Muſa, de herba Betonica*: after that are theſe words, *Liber Medicinæ Platonis herbaticus explicit*. By this it ſeemes the Author of this worke either was named, or elſe called himſelfe *Plato*, a thing not without example in theſe times. This worke was firſt printed at Baſill, 1528. amongſt ſome other workes of Phyſicke, and one *Albanus Torinus* ſet it forth by the helpe of many Manuſcripts, of whoſe imperfections he much complaines, and I thinke not without cauſe: after this, *Gabriel Humelbergius* of Rauenſpurge in Germany ſet it forth with a Comment vpon it, who alſo complaines o the imperfections of his copies, and thinkes the worke not perfect: indeed both the editions are faultie in many places: and by the help of theſe Manuſcripts I haue ſeen they might be mended (if any thought it worth their labour) in ſome things, as I obſerued in curſorily looking ouer them. One thing I much maruell at, which is, that I finde not this Author mentioned in any Writer of the middle times, as *Platearius*, *Bartholomæus Anglus*, &c. Now I coniecture this worke was originally written in Greeke, for theſe reaſons: firſt, becauſe it hath the Greeke names in ſuch plenty, and many of them proper, ſignificant, and in the firſt place: Secondly ſome are onely named in Greeke, as *Hierobulbon*, *Artemiſia Leptophyllos*, and *Artemiſia tagantes*, *Batrachion*, *Gryas* (which I iudge rather Greeke than Latine) &c. Beſides in both the written bookes in very many places amongſt the names I finde this word *Omòeos*, but diuerſly written; for I coniecture the Greeke names were written in the Greeke character, and ὁμοίως amongſt them; and then alſo when the reſt of the worke was tranſlated, which afterwards made the tranſcribers who vnderſtood it not to write it variouſly, for in the one booke it is alwaies written *Amoeos*, and in the other *Omoeos*, and ſomtimes *Omeos*, as in the Chapter of *Brittanica*, the one hath it thus, *Nomen herbæ iſtius Britanicæ, Amoeos dicunt eam Damaſinium*, &c. The other thus: *Nomen herbæ Brittanica, Omeos Damaſinius*, &c. & in the chap. of *Althæa* the one hath it thus: *Nomen huius herbæ Altea Amoeos vocant hanc herbam Moloche*, &c. The other *Nomen herbæ Ibiſcus omoeos Moloce*, &c. If it be certaine which *Philip Ferrarius* affirmes in his *Lexicon Geographicum*, that the citie Apoley is Conſtantinople, then haue I found *Apolienſis vrbis*, of which I can finde no mention in any antient or moderne Geographer beſides; and then it is more than probable that this was written in Greeke, and it may be thought differently tranſlated, which occaſions ſuch diuerſitie in the copies, as you ſhall finde in ſome places. Now I coniecture this worke was written about ſome 600. yeares agoe.

From theſe Antients haue ſprung all, or the greateſt part of the knowledge, that the middle or later times haue had of Plants; and all the controuerſies that of late haue ſo ſtuffed the bookes of ſuch as haue writ of this ſubiect, had their beginning by reaſon that the careleſneſſe of the middle times were ſuch, that they knew little but what they tranſcribed out of theſe Antients, neuer endeuouring to acquire any perfect knowledge of the things themſelues: ſo that when as learning (after a long Winter) began to ſpring vp againe, men began to be ſomwhat more curious, and by the notes and deſcriptions in theſe antient Authors they haue laboured to reſtore this loſt knowledge; making inquirie, firſt whether it were knowne by *Theophraſtus*, *Dioſcorides*, or any of the Antients, then by what name. But to returne to my Authors.

About *An. Dom.* 1100. or a little after, liued the Arabians *Auicen*, *Auerrhoes*, *Meſue*, *Rhaſis* and *Serapio*, moſt of theſe writ but briefely of this ſubiect; neither haue we their works in the Arabicke wherein they were written, but barbarouſly tranſlated into Latine, and moſt part of theſe workes were by them taken out of the Greekes, eſpecially *Dioſcorides* and *Galen*; yet ſo as they added ſomewhat of their own, and otherwhiles confounded other things with thoſe mentioned by the Greekes, becauſe they did not well know the things whereof they writ. *Auicen*, *Auerrhoes*, and *Rhaſis* alphabetically and briefly (following the method of *Galen*) giue the names, temperature, and vertues, of the chiefeſt ſimple medicines. But *Serapio* after a particular tract of the temperature and qualities of ſimple medicines in generall, comes to treat of them in particular, and therein followes chiefely *Dioſcorides*, *Galen*, and *Paulus*, and diuers Arabians that went before him. This is the chiefe worke in this kinde of the Arabians, which haue come to vs; he himſelfe tells vs his methode

The Arabians.

Auicen.
Auerrhoes.
Rhaſes.
Serapio.

thod in his preface, which is (when he comes to particulars) first of medicines temperate, then of those that are hot and drie in the first degree; then those cold and drie in the same degree: after that, those hot and dry in the second degree, &c. and in each of these tracts he followes the order of the Arabicke Alphabet.

Nor after the times of the Arabians vntill about the yeare 1400. There were diuers obscure and barbarous writers, who by sight knew little whereof they writ, but tooke out of the Greekes, Arabians, and one another, all that they writ, giuing commonly rude figures, seldome setting downe any descriptions: I will only name the chiefe of them that I haue seene, and as neare as I can guesse in that order that one of them succeeded another. For the particular times of their liuing is somewhat difficult to be found out. One of the ancientest of them seemes to be *Isidore*; then *Platearius* whose worke is Alphabeticall and intituled *Circa instans*. the next *Matthæus Syluaticus*, who flourished about the yere 1319. his worke is called *Pandectæ*: a little after him was *Bartholomæus Anglus*, whose workes (as that of *Isodore*, and most of the rest of those times) treat of diuers other things besides Plants, as Beasts, Birds, Fishes, &c. His worke is called *De proprietatibus rerum*: the Authors name was *Bartholmew Glanuill*, who was descended of the Noble Family of the Earles of Suffolke; and he wrote this worke in *Edward* the thirds time, about the yeare of our Lord, 1397. After all these, and much like them is the *Hortus sanitatis* whose Author I know not. But to leaue these obscure men and their writings, let me reckon some of later time, who with much more learning and iudgement haue endeuoured to illustrat this part of Physicke.

Isodore. *Platearius.* *Barthol. Angl.* *Hortus sanitat.*

About some 200 yeare agoe learning againe beginning to flourish, diuers begunne to leaue and loath the confused and barbarous writings of the middle times, and to haue recourse to the Antients, from whence together with puritie of language, they might acquire a more certaine knowledge of the things treated of, which was wanting in the other. One of the first that tooke paines in this kinde was *Hermolaus Barbarus* Patriarch of Aquileia, who not onely translated *Dioscorides*, but writ a Commentarie vpon him in fiue bookes, which he calls his *Corollarium*; in this worke hee hath shewed himselfe both iudicious and learned.

Herm. Barb.

After him *Marcellus Virgilius* Secretarie to the State of Florence, a man of no lesse learning and indgement than the former, set forth *Dioscorides* in Greeke and Latine with a Comment vpon him.

Merc. Virg.

Much about their time also *Iohn Ruellius* a French Physition, who flourished in the yere 1480, translated *Dioscorides* into Latine, whose translation hath been the most followed of all the rest. Moreouer he set forth a large worke, *De natura Stirpium*, diuided into three bookes, wherein he hath accurately gathered all things out of sundry writers, especially the Greekes and Latines; for first hauing (after the manner of *Theophrastus*) deliuered some common precepts and Aduertisements pertaining to the forme, life, generation, ordering, and other such accidents of plants; he then comes to the particular handling of each *species*.

Iohn. Ruellius.

Much about this time, the Germanes began to beautifie this so necessary part of Physicke; and amongst them *Otho Brunfelsius*, a Physition of good account, writ of plants, and was the first that gaue the liuely figures of them; but he treated not in all of aboue 288 Plants. He commonly obserues this method in his particular chapters: First the figure (yet he giues not the figures of all he writes of) then the Greeke, Latine, and Germane names; after that, the description and historie out of most former Authors; then the temperature and vertues, and lastly, the Authours names that had treated of them. His worke is in three parts or tomes, the first was printed in 1530. the second in 1531, and the third in 1536.

Otho Brunfel.

Next after him was *Hieronymus Tragus* a learned, ingenious, and honest writer, who set forth his workes in the German tongue, which were shortly after translated into Latine by *Dauid Kiber*. He treats of most of the Plants commonly growing in Germany, & I can obserue no generall method he keepes, but his particular one is commonly this: hee first giues the figure with the Latine and high Dutch name; then commonly a good description; after that the names, then the temperature, and lastly the vertues, first inwardly, then outwardly vsed. He hath figured some 567, and described some 800. his figures are good, (and so are most of the rest that follow.) His workes were set forth in Latine, *An.* 1552.

Hieron. Tragus.

In his time liued *Leonhartus Fuchsius*, a German Physition, being also a learned and diligent writer, but he hath taken many of his descriptions as also vertues word for word out of the Antients, and to them hath put figures; his generall method is after the Greek Alphabet, and his particular one thus: First the names in Greeke and Latine, together oft-

Leonhar. Fuch.

times

times with their Etymologies, as alſo the German and French names, then the kinds after that the forme, the place, time, temperature, then the vertues: firſt out of the Antients, as *Dioſcorides, Galen, Pliny, &c.* and ſometimes from the late Writers, whom he doth not particularize, but expreſſes in generall *ex recentioribus*. His worke was ſet forth at Baſil, 1542, in *Fol.* containing, 516 figures; alſo they were ſet forth in *Octavo*, the hiſtorie firſt, with all the figures by themſelues together at the end with the Latine and high Dutch names.

Conrade Geſner.

About this time, and a little after, flouriſhed *Conrade Geſner* alſo a German Phyſition, who ſet forth diuers things of this nature, but yet liued not to finiſh the great and generall worke of Plants, which he for many yeres intended, and about which he had taken a great deale of paines, as may be gathered by his Epiſtles. He was a very learned, painfull, honeſt and iudicious writer, as may appeare by his many & great workes; wherof thoſe of Plants were firſt a brieſe Alphabeticall Hiſtorie of plants without figures, gathered out of *Dioſcorides, Theophraſtus, Pliny*, &c with the vertues briefely, and for the moſt part taken out of *Paulus Ægineta*, with their names in Greek and French put in the margent: this was printed at Venice, 1541, in a ſmall forme. He ſet forth a catalogue of Plants, in Latin, Greeke, high-Dutch and French, printed at Zurich, 1542. Alſo another tract *De Lunarijs & noctu lucentibus cum montis fracti, ſiue Pilati Lucernarum deſcriptione, An.* 1552. in *quarto*. He alſo ſet forth the foure Books of *Valerius Cordus* (who died in his time) and his *Sylua obſeruationum* at Strausburgh, 1561. in *fol.* and to theſe he added a Catalogue of the Germane Gardens with an Appendix and *Corollarium* to *Cordus* his Hiſtorie. Alſo another treatiſe of his *De ſtirpium collectione*, was ſet forth at Zurich by *Wolphius, An.* 1587, in *Octavo*.

Loniceru.

At the ſame time liued *Adam Loniceru* a Phyſition of Frankeford, whoſe naturall hiſtorie was there printed, *An.* 1551, and the firſt part thereof is of Plants; and foure yeres after he added another part thereto, treating alſo of Plants. I finde no generall method obſerued by him, but his particular method vſually is this: firſt he giues the figure, then the names in Latine and Dutch, then the temperature, &c as in *Tragus*, from whom & *Cordus*, he borrows the moſt part of his firſt tome, as he doth the 2. from *Matth.* & *Amat Luſitanus*.

P. And. Matthiolus.

In his time the Italian Phyſition *Petrus Andreas Matthiolus* ſet forth his Commentaries vpon *Dioſcorides*, firſt in Italian with 957 large and very faire figures, and then afterwards in Latine at Venice, with the ſame figures, *An.* 1568. After this he ſet forth his Epitome in *Quarto*, with 921 ſmaller figures. Now theſe his Commentaries are very large; and he hath in them deliuered the hiſtorie of many Plants not mentioned by *Dioſcorides*; but he is iuſtly reprehended by ſome, for that he euery where taxes and notes other Writers, when as he himſelfe runs into many errours, and ſome of them wilfull ones, as when he giues figures framed by his owne fancie, as that of *Dracontium maius, Rhabarbarum*, &c. and falſified otherſome in part, the better to make them agree with *Dioſcori.* his deſcription, as when he pictures *Arbor Iudæ* with prickles, and giues it for the true *Acatia*: and he oft-times giues bare figures without deſcription of his owne, but ſaith, it is that deſcribed by *Dioſcorides, Nullis reclamantibus notis*, for which the Authors of the *Aduerſaria* much declaime againſt him. It had bin fit for him, or any one that takes ſuch a worke in hand, to haue ſhewed by deſcribing the plant he giues, and conferring it with the deſcription of his Author, that there is not any one note wanting in the deſcription, vertues, or other particulars which his Author ſets downe; and if hee can ſhew that his is ſuch, then will the contrary opinions of all others fall of themſelues, and need no confutation.

Amatus Luſitanus.

Amatus Luſitanus alſo about the ſame time ſet forth Commentaries vpon *Dioſcorides*, adding the names in diuers Languages but without figures, at Strausbourgh, *An.* 1554. in *Quarto*: he diſſented from *Matthiolus* in many things; whereupon *Matthiolus* writ an Apologie againſt him. He hath performed no great matter in his Enarrations vpon *Dioſcorides*, but was an Author of the honeſtie of *Matthiolus*, for as the one deceiued the world with counterfeit figures, ſo the other by feined cures to ſtrengthen his opinion, as *Crato* iudges of his *Curationes Medicinales* (another worke of his) which hee thinkes, *potius fictæ, quam factæ*.

Remb. Dodon.

Rembertus Dodonæus a Phyſition borne at Mechlin in Brabant, about this time begun to write of Plants. Hee firſt ſet foorth a Hiſtorie in Dutch, which by *Cluſius* was turned into French, with ſome additions, *Anno Domini*, 1560. And this was tranſlated out of French into Engliſh by Maſter *Henry Lite*, and ſet forth with figures, *Anno Dom.* 1578. and diuers times ſince printed, but without Figures. In the yeare 1552, *Dodonæus* ſet forth in Latine his *Frugum Hiſtoria*, and within a while after his *Florum, purgantium, & deleteriorum Hiſtoria*. Afterwards hee put them all together, his former, and thoſe his later Workes, and diuided them into thirtie Bookes, and ſet them forth with 1305 figures, in *fol. An.* 1583. This edition was alſo tranſlated into Engliſh, which became the foundation

of this preſent Worke, as I ſhall ſhew hereafter. It hath ſince beene printed in Latine, with the addition of ſome few new figures: and of late in Dutch, *Anno* 1618. with the addition of the ſame figures; and moſt of theſe in the *Exoticks* of *Cluſius*, and great ſtore of other additions. His generall method is this: firſt he diuides his Works into ſix Pemptades or fiues: the fifth Pemptas or fiue bookes of theſe containe Plants in an Alphabeticall order, yet ſo as that other Plants that haue affinitie with them are comprehended with them, though they fall not into the order of the Alphabet. The ſecond Pempt. containes *Flores Coronarij*, *Plantæ odoratæ & vmbelliferæ*. The third is *De Radicibus, Purgantibus Herbis, conuolvulis, deleterijs ac perniciosis Plantis, Filicibus, Muſcis & Fungis*. The fourth is *De Frumentis, Leguminibus, paluſtribus & aquatilibus*. The fifth, *De Oleribus & Carduis*. The ſixth, *de Fruticibus & Arboribus*. The particular method is the ſame vſed by our Author.

Peter Pena. Matth. Lobel. In the yeare 1570, *Peter Pena* and *Matthias Lobel* did here at London ſet forth a Worke, entituled *Stirpium Aduerſaria noua*; the chiefe end and intention whereof being to find out the *Materia medica* of the Antients. The generall method is the ſame with that of our Author, which is, putting things together as they haue moſt reſemblance one with another in externall forme, beginning with Graſſes, Cornes, &c. They giue few figures, but ſometimes refer you to *Fuchſius*, *Dodonæus*, and *Matthiolus*: but where the figure was not giuen by former Authors, then they commonly giue it; yet moſt part of theſe figures are very ſmall and vnperfect, by reaſon (as I coniecture) they were taken from dried plants. In this Worke they inſiſt little vpon the vertues of Plants, but ſuccinctly handle controuerſies, and giue their opinions of Plants, together with their deſcriptions and names, which ſometimes are in all theſe languages, Greeke, Latine, French, high and low Dutch, and Engliſh: otherwhiles in but one or two of them. Some Writers for this Work call them *Doctiſſimi Angli*; yet neither of them were borne here, for *Pena* (as I take it) was a French man, and *Lobel* was borne at Ryſſele in Flanders, yet liued moſt part of his later time in this Kingdome, and here alſo ended his dayes. In the yeare 1576 he ſet forth his Obſeruations, and ioyned them with the *Aduerſaria*, by them two to make one entire Worke: for in his Obſeruations he giues moſt part of the figures and vertues belonging to thoſe herbes formerly deſcribed onely in the *Aduerſaria*; and to theſe alſo adds ſome new ones not mentioned in the former Worke. After which he ſet forth an Herball in Dutch, wherein he comprehended all thoſe Plants that were in the two former Workes, and added diuers other to them, the Worke containing ſome 2116 figures; which were printed afterwards in a longiſh forme, with the Latine names, and references to the Latine and Dutch bookes. After all theſe, at London, *Anno* 1605, he againe ſet forth the *Aduerſaria*, together with the ſecond part thereof, wherein is contained ſome fourty figures, being moſt of them of Graſſes and Floures; but the deſcriptions were of ſome 100 plants, varieties and all. To this he added a Treatiſe of Balſam (which alſo was ſet forth alone in Quarto, *Anno* 1598.) and the *Pharmacopæa* of *Rondeletius*, with Annotations vpon it. He intended another great Worke, whoſe title ſhould haue beene *Stirpium Illuſtrationes*, but was preuented by death.

Carol. Cluſius. Some ſix yeares after the Edition of the *Aduerſaria*, *Anno* 1576, that learned, diligent, and laborious Herbariſt *Carol. Cluſius* ſet forth his Spaniſh Obſeruations, hauing to this purpoſe trauelled ouer a great part of Spaine; and being afterwards called to the Imperiall Court by *Maximilian* the ſecond, he viewed Auſtria and the adiacent prouinces, and ſet forth his there Obſeruation, *Anno* 1583. He alſo tranſlated out of Spaniſh the Works of *Garcias ab Orta* and *Chriſtopher Acoſta*, treating of the ſimple medicines of the Eaſt Indies, and *Nicolas Monardus*, who writ of thoſe of the Weſt Indies. After this he put into one body both his Spaniſh and Pannonicke Obſeruations, with ſome other, and thoſe he comprehends in ſix bookes, entituled *Rariorum Plantarum Hiſtoria*: whereto he alſo addes

Honor. Bellus. an Appendix, a treatiſe of Muſhroms, ſix Epiſtles treating of Plants, from *Honorius Bellus* an Italian Phyſition liuing at Cydonia in Candy; as alſo the deſcription of mount Baldus, being a Catalogue with the deſcription and figures of ſome rare and not before writ-

Iohn Pona. ten of Plants there growing, written by *Iohn Pona* an Apothecarie of Verona (This Deſcription of *Pona's* was afterwards with ſome new deſcriptions and thirty ſix figures ſet forth alone in Quarto, *An.* 1608.) This firſt Volume of *Cluſius* was printed in Antwerp, *Anno* 1601, in Folio: and in the yeare 1605 he alſo in Folio ſet forth in another volume ſix bookes of *Exoticks* containing various matter, as plants, or ſome particles of them, as Fruits, Woods, Barks, &c. as alſo the forenamed tranſlations of *Garcias*, *Acoſta*, and *Monardus*: Three Tracts beſides of the ſame *Monardus*; the firſt, *De lapide Bezaar, & Herba Scorſonera*. The ſecond, *De Ferro & eius facultatibus*: The third, *De Niue & eius commodis*.

To

To these he also added *Bellonius* his Obseruations or Singularities, and a tract of the same Author, *De neglecta Stirpium cultura*, both formerly translated out of French into Latine by him. He was borne at Atrebas or Arras, the chiefe city of Artois, *Anno* 1526. and died at Leyden, *Ann.* 1609. After his death, by *Euerard Vorstius*, *Peter Paw*, or some others, were set forth some additions and emendations of his former Works, together with his funerall Oration made by *Vorstius*, his Epitaph, &c. in Quarto, *Anno* 1611, by the name of his *Curæ Posteriores*.

In the yeare 1583, *Andreas Cæsalpinus* an Italian Physition, and Professor at Pisa, set forth an historie of Plants, comprehended in sixteene bookes: his Worke is without figures, and he oft times giues the Tuscane names for Latine; wherefore his worke is the more difficult to be vnderstood, vnlesse it be by such as haue been in Tuscanie, or else are already well exercised in this study. He commonly in his owne words diligently for the most part describes each Plant, and then makes enquirie whether they were knowne by the Antients. He seldome sets downe their faculties, vnlesse of some, to which former Writers haue put downe none. In the first booke he treats of Plants in generall, according as *Theophrastus* doth: but in the following bookes hee handles them in particular: he maketh the chiefe affinity of Plants to consist in the similitude of their seeds and seed vessels. *Andr. Cæsalp.*

Ioachimus Camerarius a Physition of Noremberg flourished about this time: Hee set forth the Epitome of *Matthiolus*, with some additions and accurate figures, in Quarto, at Frankfort, 1586: in the end of which Worke (as also in that set forth by *Matthiolus* himselfe) is *Iter Baldi*, or a journey from Verona to mount Baldus, written by *Francis Calceolarius* an Apothecarie of Verona. Another Worke of *Camerarius* was his *Hortus Medicus*, being an Alphabeticall enumeration of Plants, wherein is set forth many things concerning the names, ordering, vertues, &c. of Plants. To this he anexed *Hyrcinia Saxonothuringica Iohannis Thalij*, or an alphabeticall Catalogue written by *Iohn Thalius*, of such Plants as grew in Harkwald a part of Germanie betweene Saxony and Durengen. This was printed also at Frankfort in Quarto, *An.* 1588. *Ioach. Camer.* *Fr. Calceolariu* *Iob. Thalius.*

In the yeare 1587 came forth the great Historie of Plants printed at Lyons, which is therefore vulgarly termed *Historia Lugdunensis*: it was begun by *Dalechampius*: but hee dying before the finishing thereof, one *Iohn Molinæus* set it forth, but put not his name thereto. It was intended to comprehend all that had written before, and so it doth, but with a great deale of confusion; which occasioned *Bauhine* to write a treatise of the errors committed therein, in which he shewes there are about foure hundred figures twice or thrice ouer. The whole number of the figures in this Worke are 2686. This History is diuided into eighteene bookes, and the Plants in each booke are put together either by the places of their growings, as in Woods, copses, mountaines, waterie places, &c. or by their externall shape, as vmbelliferous, bulbous, &c. or by their qualities, as purging, poysonous, &c. Herein are many places of *Theophrastus* and other antient Writers explained. He commonly in each chapter giues the names, place, forme, vertue, as most other do. And at the end thereof there is an Appendix containing some Indian plants, for the most part out of *Acosta*; as also diuers Syrian and Egyptian plants described by *Reinold Rawolfe* a Physition of Ausburgh. *Hist. Lugd.* *Leon. Rawolf.*

At this time, to wit *Anno* 1588, *Iacobus Theodorus Tabernamontanus* set forth an History of Plants in the Germane tongue, and some twelue yeares after his Figures being in all 2087, were set forth in a long forme, with the Latine and high-Dutch names put vnto them; and with these same Figures was this Worke of our Author formerly printed. *Tabernamont.*

Prosper Alpinus a Physition of Padua in Italy, in the yeare 1592 set forth a Treatise of some Egyptian Plants, with large yet not very accurate figures: he there treats of some 46 plants, and at the end thereof is a Dialogue or Treatise of Balsam. Some six yeares agone, *Anno* 1627, his Son set forth two bookes of his fathers, *De Plantis Exoticis*, with the figures cut in Brasse: this Worke containes some 136 Plants. *Prosp. Alpinus.*

Fabius Columna a gentleman of Naples, of the house of *Columna* of Rome, *An.* 1592 set forth a Treatise called *Phytobasanos*, or an Examination of Plants; for therein he examines and asserts some plants to be such and such of the Antients: and in the end of this worke he giues also the historie of some not formerly described plants. Hee also set forth two other bookes, *De minus cognitis*, or of lesse knowne Plants: the first of which was printed at Rome, *Anno* 1606; and the other 1616. He in these works, which in all contain little aboue two hundred thirty six plants, shewes himselfe a man of an exquisit iudgment, and very learned and diligent, duely examining and weighing each circumstance in the writings of the Antients. *Fab. Columna.*

Caspar

Casp. Bauhine. *Caspar Bauhine*, a Physition and Professor of Basil, besides his Anatomicall Works, set forth diuers of Plants. *Anno* 1596 he set forth his *Phytopinax*, or Index of Plants, wherein he followes the best method that any yet found: for according to *Lobels* method (which our Author followed) he begins with Grasses, Rushes, &c. but then he briefely giues the Etymologie of the name in Greeke and Latine, if any such be, and tells you who of the Antients writ thereof, and in what part of their Works: and lastly (which I chiefly commend him for) he giues the *Synonima's* or seuerall names of each plant giuen by each late Writer, and quoteth the pages. Now there is nothing more troubles such as newly enter into this study, than the diuersitie of names, which sometimes for the same plant are different in each Author; some of them not knowing that the plant they mention was formerly written of, name it as a new thing; others knowing it writ of, yet not approuing of the name. In this Worke he went but through some halfe of the historie of Plants. After this, *Anno* 1598, he set forth *Matthiolus* his Commentaries vpon *Dioscorides*, adding to them 330 Figures, and the descriptions of fifty new ones not formerly described by any; together with the *Synonima's* of all such as were described in the Worke. He also *Anno* 1613 set forth *Tabernamontanus* in Dutch, with some addition of historie and figures. In *Anno* 1620 he set forth the *Prodromus*, or fore-runner of his *Theatrum Botanicum*, wherein he giues a hundred and forty new figures, and describes some six hundred plants, the most not described by others. After this, *Anno* 1623, he set forth his *Pinax Theatri Botanici*, whose method is the same with his *Phytopinax*, but the quotations of the pages in the seuerall Authors are omitted. This is indeed the Index and summe of his great and generall Worke, which should containe about six thousand plants, and was a Worke of forty yeares: but he is dead some nine yeares agone, and yet this his great worke is not in the Presse, that I can heare of.

Basil Besler. *Basil Besler* an Apothecarie of Noremberg, *Anno* 1613 set forth the garden of the Bishop of Eystet in Bauaria, the figures being very large, and all curiously cut in brasse, and printed vpon the largest paper: he onely giues the *Synonima's* and descriptions, and diuideth the worke first into foure parts, according to the foure seasons of the yeare; and then againe he subdiuides them, each into three, so that they agree with the moneths, putting in each Classis the plants that flourish at that time.

These are the chiefe and greatest part of those that either in Greeke or Latine (whose Works haue come to our hands) haue deliuered to vs the history of Plants; yet there are some who haue vsed great diligence to helpe forward this knowledge, whose names I wil
Aloys. Anguill. not passe ouer in silence. The first and antientest of these was *Aloysius Anguillara* a physition of Padua, and President of the publique Garden there: his opinions of some plants were set forth in Italian at Venice, 1561.

Melchior Guillandinus. *Melchior Guillandinus*, who succeeded *Anguillara* in the garden at Padua, writ an Apologie against *Matthiolus*, some Epistles of plants, and a Commentarie vpon three Chapters of *Pliny*, *De Papyro*.

Fer. Imperato. *Ferantes Imperatus* an Apothecary of Naples also set forth a Naturall Historie diuided into twenty eight bookes, printed at Naples *Anno* 1599. In this there is something of Plants: but I haue not yet seene the opinions of *Anguillara*, nor this Naturall Historie: yet you shall find frequent mention of both these in most of the forementioned Authors that writ in their time, or since, wherefore I could not omit them.

Let me now at last looke home, and see who we haue had that haue taken pains in this
Will. Turner. kinde. The first that I finde worthy of mention is Dr. *William Turner*, the first of whose works that I haue seene, was a little booke of the names of herbes, in Greeke, Latine, English, Dutch, and French, &c. printed at London *Anno* 1548. In the yeare 1551 he set forth his Herbal or Historie of Plants, where he giues the figures of *Fuchsius*, for the most part: he giues the Names in Latine, Greeke, Dutch, and French: he did not treat of many Plants; his method was according to the Latine alphabet. He was a man of good iudgment and learning, and wel performed what he tooke in hand.

Hen. Lyte. After this, *Dodonæus* was translated into English by Mr. *Lyte*, as I formerly mentioned. And some yeares after, our Author set forth this Worke, whereof I will presently treat, hauing first made mention of a Worke set forth betweene that former Edition, and this I now present you withall.

Iob. Parkinson. Mr. *Iohn Parkinson* an Apothecarie of this city (yet liuing and labouring for the common good) in the yeare 1629 set forth a Worke by the name of *Paradisus terrestris*, wherein he giues the figures of all such plants as are preserued in gardens, for the beauty of their floures, for vse in meats or sauces; and also an Orchard of all trees bearing fruit, and such shrubs as for their raritie or beauty are kept in Orchards and gardens, with the ordering,

planting,

planting and preſeruing of all theſe. In this Worke he hath not ſuperficially handled theſe things, but accurately deſcended to the very varieties in each ſpecies: wherefore I haue now and then referred my Reader addicted to theſe delights, to this worke eſpecially in floures and fruits, wherein I was loth to ſpend too much time, eſpecially ſeeing I could adde nothing to what he had done vpon that ſubiect before. He alſo there promiſed another worke, the which I thinke by this time is fit for the Preſſe.

Now am I at length come to this preſent Worke, whereof I know you will expect I ſhould ſay ſomewhat; and I will not fruſtrate your expectation, but labour to ſatisfie you in all I may, beginning with the Author, then his worke, what it was, and laſtly what it now is.

Iohn Gerard.

For the Author Mr. *Iohn Gerard* I can ſay little, but what you alſo may gather out of this worke; which is, he was borne in the yeare 1545. in Cheſhire, at Namptwich, from whence hee came to this city, and betooke himſelfe to Surgerie, wherein his endeauours were ſuch, as he therein attained to be a Maſter of that worthy profeſſion: he liued ſome ten yeares after the publiſhing of this worke, and died about the yeare 1607. His chiefe commendation is, that he out of a propenſe good will to the publique aduancement of this knowledge, endeauoured to performe therein more than he could well accompliſh; which was partly through want of ſufficient learning, as (beſides that which he himſelfe ſaith of himſelfe in the chapter of Water Docke) may be gathered by the tranſlating of diuers places out of the *Aduerſaria*; as this for one in the deſcription of * *After Atticus, Caules pedales terni aut quaterni*: which is rendred, A ſtalke foure or fiue foot long. He alſo by the ſame defect called burnt Barley, * *Hordeum diſtichon*; and diuided the titles of honour from the name of the perſon whereto they did belong, making two names thereof, beginning one clauſe with * *Iulius Alexandrinus* ſaith, &c. and the next with, *Cæſarius Archiater* ſaith. He alſo was very little conuerſant in the writings of the Antients, neither, as it may ſeeme by diuers paſſages, could hee well diſtinguiſh betweene the antient and moderne writers: for he in one place ſaith, [* Neither by *Dioſcorides*, *Fuchſius*, or any other antient writer once remembred.] Diuers ſuch there are, which I had rather paſſe ouer in ſilence, than here ſet downe: neither ſhould I willingly haue touched hereon, but that I haue met with ſome that haue too much admired him, as the only learned and iudicious writer. But let none blame him for theſe defects, ſeeing he was neither wanting in pains nor good will, to performe what he intended; and there are none ſo ſimple but know, that heauy burthens are with moſt paines vndergone by the weakeſt men: and although there were many faults in the worke, yet iudge well of the Author; for as a late writer well ſaith, *Falli & hallucinari humanum eſt; ſolitudinem quærat oportet, qui vult cum perfectis viuere. Penſanda vitijs bona cuiuſque ſunt, & qua maior pars ingenij ſtetit, ea iudicandum de homine eſt.*

See the former Edition in the places here mentioned.

p. 518.
Cun. li. 3. ca. 3. de Rep. Heb.

Now let me acquaint you how this Worke was made vp. *Dodonæus* his Pemptades comming forth *Anno* 1583, were ſhortly after tranſlated into Engliſh by Dr. *Prieſt* a phyſition of London, who died either immediately before or after the finiſhing of this tranſlation. This I had firſt by the relation of one who knew Dr. *Prieſt* and Mr. *Gerard*: and it is apparant by the worke it ſelfe, which you ſhall finde to containe the Pemptades of *Dodonæus* tranſlated, ſo that diuers chapters haue ſcarce a word more or leſſe than what is in him. But I cannot commend my Author for endeauouring to hide this thing from vs, cauilling (though commonly vniuſtly) with *Dodonæus*, whereſoeuer he names him, making it a thing of heare-ſay, * that Dr. *Prieſt* tranſlated *Dodonæus*: when in the Epiſtle of his friend Mr. *Bredwell*, prefixed before this worke, are theſe words: [The firſt gatherers out of the Antients, and augmenters by their owne paines, haue already ſpred the odour of their good names through all the lands of learned habitations: Dr. *Prieſt* for tranſlating ſo much as *Dodonæus*, hath hereby left a tombe for his honorable ſepulture. Mr. *Gerard* comming laſt, but not the leaſt, hath many waies accommodated the whole worke vnto our Engliſh Nation, &c.] But that which may ſerue to cleare all doubts, if any can be in a thing ſo manifeſt, is a place in *Lobels* Annotations vpon *Rondeletius* his *Pharmacopeia*, where *pag.* 59. he findes fault with *Dodonæus*, for vſing barbarouſly the word *Seta* for *Sericum*: and with Dr. *Prieſt*, who (ſaith he) at the charges of Mr. *Norton* tranſlated *Dodonæus*, and deceiued by this word *Seta*, committed an abſurd errour in tranſlating it a briſtle, when as it ſhould haue been ſilke. This place ſo tranſlated is to be ſeen in the chapter of the Skarlet Oke, at the letter F. And *Lobel* well knew that it was Dr. *Prieſt* that committed this error, and therefore blames not Mr. *Gerard*, to whom hee made ſhew of friendſhip, and who was yet liuing: but yet he couertly gaue vs to vnderſtand, that the worke wherein that error was committed, was a tranſlation of *Dodonæus*, and that made by

See his Epiſtle to the Reader.

Dr. *Prieſt*, and ſet forth by Mr. *Norton*. Now this tranſlation became the ground-worke whereupon Mr. *Gerard* built vp this Worke: but that it might not appeare a tranſlation, he changes the generall method of *Dodonæus*, into that of *Lobel*, and therein almoſt all ouer followes his *Icones* both in method and names, as you may plainly ſee in the Graſſes and *Orchides*. To this tranſlation he alſo added ſome plants out of *Cluſius*, and otherſome out of the *Aduerſaria*, and ſome fourteene of his owne not before mentioned. Now to this hiſtorie figures were wanting, which alſo Mr. *Norton* procured from Frankfort, being the ſame wherewith the Works of *Tabernamontanus* were printed in Dutch: but this fell croſſe for my Author, who (as it ſeemes) hauing no great iudgement in them, frequently put one for another: and beſides, there were many plants in thoſe Authors which he followed, which were not in *Tabernamontanus*, and diuers in him which they wanted, yet he put them all together, and one for another; and oft times by this meanes ſo confounded all, that none could poſſibly haue ſet them right, vnleſſe they knew this occaſion of theſe errors. By this meanes, and after this manner was the Worke of my Author made vp, which was printed at the charges of Mr. *Norton*, *An.* 1597.

Now it remaines I acquaint you with what I haue performed in this Edition, which is either by mending what was amiſſe, or by adding ſuch as formerly were wanting: ſome places I helped by putting out, as the Kindes in the Chapter of Stonecrop, where there was but one mentioned. I haue alſo put out the Kindes in diuers places elſe where they were not very neceſſarie, by this meanes to get more roome for things more neceſſarie: as alſo diuers figures and deſcriptions which were put in two or three places, I haue put them out in all but one, yet ſo, as that I alwaies giue you notice where they were, and of what. Some words or paſſages are alſo put out here and there, which I thinke needleſſe to mention. Sometimes I mended what was amiſſe or defectiue, by altering or adding one or more words, as you may frequently obſerue if you compare the former edition with this, in ſome few chapters almoſt in any place. But I thinke I ſhall beſt ſatisfie you if I briefely ſpecifie what is done in each particular, hauing firſt acquainted you with what my generall intention was: I determined, as wel as the ſhortneſſe of my time would giue me leaue, to retaine and ſet forth whatſoeuer was formerly in the booke deſcribed, or figured without deſcriptions (ſome varieties that were not neceſſarie excepted) and to theſe I intended to adde whatſoeuer was figured by *Lobel*, *Dodonæus*, or *Cluſius*, whoſe figures we made vſe of; as alſo ſuch plants as grow either wilde, or vſually in the gardens of this kingdome, which were not mentioned by any of the forenamed Authors; for I neither thought it fit nor requiſite for me, ambitiouſly to aime at all that *Bauhine* in his *Pinax* reckons vp, or the Exotickes of *Proſper Alpinus* containe, not mentioned in the former. This was my generall intention. Now come I to particulars, and firſt of figures: I haue, as I ſaid, made vſe of thoſe wherewith the Workes of *Dodonæus*, *Lobel*, and *Cluſius* were formerly printed, which, though ſome of them be not ſo ſightly, yet are they generally as truly expreſt, and ſometimes more. When figures not agreeable to the deſcriptions were formerly in any place, I giue you notice thereof with a marke of alteration before the title, as alſo in the end of the Chapter; and if they were not formerly in the booke, then I giue you them with a marke of addition. Such as were formerly figured in the booke, though put for other things, and ſo hauing no deſcription therein, I haue cauſed to be new cut and put into their fit places, with deſcriptions to them, and only a marke of alteration. The next are the deſcriptions, which I haue in ſome places lightly amended, without giuing any notice thereof; but when it is much altered, then giue I you this marke † at the beginning thereof; but if it were ſuch as that I could not helpe it but by writing a new one, then ſhall you finde it with this marke ‡ at the beginning and end thereof, as alſo whatſoeuer is added in the whole booke, either in deſcription or otherwiſe. The next is the Place, which I haue ſeldome altered, yet in ſome places ſupplied, and in others I haue put doubts, & do ſuſpect otherſome to be falſe, which becauſe I had not yet viewed, I left as I found. The Time was a thing of no ſuch moment, for any matter worth mentioning to be performed vpon, wherefore I will not inſiſt vpon it. Names are of great importance, and in them I ſhould haue been a little more curious if I had had more time, as you may ſee I at the firſt haue beene; but finding it a troubleſome worke, I haue onely afterwards where I iudged it moſt needfull inſiſted vpon it: *Bauhinus* his *Pinax* may ſupply what you in this kinde finde wanting. In many places of this worke you ſhall finde large diſcourſes and ſometimes controuerſies handled by our Authour in the names; theſe are for the moſt part out of *Dodonæus*, & ſome of them were ſo abbreuiated, and by that meanes confounded, that I thought it not worth my paines to mend them, ſo I haue put them out in ſome few places, and referred you to the places in *Dodonæus* out of

which

which they were taken, as in the chapter of Alehoofe: it may be they are not ſo perfect as they ſhould be in ſome very few other places, (for I could not compare all) but if you ſuſpect any ſuch thing, haue recourſe to that Author, and you ſhall finde full ſatisfaction.

Now come I to the Temper and Vertues. Theſe commonly were taken forth of the fore-mentioned Author, and here and there out of *Lobels* Obſeruations, and *Camerarius* his *Hortus medicus*. To theſe he alſo adddedſome few Receipts of his owne: theſe I haue not altered, but here and there ſhewed to which they did moſt properly belong; as alſo if I found them otherwiſe than they ought, I noted it; or if in vnfit places, I haue tranſferred them to the right place, and in diuers things whereof our Author hath bin ſilent, I haue ſupplied that defect.

For my additions I will here ſay nothing, but refer you to the immediate enſuing Catalogue, which will enforme you what is added onely in figure, or deſcription, or in both, by which, and theſe two formerly mentioned marks, you may ſee what is much altered or added in the Work; for this marke † put either to figure, or before any clauſe, ſhews it to haue bin otherwiſe put before; or that clauſe whether it be in deſcription, Place, Time, Names, or Vertues to be much altered. This other marke ‡ put to a figure ſhewes it not to haue been formerly in the worke, but now added; and put in any other place it ſhewes all is added vntill you come to another of the ſame marks. But becauſe it is ſomtimes omitted, I will therefore giue notice in the *Errata* where it ſhould be put, in thoſe places where I obſerue either the former or later of them to be wanting.

Further, I muſt acquaint you how there were the deſcriptions of a few plants here and there put in vnfitting places, which made me deſcribe them as new added, as *Saxifraga maior Matthioli*, *Perſicaria ſiliquoſa*, of which in the chapter of *Perſicaria* there was an ill deſcription, but a reaſonable good one in the chapter of *Aſtrantia nigra*. *Papauer ſpinoſum*, was figured and deſcribed amongſt the *Cardui*; now all theſe (as I ſaid) I added as new in the moſt fitting places: yet found them afterwards deſcribed, but put them out all, except the laſt, whoſe hiſtorie I ſtill retaining, with a reference to the preceding figure and Hiſtorie. Note alſo, whereſoeuer my Author formerly mentioned *Cluſius*, according to his Spaniſh or Pannonicke Obſeruations, I haue made it, according to his Hiſtorie, which containes them both with additions.

Alſo I muſt certifie you, (becauſe I know it is a thing that ſome will thinke ſtrange, that the number of the pages in this booke do no more exceed that of the former, conſidering there is ſuch a large acceſſion of matter and figures) the cauſe hereof is, each page containes diuers lines more than the former, the lines themſelues alſo being longer; and by the omiſſion of deſcriptions and figures put twice or thrice ouer, and the Kindes, vnneceſſarily put in ſome places, I gained as much as conueniently I could, beeing deſirous that it might be bound together in one volume.

Thus haue I ſhewed what I haue performed in this Worke, entreating you to take this my Labor in good part; and if there be any defect therein (as needs there muſt in all humane works) aſcribe it in part to my haſte and many buſineſſes, and in ſome places to the want of ſufficient information, eſpecially in Exoticke things; and in other ſome, to the little conuerſation I formerly had with this Author, before ſuch time as (ouercome by the importunitie of ſome friends, and the generall want of ſuch a Worke) I tooke this taske vpon me. Furthermore I deſire, that none would raſhly cenſure me for that which I haue here done; but they that know in what time I did it, and who themſelues are able to do as much as I haue here performed; for to ſuch alone I ſhall giue free libertie, and will be as ready to yeeld further ſatisfaction if they deſire it, concerning any thing I haue here aſſerted, as I ſhall be apt to neglect and ſcorne the cenſure of the Ignorant and Vnlearned, who I know are ſtill forward to verifie our Engliſh prouerbe *

* *A fooles bolt is ſoone ſhot.*

I muſt not in ſilence paſſe ouer thoſe from whom I haue receiued any fauour or incouragement, whereby I might be the better enabled to performe this Taske. In the firſt place let me remember the onely Aſſiſtant I had in this Worke, which was M^r. *Iohn Goodyer* of Maple-Durham in Hampſhire, from whom I receiued many accurate deſcriptions, and ſome other obſeruations concerning plants; the which (deſirous to giue euery man his due) I haue cauſed to be ſo printed, as they may be diſtinguiſhed from the reſt: and thus you ſhall know them; in the beginning is the name of the plant in Latine in a line by it ſelfe, and at the end his name is inſerted; ſo that the Reader may eaſily finde thoſe things that I had from him, and I hope together with me will be thankfull to him, that he would ſo readily impart them for the further increaſe of this knowledge.

M^r. *George Bowles* of Chiſſelhurſt in Kent muſt not here be forgot, for by his trauells and induſtry I haue had knowledge of diuers plants, which were not thought nor formerly

knowne to grow wilde in this kingdome, as you shall finde by diuers places in this booke. My louing friends and fellow Trauellers in this study, and of the same profession, whose companie I haue formerly enioyed in searching ouer a great part of Kent, and who are still ready to do the like in other places, are here also to be remembred, and that the rather, because this Knowledge amongst vs in this city was almost lost, or at least too much neglected, especially by those to whom it did chiefely belong, and who ought to be ashamed of ignorance, especially in a thing so absolutely necessarie to their profession. They should indeed know them as workemen do their tooles, that is readily to cal them by their names, know where to fetch, and whence to procure the best of each kinde; and lastly, how to handle them.

I haue already much exceeded the bounds of an Epistle, yet haue omitted many things of which I could further haue informed thee Reader, but I will leaue them vntill such time as I finde a gratefull acceptance; or some other occasion that may againe inuite me to set Pen to Paper; which, That it may be for my Countreyes good and Gods glory, shall euer be the prayers and Endeauours of thy Well-Wisher

From my house on Snow-hill,
Octob. 22. 1633.

THOMAS IOHNSON.

A Catalogue of Additions.

BEcauſe the markes were not ſo carefully and right put to theſe Figures, which were not formerly in the booke, I haue thought good to giue you the names of all ſuch as are added, either in figure or deſcription, or both: together with the booke, chapter, and number or place they hold in each chapter. *F* ſtands for figure, *D* for Deſcription, and where both are added, you ſhall finde both theſe letters; and where the letter *C* is put, the Hiſtorie of the whole Chapter is added.

THE

THE FIRST BOOKE OF THE HISTORIE OF PLANTS:

Containing Graſſes, Ruſhes, Reeds, Corne, Flags, and Bulbous, or Onion-rooted Plants.

IN this Hiſtorie of Plants it would be tedious to vſe by way of introduction, any curious diſcourſe vpon the generall diuiſion of Plants, contained in Latine vnder *Arbor, Frutex, Suffrutex, Herba*: or to ſpeake of the differing names of their ſeuerall parts, more in Latine than our vulgar tongue can well expreſſe. Or to go about to teach thee, or rather to beguile thee by the ſmell or taſte, to gueſſe at the temperature of Plants: when as all and euery of theſe in their place ſhall haue their true face and note, whereby thou maiſt both know and vſe them.

In three bookes therefore, as in three gardens, all our Plants are beſtowed; ſorted as neere as might be in kindred & neighbourhood.

The firſt booke hath Graſſes, Ruſhes, Corne, Reeds, Flags, Bulbous or Onion-rooted Plants,

The ſecond, moſt ſorts of herbes vſed for meate, medicine, or ſweet ſmelling.

The third hath Trees, Shrubs, Buſhes, Fruit-bearing Plants, Roſins, Gummes, Roſes, Heathes, Moſſes, Muſhroms, Corall, and their ſeuerall kindes.

Each booke hath chapters, as for each herbe a bed: and euery Plant preſents thee with the Latine and Engliſh name in the title, placed ouer the picture of the Plant.

Then followes the kindes, deſcription, place, time, names, natures, and vertues, agreeing with the beſt receiued opinions.

Laſt of all thou haſt a generall Index, as well in Latine as Engliſh, with a carefull ſupply likewiſe of an *Index barbarus*, of barbarous names.

And thus hauing giuen thee a generall view of this garden, now with our friendly labours wee will accompany thee, and leade thee through a Graſſe-plot, little or nothing of many Herbariſts heretofore touched; and begin with the moſt common or beſt knowne Graſſe, which is called in Latine, *Gramen pratenſe*: and then by little and little conduct thee through moſt pleaſant gardens and other delightfull places, where any herbe or plant may be found fit for meate or medicine.

CHAP. I. *Of Medow-Graſſe.*

THere be ſundry and infinite kindes of Graſſes not mentioned by the Antients, either as vnneceſſarie to be ſet downe, or vnknowne to them: onely they make mention of ſome few, whoſe wants we meane to ſupply, in ſuch as haue come to our knowledge, referring the reſt to the curious ſearcher of Simples.

¶ *The Deſcription.*

1 COmmon Medow Graſſe hath very ſmall tufts or roots, with thicke hairy threds depending vpon the higheſt turfe, matting and creeping on the ground with a moſt thicke and apparant ſhew of wheaten leaues, lifting vp long thinne ioynted and light ſtalks, a foot or a cubit high, growing ſmall and ſharpe at the top, with a looſe eare hanging downward, like the tuft or top of the common Reed.

2 Small medow Graſſe differeth from the former in varietie of the ſoile; for as the firſt kind groweth in medowes, ſo doth this ſmall graſſe clothe the hilly and more dry grounds vntilled, and barren by nature; a Graſſe more fit for ſheepe than for greater cattell. And becauſe the kindes of Graſſe do differ apparantly in root, tuft, ſtalke, leafe, ſheath, eare, or creſt, we may aſſure our ſelues that they are endowed with ſeuerall vertues, formed by the Creator for the vſe of man, although they haue been by a common negligence hidden and vnknowne. And therefore in this our Labor we haue placed each of them in their ſeuerall bed, where the diligent ſearcher of Nature may, if ſo he pleaſe, place his learned obſeruations.

1 *Gramen pratenſe.*
Medow Graſſe.

2 *Gramen pratenſe minus.*
Small Medow-graſſe.

¶ *The Place.*

Common Medow-graſſe groweth of it ſelfe vnſet or vnſowen, euery where, but the ſmall medow graſſe for the moſt part groweth vpon dry and barren grounds, as partly wee haue touched in the deſcription.

¶ *The Time.*

Concerning the time when Graſſe ſpringeth and ſeedeth, I ſuppoſe there is none ſo ſimple but knoweth it, and that it continueth all the whole yeare, ſeeding in Iune and Iuly. Neither needeth it any propagation or replanting by ſeed or otherwiſe; no not ſo much as the watery Graſſes, but that they recouer themſelues againe, although they haue beene drowned in water all the Winter long, as may appeare in the wilde fennes in Lincolnſhire and ſuch like places.

¶ *The Names.*

Graſſe is called in Greeke, χόρτος: in Latine, *Gramen*, as it is thought, *à gradiendo, quod geniculatis internodijs ſerpat crebroque nouas ſpargat radices*: for it groweth, goeth, or ſpreadeth it ſelfe vnſet or vnſowen, naturally ouer all fields or grounds, cloathing them with a faire and perfect greene. It is yearely mowed, in ſome places twice, and in ſome rare places thrice; then is it dried and withered by the heate of the Sunne, with often turning it; and then is it called *Fœnum, neſcio an à fœnore aut fœtu.* In Engliſh, Hay: in French, *Le herbe du praiz.*

¶ *The Nature.*

The roots and ſeeds of Graſſe are of more vſe in phyſicke than the herbe, and are accounted of all Writers moderately to open obſtructions, and prouoke vrine.

¶ *The*

¶ *The Vertues.*

The decoction of Graſſe with the roots of Parſley drunke, helpeth the diſſurie, and prouoketh vrine. A

The roots of Graſſe, according to *Galen*, doe glew and conſolidate together new and bleeding wounds. B

The iuyce of Graſſe mixed with honey and the pouder of Sothernwood taken in drinke, killeth wormes in children; but if the childe be young, or tender of nature, it ſhall ſuffice to mixe the iuyce of Graſſe, and the gall of an Oxe or Bull together, and therewith anoint the childes belly, and lay a clout wet therein vpon the nauell. C

Fernelius ſaith, that graſſe doth helpe the obſtructions of the liuer, reines and kidnies and the inflammation of the raines called *Nephritis*. D

Hay ſodden in water till it be tender, and applied hot to the chaps of beaſts that be chap-fallen, through long ſtanding in pound or ſtable without meate, is a preſent remedie. E

CHAP. 2. *Of Red Dwarfe-Graſſe.*

¶ *The Deſcription.*

1 DWarfe Graſſe is one of the leaſt of Graſſes. The root conſiſts of many little bulbes, couered with a reddiſh filme or skinne, with very many ſmal hairy and white ſtrings: the tuft or eare is of a reddiſh colour, and not much differing from the graſſe called *Iſchæmon*, though the eare be ſofter, broader, and more beautifull.

† 1 *Gramen minimum rubrum, ſiue Xerampelinum.*
Red Dwarfe-graſſe.

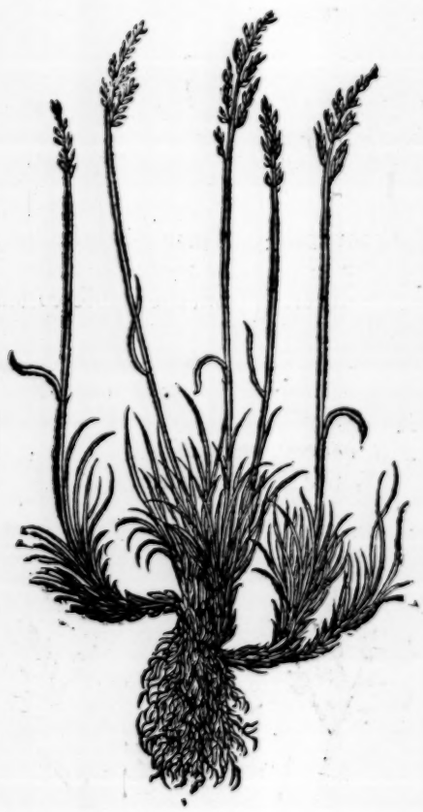
2 *Gramen minimum album.*
White Dwarfe-graſſe.

† 2 This kinde of Graſſe hath ſmall hairy roots; the leaues are ſmall and ſhort, as alſo the ſtalke, which on the top thereof beares a pannicle not much vnlike the ſmall medow Graſſe, but leſſe: the colour thereof is ſometimes white, and otherwhiles reddiſh; whence ſome haue giuen two figures, which I thinking needleſſe, haue onely retained the later, and for the former giuen the figure of another Graſſe, intended by our Author to be comprehended in this Chapter.

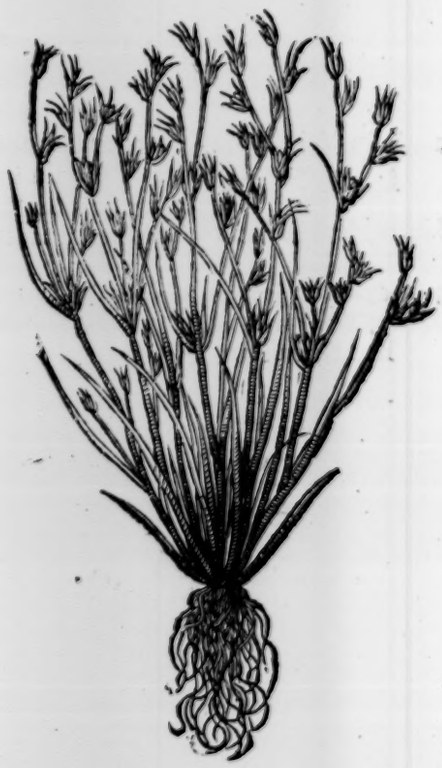
3 Small hard Graſſe hath ſmall roots compact of little ſtrings or threds, from which come forth many ſoure ruſhy leaues of the length of an inch and a halfe: the tuft or eare is compact of many pannicles or very little eares, which to your feeling are very hard or harſh. This Graſſe is vnpleaſant, and no wholeſome food for cattell.

4 Ruſh-graſſe is a ſmall plant ſome handfull high, hauing many ſmall ruſhy leaues tough and pliant, as are the common Ruſhes: whereupon do grow ſmall ſcaly or chaffie huskes, in ſtead of floures, like thoſe of Ruſhes, but ſmaller. The root is threddy like the former. ‡ There is a varietie of this to be found in bogs, with the ſeeds bigger, and the leaues and whole plant leſſer. ‡

3 *Gramen minus duriuſculum.*
Small hard Graſſe.



4 *Gramen junceum.*
Ruſh-graſſe, or Toad-graſſe.



¶ *The Place.*

The Dwarfe-graſſe doth grow on heathy rough and dry barren grounds in moſt places of England. ‡ That which I haue giuen you I haue not as yet obſerued growing in any part of England. ‡

The white Dwarfe-graſſe is not ſo common as the former, yet doth it grow very plentifully among the Hop gardens in Eſſex and many other places.

Small Hard-graſſe groweth in moiſt freſh mariſhes, and ſuch like places.

Ruſh-graſſe groweth in ſalt mariſhes neere vnto the ſea, where the mariſhes haue beene ouerflowne with ſalt water. ‡ It alſo groweth in many wet woods, lanes, and ſuch places, as in the lane going by Totenham Court towards Hampſtead. The leſſer varietie hereof growes on the bogges vpon Hampſtead heath. ‡

¶ *The Time.*

Theſe kindes of Graſſes do grow, floure, and flouriſh when the common Medow graſſe doth.

¶ *The Names.*

It ſufficeth what hath beene ſaid of the names in the deſcription, as well in Engliſh as Latine; onely that ſome haue deemed White Dwarfe-graſſe to be called *Xerampelinum.*

Ruſh-graſſe hath been taken for *Holoſteum Matthioli.*

‡ ¶ *The Names in particular.*

1 This I here giue you in the firſt place is the *Gramen minimum Xerampelinum* of *Lobel:* it is the

Gramen

Gramen of *Matthiolus*, and *Gramen bulboſum* of *Daleſchampius*. Our Author did not vnderſtand what *Xerampelinus* ſignified, when as he ſaid the white Dwarfe-graſſe was ſo termed; for the word imports red, or murrey, ſuch a colour as the withered leaues of Vines are of. 2. *Tabern.* calls this, *Gramen panniculatum minus*. 3. *Lobel* calls this, *Exile Gramen durius*. 4. This by *Matthiolus* was called *Holoſtium*: by *Thalius*, *Gramen epigonatocaulon*: by *Tabernamontanus*, *Gra. Buſonium*, that is, Toad-graſſe. ‡

¶ *The Nature and Vertues.*

Theſe kindes of Graſſes doe agree as it is thought with the common Medow-graſſe, in nature and vertues, notwithſtanding they haue not beene vſed in phyſicke as yet, that I can reade of.

† The firſt figure was onely a varietie of the ſecond, according to *Bauhinus*; yet in my iudgement it was the ſame with the third, which is *Gramen minus durius-culum*.

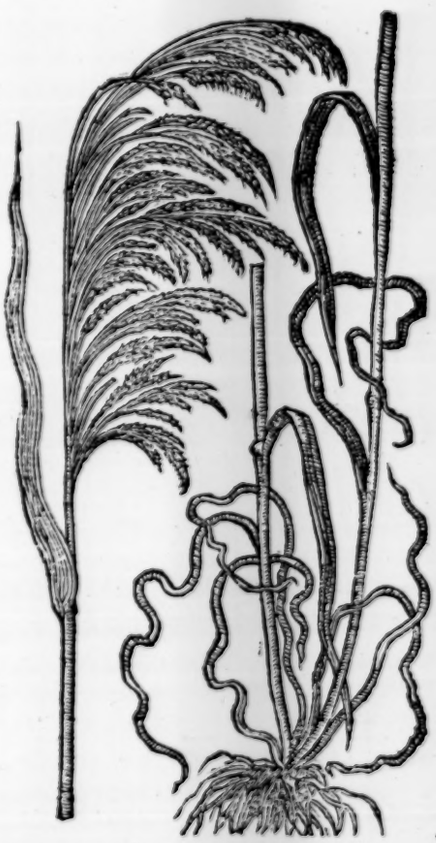
CHAP. 3. *Of Corne-Graſſe.*

¶ *The Deſcription.*

1 COrne-graſſe hath many graſſie leaues reſembling thoſe of Rie, or rather Otes, amongſt the which commeth vp ſlender benty ſtalkes, kneed or ioynted like thoſe of corne, whereupon groweth a faire tuft or pannicle not much vnlike to the feather-like tuft of common Reed, but rounder compact together like vnto Millet. The root is threddy like thoſe of Otes.

1 *Gramen ſegetale.*
Corne-graſſe.

2 *Gramen harundinaceum.*
Reed-graſſe, or Bent.



2 Reed-graſſe hath many thin graſſie leaues like the former: the buſhy top, with his long feather-like pannicles doreſemble the common Reed, which is lightly ſhaken with the winde, branched vpon a long ſlender reeden ſtalke, kneed or ioynted like corne. The root is ſmall and fibrous.

¶ *The Place and Time.*

Theſe kindes of Graſſes grow for the moſt part neere hedges, & in fallow fields in moſt places. Their time of ſpringing, flouring, and fading may be referred to the common Medow-graſſe.

The Names.

† The firſt is called in Engliſh, Corne-graſſe. *Lobelius* calls this, *Segetum gramen panniculâ ſpecioſa latiore:* others termeit *Gramen ſegetale*, for that it vſually groweth among corne; the which I haue not as yet ſeene.

The ſecond is called in Engliſh, Reed-graſſe: of *Lobelius* in Latine, *Gramen agrorum latiore, arundinacea, & comoſa pannicula*, for that his tuft or pannicles do reſemble the Reed: and *Spica venti agrorum*, by reaſon of his feather-top, which is eaſily ſhaken with the wind. ‡ Some in Engliſh, much agreeable to the Latine name, call theſe, Windle-ſtrawes. Now I take this laſt to be the Graſſe with which we in London do vſually adorne our chimneys in Sommer time: and we commonly call the bundle of it handſomely made vp for our vſe, by the name of Bents. ‡

¶ *The Temperature and Vertues.*

Theſe Graſſes are thought to agree with common Graſſe, as well in temperature as vertues, although not vſed in phyſicke.

Chap. 4. *Of Millet Graſſe.*

1 *Gramen Miliaceum.*
Millet Graſſe.

† 2 *Gramen majus aquaticum.*
Great Water-graſſe.

¶ *The Deſcription.*

1 Millet Graſſe is but a ſlender Graſſe, bearing a tuft or eare like vnto the common Medow-graſſe, but conſiſting of ſmall ſeeds or chaffie heads like to *Milium*, or Miller, whereof it tooke the name. The ſtalke or leaues do reſemble the Bent, wherewith countrey people do trimme their houſes.

2 The great Water-graſſe in root, leafe, tuft, and reeden ſtalke doth very well reſemble the Graſſe called in Latine, *Gramen ſulcatum*, or *Pictum*; and by our Engliſh women, Lady-laces, becauſe it is ſtript or furrowed with white and greene ſtreakes like ſilke laces; but yet differs from that, that this Water graſſe doth get vnto it ſelfe ſome new roots from the middle of the ſtalks and ioynts, which the other doth not. ‡ This is a large Graſſe, hauing ſtalkes almoſt as thicke as ones little finger, with the leaues anſwerable vnto them, and a little rougiſh: the tuft is ſomewhat like a reed, but leſſe, and whitiſh coloured. ‡

¶ *The*

¶ *The Place, Names, Nature, and Vertues.*

The former growes in medowes, and about hedges, and the later is to be found in moſt fenny and watery places, and haue their vertues and natures common with the other Graſſes, for any thing that wee can finde in writing. The reaſon of their names may be gathered out of the deſcription.

† This which I giue you in the ſecond place is not of the ſame plant that was figured in the former edition; for that picture was of *Gramen aquaticum harundinaceum panniculatum* of *Taber.* which hath a running root and large ſpecious pannicle like to a Reed, of a browne colour. But it is moſt apparant that our Author meant this, and framed his deſcription by looking vpon this figure, eſpecially the latter part thereof. The true figure of this was in the ſecond place in the next Chapter.

CHAP. 5.

Of Darnell Graſſe.

¶ *The Deſcription.*

1 DArnell Graſſe, or *Gramen Sorghinum*, as *Lobel* hath very properly termed it, hath a brownish ſtalke thicke and knotty, ſet with long ſharpe leaues like vnto the common Dogs Graſſe: at the top whereof groweth a tuft or eare of a grayiſh colour, ſomwhat like *Sorghum*, whereof it tooke his name.

1 *Gramen Sorghinum.* Darnell Graſſe.

2 *Gramen harundinaceum panniculatum.* Wilde Reed.

2 Wilde Reed, or *Gramen harundinaceum panniculatum*, called alſo *Calamogroſtis*, is far bigger than Couch graſſe, or Dogs graſſe, and in ſtalkes and leaues more rough, rugged, and cutting. It is bad food for cattell, though they want, or be very hungry; and deadly to Sheepe, becauſe that, as the Husbandman ſaith, it is a cauſe of leanneſſe in them, thirſt, and conſumption: it cutteth their

‡ 3 *Gramen arundinaceum minus.*
The leſſer Reed-Graſſe.

tongue, ſtraitneth the gullet or throat, and draweth downe bloud into the ſtomacke or maw; whereof enſueth inflammation, and death for the moſt part. And not onely this *Calamogroſtis* is hurtfull, but alſo all other kindes of ſhearing leaued reeds, flagges, ſedge, or the like, which haue as it were edges; and cut on both ſides like kniues as well mens fingers, as cattels mouthes. This herbe is in a meane between reed & graſſe. The root is white, creeping downwards very deepe. The ſpike or eare is like vnto the reed, being ſoft and cottony, ſomewhat reſembling Pannicke.

‡ 3 This in root, ſtalkes, and leaues is like to the laſt deſcribed, but that they are leſſer: the top or head is a long ſingle ſpike or eare, not ſeuered or parted into many eares like the top of the precedent, and by this and the magnitude it may chiefely be diſtinguiſhed from it. This was in the twelfth place in the ſixteenth chapter, vnder the title of *Gramen harundinaceum minus*: and the *Calamogroſtis* but now deſcribed, was alſo there againe in the eleuenth place. ‡

¶ *The Place.*

The firſt growes in fields and orchards almoſt euery where; the other grow in fenny wateriſh places.

¶ *The Names.*

2 This in Lincolneſhire is called Sheere-graſſe, or Henne: in other parts of England, wild Reed: in Latine, *Calamogroſtis*: out of the Greeke, καλαμωγρωστις. As for their natures and vertues we doe not finde any great vſe of them worth the ſetting downe.

† The figure that was in the ſecond place was of *Gramen maius aquaticum*, being the ſecond of the precedent Chapter. The true figure of this was page 21. vnder the title of *Gramen harundinaceum maius*. The third being there alſo, as I haue touched in the deſcription.

Chap. 6. *Of Feather-top, Ferne, and Wood-graſſe.*

¶ *The Deſcription.*

‡ 1 THis might fitly haue beene put to thoſe mentioned in the foregoing chapter, but that our Author determined it for this, as may appeare by the mention made of it in the names, as alſo by the deſcription hereof, framed from the figure we here giue you. ‡ This Graſſe is garniſhed with chaffie and downie tufts, ſet vpon a long benty ſtalke of two cubits high or ſomewhat more, naked without any blades or leaues, for the moſt part. His root is tough and hard. ‡ The top is commonly of a red or murrey colour, and the leaues ſoft and downy. ‡

‡ 2 This, whoſe figure was formerly by our Author giuen for the laſt deſcribed, though verie much different from it, is a very pretty and elegant graſſe: it in roots and leaues is not vnlike to the vſuall medow Graſſe; the ſtalke riſeth to the height of a foot, and at the top thereof it beareth a beautifull pannicle, (whence the French and Spaniſh Nations call it *Amourettes*, that is, the Louely Graſſe.) This head conſiſts of many little eares, ſhaped much like thoſe of the ordinarie Quaking Graſſe, longer and flatter, being compoſed of more ſcales, ſo that each of them ſomewhat reſembles the leafe of a ſmall Ferne, whence I haue called it Ferne-Graſſe. Theſe tops when they are ripe are white, and are gathered where they grow naturally to beautifie garlands. ‡

3 Wood-graſſe hath many ſmall and threddy roots, compact together in manner of a tuft; from which ſpring immediately out of the earth many graſſy leaues, among the which are ſundrie benty

‡ 1 *Gramen tomentoſum arundinaceum.*
Feather-top, or Woolly Reed-graſſe.

2 *Gramen panniculatum elegaſis.*
Ferne-graſſe.

3 *Gramen ſyluaticum majus.*
The greater Wood-graſſe.

benty ſtalkes, naked and without leaues or blades like the former, bearing at the top a ſoft ſpikie tuft or eare much like vnto a Fox-taile, of a browniſh colour.

‡ 4 This in leaues, ſtalks, roots, manner and place of growing is like the laſt deſcribed: the onely difference betweene them is, That this hath much leſſe, yet ſharper or rougher eares or tufts. The figure and deſcription of this was formerly giuen by our Author in the ſixteenth chapter, and ninth place, vnder the title of *Gramen ſyluaticum minus*. But becauſe the difference between the laſt deſcribed and this is ſo ſmall, we haue ſpared the figure, to make roome for others more different and note-worthy.

¶ *The Time and Place.*

1 This kinde of Graſſe growes in fertil fields and paſtures.

2 The ſecond growes in diuers places of Spaine and France.

The other two grow in Woods.

¶ *The Names.*

1 *Lobelius* in Latine calls this *Gramen tomentoſum & Aceroſum*. Some haue taken it for the ſecond kinde of *Calamogroſtis*; but moſt commonly

it

it is called *Gramen plumoſum*: and in Engliſh, a Bent, or Feather-top Graſſe.

2 *Gramen panniculatum* is called by ſome *Heragroſtis* in Greeke. *Lobel* calls this *Gramen panniculoſum phalaroides*. And it is named in the *Hiſt. Lugd. Gramen filiceum, ſeu polyanthos*: that is, Ferne, or many-floured Graſſe. ‡

3 *Gramen ſyluaticum*, or as it pleaſeth others, *Gramen nemoroſum*, is called in our tongue, wood Graſſe, or ſhadow Graſſe.

Chap. 7. *Of great Fox-taile Graſſe.*

¶ *The Deſcription.*

1 THe great Fox-taile Graſſe hath many threddy roots like the common Medow graſſe; and the ſtalke riſeth immediatly from the root, in faſhion like vnto Barley, with two or three leaues or blades like Otes; but is nothing rough in handling, but ſoft and downie, and ſomewhat hoarie, bearing one eare or tuft on the top, and neuer more; faſhioned like a Fox-taile, whereof it tooke his name. At the approch of Winter it dieth, and recouereth it ſelfe the next yeare by falling of his ſeed.

1 *Gramen Alopecuroides majus.*
Great Fox-taile Graſſe.

† 2 *Gramen Alopecuroides minus.*
Small Fox-taile Graſſe.

2 The leſſer Fox-taile Graſſe hath a tuffe and hard root compact of many ſmall ſtrings, yeelding a ſtrawie ſtalke like the former, though ſomwhat leſſer, with the like top or creſt, but of a whitiſh colour.

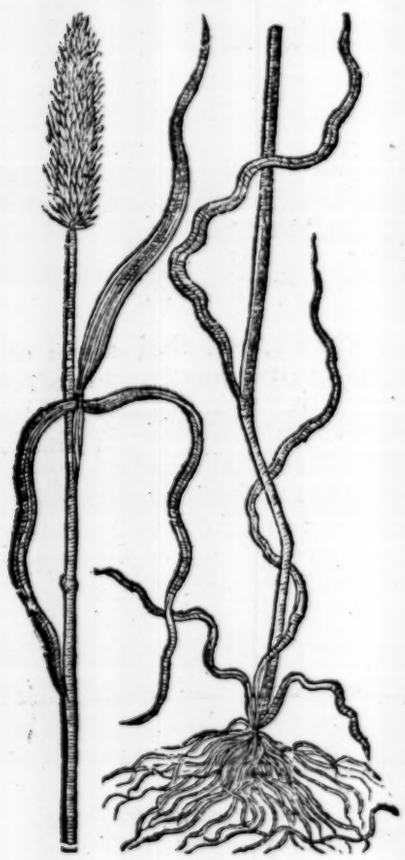
3 Great baſtard Fox-taile Graſſe hath a ſtrawie ſtalke or ſtemme, which riſeth to the height of a cubit and an halfe, hauing a ſmall root conſiſting of many fibres. His leafe is ſmall and graſſie, and hath on his top one tuft or ſpike, or eare of a hard chaffie ſubſtance, ſome three inches long, compoſed of longiſh ſeeds, each hauing a little beard or awne.

4 Small baſtard Fox-taile Graſſe doth reſemble the former, ſauing that this kinde doth not

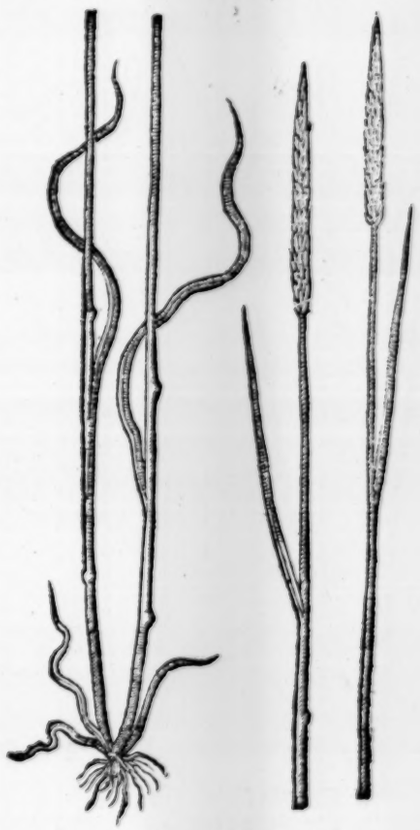
ſend

ſend forth ſuch large ſtalkes and eares as the other, but ſmaller, and not ſo cloſe packed together, neither hauing ſo long beards or awnes.

† 3 *Gramen Alopecurinum majus.*
Great baſtard Fox-taile Graſſe.



4 *Gramen Alopecurinum minus.*
Small baſtard Fox-taile Graſſe.



¶ *The Place and Time.*

Theſe wilde baſtard Fox-taile Graſſes doe grow in the moiſt furrowes of fertile fields, towards the later end of Sommer.

¶ *The Names.*

‡ The firſt by *Lobel* and *Tabern.* is called *Gramen phalaroides.* The other *Lobel* calleth 2 *Gramen Alopecuroides.* 3. *minus.* 4. *minus alterum.*

CHAP. 8. *Of Great Cats-taile Graſſe.*

¶ *The Deſcription.*

1 GReat Cats-taile Graſſe hath very ſmall roots, compact of many ſmall skins or threds, which may eaſily be taken from the whole root. The ſtalke riſeth vp in the middeſt, and is ſomewhat like vnto wilde Barley, kneed and ioynted like corne, of a foot high or thereabout, bearing at the top a handſome round cloſe compact eare reſembling the Cats-taile.

2 The ſmall Cats-taile graſſe is like vnto the other, differing chiefely in that it is leſſer than it. The root is thicke and cloued like thoſe of Ruſh Onions, or Ciues, with many ſmall ſtrings or hairie threads annexed vnto it.

‡ 3 There is another that growes plentifully in many places about London, the which may fitly be referred to this Claſſis. The root thereof is a little bulbe, from whence ariſeth a ſtalke ſome two foot or better high, ſet at each ioynt with long graſſie leaues: the ſpike or eare is commonly

Gramen Typhinum minus.
Small Cats-taile Graſſe.

monly foure or fiue inches long, cloſely and handſomely made in the faſhion of the precedent, which in the ſhape it doth very much reſemble. ‡

¶ *The Place and Time.*

Theſe kindes of Graſſes do grow very well neere waterie places, as *Gramen Cyperoides* doth, and flouriſh at the ſame time that all the others doe.

‡ The latter may be found by the bridge entring into Chelſey field, as one goeth from Saint *Iames* to little Chelſey. ‡

¶ *The Names.*

The Latines borrow theſe names of the Greekes, and call it *Gramen Typhinum*, of *Typha*, a Cats taile: and it may in Engliſh as wel be called round Bent-graſſe, as Cats-taile Graſſe.

‡ The laſt deſcribed is by *Bauhine*, who firſt gaue the figure and deſcription thereof in his *Prodomus*, *pag.* 10. called *Gramen Typhoides maximum ſpica longiſſima*; that is, The largeſt Foxe-taile Graſſe with a very long eare. ‡

Chap. 9. *Of Cyperus Graſſe.*

1 *Gramen Cyperoides.*
Cyperus Graſſe.

2 *Gramen Iunceum aquaticum.*
Ruſhy Water-Graſſe.

¶ *The Deſcription.*

1 CYperus Graſſe hath roots ſomewhat like Cyperus, whereof it tooke his name: his leaues are long and large like vnto the common reed: the ſtalke doth grow to the height of a cubit in ſome places; vpon which groweth little ſcaly knobs or eares, ſpike faſhion, ſomewhat like vnto Cats-taile, or Reed-mace, very chaffie, rough, and rugged.

2 Ruſhy Water-graſſe hath his roots like the former, with many fibres or ſtrings hanging at them; and creepeth along vpon the vppermoſt face of the earth, or rather mud, wherein it groweth, bearing at each ioynt one ſlender benty ſtalke, ſet with a few ſmall graſſie blades or leaues; bringing forth at the top in little hoods, ſmall feather-like tufts or eares.

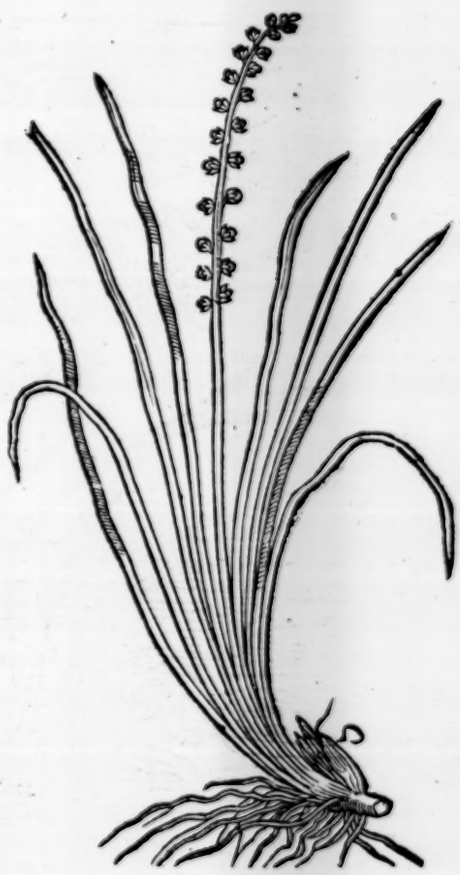
¶ *The Place, Time, and Names.*

They grow, as I haue inſinuated, in myrie and muddy grounds, in the ſame ſeaſon that others do. And concerning their names there hath been ſaid enough in their titles.

CHAP. 10. *Of Water-Graſſe.*

1 *Gramen aquaticum.*
Water-graſſe.

2 *Gramen aquaticum ſpicatum,*
Spiked Water-graſſe.



¶ *The Deſcription.*

† 1 WAter-graſſe, or as we terme it, Water Burre-graſſe, hath a few long narrow ſlender and ioynted leaues: among which riſeth vp a ſtalke of two foot high, bearing vpon his ſmall and tender branches certaine little rough knobs, or browniſh ſharpe pointed ſeeds made vp into cornered heads: his root is ſmall and threddy.

‡ The figure of this plant is not well expreſt, for it ſhould haue had the leaues made narrower, and ioynts expreſt in them, like as you may ſee in the *Gramen junceum ſyluaticum*, which is the ninth in the ſixteenth chapter; for that and this are ſo like, that I know no other difference betweene them, but that this hath leaues longer and narrower than that, and the heads ſmaller and whiter. There is a reaſonable good figure of this in the *Hiſtoria Lugd.p.*1001. vnder the name of *Arundo minima.* ‡

2 Spiked

2 Spiked Water-graſſe hath long narrow leaues: the ſtalke is ſmall, ſingle, and naked, without leaues or blades, bearing alongſt the ſame toward the top an eare or ſpike made of certaine ſmall buttons, reſembling the buttonie floures of Sea Worme-wood. His root is thick & tough, full of fibres or threds.

¶ *The Place and Time.*

They differ not from the former kindes of Graſſes in place and time: and their names are manifeſt.

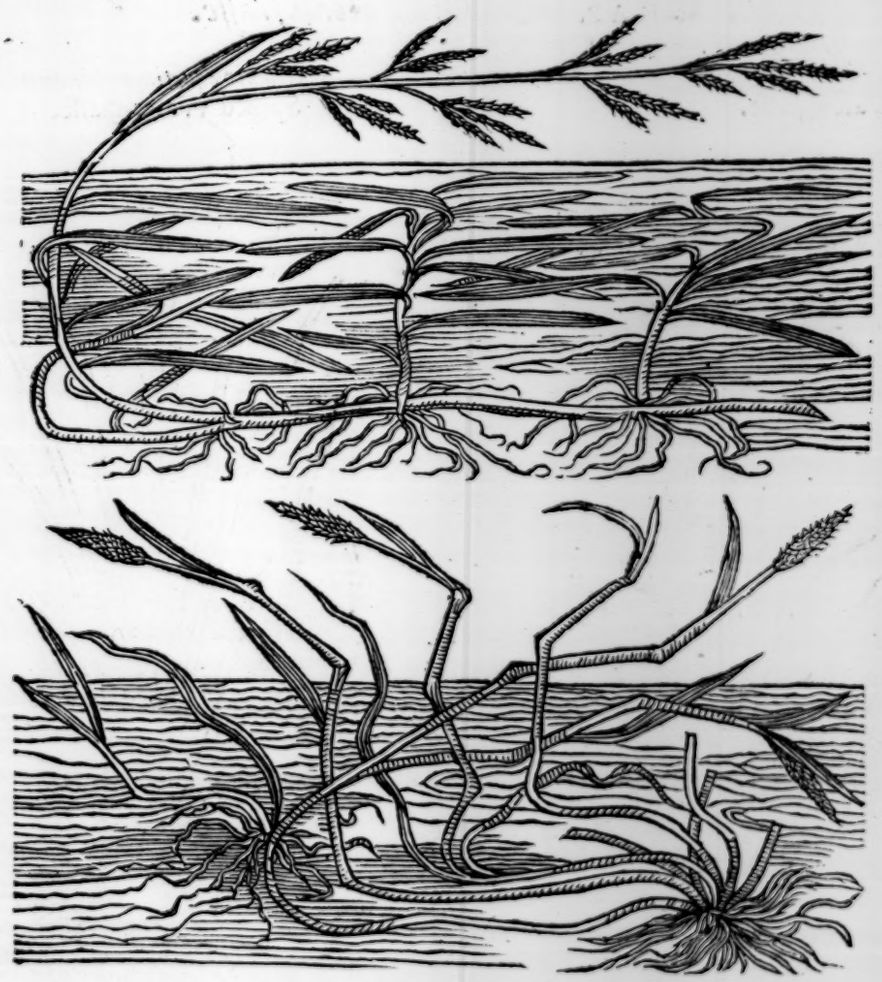
¶ *The Nature and Vertues.*

Their nature and vertues are referred vnto Dogs Graſſe, whereof we will ſpeake hereafter.

Chap. 11. *Of Flote-Graſſe.*

1 *Gramen fluviatile.*
Flote-graſſe.

2 *Gramen fluviatile ſpicatum.*
Spiked Flote-graſſe.



¶ *The Deſcription.*

† 1 Flote-graſſe hath a long and round root ſomewhat thicke, likevnto Dogs-graſſe, ſet on euen ioynts with ſmall ſtrings or threds; from the which riſe vp long and crooked ſtalkes, croſſing, winding, and folding one within another with many flaggie leaues, which horſes eate greedily of. At the top of theſe ſtalks, and ſomewhat lower, there come forth very many little eares of a whitiſh colour, compoſed of two ranks of little chaffie ſeeds ſet alternately, each of theſe ſmall eares being almoſt an inch in length.

2 Spike Flote-Graſſe, or ſpiked Flote-graſſe beareth at the top of each ſlender creeping ſtalke one ſpiked eare and no more, and the other many, which maketh a difference betwixt them; otherwiſe they are one like the other. His root is compact, tufted, and made of many thrummie threds.

¶ *The Place.*

The firſt of theſe growes euery where in waters. The ſecond is harder to be found.

¶ *The*

¶ *The Names.*

The firſt is called *Gramen fluviatile*, and alſo *Gramen aquis innatans*: in Engliſh, Flote-graſſe. *Tragus* calls it, *Gramen Anatum*, Ducks-graſſe.

The ſecond is called *Gramen fluviatile ſpicatum*, and *fluviatile album* by *Tabernamontanus*. Likewiſe in Engliſh it is called Flote-graſſe, and Floter-graſſe, becauſe they ſwimme and flote in the water.

Chap. 12. *Of Kneed-Graſſe.*

¶ *The Deſcription.*

1 Kneed-graſſe hath ſtraight and vpright ſtrawie ſtalkes, with ioynts like to the ſtraw of corne, and beareth ſmall graſſie leaues or blades ſpiked at the top like vnto Pannick, with a rough eare of a darke browne colour. His roots are hairy and thredd'y, and the ioynts of the ſtraw are very large and conſpicuous.

1 *Gramen geniculatum*, Kneed-graſſe.

2 *Gramen geniculatum aquaticum*, Water Kneed-graſſe.

2 Water Kneed-graſſe hath many long and ſlender ſtemmes, ioynted with many knobby and gouty knees like vnto Reed, ſet with broad flaggy leaues ſomewhat ſharpe pointed; bearing at the top a tuft or pannicle diuided into ſundry ſmall branches, of a duskiſh colour. His root is thredie like the other.

¶ *The Place, Time, and Names.*

Theſe Graſſes do grow in fertile moiſt medowes; not differing in time from others. And they are called *Geniculata*, becauſe they haue large ioynts like as it were knees.

We haue nothing deliuered vs of their nature and properties.

Chap.

Chap. 13. *Of Bearded Panicke Graſſe.*

1 *Gramen Paniceum.*
Bearded Panick Graſſe.

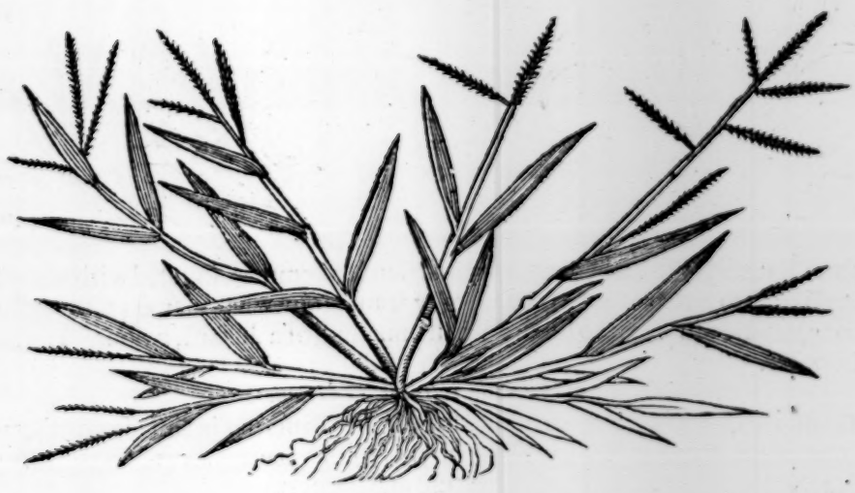
¶ *The Deſcription.*

1 BEarded Panicke graſſe hath broad and large leaues like barly, ſomwhat hoarie, or of an oner-worne ruſſet colour. The ſtalkes haue two or three ioynts at the moſt, and many eares on the top, without order; vpon ſome ſtalkes more eares, on others fewer, much like vnto the eare of wilde Panicke, but that this hath many beards or awnes, which the other wants.

2 Small Pannicke Graſſe, as *Lobelius* writeth, in roots, leaues, ioynts, and ſtalkes is like the former, ſauing that the eare is much leſſe, conſiſting of fewer rowes of ſeed, contained in ſmall chaffie blackiſh huskes. This, as the former, hath many eares vpon one ſtalke.

‡ 3 This ſmall Pannicke Graſſe from a threddy root ſendeth forth many little ſtalkes, whereof ſome are one handfull, other-ſome little more than an inch high; and each of theſe ſtalkes on the top ſuſtaines one ſingle eare, in ſhape very like vnto the eare of wilde Pannicke, but about halfe the length. The ſtalkes of this are commonly crooked, and ſet with graſſie leaues like to the reſt of this kinde. The figure hereof was vnfitly placed by our Author in the ſixteenth place in the eighth chapter, vnder the title of *Gramen cyperoides ſpicatum.*

2 *Gramen paniceum parvum.*
Small Panicke Graſſe.



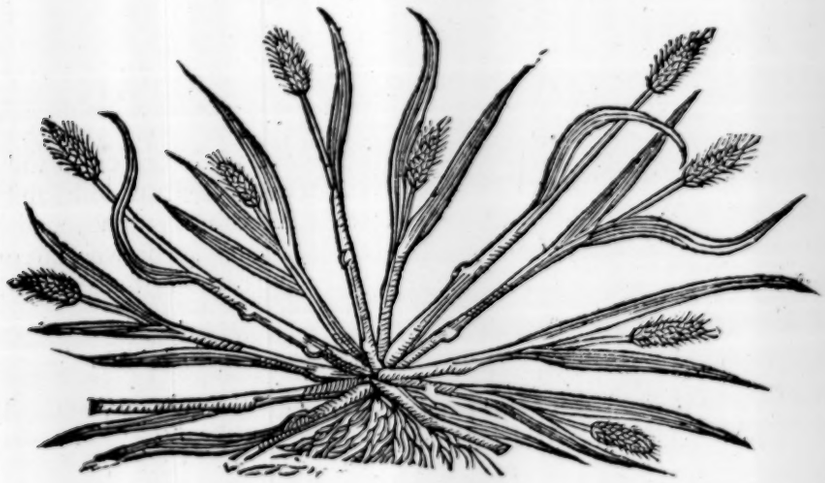
¶ *The Place and Time.*

The firſt of theſe two doth grow neere vnto mud walls, or ſuch like places not manured, yet fertile or fruitfull.

The

The ſecond groweth in ſhallow waterie plaſhes of paſtures, and at the ſame time with others.
‡ I haue not as yet obſerued any of theſe three growing wilde. ‡

† 3 *Gramen Pannici effigie ſpica ſimplici.*
Single eared Pannicke Graſſe.



¶ *The Names and Vertues.*
They are called Panicke Graſſes, becauſe they are like the Italian corne called Panicke.
Their nature and vertues are not knowne.

CHAP. 14. *Of Hedge-hog Graſſe.*

† 1 *Gramen paluſtre Echinatum.*
Hedge-hog Graſſe.

2 *Gramen exile Hirſutum.*
Hairy-graſſe.

‡ 3 *Gramen Capitulis globoſis.*
Round headed Siluer-graſſe.

¶ *The Deſcription.*

1 HEdge-hog Graſſe hath long ſtiffe flaggy leaues with diuers ſtalkes proceeding from a thicke ſpreading root; and at the top of euery ſtalke growe certaine round and pricking knobs faſhioned like an hedge-hog.

† 2 The ſecond is rough and hairie: his roots do ſpred and creep vnder the mud and myre as Cyperus doth; and at the top of the ſtalkes are certaine round ſoft heads, their colour being browne, intermixed with yellow, ſo that they looke prettily when as they are in their prime.

‡ 3 This Graſſe (whoſe figure was formerly in the firſt place in this Chapter) hath a ſmall and fibrous root, from which riſe leaues like thoſe of Wheat, but with ſome long white hairs vpon them like thoſe of the laſt deſcribed: at the tops of the ſtalks (which are ſome foot or better high) there grow two or three round heads conſiſting of ſoft and white downie threds. Theſe heads are ſaid to ſhine in the night, and therefore they in Italy call it (according to *Caſalpinus*) *Luciola, quia noctu lucet.*

4 To this I may adde another growing alſo in Italy, and firſt deſcribed by *Fabius Columna*. It hath ſmall creeping ioynted roots, out of which come ſmall fibres, and leaues little and very narrow at the firſt, but thoſe that are vpon the ſtalkes are as long againe, incompaſſing the ſtalks, as in Wheat, Dogs-graſſe, and the like. Theſe leaues are creſted all along, and a little forked at the end: the ſtraw or ſtalke is very ſlender, at the top whereof growes a ſharpe prickly round head, much after the manner of the laſt deſcribed: each of the ſeed-veſſels whereof this head conſiſts ends in a prickly ſtalke hauing fiue or ſeuen points, whereof the vppermoſt that is in the middle is the longeſt. The ſeed that is contained in theſe prickly veſſels is little and tranſparent, like in colour to that of Cow-wheat. The floures (as in others of this kinde) hang trembling vpon yellowiſh ſmall threds. ‡

¶ *The Place and Time.*

† 1 2 They grow in watery medows and fields, as you may ſee in Saint *Georges* fields and ſuch like places.

3 4 Both theſe grow in diuers mountainous places of Italy; the later whereof floures in May.

¶ *The Names.*

The firſt is called Hedge-hog Graſſe, and in Latine, *Gramen Echinatum*, by reaſon of thoſe prickles which are like vnto a hedge-hog.

The ſecond hairy Graſſe is called *Gramen exile hirſutum Cyperoides*, becauſe it is ſmall and little, and rough or hairy like a Goat: and *Cyperoides*, becauſe his roots do ſpring and creepe like the *Cyperus*.

‡ 3 This by *Anguillara* is thought to be *Combretum* of *Pliny*; it is *Gram. Iucidum* of *Tabernamontanus*; and *Gramen hirſutum capitulo globoſo*, of *Bauhine*, *Pin. pag.* 7.

4 *Fabius Columna* calls this, *Gramen montanum Echinatum tribuloides capitatum*: and *Bauhine* nameth it, *Gramen ſpica ſubrotunda echinata*. Wee may call it in Engliſh, Round headed Caltrope Graſſe.

¶ *The Vertues.*

3 The heade of this (which I haue thought good to call Siluer-graſſe) is very good to be applied to greene wounds, and effectuall to ſtay bleeding, *Caſalp.* ‡

† It is euident by the name and deſcription, that our Author meant this which we here giue you in the firſt place; yet his figure was of another Graſſe ſomwhat like the ſecond, which figure and deſcription you may finde here expreſt in the third place.

Chap.

CHAP. 15. *Of Hairy Wood-Graſſe.*

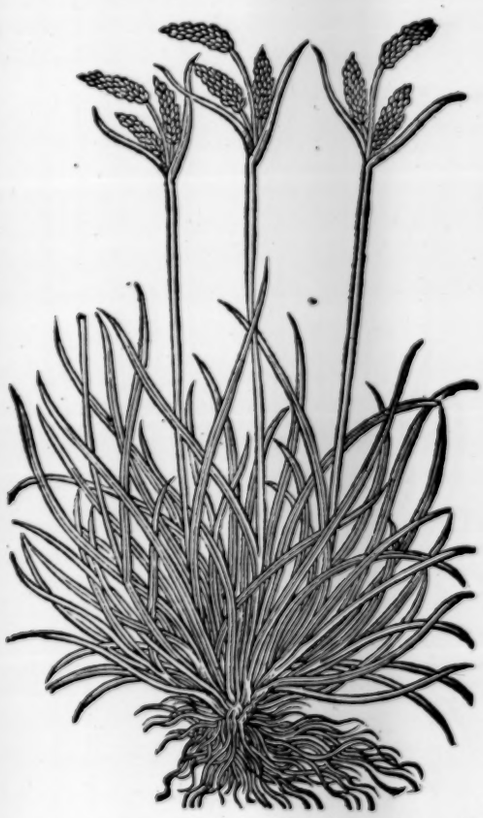
¶ *The Deſcription.*

1 HAiry Wood-graſſe hath broad rough leaues ſomewhat like the precedent, but much longer, and they proceed from a threddy root, which is very thicke, and ful of ſtrings, as the common Graſſe, with ſmall ſtalkes riſing vp from the ſame roots; but the top of theſe ſtalkes is diuided into a number of little branches, and on the end of euery one of them ſtandeth a little floure or huske like the top of *Allium Vrſinum*, or common Ramſons, wherein the ſeed is contained when the floure is fallen.

2 Cyperus Wood-graſſe hath many ſheary graſſie leaues, proceeding from a root made of many hairy ſtrings or threds: among which there riſeth vp ſundry ſtraight and vpright ſtalkes, on whoſe tops are certaine ſcaly and chaffie huskes, or rather ſpikie blackiſh eares, not much vnlike the catkins or tags which grow on Nut-trees, or Aller trees.

1 *Gramen hirſutum nemoroſum.*
Hairy Wood-graſſe.

2 *Gramen Cyperinum nemoroſum.*
Cyperus Wood-graſſe.



¶ *The Place, Time, and Names.*

Theſe two grow in woods or ſhadowie places, and may in Engliſh be called Wood-graſſes. Their time is common with the reſt.

¶ *Their Nature and Vertues.*

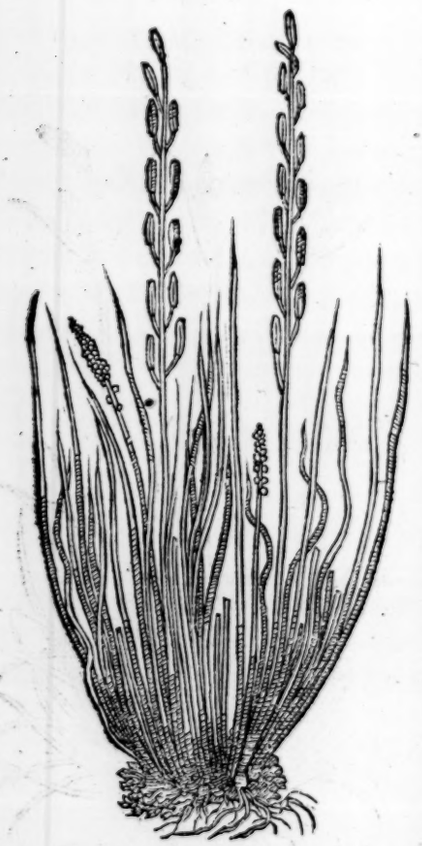
There is nothing to be ſaid of their nature and vertues, being as vnknowne as moſt of the former.

Chap. 16. *Of Sea Spike-Graſſe.*

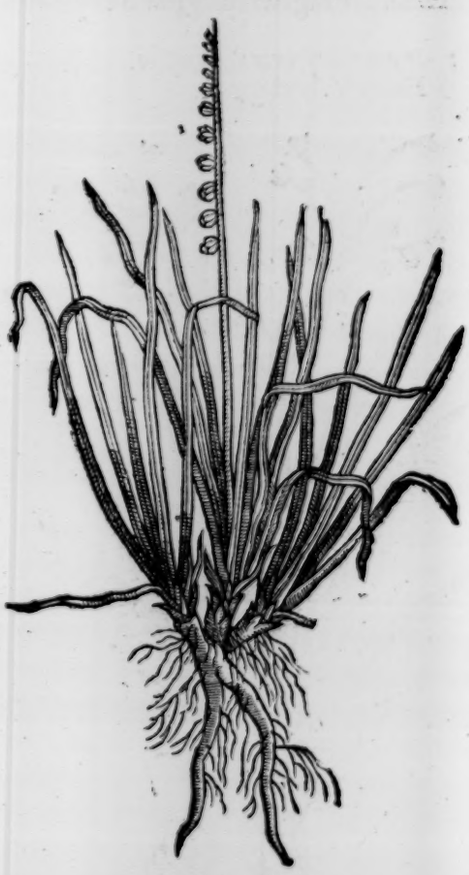
¶ *The Deſcription.*

† 1 SEa Spike-graſſe hath many ſmall hollow round leaues about ſix inches long, riſing from a buſhy threddy white fibrous root, which are very ſoft and ſmooth in handling. Among theſe leaues there doe ſpring vp many ſmall ruſhy ſtalkes; alongſt which are at the firſt diuers ſmall flouring round buttons; the ſides whereof falling away, the middle part growes into a longiſh ſeed-veſſell ſtanding vpright.

1 *Gramen marinum ſpicatum.*
Sea Spike-graſſe.



2 *Gramen ſpicatum alterum.*
Salt marſh Spike graſſe.



† 2 Salt-marſh Spike-graſſe hath a woody tough thicke root with ſome ſmall hairy threds faſtned thereunto; out of which ariſe long and thicke leaues very like thoſe of that Sea-graſſe we vulgarly call Thrift. And amongſt theſe leaues grow vp ſlender naked ruſhy ſtalkes which haue on one ſide ſmall knobs or buttons of a greeniſh colour hanging on them.

3 The third hath many ruſhy leaues tough and hard, of a browne colour, well reſembling Ruſhes: his root is compact of many ſmall tough and long ſtrings. His ſtalke is bare and naked of leaues vnto the top, on which it hath many ſmall pretty chaffie buttons or heads.

4 The fourth is like the third, ſauing that it is larger; the ſtalke alſo is thicker and taller than that of the former, bearing at the top ſuch huskes as are in Ruſhes.

5 Great Cypreſſe Graſſe hath diuers long three-ſquare ſtalkes proceeding from a root compact of many long and tough ſtrings or threds. The leaues are long and broad, like vnto the ſedge called *Carex*. The ſpike or eare of it is like the head of Plantaine, and very prickly, and commonly of a yellowiſh greene colour.

6 Small Cypreſſe Graſſe is like vnto the other in root and leaues, ſauing that it is ſmaller. His ſtalke is ſmooth and plaine, bearing at the top certaine tufts or pannicles, like to the laſt deſcribed in roughneſſe and colour.

7 The

3 *Gramen junceum marinum.*
Sea Ruſh-graſſe.

4 *Gramen junceum maritimum.*
Mariſh Ruſh-graſſe.

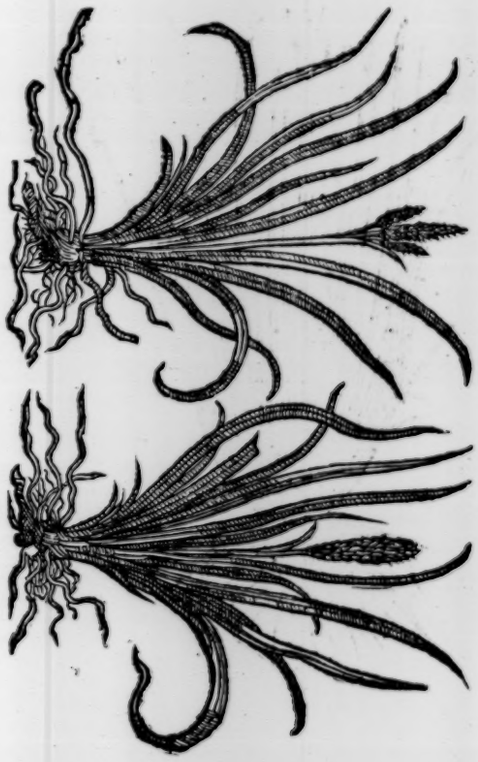
5 *Gramen paluſtris Cyperoides.*
Great Cypreſſe Graſſe.

6 *Gramen Cyperoides parvum.*
Small Cypreſſe Graſſe.

7 *Gramen aquaticum Cyperoides vulgatius.*
Water Cypreſſe Graſſe.

9 *Gramen junceum ſyluaticum.*
Wood Ruſhy-graſſe.

† 8 *Gramen Cyperoides ſpicatum.* Spike Cypreſſe Graſſe.



7 The firſt of theſe two kindes hath many crooked and crambling roots of a woody ſubſtance, very like vnto the right Cyperus, differing from it onely in ſmell, becauſe the right Cyperus roots haue a fragrant ſmell, and theſe none at all. His leaues are long and broad, rough, ſharp or cutting at the edges like ſedge. His ſtalke is long, big, and three ſquare, like to Cyperus, and on his top a chaffie vmbel or tuft like vnto the true Cyperus.

‡ 8 The ſecond kinde hath many broad leaues like vnto thoſe of Gillouers, but of a freſher greene: amongſt the which riſeth vp a ſhort ſtalke ſome handful or two high, bearing at the top three or foure ſhort eares of a reddiſh murrey colour, and theſe eares grow commonly together at the top of the ſtalk, and not one vnder another. There is alſo another leſſer ſort hereof, with leaues and roots like the former, but the ſtalke is commonly ſhorter, and it hath but one ſingle eare at the top thereof. You haue the figures of both theſe expreſt in the ſame table or piece. This kinde of Graſſe is the *Gramen ſpicatum folijs Vetonicæ* of *Lobel.* ‡

9 This hath long tough and hairy ſtrings growing deepe in the earth like a turfe, which make the root, from which riſe many crooked tough and ruſhy ſtalks, hauing toward the top ſcaly and chaffie knobs or buttons. ‡ This

growes

growes ſome halfe yard high, with round browniſh heads, and the leaues are ioynted as you ſee them expreſſed in the figure we here giue you. ‡

¶ *The Place, Time, Names, Nature, and Vertues.*

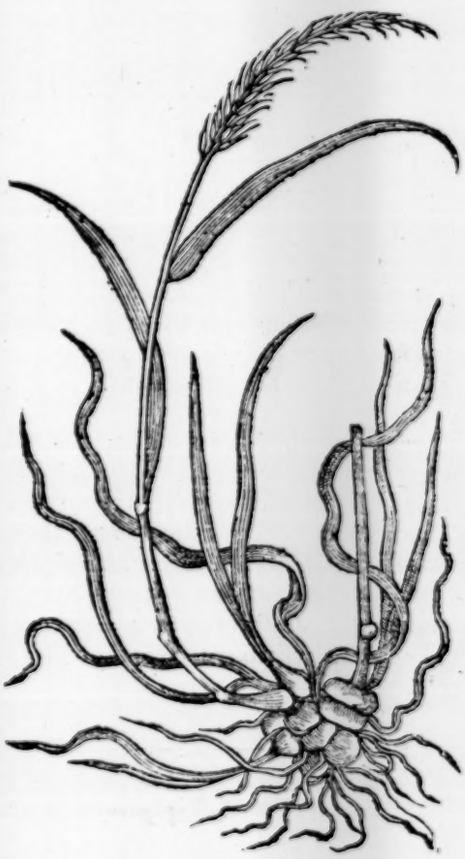
All the Graſſes which we haue deſcribed in this chapter doe grow in mariſh and watery places neere to the ſea, or other fenny grounds, or by muddy and myrie ditches, at the ſame time that the others do grow and flouriſh. Their names are eaſily gathered of the places they grow in, or by their Deſcriptions, and are of no vertue nor propertie in medicine, or any other neceſſarie vſe as yet knowne.

† Formerly in the eighth place (but very vnfitly) was the figure of *Gramen panicis effigie ſpica ſimp.* being the third in the thirteenth chapter. The ninth alſo is reſtored to his due place, being the fourth in the nxth chapter. The two Reed-graſſes that were in the eleuenth and twelfth places are alſo before in the fifth Chapter.

CHAP. 17. *Of Couch-Graſſe, or Dogs-graſſe.*

1 *Gramen Caninum.*
Couch-graſſe, or Dogs-graſſe.

2 *Gramen Caninum nodoſum.*
Knotty Dogs-graſſe.



¶ *The Deſcription.*

† 1 THe common or beſt knowne Dogs-graſſe, or Couch-graſſe hath long leaues of a whitiſh greene colour: the ſtalke is a cubit and a halfe high, with ioynts or knees like wheaten ſtraw, but theſe ioynts are couered with a little ſhort down or woollineſſe. The plume or tuft is like the reed, but ſmaller and more chaffie, and of a grayiſh colour: it creepeth in the ground hither and thither with long white roots, ioynted at certaine diſtances, hauing a pleaſant ſweet taſte, and are platted or wrapped one within another very intricately, inſomuch as where it hapneth in gardens amongſt pot-herbes, great labour muſt be taken before it can be deſtroyed, each piece being apt to grow, and euery way to dilate it ſelfe.

† 2 Knotty Dogs graſſe is like vnto the former in ſtalke and leafe, but that they are of a deeper colour; alſo the ſpike or eare is greener, and about ſome two handfulls long, much in ſhape reſembling an Oate, yet far ſmaller, and is much more diſperſed than the figure preſents to you. The roots of this are ſomewhat knotty and tuberous, but that is chiefely about the Spring of the yeare, for afterwards they become leſſe and leſſe vntill the end of Summer. And theſe bulbes do grow confuſedly together, not retaining auy certaine ſhape or number.

¶ *The Place.*

1 The firſt growes in gardens and arable lands, as an infirmitie or plague of the fields, nothing pleaſing to Husbandmen; for after that the field is plowed, they are conſtrained to gather the roots together with harrowes and rakes; and being ſo gathered and laid vpon heapes, they ſet them on fire leſt they ſhould grow againe.

2 The ſecond growes in plowed fields and ſuch like places, but not euery where as the other. I haue found of theſe in great plenty, both growing, and plucked vp with harrowes, as before is rehearſed, in the fields next to S. *Iames* wall as ye go to Chelſey, and in the fields as ye go from the Tower-hill of London to Radcliffe.

¶ *The Time.*

Theſe Graſſes ſeldome come to ſhew their eare before Iuly.

¶ *The Names.*

It is called *Gramen Caninum*, or *Sanguinale*, and *Viola*. The Countreymen of Brabant name it **Deen:** others, **Ledt graſſe:** of the Grecians, ἄγριος: of the Latines, by the common name, *Gramen*. It is of ſome named ἀγρωστὶς: in Engliſh, Couch-graſſe, Quitch-Graſſe, and Dogs-graſſe.

Gramen Caninum bulboſum, or *nodoſum*, is called in Engliſh, Knobby, or Knotty Couch-graſſe.

¶ *The Nature.*

The nature of Couch-graſſe, eſpecially the roots, agreeth with the nature of common Graſſe: although that Couch-graſſe be an vnwelcome gueſt to fields and gardens, yet his phyſicke vertues do recompence thoſe hurts; for it openeth the ſtoppings of the liuer and reines, without any manifeſt heate.

The learned Phyſitions of the Colledge and Societie of London do hold this bulbous Couch graſſe in temperature agreeing with the common Couch-graſſe, but in vertues more effectuall.

¶ *The Vertues.*

A Couch-graſſe healeth greene wounds. The decoction of the root is good for the kidneys and bladder: it prouoketh vrine gently, and driueth forth grauell. *Dioſcorides* and *Galen* do agree, that the root ſtamped and laid vpon greene wounds doth heale them ſpeedily.

B The decoction thereof ſerueth againſt griping paines of the belly, and difficultie of making water.

C *Marcellus* an old Author maketh mention in his 26 chapter, That ſeuen and twenty knots of the herbe which is called *Gramen*, or Graſſe, boiled in wine till halfe be conſumed, preſſed forth, ſtrained, and giuen to drinke to him that is troubled with the ſtrangurie, hath ſo great vertue, that after the Patient hath once begun to make water without paine, it may not be giuen any more. But it muſt be giuen with water onely to ſuch as haue a Feuer. By which words it appeareth, That this knotted Graſſe was taken for that which is properly called *Gramen*, or *Agroſtis*; and hath bin alſo commended againſt the ſtone and diſeaſes of the bladder.

D The later Phyſitions doe vſe the roots ſometimes of this, and ſometimes of the other indifferently.

Chap. 18. *Of Sea Dogs-Graſſe.*

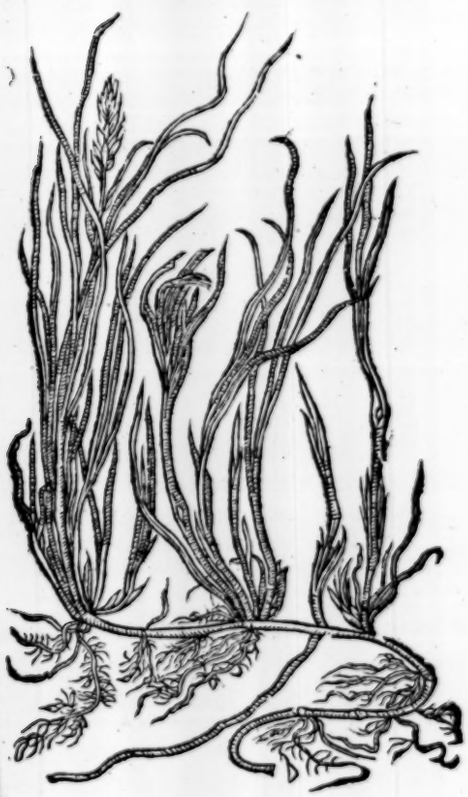
¶ *The Deſcription.*

1 THe Sea Dogs-graſſe is very like vnto the other before named: his leaues are long and ſlender, and very thicke compact together, ſet vpon a knotty ſtalke ſpiked at the top like the former. Alſo the root crambleth and creepeth hither and thither vnder the earth, occupying much ground by reaſon of his great encreaſe of roots.

‡ This Graſſe (whereof *Lobel* gaue the firſt figure and deſcription, vnder the name of *Gramen geniculatum Caninum marinum*) I conieture to be that which growes plentifully vpon the banks in the ſa't mariſhes by Dartford in Kent, and moſt other ſalt places by the ſea; as alſo in many banks and orchards about London, and moſt other places farre from the ſea. Now *Lobels* figure being not good, and the deſcription not extant in any of his Latine Workes; I cannot certainly affirme any thing. Yet I thinke it fit to giue you an exact deſcription of that I do probably iudge to be it; and

and not onely ſo, but I iudge it to be the ſame Graſſe that *Bauhine* in his *Prodromus* hath ſet forth, *pag.* 17. vnder the name of *Gramen latifolium ſpica triticea compacta*. This is a very tall Graſſe; for it ſends forth a ſtalke commonly in good ground to the height of a yard and an halfe: the leaues are large, ſtiffe, and greene, almoſt as big as thoſe of white Wheat; the which it alſo very much reſembles in the eare, which vſually is ſome handfull and an halfe long, little ſpokes ſtanding by courſe with their flat ſides towards the ſtraw. About the beginning of Iuly it is hung with little

1 *Gramen Caninum marinum.*
Sea Dogs-graſſe.



2 *Gramen Caninum marinum alterum.*
Sea Couch-graſſe.

whitiſh yellow floures ſuch as Wheat hath. The roots of this are like thoſe of the firſt deſcribed. This ſometimes varies in the largeneſſe of the whole Plant, as alſo in the greatneſſe, ſparſedneſſe, and compactneſſe of the eare. ‡

2 The ſecond Sea Dogs-graſſe is according vnto *Lobel* ſomewhat like the former: his roots are more ſpreading and longer, diſperſing themſelues vnder the ground farther than any of the reſt. The leaues are like the former, thicke buſhed at the top, with a cluſter or buſh of ſhort thick leaues one folded within another. The ſtalke and tuft is of a middle kinde, betweene *Iſchæmon* and the common Couch-graſſe.

¶ *The Place, Time, Names, Nature, and Vertues.*

They grow on the ſea ſhore at the ſame time that others do; and are ſo called becauſe they grow neere the ſea ſide. Their nature and vertues are to be referred vnto Dogs-graſſe.

CHAP. 19. *Of vpright Dogs-Graſſe.*

¶ *The Deſcription.*

1 VPright Dogs-graſſe, or Quich-graſſe, by reaſon of his long ſpreading ioynted roots is like vnto the former, and hath at euery knot in the root ſundry ſtrings of hairie ſubſtance, ſhooting into the ground at euery ioint as it ſpreadeth: the ſtalks ly creeping, or riſe but a little from the ground, and at their tops haue ſpokie pannicles farre ſmaller than the common

common Couch-graſſe. By which notes of difference it may eaſily be diſcerned from the other kindes of Dogs-graſſe.

1 *Gramen Caninum ſupinum.*
Vpright Dogs-graſſe.

2 Ladies Laces hath leaues like vnto Millet in faſhion, rough and ſharpe pointed like to the Reed, with many white vaines or ribs, and ſiluer ſtreakes running along through the midſt of the leaues, faſhioning the ſame like to laces or ribbons wouen of white and greene ſilke, very beautifull and faire to behold: it groweth vnto the height of wilde Pannicke, with a ſpoky top not very much vnlike, but more compact, ſoft, white, and chaffie. The root is ſmall and hairie, and white of colour like vnto the Medow-graſſe.

2 *Gramen ſtriatum.*
Lady-lace Graſſe.

¶ *The Place.*

1 Vpright Dogs-graſſe groweth in dunged grounds and fertile fields.

2 Lady-laces growes naturally in woody and hilly places of Sauoy, and anſwers common Graſſe in his time of ſeeding.

It is kept and maintained in our Engliſh gardens, rather for pleaſure than vertue, which is yet knowne.

¶ *The Names.*

Lobelius calleth the later, *Gramen ſulcatum*, and *ſtriatum*, or *Gramen pictum*: in Engliſh, the Furrowed Graſſe, the white Chamelion Graſſe, or ſtreaked Graſſe; and vſually of our Engliſh women it is called Lady-laces, or painted Graſſe: in French, *Aiguillettes d'armes.*

¶ *The Nature and Vertues.*

The vertues are referred vnto the Dogs-graſſes.

Chap. 20. *Of Dew-Graſſe.*

¶ *The Deſcription.*

1 Dew-graſſe hath very hard and tough roots long and fibrous: the ſtalkes are great, of three or foure cubits high, very rough and hairy, ioynted and kneed like the common Reed: the leaues are large and broad like vnto corne. The tuft or eare is diuided into ſundry branches, chaffie, and of a purple colour; wherein is contained ſeed like *Milium*, wherewith the Germanes do make pottage and ſuch like meat, as we in England do with Otemeale; and it is ſent into Middleborough and other townes of the Low-countries, in great quantitie for the ſame purpoſe, as *Lobel* hath told me.

2 The ſecond kinde of Dew-graſſe or *Iſchæmon* is ſomewhat like the firſt kinde of Medow-graſſe, reſembling one the other in leaues and ſtalkes, ſauing that the creſt or tuft is ſpred or ſtretched out abroad like a Cocks foot ſet downe vpon the ground, whereupon it was called *Galli crus*, by *Apuleius*. Theſe tops are cleere and vpright, of a gliſtering purple colour, or rather violet; and it is diuided into foure or fiue branches like the former Dew-graſſe. The root conſiſts of a great many ſmall fibres.

‡ 3 To theſe may fitly be added another Graſſe, which *Cluſius* hath iudged to be the medicinall Graſſe of the Antients: and *Lobel* referres it to the Dogs graſſes, becauſe it hath a root ioynted thicke, and creeping like as the Dogs-graſſes: the ſtalkes are ſome foot high, round, and of a purpliſh colour: but the top is very like to that of the laſt deſcribed, of a darke purple colour.

1 *Gramen Mannæ eſculentum.*
Dew-graſſe.

2 *Iſchæmon vulgare.*
Cocks-foot graſſe.

¶ *The Place and Time.*

1 The firſt groweth naturally in Germanie, Bohemia, Italy, and in the territories of Goritia and Carinthia, as *Matthiolus* reporteth.

2 The ſecond groweth neere vnto rough bankes of fields, as I haue ſeene in the hilly bankes neere Greenhithe in Kent. It differeth not in time from thoſe we haue ſpoken of.

‡ 3 This

‡ 3 *Gramen dactiloides radice repente.*

Cocks-foot Graſſe with creeping roots.

A

‡ 3 This groweth plentifully in moſt parts of Spaine and France; and it is probable, that this was the graſſe that our Author found neere Greenhithe in Kent.

¶ *The Names.*

1 The Germanes call it **Hymeldau**: That is to ſay, *Cœli ros*; whereupon it was called *Gramen Mannæ*: it ſeemeth to be *Milij ſylueſtris ſpurium quoddam genus*, a certaine wilde or baſtard kinde of Millet. *Leonicenus* and *Ruellius* name it *Capriola*, and *Sanguinaria*: ſome would haue it to be *Gramen aculeatum Plinij*, but becauſe the deſcription thereof is very ſhort, nothing can be certainly affirmed. But they are far deceiued who thinke it be *Coronopus*, as ſome very learned haue ſet downe: but euery one in theſe dayes is able to controll that errour. *Lobel* calleth it *Gramen Mannæ eſculentum*, for that in Germany and other parts, as Bohemia and Italy, they vſe to eate the ſame as a kind of bread-corne, and alſo make pottage therewith as wee do with Otemeale; for the which purpoſe it is there ſowen as Corne, and ſent into the Low-countries, and there ſold by the pound. In Engliſh it may be called Manna-graſſe, or Dew-graſſe; but more fitly Rice-graſſe.

2 This is iudged to be *Iſchæmon* of *Pliny*; and *Galli crus* of *Apuleius*.

¶ *The Nature.*

Theſe Graſſes are aſtringent and drying, in taſte ſweet like the common Dogs-graſſe.

¶ *The Vertues.*

Apuleius ſaith, if a plaiſter be made of this Graſſe, Hogs greaſe, and leuen of houſehold bread, it cureth the biting of mad dogs.

B As in the deſcription I told you, this plant in his tuft or eare is diuided into ſundry branches, ſome tuft into three, ſome foure, and ſome fiue clouen parts like Cocks toes. *Apuleius* reporteth, If ye take that eare which is diuided onely into three parts, it wonderfully helpeth the running or dropping of the eyes, and thoſe that begin to be bleare eyed, being bound about the necke, and ſo vſed for certaine dayes together, it turneth the humors away from the weake part.

C ‡ Manna Graſſe, or Rice-graſſe is ſaid to be very good to be put into pulteſſes, to diſcuſſe hard ſwellings in womens breſts.

D The Cocks-foot Dogs-graſſe is very good in all caſes, as the other Dogs-graſſes are, and equally as effectuall. ‡

‡ Chap. 21. *Of diuers Cyperus Graſſes.*

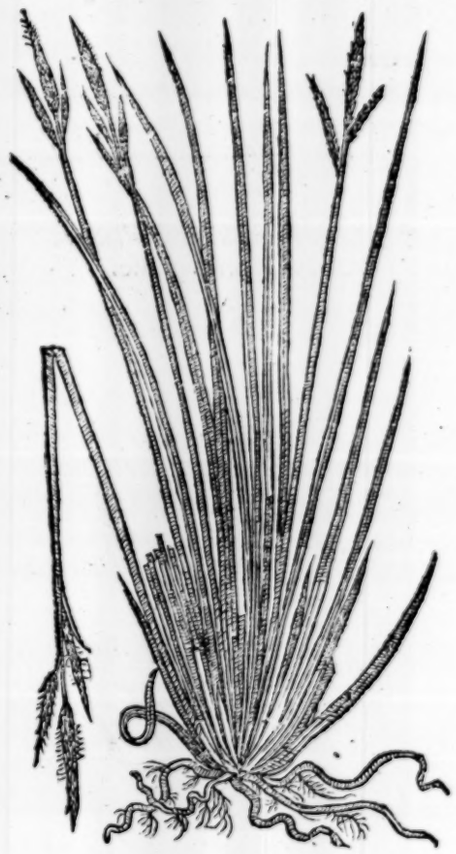
¶ *The Deſcription.*

‡ 1 THe firſt of theſe hath reaſonable ſtrong fibrous roots, from whence riſe ſtiffe long and narrow leaues like thoſe of other Cyperus Graſſes: the ſtalkes alſo (as it is proper to all the plants of this kindred) are three ſquare, bearing at their tops ſome three browniſh eares ſoft and chaffie like the reſt of this kinde, and ſtanding vpright, and not hanging downe as ſome others do.

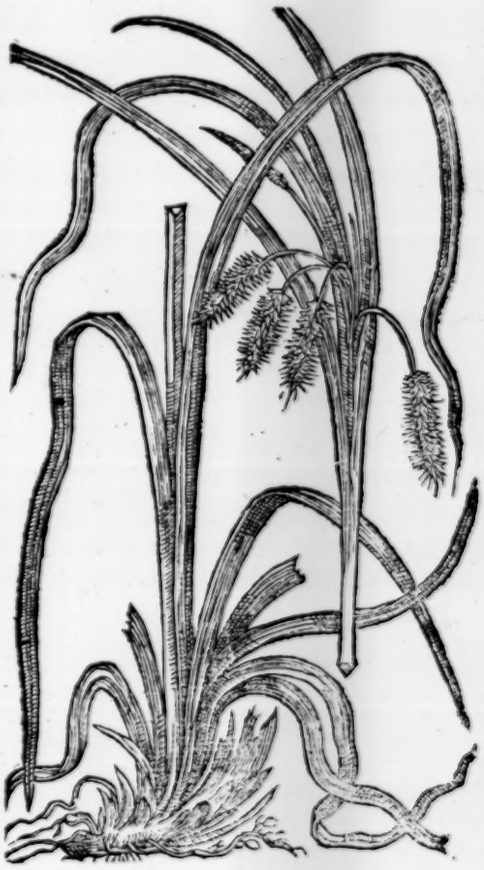
2 This hath pretty thicke creeping blacke roots, from whence ariſe three ſquare ſtalkes ſet with leaues ſhorter, yet broader than thoſe of the laſt deſcribed; and from the top of the ſtalke come forth three or foure foot-ſtalkes, whereupon doe hang longiſh rough ſcaly and yelloviſh heads.

3 The roots of this are blacke, without ſmell, and ſomewhat larger than thoſe of the laſt deſcribed:

‡ 1 *Gramen Cyperoides anguſtifolium majus.*
Great narrow leaued Cyperus Graſſe.



‡ 2 *Pſeudocyperus.*
Baſtard Cyperus.



‡ 3 *Cyperus longus inodorus ſylueſtris.*
Long Baſtard Cyperus.

deſcribed: the 3 ſquare ſtalke alſo is ſome two cubits high, bearing at the top diſperſedly round ſcaly heads ſomewhat like thoſe of the wood Ruſh-graſſe: the leaues are ſomewhat ſharpe and triangular like thoſe of the other Cyperus.

4 This Cyperus hath creeping blacke roots, hauing here and there knotty tuberous heads for the moſt part, putting vp leaues like thoſe of the laſt deſcribed, as alſo a ſtalke bearing at the top long chaffy eares like to ſome others of this kinde.

5 This Cyperus Graſſe hath pretty thicke fibrous and blacke roots, from whence ariſeth a ſtalke ſome cubit high, pretty ſtiffe, triangular, ioynted, ſet at each ioynt with a large greene leafe which at the bottome incompaſſes the ſtalke, which is omitted in the figure. At the top of the ſtalke, as in the true Cyperus, come forth two or three pretty large leaues, betweene which riſe vp many ſmall foot-ſtalkes very much branched, and bearing many blacke ſeeds ſomewhat like Millet or ruſhes.

¶ *The Place and Time.*
All theſe grow in ditches and waterie places;

places, and are to be found with their heads about the middle of Sommer, and ſome of them ſooner.

¶ *The Names.*

The firſt of theſe by *Lobel* is called *Gramen paluſtre majus.*

2 This by *Geſner*, *Lobel*, and *Dodonæus* is called *Pſeudocyperus.*

3 *Lobel* names this, *Cyperus longus inodorus ſylueſtris.*

4 He alſo calls this, *Cyperus aquaticus ſeptentrionalis.*

5 This is the *Cyperus graminea miliacea* of *Lobel* and *Pena*: the *Iuncus latus* in the *Hiſtor. Lugd. pag.* 988. and the *Pſeudocyperus polycarpos* of *Thalius.*

‡ 4 *Cyperus rotundus inoderus ſylueſtris.*
Round Baſtard Cyperus.

‡ 5 *Cyperus gramineus miliaceus.*
Millet Cyperus graſſe.

¶ *The Temper and Vertue.*

None of theſe are made vſe of in phyſicke; but by their taſte they ſeeme to be of a cold and aſtringent qualitie. ‡

‡ Chap. 22. *Of diuers other Graſſes.*

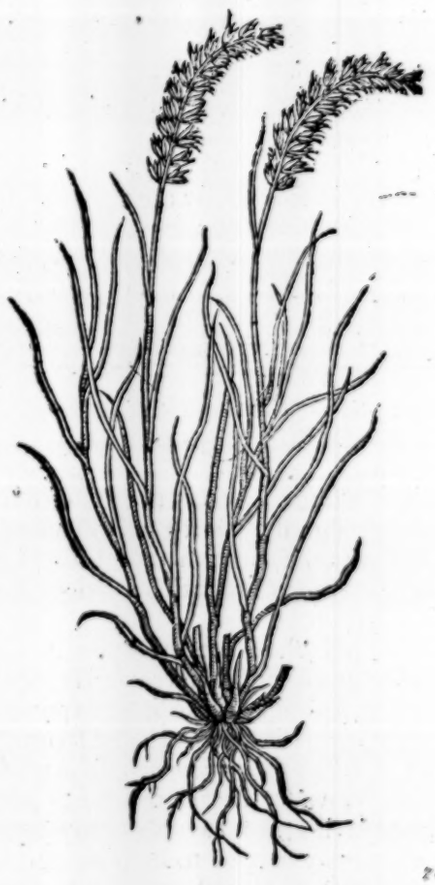
¶ *The Deſcription.*

‡ 1 THis Ote or Hauer-graſſe, deſcribed by *Cluſius*, hath ſmall creeping roots: the ſtalks are ſome cubit high, ſlender ioynted, and ſet with ſhort narrow leaues: at the top of the ſtalke growes the eare, long, ſlender, and bending, compoſed of downy huskes containing a ſeed like to a naked Ote. The ſeed is ripe in Iuly. It growes in the mountainous and ſhadowie woods of Hungary, Auſtria, and Bohemia. Our Author miſtaking himſelfe in the figure, and as much in the title, gaue the figure of this for Burnt Barley, with this title, *Hordeum Diſtichon.* See the former edition, *pag.* 66.

2 I cannot omit this elegant Graſſe, found by M. *Goodyer* vpon the wals of the antient city of Wincheſter, and not deſcribed as yet by any that I know of. It hath a fibrous and ſtringy root, from which ariſe leaues long and narrow, which growing old become round as thoſe of *Spartum* or Mat-

Mat-weed: amongſt theſe graſſie leaues there growes vp a ſlender ſtalke ſome two foot long, ſcarſe ſtanding vpright, but oft times hanging down the head or top of the eare: it hath ſome two ioints, and at each of theſe a pretty graſſy leafe. The eare is almoſt a foot in length, compoſed of many ſmall and ſlender hairy tufts, which when they come to maturitie looke of a grayiſh or whitiſh colour, and do very well reſemble a Capons taile; whence my friend, the firſt obſeruer thereof, gaue it the title of *Gramen* Ἀλωπούρικος, or Capons-taile Graſſe: by which name I receiued the ſeed thereof, which ſowen, tooke root, and flouriſhes.

‡ 1 *Gra. montanum avenaceum.*
Mountaine Hauer-graſſe.



‡ 2 *Gramen murorum ſpica longiſſima.*
Capon-taile Graſſe.

3 Next to this I thinke fit to place the *Gramen Criſtatum*, or Cocks-combe graſſe of *Bauhinus*. This Graſſe hath for the root many white fibrous threds thicke packt together; the leaues are but ſhort, about the bigneſſe of the ordinarie medow graſſe; the ſtalks are ſome cubit and halfe high, with ſome two or three knots a piece: the leaues of the ſtalke are ſome foure or fiue inches long: the eare is ſmall, longiſh, of a pale greene colour, ſomewhat bending, ſo that in ſome ſort it reſembles the combe of a Cocke, or the ſeed-veſſell of that plant which is called *Caput Gallinaceum*. This is ordinarily to be found in moſt medowes about Mid-ſummer.

4 There is alſo commonly about the ſame time in our medowes to be found a Graſſe growing to ſome cubit high, hauing a ſmall ſtalke, at the top whereof there growes an eare ſome inch and an halfe, or two inches long, conſiſting as it were of two rankes of corne: it very much reſembles Rie both in ſhape and colour, and in his ſhort bearded awnes, wherefore it may very fitly be termed *Gramen ſecalinum*, or Rie-graſſe. Yet is it not *Gramen ſpica ſecalina* which *Bauhine* deſcribes in the fifty ſeuenth place, in his *Prodromus*, *pag.* 18. for that is much taller, and the eare much larger than this of my deſcription.

5 In diuers places about hedges, in Iuly and Auguſt is to be found a fine large tall Graſſe, which *Bauhine* (who alſo firſt deſcribed it) hath vnder the name of *Gramen ſpica Briz æ majus*. This hath ſtalkes as tall as Rie, but not ſo thicke, neither are the leaues ſo broad: at the top of the ſtalk grow diuers pretty little flattiſh eares conſiſting of two rankes of chaffie huskes or ſeed-veſſells, which haue yellowiſh little floures like to thoſe of Wheat.

6 There is alſo commonly to be found about May or the beginning of Iune, in medowes and ſuch

ſuch places that graſſe which in the *Hiſtoria Lugdun.* is ſet forth vnder the name of *Gramen Lanatum Daleſchampij:* the ſtalkes and leaues are much like the common medow graſſe, but that they are more whitiſh and hairy; the head or panicle is alſo ſoft and woolly, and it is commonly of a gray, or elſe a murrie colour.

7 There is to be found in ſome bogs in Summer time about the end of Iuly a pretty ruſhie graſſe ſome foote or better in height, the ſtalke is hard and ruſhie, hauing ſome three ioints, at each whereof there comes forth a leafe as in other graſſes, and out of the boſome of the two vppermoſt of theſe leaues comes out a ſlender ſtalke being ſome 2 or 3 inches high, and at the top thereof growes as in a little vmble a prety white chaffie floure; and at, or nigh to the top of the maine ſtalke there grow three or foure ſuch floures cluſtering together vpon little ſhort and ſlender foot ſtalkes: the leaues are but ſmall, and ſome handfull or better long; the roote I did not obſerue. This ſeemes to haue ſome affinitie with the *Gramen junceum aquaticum*, formerly deſcribed in the ninth chapter. I neuer found this but once, and that was in the companie of M. *Thomas Smith*, and M. *Iames Clarke*, Apothecaries of London; we riding into Windſore Foreſt vpon the ſearch of rare plants, and we found this vpon a bogge neere the high way ſide at the corner of the great parke. I thinke it may very fitly be called *Gramen junceum leucanthemum:* White flowred ruſh-graſſe.

8 The laſt yeare at Margate in the Iſle of Tenet, neere to the ſea ſide and by the chalky cliffe I obſerued a pretty litle graſſe which from a ſmall white fibrous roote ſent vp a number of ſtalkes of an vnequall height; for the longeſt, which were thoſe that lay partly ſpred vpon the ground, were ſome handfull high, the other that grew ſtraight vp were not ſo much; and of this, one inch and halfe was taken vp in the ſpike or eare, which was no thicker than the reſt of the ſtalke, and ſeemed nothing elſe but a plaine ſmooth ſtalke, vnleſſe you looked vpon it earneſtly, and then you might perceiue it to be like Darnell graſſe: wherefore in the Iournall that I wrot of this Simpling voyage, I called it *pag.* 3. *Gramen parvum marinum ſpica Loliacea.* I iudge it to be the ſame that *Bauhine* in his *Prodromus*, *pag.* 19 hath ſet forth vnder the name of *Gramen Loliaceum minus ſpica ſimplici.* It may be called in Engliſh, Dwarfe Darnell Graſſe.

9 The Darnell graſſe that I compared the eare of this laſt deſcribed vnto, is not the *Gramen ſorghinum* (which our Author called Darnel-graſſe) but another graſſe growing in moſt places with ſtalkes about ſome ſpan high, but they ſeldome ſtand vpright, the eare is made iuſt like that which hereafter *chap.* 58. is called *Lolium rubrum*, Red Darnell, of which I iudge this a variety, differing little therefrom but in ſmallneſſe of growth.

10 Vpon Hampſted heath I haue often obſerued a ſmall graſſe whoſe longeſt leaues are ſeldome aboue two or three inches high, and theſe leaues are very greene, ſmall, and perfectly round like the *Spartum Auſtriacum*, or Feather-graſſe: I could neuer finde any ſtalke or eare vpon it: wherefore I haue brought it into the Garden to obſerue it better. In the forementioned Iournall, *pag.* 33. you may finde it vnder the name of *Gramen Spartium capillaceo folio minimum.* It may be this is that graſſe which *Bauhine* ſet forth in his *Prodromus*, *pag.* 11. vnder the title of *Gramen ſparteum Monſpeliacum capillaceo folio minimum.* I haue thought good in this place to explaine my meaning by theſe two names to ſuch as are ſtudious of plants, which may happen to light by chance (for they were not intended for publicke) vpon our Iournall, that they need not doubt of my meaning.

11 I muſt not paſſe ouer in ſilence two other Graſſes, which for any thing that I know are ſtrangers with vs, the one I haue ſeene whith M. *Parkinſon*, and it is ſet forth by *Bauhine*, *pag.* 30. of his *Prodromus*. The other by *Lobell* in the ſecond part of his *Adverſaria*, *pag.* 468. The firſt (which *Bauhine* fitly calls *Gramen alopecuriodes ſpica aſpera*, and thinkes it to be *Gram. Echinatum Daleſchampij*, deſcribed *Hiſt. Lugd. pag.* 432.) hath a fibrous and white root, from which ariſes a ſtiffe ſtalke diuided by many knots, or knees: the leaues are like to the other fox-taile graſſes, but greener: the eare is rough, of ſome inch in length, and growes as it were vpon one ſide of the ſtalke: the eare at firſt is greene, and ſhewes yellowiſh little flowers in Auguſt.

12 This other Graſſe which *Lobell* in the quoted place figures and deſcribes by the name of *Gramen Scoparium Iſchæmi panniculis Gallicum*, hath rootes ſome cubit long, ſlender, and very ſtiffe, (for of theſe are made the head bruſhes which are vulgarly vſed) the ſtraw is ſlender, and ſome cubit high, being heere and there ioynted like to other Graſſes: the top hath foure or fiue eares ſtanding after the manner of Cocks foot Graſſe, whereof it is a kinde. It growes naturally about Orleance, and may be called in Engliſh, Bruſh-graſſe. ‡

Chap.

CHAP. 23. *Of Cotton Graſſe.*

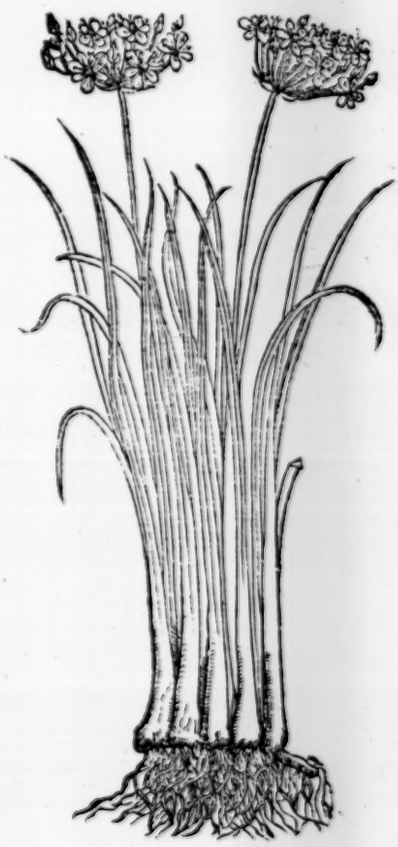
¶ *The deſcription.*

1 THis ſtrange Cotton graſſe, which *L'Obelius* hath comprehended vnder the kindes of Ruſhes; notwithſtanding that it may paſſe with the Ruſhes, yet I finde in mine owne experience, that it doth rather reſemble graſſe than ruſhes, and may indifferently be taken for either, for that it doth participate of both. The ſtalke is ſmall and ruſhy, garniſhed with many graſſy leaues alongſt the ſame, bearing at the top a buſh or tuft of moſt pleaſant downe or cotton like vnto the moſt fine and ſoft white ſilke. The root is very tough, ſmall and threddy.

2 This Water Gladiole, or graſſy Ruſh, of all others is the faireſt and moſt pleaſant to behold, and ſerueth very well for the decking and trimming vp of houſes, becauſe of the beauty and brauerie thereof: conſiſting of ſundry ſmall leaues, of a white colour mixed with carnation, growing at the top of a bare and naked ſtalke, fiue or ſix foot long, and ſometime more. The leaues are long and flaggy, not much vnlike the common reed. The root is threddy, and not long.

1 *Gramen Tomentarium.*
Cotton Graſſe.

2 *Gladiolus paluſtris Cordi.*
Water Gladiole.



¶ *The place and time.*

1 Cotton graſſe groweth vpon bogs and ſuch like mooriſh places, and it is to be ſeene vpon the bogs on Hampſted heath. It groweth likewiſe in Highgate parke neere London.

2 Water Gladiole groweth in ſtanding pooles, motes, and water ditches. I found it in great plenty being in company with a Worſhipfull Gentleman Maſter *Robert Wilbraham*, at a Village fifteene miles from London called Buſhey. It groweth likewiſe neere Redriffe by London, and many other places: the ſeaſon anſwereth all others.

¶ *The names.*

1 *Gramen Tomentoſum* is called likewiſe *Iuncus bombicinus*: of *Cordus*, *Linum pratenſe*, and *Gnaphalium Hieronymi Bockij*. In Engliſh Cotton graſſe.

2 Water Gladiole is called of *L' Obelius*, *Iuncus Cyperoides floridus paludoſus*, Flowring Cypreſſe Ruſh : *Iuncus*, for that his ſtalke is like the ruſh : *Cyperoides*, becauſe his leaues reſemble *Cyperus* : *Floridus*, becauſe it hath on the top of euery ſtalke a fine vmble or tuft of ſmall flowers, in faſhion of the Lilly of Alexandria, the which it is very like, and therefore I had rather call it Lilly graſſe.

The nature and vertues.

A *Cordus* ſaith, That *Iuncus bombicinus* ſodden in wine, and ſo taken, helpeth the throwes and gripings of the belly, that women haue in their childing.

There be alſo ſundry kinds of Graſſes wholly vnknowne, or at the leaſt not remembred of the old Writers, whereof ſome few are touched in name onely by the late and new Writers : now for as much as they haue onely named them, I will referre the better conſideration of them to the induſtrie and diligence of painefull ſearchers of nature, and proſecute my purpoſed labour, to vnfold the diuers ſorts and manifold kindes of *Cyperus*, Flags, and Ruſhes : and becauſe that there is added vnto many of the Graſſes before mentioned, this difference, *Cyperoides*, that is to ſay, reſembling *Cyperus*, I thought it therefore expedient to ioyne next vnto the hiſtory of graſſes, the diſcourſe of *Cyperus*, and his kindes, which are as follow.

Chap. 24. *Of Engliſh Galingale.*

1 *Cyperus longus.*
Engliſh Galingale

2 *Cyperus rotundus vulgaris.*
Round Galingale.

¶ *The deſcription.*

1 ENgliſh Galingale hath leaues like vnto the common Reed, but leſſer and ſhorter. His ſtalke is three ſquare, two cubits high : vpon whoſe top ſtand ſundry branches, euery little branch bearing many ſmall chaffy ſpikes. The root is blacke and very long, creeping hither and thither, occupying much ground by reaſon of his ſpreading : it is of a moſt ſweet and pleaſant ſmell when it is broken.

2 The

2 The common round *Cyperus* is like the former in leaues and tops, but the roots are here and there knotty and round, and not altogether ſo well ſmelling as the former.

‡ 3 There is alſo another *Cyperus* which growes in Syria and Ægypt, whoſe roots are round, blackiſh, and large, many hanging vpon one ſtring, and hauing a quicke and aromaticke ſmell: the leaues and ſpokyn-tufts reſemble the former.

4 There is ſaid to be another kinde of this laſt deſcribed, which is leſſer, and the roots are blacker, and it growes in Creet, now called Candy.

5 There is alſo another round *Cyperus* which growes about ditches and the bankes of Riuers whereas the ſalt water ſometimes comes: the roots of this are hard and blacke without ſmell, many hanging ſometimes vpon one ſtring: the ſtalke and leaues are much like the former, but the heads vnlike, for they are rough and blackiſh, about the bigneſſe of a filbert, and hang ſome ſix or ſeuen at the top of the ſtalke. It floures in Iuly and Auguſt. ‡

¶ *The place and time.*

1 2 The firſt and ſecond of theſe grow naturally in fenny grounds, yet will they proſper exceedingly in gardens, as experience hath taught vs.

3 4 The former of theſe growes naturally in Syria and Ægypt, the later in Candy.

5 This growes plentifully in the Mariſhes below Graueſend, in Shipey, Tenet, and other places.

¶ *The name in generall.*

Cyperus is called in Greeke, Κύπειρος, or Κύπερος: of the Latines as well *Cypirus* as *Cyperus*: of ſome *Iuncus quadratus*: of *Pliny Iuncus Anguloſus*, and *Triangularis*: of others *Aſphalathum* and *Eryſiſceptron*: in French *Souchet*: in Dutch **Galgan**: in Spaniſh *Iunco odoroſa*: By vs *Cyperus* and Engliſh Galangall.

‡ ¶ *The names in particular.*

1 This is called *Cyperus longus*, and *Cyperus longus Oderatior*: in Engliſh, Common *Cyperus*, and Engliſh Gallingall. 2 This is called *Cyperus rotundus vulgaris*, Round Engliſh Galangall. 3 *Cyperus rotundus Cyriacus*, or *Ægyptiacus*, Syrian or Ægyptian round *Cyperus*. 4 *Cyperus minor Creticus*, Candy round *Cyperus*. 5 *Cyperus rotundus inodorus Littoreus*, Round Salt-marſh *Cyperus*, or Galingale. ‡

¶ *The nature.*

Dioſcorides ſaith, That *Cyperus* hath an heating qualitie. *Galen* ſaith, The roots are moſt effectual in medicine, and are of an heating and drying qualitie: and ſome doe reckon it to be hot and dry in the ſecond degree.

¶ *The vertues.*

It maketh a moſt profitable drinke to breake and expell grauell, and helpeth the dropſie. A

If it be boyled in wine, and drunke, it prouoketh vrine, driueth forth the ſtone, and bringeth downe the naturall ſickneſſe of women. B

The ſame taken as aforeſaid, is a remedie againſt the ſtinging and poyſon of Serpents. C

Fernelius ſaith, The root of *Cyperus* vſed in Baths helpeth the coldneſſe and ſtopping of the matrix, and prouoketh the termes. D

He writeth alſo, that it increaſeth bloud by warming the body, and maketh good digeſtion; wonderfully refreſhing the ſpirits, and exhilarating the minde, comforting the ſenſes, and encreaſing their liuelineſſe, reſtoring the colour decayed, and making a ſweet breath. E

The powder of *Cyperus* doth not onely dry vp all moiſt vlcers either of the mouth, priuy members, and fundament, but ſtayeth the humor and healeth them, though they be maligne and virulent, according to the iudgement of *Fernelius*. F

5 *Cyperus rotundus littoreus.*
Round Salt-marſh *Cyperus.*

‡ Chap. 25. *Of Italian Traſi, or Spaniſh Galingale.*

1 *Cyperus Eſculentus ſine Caule & flore.*
Italian Traſi, or Spaniſh Galingall, without ſtalke and floure.

2 *Cyperus Eſculentus, ſiue Traſi Italorum.*
Italian Traſi, or Spaniſh Galingall.

‡ 1 THe Italian Traſi, which is here termed Spaniſh Galingale, is a plant that hath many ſmall roots, hanging at ſtringy fibers like as our ordinary Dropwort roots do, but they are of the bigneſſe of a little Medlar, and haue one end flat and as it were crowned like as a Medlar, and it hath alſo ſundry ſtreakes or lines, ſeeming to diuide it into ſeueral parts; it is of a browniſh colour without, and white within; the taſte thereof is ſweet almoſt like a Cheſnut. The leaues are very like thoſe of the garden *Cyperus*, and neuer exceed a cubit in length. Stalkes, flowers, or ſeed it hath none, as *Iohn Pona* an Apothecary of Verona, who diligently obſerued it nigh to that city whereas it naturally growes, affirmes; but he ſaith there growes with it much wild *Cyperus*, which as he judges hath giuen occaſion of their error who giue it the ſtalkes and flowers of *Cyperus*, or Engliſh Galingale, as *Matthiolus* and others haue done. It is encreaſed by ſetting the roots firſt ſteeped in water, at the beginning of Nouember. I haue here giuen you the figure of it without the ſtalke, according to *Pona*, and with the ſtalke, according to *Matthiolus* and others.

¶ *The names.*

The Italian Traſi is called in Greeke by *Theophraſtus* Μαλακὸς Σῦτος, *Hiſt. plant. 4. cap. 10.* as *Fabius Columna* hath proued at large: *Pliny* termes it *Anthalium*: the later writers *Cyperus Eſculentus*, and *Dulcichinum*: The Italians, *Traſi*, and *Dolzolini*, by which names in Italy they are cryed vp and downe the ſtreets, as Oranges and Lemmons are here.

¶ *The temper and vertues.*

A The milke or creame of theſe Bulbous rootes being drunke, mundifies the breſt and lungs, wherefore it is very good for ſuch as are troubled with coughs. Now you muſt beat theſe roots, and macerate them in broth, and then preſſe out the creame through a linnen cloath, which by ſome late Writers is commended alſo to be vſed in venereous potions.

B The ſame creame is alſo good to be drunke againſt the heate and ſharpneſſe of the vrine, eſpecially if you in making it do adde thereto the ſeeds of Pompions, Gourds, and Cucumbers. The Citiſens of Verona eate them for dainties, but they are ſomewhat windy. ‡

Chap.

‡ CHAP. 26. *Of the true Galingale, the greater and the leſſer.*

‡ 1 *Galanga major.*
The greater Galingale.

‡ 2 *Galanga minor.*
The leſſer Galingale.

THe affinitie of name and nature hath induced me in this place to inſert theſe two, the bigger and the leſſer Galingale; firſt therefore of the greater.

¶ *The deſcription.*

1 The great Galingale, whoſe root onely is in vſe, and brought to vs from Iava in the Eaſt Indies, hath flaggy leaues ſome two cubits high, like theſe of Catſ-taile or Reed-mace: the root is thicke and knotty, reſembling thoſe of our ordinary flagges, but that they are of a more whitiſh colour on the inſide, and not ſo large. Their taſt is very hot and biting, and they are ſomwhat reddiſh on the outſide.

2 The leſſer growing in China, and commonly in ſhops called Galingale, without any addition, is a ſmall root of a browniſh red colour both within and without; the taſte is hot and biting, the ſmell aromaticall, the leaues (if we may beleeue *Garcias ab Horto*) are like thoſe of Myrtles.

¶ *The names.*

1 The firſt is called by *Matthiolus*, *Lobell*, and others, *Galanga major*. Some thinke it to be the *Acorus* of the Ancients: and *Pena* and *Lobell* in their *Stirp. Aduerſ.* queſtion whither it be not the *Acorus Galaticus* of *Dioſcorides*. But howſoeuer, it is the *Acorus* of the ſhops, and by many vſed in Mithridate in ſtead of the true. The Indians call it *Lancuaz*.

2 The leſſer is called *Galanga*, and *Galanga minor*, to diſtinguiſh it from the precedent. The Chinois call it *Lauandon*: the Indians *Lancuaz*: we in England terme it Galingale, without any addition.

¶ *Their temper and vertue.*

Theſe roots are hot and dry in the third degree, but the leſſer are ſomewhat the hotter.

They ſtrengthen the ſtomacke, and mitigate the paines thereof ariſing from cold and flatu- A
lencies.

The ſmell, eſpecially of the leſſer, comforts the too cold braine; the ſubſtance thereof being B
chewed ſweetens the breath. It is good alſo againſt the beating of the heart.

They are vſefull againſt the Collicke proceeding of flatulencies, and the flatulent affects of C
the wombe; they conduce to venery, and heate the too cold reines. To conclude, they are good againſt all cold diſeaſes. ‡

‡ CHAP. 27. *Of Turmericke.*

THis alſo challengeth the next place, as belonging to this Tribe, according to *Dioſcorides*; yet the root, which onely is brought vs, and in vſe, doth more on the outſide reſemble Ginger, but that it is yellower, and not ſo flat, but rounder. The inſide thereof is of a Saffron colour, the taſte hot and bitteriſh; it is ſaid to haue leaues larger than thoſe of Millet, and a leafie ſtalke. There is ſome varietie of theſe roots, for ſome are longer, and others rounder, and the later are the hotter, and they are brought ouer oft times together with Ginger.

¶ *The place.*

It growes naturally in the Eaſt-Indies about Calecut, as alſo at Goa.

¶ *The names.*

This without doubt is the *Cyperus Indicus* of *Dioſcorides*, *Lib.* 1. *Cap.* 4. It is now vulgarly by

moſt Writers, and in ſhops, called by the name of *Terra merita*, and *Curcuma*: yet ſome terme it *Crocus Indicus*, and we in Engliſh call it Turmericke.

¶ *The temperature and vertues.*

A This root is certainly hot in the third degree, and hath a qualitie to open obſtructions, and it is vſed with good ſucceſſe in medicines againſt the yellow Iaundiſe, and againſt the cold diſtempers of the liuer and ſpleene.

Chap. 28. *Of Zedoarie.*

‡ Zedoarie is alſo a root growing naturally in the woods of Malavar about Calecut and Cananor in the Indies; the leaues thereof are larger than Ginger, and much like them; the root is alſo as large, but conſiſting of parts of different figures, ſome long and ſmall, others round; their colour is white, and oft times browniſh on the inſide, and they haue many fibers comming out of them, but they are taken away together with the outward rinde before they come to vs. Theſe roots haue a ſtrong medicine-like ſmell, and ſomewhat an vngratefull taſte.

‡ *Zerumbeth, ſiue Zedoaria rotunda.* Round Zedoarie.

¶ *The names.*

Some call the long parts of theſe roots *Zedoaria*, and the round (whoſe figure we here giue you) *Zerumbeth*, and make them different, whenas indeed they are but parts of the ſame root, as *Lobell* and others haue well obſerued. Some make *Zedoaria* and *Zerumbeth* different, as *Auicen*: others confound them and make them one, as *Rhaſes* and *Serapio*. Some thinke it to be Ἀμάῤῥη of Ægineta: but that is not ſo; for he ſaith, ἀπὸ φύσεως ἔχει, ὅσων ἕνεκα μάλιστα μίγνυται; It is an Aromaticke, and therefore chiefely mixed in ointments: which is as much as if he ſhould haue ſaid, That it was put into ointments for the ſmells ſake, which in this is no wayes gratefull, but rather the contrarie.

¶ *The temperature and vertues.*

A It is hot and dry in the ſecond degree; it diſcuſſes flatulencies, and fattens by a certaine hidden qualitie. It alſo diſſipates and amends the vngratefull ſmell which Garlicke, Onions, or too much wine infect the breath withall, if it be eaten after them. It cures the bites and ſtings of venomous creatures, ſtops laskes, reſolues the Abſceſſes of the wombe, ſtayes vomiting, helpes the Collicke, as alſo the paine of the ſtomacke.

B It kills all ſorts of wormes, and is much vſed in Antidotes againſt the plague, and ſuch like contagious diſeaſes. ‡

Chap. 29. *Of Ruſhes.*

‡ I Do not here intend to trouble you with an accurate diſtinction and enumeration of Ruſhes; for if I ſhould, it would be tedious to you, laborious to me, and beneficiall to neither. Therefore I will onely deſcribe and reckon vp the chiefe and more note-worthy of them, beginning with the moſt vſuall and common. ‡

¶ *The deſcription.*

1 The roots of our common Ruſhes are long and hairy, ſpreading largely in the ground, from which, as from one entire tuft, proceed a great company of ſmall ruſhes; ſo exceedingly well knowne, that I ſhall not need to ſpend much time about the deſcription thereof.

2 There be ſundry ſorts of Ruſhes beſides the former, whoſe pictures are not here expreſt, and the rather, for that the generall deſcription of Ruſhes, as alſo their common vſe and ſeruice, are ſufficient to leade vs to the knowledge of them. This great Water-Graſſe or Bul-Ruſh, in ſtead of leaues bringeth forth many ſtrait twiggie ſhoots or ſprings, which be round, ſmooth, ſharpe pointed, and without knots. Their tuft or flower breaketh forth a little beneath the top, vpon the one ſide of the Ruſh, growing vpon little ſhort ſtems like Grape cluſters, wherein is contained the ſeed after the faſhion of a ſpeares point. The roots be ſlender and full of ſtrings. *Pliny*, and *Theophraſtus* before him, affirme that the roots of the Ruſh do die euery yeare, and that it groweth

it groweth againe of the ſeed. And they affirme likewiſe that the male is barren, and groweth againe of the yong ſhoots; yet I could neuer obſerue any ſuch thing.

‡ 3 There growes a Ruſh to the thicknes of a Reed, and to ſome two yards and an halfe, or three yards high, in diuers fenny grounds in this kingdome; it is very porous and light, and they vſually make mats, and bottom chaires therewith. The ſeeds are contained in reddiſh tufts, breaking out at the top thereof. The roots are large and ioynted, and it grows not vnleſſe in waters. ‡

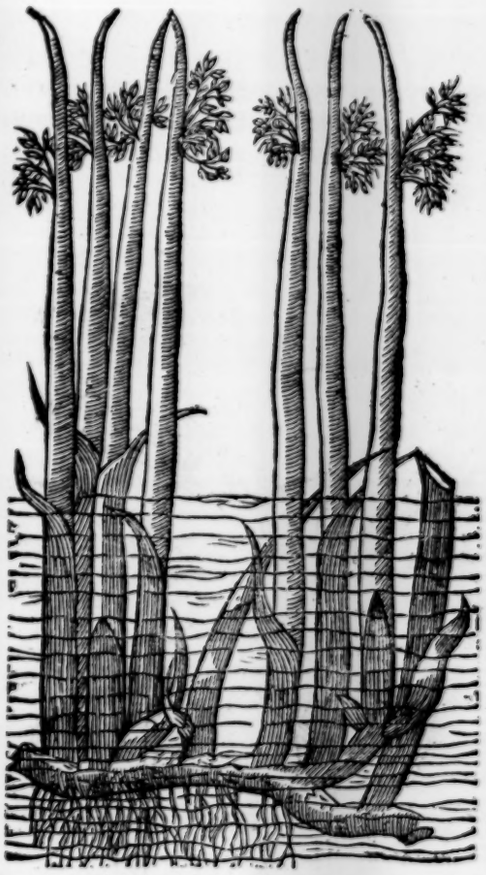
4 *Iuncus acutus*, or the ſharpe Ruſh, is likewiſe common and well knowne; not much differing from *Iuncus læuis*, but harder, rougher, and ſharper pointed, fitter to ſtraw houſes and chambers than any of the reſt; for the others are ſo ſoft and pithy, that they turne to duſt and filth with much treading; where contrariwiſe this ruſh is ſo hard that it will laſt ſound much longer.

‡ 5 There is alſo another pretty ſmall kinde of Ruſh growing to ſome foot in heigth, hauing ſmooth ſtalkes which end in a head like to that of the ordinary Horſe-taile. This ruſh hath alſo one little ioynt towards the bottome thereof. It growes in watery places, but not ſo frequently as the former. ‡

1 *Iuncus læuis.* Common Ruſhes.

4 *Iuncus acutus.* Sharpe Ruſh, or hard Ruſh.

3 *Iuncus aquaticus maximus.* Great Water-Ruſh, or Bul-Ruſh.



¶ *The place.*

1 *Iuncus læuis* groweth in fertile fields, and meadowes that are ſomewhat moiſt.

2 3 5 Grow in ſtanding pooles, and by riuers ſides in ſundry places.

4 *Iuncus acutus* groweth vpon dry and barren grounds, eſpecially neere the furrows of plowed land. I need not ſpeake of their time of growing, they being ſo common as they are.

¶ *The names.*

The Ruſh is called in Greeke σχοῖνος: in Latine *Iuncus*: in high Dutch **Binken**: in low Dutch **Bieſen**: in Italian *Giunco*: in Spaniſh *Iunco*: in French *Ionc*: in Engliſh Ruſhes.

2 3 The Grecians haue called the Bull-Ruſh ὀξυσχοῖνος. The greater are commonly in many places termed Bumbles.

1 *Iuncus læuis* is that Ruſh which *Dioſcorides* called σχοῖνος λεῖος.

4 *Iuncus acutus* is called in Greeke ὀξυσχοῖνος: In Dutch **Pleren Bieſen.**

5 This is called by *Lobell*, *Iuncus aquaticus minor Capitulis Equiſeti*: By *Daleſchampius*, *Iuncus clauatus*, or Club-Ruſh.

¶ *The*

¶ *The nature and vertues.*

Theſe Ruſhes are of a dry nature.

A The ſeed of Ruſhes dried at the fire, and drunke with wine alayed with water, ſtayeth the laske and the ouermuch flowing of womens termes.

B *Galen* yeeldeth this reaſon thereof, becauſe that their temperature conſiſteth of an earthy eſſence, moderately cold and watery, and meanly hot, and therefore doth the more eaſily drie vp the lower parts, and by little and little ſend vp the cold humours to the head, whereby it prouoketh drowſineſſe and deſire to ſleepe, but cauſeth the head-ache; whereof *Galen* yeeldeth the reaſon as before.

C The tender leaues that be next the root make a conuenient ointment againſt the bitings of the Spider called *Phalangium*.

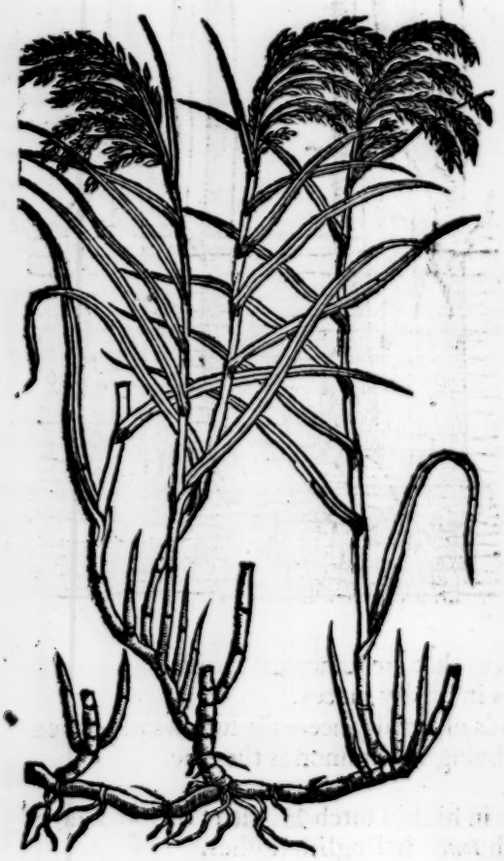
D The ſeed of the Bull-Ruſh is moſt ſoporiferous, and therefore the greater care muſt be had in the adminiſtration thereof, leſt in prouoking ſleepe you induce a drowſineſſe or dead ſleepe.

Chap. 30. *Of Reeds.*

¶ *The kindes.*

OF Reeds the Ancients haue ſet downe many ſorts. *Theophraſtus* hath brought them all firſt into two principall kindes, and thoſe hath he diuided againe into moe ſorts. The two principall are theſe, *Auleticæ*, or *Tibiales Arundines*, and *Arundo vallatoria*. Of theſe and the reſt we will ſpeake in their proper places.

1 *Arundo vallatoria.*
Common Reed.



2 *Arundo Cypria.*
Cypreſſe Canes.

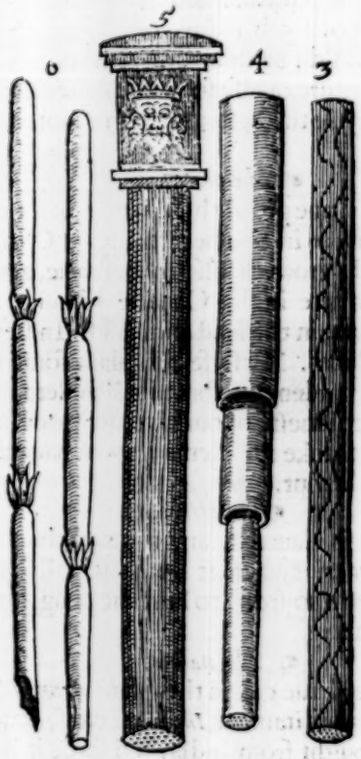
¶ *The deſcription.*

1 THe common Reed hath long ſtrawie ſtalkes full of knotty joints or knees like vnto corne, whereupon do grow very long rough flaggy leaues. The tuft or ſpoky eare doth grow at the top of the ſtalkes, browne of colour, barren and without ſeed, and doth reſemble a buſh of feathers, which turneth into fine downe or cotton which is carried away with the winde. The root is thicke, long, and full of ſtrings, diſperſing themſelues farre abroad, whereby

whereby it doth greatly increaſe. ‡ *Bauhinus* reports, That he receiued from D. *Cargill* a Scottiſh-man a Reed whoſe leaues were a cubit long, and two or three inches broad, with ſome nerues apparantly running alongſt the leafe; theſe leaues at the top were diuided into two, three, or foure points or parts; as yet I haue not obſerued it. *Bauhine* termes it *Arundo Anglica folijs in ſummitate diſſectis.* ‡

1 The Cypreſſe Reed is a great Reed hauing ſtalkes exceeding long, ſometimes twenty or thirty foot high, of a woody ſubſtance, ſet with very great leaues like thoſe of Turky wheate. It carrieth at the top the like downie tuft that the former doth.

3 *Arundo farcta.*
Stuffed Canes.
4 *Calamus ſagittalis Lobelij.*
Small ſtuffed Reed.
5 *Naſtos Cluſij.*
Turky walking ſtaues.
6 *Arundo ſcriptoria.*
Turky writing Reeds.



3 Theſe Reeds *Lobelius* hath ſeene in the Low countries brought from Conſtantinople, where, as it is ſaid, the people of that countrey haue procured them from the parts of the Adriaticke ſea ſide where they do grow. They are full ſtuft with a ſpongeous ſubſtance, ſo that there is no hollowneſſe in the ſame, as in Canes & other Reeds, except here and there certaine ſmall pores or paſſages of the bigneſſe of a pinnes point; in manner ſuch a pith as is to be found in the Bull-Ruſh, but more firme and ſolid.

4 The ſecond differeth in ſmalneſſe, and that it will winde open in ſleakes, otherwiſe they are very like, and are vſed for darts, arrowes, and ſuch like.

5 This great ſort of Reeds or Canes hath no particular deſcription to anſwer your expectation, for that as yet there is not any man which hath written thereof, eſpecially of the manner of growing of them, either of his owne knowledge or report from others: ſo that it ſhall ſuffice that yee know that that great cane is vſed eſpecially in Conſtantinople and thereabout, of aged and wealthy Citiſens, and alſo Noblemen and ſuch great perſonages, to make them walking ſtaues of, caruing them at the top with ſundry Scutchions, and pretty toyes of imagerie for the beautifying of them; and ſo they of the better ſort do garniſh them both with ſiluer and gold, as the figure doth moſt liuely ſet forth vnto you.

6 In like manner the ſmaller ſort hath not as yet beene ſeene growing of any that haue beene curious in herbariſme, whereby they might ſet downe any certaintie thereof; onely it hath beene vſed in Conſtantinople and thereabout, euen to this day, to make writing pens withall, for the which it doth very fitly ſerue, as alſo to make pipes, and ſuch like things of pleaſure.

¶ *The place.*

The common Reed groweth in ſtanding waters and in the edges and borders of riuers almoſt euery where: and the other being the angling Cane for Fiſhers groweth in Spaine and thoſe hot Regions.

¶ *The time.*

They flouriſh and flower from April to the end of September, at what time they are cut down for the vſe of man, as all do know.

¶ *The names.*

The common Reed is called *Arundo* and *Harundo vallatoria*: in French *Roſeau*: in Dutch **Riet**: in Italian *Canne a far ſiepo*: of *Dioſc. Phragmitis*: in Engliſh, Reed.

Arundo Cypria, or after *Lobelius*, *Arundo Donax*: in French *Canne*: in Spaniſh *Cana*: in Italian, *Calami a far Connochia*: In Engliſh, Pole reed, and Cane, or Canes.

¶ *The nature.*

Reeds are hot and dry in the ſecond degree, as *Galen* ſaith.

¶ *The vertues.*

The roots of reed ſtamped ſmal draw forth thorns and ſplinters fixed in any part of mans body. A
The ſame ſtamped with vineger eaſe all luxations and members out of ioynt. B
And likewiſe ſtamped they heale hot and ſharpe inflammations. The aſhes of them mixed with vineger helpeth the ſcales and ſcurfe of the head, and helpeth the falling of the haire. C

The

D The great Reed or Cane is not vſed in phyſicke, but is eſteemed to make ſlears for Weauers, ſundry ſorts of pipes, as alſo to light candles that ſtand before Images, and to make hedges and pales, as we do of laths and ſuch like; and alſo to make certaine diuiſions in ſhips to diuide the ſweet oranges from the ſowre, the pomecitron and lemmons likewiſe in ſunder, and many other purpoſes.

Chap. 31. *Of Sugar Cane.*

¶ *The deſcription.*

1 Sugar Cane is a pleaſant and profitable Reed, hauing long ſtalkes ſeuen or eight foot high, ioynted or kneed like vnto the great Cane; the leaues come forth of euerie joynt on euery ſide of the ſtalke one, like vnto wings, long, narrow, and ſharpe pointed. The Cane it ſelfe, or ſtalke is not hollow as other Canes or Reeds are, but full, and ſtuffed with a ſpongeous ſubſtance in taſte exceeding ſweet. The root is great and long, creeping along within the vpper cruſt of the earth, which is likewiſe ſweet and pleaſant, but leſſe hard or woody than other Canes or Reeds; from the which there doth ſhoot forth many yong ſiens, which are cut away from the maine or mother plant, becauſe they ſhould not draw away the nouriſhment from the old ſtocke, and ſo get vnto themſelues a little moiſture, or elſe ſome ſubſtance not much worth, and cauſe the ſtocke to be barren, and themſelues little the better; which ſhoots do ſerue for plants to ſet abroad for encreaſe.

Arundo Saccharina.
Sugar Cane.

A

¶ *The place.*

The Sugar Cane groweth in many parts of Europe at this day, as in Spaine, Portugal, Olbia, and in Prouence. It groweth alſo in Barbarie, generally almoſt euery where in the Canarie Iſlands, and in thoſe of Madera, in the Eaſt and Weſt Indies, and many other places. My ſelfe did plant ſome ſhoots thereof in my garden, and ſome in Flanders did the like: but the coldneſſe of our clymate made an end of mine, and I thinke the Flemings will haue the like profit of their labour.

¶ *The time.*

This Cane is planted at any time of the yeare in thoſe hot countries where it doth naturally grow, by reaſon they feare no froſts to hurt the yong ſhoots at their firſt planting.

¶ *The names.*

The Latines haue called this plant *Arundo Saccharina*, with this additament, *Indica*, becauſe it was firſt knowne or brought from India. Of ſome it is called *Calamus Saccharatus*: in Engliſh Sugar Cane: in Dutch **Suyckerriedt.**

¶ *The nature and vertues.*

The Sugar or iuice of this Reed is of a temperate qualitie; it drieth and cleanſeth the ſtomacke, maketh ſmooth the roughneſſe of the breſt and lungs, cleareth the voice, and putteth away hoarſeneſſe, the cough, and all ſoureneſſe and bitterneſſe, as *Iſaac* ſaith in *Dictis*.

¶ *The vſe.*

Of the iuyce of this Reed is made the moſt pleaſant and profitable ſweet, called Sugar, whereof is made infinite confections, confectures, ſyrups, and ſuch like, as alſo preſeruing and conſeruing of ſundry fruits, herbes, and flowers, as Roſes, Violets, Roſemary flowers, and ſuch like, which ſtill retaine with them the name of Sugar, as Sugar Roſet, Sugar violet, &c. The which to write of would require a peculiar volume, and not pertinent vnto this hiſtorie, for that it is not my purpoſe to make of my booke a Confectionarie, a Sugar Bakers furnace, a Gentlewomans preſeruing pan, nor yet an Apothecaries ſhop or Diſpenſatorie; but onely to touch the chiefeſt matter that I purpoſed to handle in the beginning, that is, the nature, properties, and deſcriptions of plants. Notwithſtanding I thinke it not amiſſe to ſhew vnto you the ordering of theſe reeds when

when they be new gathered, as I receiued it from the mouth of an Indian my ſeruant: he ſaith, They cut them in ſmall pieces, and put them into a trough made of one whole tree, wherein they put a great ſtone in manner of a mill-ſtone, whereunto they tie a horſe, buffle, or ſome other beaſt which draweth it round: in which trough they put thoſe pieces of Canes, and ſo cruſh and grind them as we do the barkes of trees for Tanners, or apples for Cyder. But in ſome places they vſe a great wheele, wherein ſlaues do tread and walke as dogs do in turning the ſpit: and ſome others do feed as it were the bottome of the ſaid wheele, wherein are ſome ſharpe or hard things which do cut and cruſh the Canes into powder. And ſome likewiſe haue found the inuention to turne the wheele with water workes, as we do our iron mills. The Canes being thus brought into duſt or powder, they put them into great cauldrons with a little water, where they boyle vntill there be no more ſweetneſſe left in the cruſhed reeds. Then doe they ſtraine them through mats and ſuch like things, and put the liquor to boyle againe vnto the conſiſtence of honey, which being cold is like vnto ſand both in ſhew and handling, but ſomewhat ſofter; and ſo afterward it is carried into all parts of Europe, where it is by the Sugar Bakers artificially purged and refined to that whiteneſſe as we ſee.

CHAP. 32. *Of Flowring Reed.*

Arundo florida.
Flowring Reed.

¶ *The deſcription.*

FLouriſhing Reed hath a thicke and fat ſtalke of foure or fiue foot high, great below neere the ground, and ſmaller toward the top, taper-wiſe: whereupon do grow very faire broad leaues ful of ribs or ſinewes like vnto Plantaine, in ſhape repreſenting the leaues of white Hellebor, or the great Gentian, but much broader and larger euery way: at the top of which ſtalkes do grow phantaſticke flowers of a red or vermilion colour; which being faded, there follow round, rough, and prickly knobs, like thoſe of *Sparganium*, or water-Burre, of a browne colour, and from the middle of thoſe knobs three ſmall leaues. The ſeed contained in thoſe knobs is exceeding black, of a perfect roundneſſe, of the bigneſſe of the ſmalleſt peaſe. The root is thicke, knobby, and tuberous, with certain ſmall threds fixed thereto. ‡ There is a variety of this, hauing floures of a yellow or Saffron colour, with red ſpots. ‡

¶ *The place.*

It groweth in Italy in the garden of Padua, and many other places of thoſe hot regions. My ſelfe haue planted it in my garden diuers times, but it neuer came to flowring or ſeeding, for that it is very impatient to endure the injurie of our cold clymate. It is a natiue of the Weſt Indies.

¶ *The time.*

It muſt be ſet or ſowen in the beginning of Aprill, in a pot with fine earth, or in a bed made with horſe-dung, and ſome earth ſtrawed thereon, in ſuch manner as Cucumbers and Muske-Melons are.

¶ *The names.*

The name *Arundo Indica* is diuerſly attributed to ſundrie of the Reeds, but principally vnto this, called of *Lobelius, Cannacorus*: of others, *Arundo florida*, and *Harundo florida*: in Engliſh, the Flowring Reed.

¶ *The nature and vertues.*

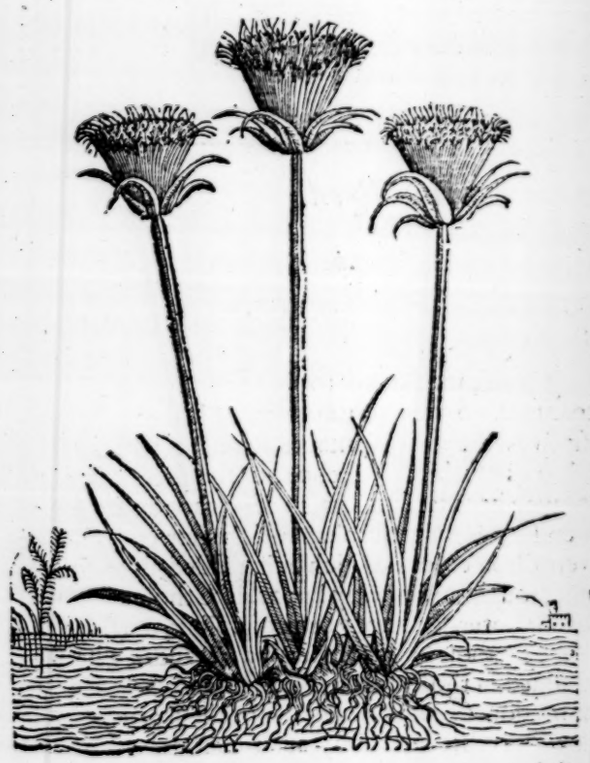
There is not any thing ſet downe as touching the temperature and vertues of this Flouriſhing Reed, either of the Ancients, or of the new or later Writers.

CHAP.

Chap. 33. *Of Paper Reed.*

PAper Reed hath many large flaggie leaues ſomewhat triangular and ſmooth, not much vnlike thoſe of Catſ-taile, riſing immediatly from a tuft of roots compact of many ſtrings, among ſt the which it ſhooteth vp two or three naked ſtalkes, ſquare, and riſing ſome ſix or ſeuen cubits high aboue the water; at the top whereof there ſtands a tuft or bundle of chaffie threds ſet in comely order, reſembling a tuft of flowers, but barren and void of ſeed.

Papyrus Nilotica.
Paper Reed.



A

¶ *The place.*

This kinde of Reed growes in the Riuers about Babylon, and neere the city Alcaire, in the riuer Nilus, and ſuch other places of thoſe countries.

¶ *The time.*

The time of ſpringing and flouriſhing anſwereth that of the common Reed.

¶ *The names.*

This kinde of Reed which I haue Engliſhed Paper Reed, or Paper plant, is the ſame (as I do reade) that Paper was made of in Ægypt, before the inuention of paper made of linnen clouts was found out. It is thought by men of great learning and vnderſtanding in the Scriptures, and ſet downe by them for truth, that this plant is the ſame Reed mentioned in the ſecond chapter of *Exodus*; whereof was made that basket or cradle, which was dawbed within and without with ſlime of that countrey, called *Bitumen Iudaicum*, wherein *Moſes* was put being committed to the water, when *Pharaoh* gaue commandement that all the male children of the Hebrewes ſhould be drowned.

¶ *The nature, vertues, and vſe.*

The roots of Paper Reed doe nouriſh, as may appeare by the people of Ægypt, which do vſe to chew them in their mouthes, and ſwallow downe the juice, finding therein great delight and comfort.

B The aſhes burned aſſwage and conſume hard apoſtumes, tumors, and corraſiue vlcers in any part of the body, but chiefely in the mouth.

C The burnt paper made hereof doth performe thoſe effects more forcibly.

D The ſtalkes hereof haue a ſingular vſe and priuiledge in opening the chanels or hollow paſſages of a Fiſtula, being put therein; for they do ſwell as doth the pith of Elder, or a tent made of a ſponge.

E The people about Nilus do vſe to burne the leaues and ſtalkes, but eſpecially the roots.

F The frailes wherein they put Raiſins and Figs are ſometimes made hereof; but generally with the herbe *Spartum*, deſcribed in the nexr Chapter.

Chap. 34. *Of Mat-Weed.*

¶ *The kindes.*

There be diuers kindes of Mat-Weeds, as ſhall be declared in their ſeuerall deſcriptions.

¶ *The deſcription.*

THe herbe *Spartum*, as *Pliny* ſaith, growerh of it ſelfe, and ſendeth forth from the root a multitude of ſlender ruſhie leaues of a cubit high, or higher, tough and pliable, of a whitiſh colour, which in time draweth narrow together, making the flat leafe to become round, as is the Ruſh. The ſtub or ſtalke thereof beareth at the top certaine feather-like tufts comming forth

forth of a ſheath or huske, among the which chaffie huskes is contained the ſeed, long and chaffie. The root conſiſteth of many ſtrings folding one within another, by meanes whereof it commeth to the forme of a turfe or haſſocke.

1 *Spartum Plinÿ Cluſio.*
Plinies Mat-Weed.

2 *Spartum alterum Plinÿ.*
Hooded Mat-Weed.

2 The ſecond likewiſe *Pliny* deſcribeth to haue a long ſtalke not much vnlike to Reed, but leſſer, whereupon do grow many graſſie leaues, rough and pliant, hard in handling as are the Ruſhes. A ſpokie chaffie tuft groweth at the top of the ſtalke, comming forth of a hood or ſinewie ſheath, ſuch as encloſeth the flowers of Onions, Leekes, Narciſſus, and ſuch like, before they come to flowring, with ſeed and roots like the precedent.

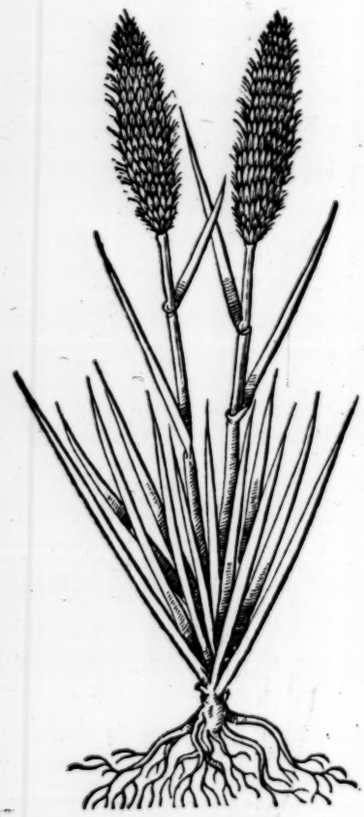
3 Engliſh Mat-weed hath a ruſhie root, deepely creeping and growing in heapes of ſand and grauell, from the which ariſe ſtiffe and ſharpe pointed leaues a foot and a halfe long, of a whitiſh colour, very much reſembling thoſe of Camels hay. The ſtalke groweth to the height of a cubit or more, whereupon doth grow a ſpike ‡ or eare of ſome fiue or ſix inches long, ſomwhat reſembling Rie; it is the thickneſſe of a finger in the midſt, and ſmaller towards both the ends. The ſeed is browne, as ſmall as Canarie ſeed, but round, and ſomewhat ſharpe at the one end ‡. Of this plant neither Sheepe nor any other Cattle will taſte or eate.

4 The other Engliſh Mat-Weed is like vnto the former, ſauing that the roots of this are long, not vnlike to Dogs Graſſe, but do not thruſt deepe into the ground, but creepe onely vnder the vpper cruſt of the earth. The tuft or eare is ſhorter, and more reſembling the head of Canary ſeed than that of Rie.

‡ 5 *Lobell* giues a figure of another ſmaller Ruſh, leaued *Spartum*, with ſmall heads, but hee hath not deſcribed it in his Latine Workes, ſo that I can ſay nothing certainly of it.

6 To this kindred muſt be added the Feathered Graſſe, though not partaking with the former in place of growth. Now it hath many ſmall leaues of a foots length round, green, and ſharp pointed, not much in forme vnlike the firſt deſcribed Mat-weed, but much leſſe: amongſt theſe leaues riſe vp many ſmall ſtalkes not exceeding the height of the leaues, which beare a ſpike vnlike the forementioned Mat-weeds, hauing 3 or foure ſeeds ending in, or ſending vp very fine white Feathers, reſembling the ſmaller ſort of feathers of the wings of the Bird of Paradiſe. The root conſiſts of many ſmall graſſie fibres.

3 *Spartum Anglicanum.*
Engliſh Mat-Weed, or Helme.



4 *Spartum Anglicanum alterum.*
Small Engliſh Mat-Weed, or Helme.

‡ 6 *Spartum Auſtriacum.*
Feather-Graſſe.

¶ *The place.*

1 2 Theſe two grow in diuers places of Spaine.

3 I being in company with M. *Tho. Hicks, William Broad,* and three other London Apothecaries beſides, in Auguſt, 1632, to finde out rare plants in the Iſland of Tenet, found this bigger Engliſh one in great plentie, as ſoone as we came to the ſea ſide, going betweene Margate and Sandwich.

4 5 Theſe it may be grow alſo vpon our Coaſts; howeuer they grow neere the ſea ſide in diuers parts of the Low-Countries.

6 This elegant Plant *Cluſius* firſt obſerued to grow naturally in the mountaines nigh to the Bathes of Baden in Germany, and in diuers places of Auſtria and Hungarie. It is nouriſhed for the beautie in ſundrie of our Engliſh gardens.

¶ *The time.*

Theſe beare their heads in the middle, and ſome in the later end of Sommer.

¶ *The names.*

1 This is called *Spartum primum Plinij*; that is, the firſt Mat-Weed deſcribed by *Pliny*: in Spaine they call it *Sparto*: the French in Prouence terme it *Olpho*.

2 This is *Spartum alterum Plinij*, *Plinie* his ſecond Mat-Weed, or Hooded Mat-weed, it is called *Albardin* in Spaine.

3 This is *Spartum tertium* of *Cluſius*, and *Gramen Sparteum ſecundum Schænanthinum* of *Taber*. Our Author

gaue

gaue *Cluſius* his figure for his firſt, and *Tabernamontanus* figure for the ſecond *Spartum Anglicanum*; but I will thinke them both of one plant (though *Bauhine* diſtinguiſh them) vntill ſome ſhall make the contrary manifeſt. This the Dutch call **Halme**; and our Engliſh in Tenet, Helme. *Turner* calls it Sea-Bent.

4 This is *Spartum herba* 4 *Batavicum* of *Cluſius*; *Gramen Sparteum*, or *Iunci Spartium* of *Tabern.* and our Author gaue *Tabern.* figure in the 23 Chapter of this Booke vnder the title of *Iuncus marinus gramineus*; *Lobell* calls it *Spartum noſtras alterum.*

5 *Lobell* calls this *Spartum noſtras parvum.*

6 *Cluſius* calls this *Spartum Auſtriacum*; *Daleſchampius*, *Gramen pinnatum*; we in England call it *Gramen plumoſum*, or Feathered Graſſe. ‡

¶ *The temperature, vertues, and vſe.*

Theſe kindes of graſſie or rather ruſhie Reed haue no vſe in phyſicke, but ſerue to make Mats, and hangings for chambers, frailes, baskets, and ſuch like. The people of the Countries where they grow do make beds of them, ſtraw their houſes and chambers in ſtead of Ruſhes, for which they do excell, as my ſelfe haue ſeene. *Turner* affirmeth, That they made hats of the Engliſh one in Northumberland in his time. A

They do likewiſe in ſundry places of the Iſlands of Madera, Canaria, Saint *Thomas*, and other of the Iſlands in the tract vnto the Weſt Indies, make of them their boots, ſhooes, Herd-mens Coats, fires, and lights. It is very hurtfull for cattell, as Sheere-graſſe is. B

The Feather-Graſſe is worne by ſundry Ladies and Gentlewomen in ſtead of a Feather, the which it exquiſitely reſembles.

CHAP. 35. *Of Camels Hay.*

1 *Scœnanthum*
Camels Hay.

2 *Scœnanthum adulterinum.*
Baſtard Camels Hay.

¶ *The deſcription.*

1 CAmels Hay hath leaues very like vnto Mat-Weed or Helme; his roots are many, in quantitie meane, full of ſmall haires or threds proceeding from the bigger Root deeply growing in the ground, hauing diuers long ſtalkes like Cyperus Graſſe, ſet

with ſome ſmaller leaues euen vnto the top, where do grow many ſmall chaffie tufts or pannicles like vnto thoſe of the wilde Oats, of a reaſonable good ſmell and ſauour, when they are broken, like vnto a Roſe, with a certaine biting and nipping of the tongue.

† 2 *Francis Penny*, of famous memory, a good Phyſitian and skilfull Herbariſt, gathered on the coaſt of the Mediterranean ſea, between Aigues Mortes and Peſcaire, this beautifull plant, whoſe roots are creeping, and ſtalkes and leaues reſemble Squinanth. The flowers are ſoft, pappous, and thicke compact, and ſome fiue or ſix inches in length, like to Fox-taile; they in colour reſemble white ſilke or ſiluer. Thus much *Lobell*. Our Author deſcribed this in the firſt place, *Ch.* 23. vnder *Iuncus Marinus Gramineus*, for ſo *Lobell* alſo calls it. †

¶ *The place.*

1 This growes in Africa, Nabathæa, and Arabia, and is a ſtranger in theſe Northerne Regions.

2 The place of the ſecond is mentioned in the deſcription.

¶ *The time.*

Their time anſwereth the other Reeds and Flags.

¶ *The names.*

1 Camels Hay is called in Greeke σχοῖνος εὐώδης: in Latine, *Iuncus odoratus*, and *Scœnanthum*: in ſhops *Squinanthum*, that is, *Flos Iunci*: in French, *Paſteur de Chammeau*: in Engliſh, Camels Hay, and Squinanth.

2 This *Lobell* calls *Iuncus marinus gramineus*, and *Pſeudoſchœnanthum*: We call it Baſtard Squinanth, and Fox-taile Squinanth.

¶ *The temper.*

This plant is indifferently hot, and a little aſtrictiue.

¶ *The vertues.*

A Camels Hay prouoketh vrine, moueth the termes, and breaketh winde about the ſtomacke.

B It cauſeth aking and heauineſſe of the head, *Galen* yeeldeth this reaſon thereof, becauſe it heateth moderately, and bindeth with tenuitie of parts.

C According to *Dioſcorides*, it diſſolues, digeſts, and opens the paſſages of the veines.

D The floures or chaffie tufts are profitable in drinke for them that piſſe bloud any wayes: It is giuen in medicines that are miniſtred to cure the paines and griefes of the guts, ſtomacke, lungs, liuer, and reines, the fulneſſe, loathſomeneſſe, and other defects of the ſtomacke, the dropſie, conuulſions, or ſhrinking of ſinews, giuen in the quantitie of a dram, with a like quantitie of Pepper, for ſome few dayes.

E The ſame boyled in wine helpeth the inflammation of the matrix, if the woman do ſit ouer the fume thereof, and bathe her ſelfe often with it alſo.

Chap. 36. *Of Burre-Reed.*

¶ *The deſcription.*

1 The firſt of theſe plants hath long leaues, which are double edged, or ſharpe on both ſides, with a ſharpe creſt in the middle, in ſuch manner raiſed vp that it ſeemeth to be triangle or three ſquare. The ſtalkes grow among the leaues, and are two or three foot long, being diuided into many branches, garniſhed with many prickly huskes or knops of the bigneſſe of a nut. The root is full of hairy ſtrings.

2 The great Water Burre differeth not in any thing from the firſt kind in roots or leaues, ſaue that the firſt hath his leaues riſing immediately from the tuft or knop of the root; but this kinde hath a long ſtalke comming from the root, whereupon, a little aboue the root, the leaues ſhoot out round about the ſtalke ſucceſſiuely, ſome leaues ſtill growing aboue others, euen to the top of the ſtalke, and from the top thereof downeward by certaine diſtances. It is garniſhed with many round wharles, or rough coronets, hauing here and there among the ſaid wharles one ſingle ſhort leafe of a pale greene colour.

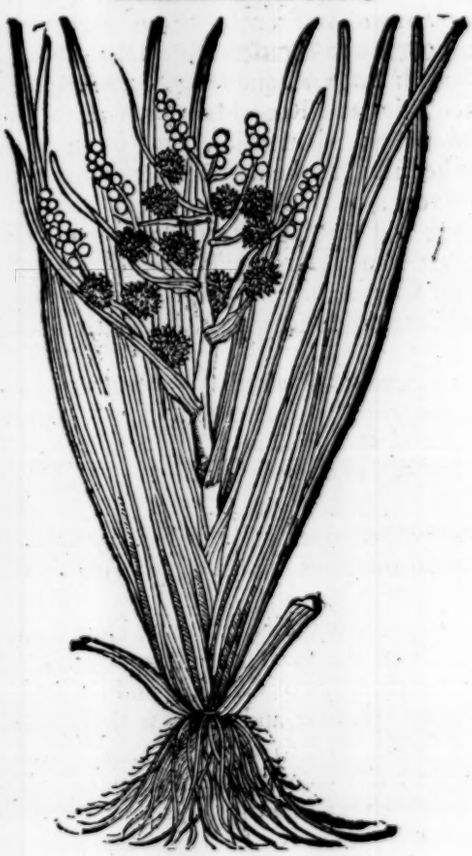
¶ *The place.*

Both theſe are very common, and grow in moiſt medowes, and neere vnto water-courſes. They plentifully grow in the fenny grounds of Lincolnſhire, and ſuch like places; in the ditches about S. *George* his fields, and in the ditch right againſt the place of execution, at the end of Southwark, called S. *Thomas* Waterings.

¶ *The time.*

They bring forth their burry bullets or ſeedy knots in Auguſt.

1 *Sparganium Ramoſum.*
Branched Burre-Reed.



2 *Sparganium latifolium.*
Great Water-Burre.

¶ *The names.*

Theſe Plants of ſome are called *Sparganium: Theophraſtus* in his fourth Booke and eighteenth Chapter calleth them *Butomus:* of ſome, *Platanaria:* I call them Burre-Reed: in the Arabian tongue they are called *Safarhe Bamon:* in Italian *Sparganio:* of *Dodoneus, Carex:* Some call the firſt *Sparganium ramoſum,* or Branched Burre-Reed. The ſecond, *Sparganium non ramoſum,* Not-branching Burre-Reed.

¶ *The temperature.*

They are cold and dry of complexion.

¶ *The vertues.*

Some write, that the knops or rough burres of theſe plants boyled in wine, are good againſt the bitings of venomous beaſts, if either it be drunke, or the wound waſhed therewith. A

CHAP. 37. *Of Cats Taile.*

¶ *The deſcription.*

CAts Taile hath long and flaggy leaues, full of a ſpongeous matter, or pith, among which leaues groweth vp a long ſmooth naked ſtalke, without knot, faſhioned like a ſpeare, of a firme or ſolid ſubſtance, hauing at the top a browne knop or eare, ſoft, thicke and ſmooth, ſeeming to be nothing elſe but a deale of flockes thicke ſet and thruſt together, which being ripe turneth into a downe, and is carried away with the winde. The Roots be hard, thicke, and white, full of ſtrings, and good to burne, where there is plenty thereof to be had.

¶ *The place.*

It groweth in pooles and ſuch like ſtanding waters, and ſometimes in running ſtreames.

I haue found a ſmaller kinde hereof growing in the ditches and marſhie grounds in the Iſle of Shepey, going from Sherland houſe to Feuerſham.

¶ *The time.*

They floure and beare their mace or torch in Iuly and Auguſt.

Typha.
Cats Taile.

A

B

¶ *The names.*

They are called in Greeke τυφη: in Latine *Typha*: of ſome *Ceſtrum Morionis*: in French *Marteau Maſſes*: in Dutch, **Liſchdoden**, and **Donſen**: In Italian *Mazza ſorda*: in Spaniſh *Behordo*, and *Iunco amacorodato*: In Engliſh, Cats Taile, and Reed-Mace. Of this Cats Taile *Ariſtophanes* maketh mention in his Comedy of Frogs, where he bringeth them forth one talking with another, being very glad that they had ſpent the whole day in skipping and leaping *inter Cyperum & Phleum*, among Galingale and Cats Taile. *Ouid* ſeemeth to name this plant *Scirpus*; for he termeth the mats made of the leaues, Catſ-taile Mats, as in his ſixth Booke *Faſtorum*,

At Dominus, diſcedite, ait, plauſtróque morantes
Suſtulit, in plauſtro ſcirpea matta fuit.

¶ *The nature.*

It is cold and dry of complexion.

¶ *The vertues.*

The ſoft Downe ſtamped with ſwines greaſe well waſhed, healeth burnings or ſcaldings with fire or water.

Some practitioners by their experience haue found, That the Downe of the Cats taile beaten with the leaues of Betony, the roots of Gladiole, and the leaues of *Hippogloſſon* into powder, and mixed with the yelks of egges hard ſodden, and ſo eaten, is a moſt perfect medicine againſt the diſeaſe in children called in Greeke εντερικὸν, which is, when the gut called *Inteſtinum cæcum* is fallen into the cods. This medicine muſt be miniſtred euery day faſting for the ſpace of thirtie dayes, the quantitie thereof to be miniſtred at one time is 1. ʒ. This being vſed as before is ſpecified doth not onely helpe children and ſtriplings, but growne men alſo, if in time of their cure they vſe conuenient ligature or truſſings, and fit conſounding plaiſters vpon the grieued place, according to art appointed for that purpoſe in Chirurgerie.

C This Downe in ſome places of the Iſle of Elie, and the low countries adioyning thereto, is gathered and well ſold to make mattreſſes of, for plowmen and poore people.

D It hath beene alſo often proued to heale kibed or humbled heeles (as they are termed) being applied to them, either before or after the skinne is broken.

Chap. 38. *Of Stitchwort.*

¶ *The deſcription.*

1 Stitchwort, or as *Ruellius* termeth it *Holoſteum*, is of two kindes, and hath round tender ſtalkes full of joints leaning toward the ground; at euery ioynt grow two leaues one againſt another. The flowers be white, conſiſting of many ſmall leaues ſet in the manner of a ſtarre. The roots are ſmall, jointed, and threddy. The ſeed is contained in ſmall heads ſomewhat long, and ſharpe at the vpper end, and when it is ripe it is very ſmall and browne.

2 The ſecond is like the former in ſhape of leaues and flowers, which are ſet in forme of a ſtarre; but the leaues are orderly placed, and in good proportion, by couples two together, being of a whitiſh colour. When the flowers be vaded then follow the ſeeds, which are incloſed in bullets like the ſeed of flax, but not ſo round. The chiues or threds in the middle of the floure are ſometimes of a reddiſh, or of a blackiſh colour. ‡ There are more differences of this plant, or rather varieties, as differing little but in the largeneſſe of the leaues, floures, or ſtalkes. ‡

¶ *The place.*

They grow in the borders of fields vpon banke ſides and hedges, almoſt euery where.

¶ *The time.*

They flouriſh all the Sommer, eſpecially in May and Iune.

¶ *The*

Gramen Leucanthemum.
Stitchwort.

¶ *The names.*

Some (as *Ruellius* for one) haue thought this to be the plant which the Grecians call ὀστεον: in Latine, *Tota oſſea:* in Engliſh, All-Bones; whereof I ſee no reaſon, except it be by the figure *Antonomia*; as when we ſay in Engliſh, He is an honeſt man, our meaning is that he is a knaue: for this is a tender herbe hauing no ſuch bony ſubſtance. ‡ *Dodonæus* queſtions, whether this plant be not *Crataogonon*; and he calls it *Gramen Leucanthemum*, or White-floured Graſſe. The qualitie here noted with B. is by *Dioſcorides* giuen to *Crataogonon*; but it is with his ἱστορεῖται δ' ὅτι, (that is) Some ſay or report ſo much: which phraſe of ſpeech hee often vſeth when as he writes faculties by heare-ſay, and doubts himſelfe of the truth of them. ‡

¶ *The nature.*

The ſeed of Stitchwort, as *Galen* writeth, is ſharpe and biting to him that taſteth it; and to him that vſeth it very like to Mill.

¶ *The vertues.*

They are wont to drinke it in Wine with the pwo- A
der of Acornes, againſt the paine in the ſide, ſtitches, and ſuch like.

Diuers report, ſaith *Dioſcorides*, That the Seed of B
Stitchwort being drunke cauſeth a woman to bring forth a man childe, if after the purgation of her Sickneſſe, before ſhe conceiue, ſhe do drinke it faſting thrice in a day, halfe a dram at a time, in three ounces of water many dayes together.

CHAP. 39. *Of Spiderwort.*

¶ *The deſcription.*

1 THe obſcure deſcription which *Dioſcorides* and *Pliny* haue ſet downe for *Phalangium*, hath bred much contention among late Writers. This plant *Phalangium* hath leaues much like Couch Graſſe, but they are ſomewhat thicker and fatter, and of a more whitiſh greene colour. The ſtalkes grow to the height of a cubit. The top of the ſtalke is beſet with ſmall branches, garniſhed with many little white flowers, compact of ſix little leaues. The threds or thrums in the middle are whitiſh, mixed with a faire yellow, which being fallen, there follow blacke ſeeds, incloſed in ſmall round knobs, which be three cornered. The roots are many, tough, and white of colour.

2 The ſecond is like the firſt, but that his ſtalke is not branched as the firſt, and floureth a moneth before the other.

3 The third kinde of Spiderwort, which *Carolus Cluſius* nameth *Aſphodelus minor*, hath a root of many threddy ſtrings, from the which immediately riſe vp graſſie leaues, narrow and ſharpe pointed: among the which come forth diuers naked ſtrait ſtalkes diuided towards the top into ſundry branches, garniſhed on euery ſide with faire ſtarre-like flowers, of colour white, with a purple veine diuiding each leafe in the middeſt: they haue alſo certaine chiues or threds in them. The ſeed followeth incloſed in three ſquare heads like vnto the kindes of Aſphodils.

‡ 4 This Spiderwort hath a root conſiſting of many thicke, long, and white fibers, not much vnlike the precedent, out of which it ſends forth ſome fiue or ſix greene and firme leaues, ſomewhat hollowed in the middle, and mutually inuoluing each other at the root: amongſt theſe there riſeth vp a round greene ſtalke, bearing at the top thereof ſome nine or ten floures, more or leſſe; theſe conſiſt of ſix leaues apiece, of colour white (the three innermoſt leaues are the broader, and more curled, and the three outmoſt are tipt with greene at the tops.) The whole floure much reſembles

reſembles a white Lilly, but much ſmaller. Three ſquare heads, containing a dusky and vnequall ſeed, follow after the floure.

1 *Phalangium Ramoſum.*
Branched Spiderwort.

2 *Phalangium non ramoſum.*
Vnbranched Spiderwort.

† 3 *Phalangium Cretæ.*
Candy Spiderwort.

‡ 4 *Phalangium Antiquorum.*
The true Spiderwort of the Ancients.

5 *Phalangium*

‡ 5 *Phalangium Virginianum Tradeſcanti.*
Tradeſcants Virginian Spiderwort.

5 This plant in my iudgement cannot be fitlier ranked with any than theſe laſt deſcribed; therefore I haue here giuen him the fifth place, as the laſt commer. This plant hath many creeping ſtringy roots, which here and there put vp greene leaues, in ſhape reſembling thoſe of the laſt deſcribed: amongſt theſe there riſeth vp a pretty ſtiffe ſtalke jointed, and hauing at each joint one leafe incompaſſing the ſtalke, and out of whoſe boſome oft times little branches ariſe: now the ſtalke at the top vſually diuides it ſelfe into two leaues, much after the manner of *Cyperus*; between which there come forth many floures conſiſting of three pretty large leaues a piece, of colour deepe blew, with reddiſh chiues tipt with yellow ſtanding in their middle. Theſe fading (as vſually they doe the ſame day they ſhew themſelues) there ſucceed little heads couered with the three little leaues that ſuſtained the floure. In theſe heads there is contained a long blackiſh ſeed.

¶ *The place.*

1. 2. 3. Theſe grow only in gardens with vs, and that very rarely. 4 This growes naturally in ſome places of Sauoy. 5 This Virginian is in many of our Engliſh gardens, as with M. *Parkinſon*, M. *Tradeſcant*, and others.

¶ *The time.*

1. 4. 5. Theſe floure in Iune: the ſecond about the beginning of May: and the third about Auguſt.

¶ *The names.*

The firſt is called *Phalangium ramoſum*, Branched Spiderwort. 2 *Phalangium non ramoſum*, Vnbranched Spiderwort. *Cordus* calls it *Liliago*. 3 This, *Cluſius* calls *Aſphodelus minor: Lobell, Phalangium Cretæ*, Candy Spiderwort. 4 This is thought to be the *Phalangium* of the Ancients, and that of *Matthiolus*: it is *Phalangium Allobrogicum* of *Cluſius*, Sauoy Spiderwort. 5 This by M. *Parkinſon* (who firſt hath in writing giuen the figure and deſcription thereof) is aptly termed *Phalangium Ephemerum Virginianum*, Soone-fading Spiderwort of Virginia, or *Tradeſcants* Spiderwort, for that M. *Iohn Tradeſcant* firſt procured it from Virginia. *Bauhine* hath deſcribed it at the end of his *Pinax*, and very vnfitly termed it *Allium, ſiue Moly Virginianum*. ‡

¶ *The nature.*

Galen ſaith, *Phalangium* is of a drying qualitie, by reaſon of the tenuitie of parts.

¶ *The vertues.*

Dioſcorides ſaith, That the leaues, ſeed, and floures, or any of them drunke in Wine, preuaileth A
againſt the bitings of Scorpions, and againſt the ſtinging and biting of the Spider called *Phalangium*, and all other venomous beaſts.

The roots tunned vp in new ale, and drunke for a moneth together, expelleth poyſon, yea al- B
though it haue vniuerſally ſpred it ſelfe through the body.

CHAP. 40. *Of the Floure de-luce.*

¶ *The kindes.*

THere be many kindes of Iris or Floure de-luce, whereof ſome are tall and great, ſome little, ſmall, and low; ſome ſmell exceeding ſweet in the root, ſome haue no ſmell at all: ſome floures are ſweet in ſmell, and ſome without; ſome of one colour, ſome of many colours mixed: vertues attributed to ſome, others not remembred: ſome haue tuberous or knobby roots, others bulbous or Onion roots, ſome haue leaues like flags, others like graſſe or ruſhes.

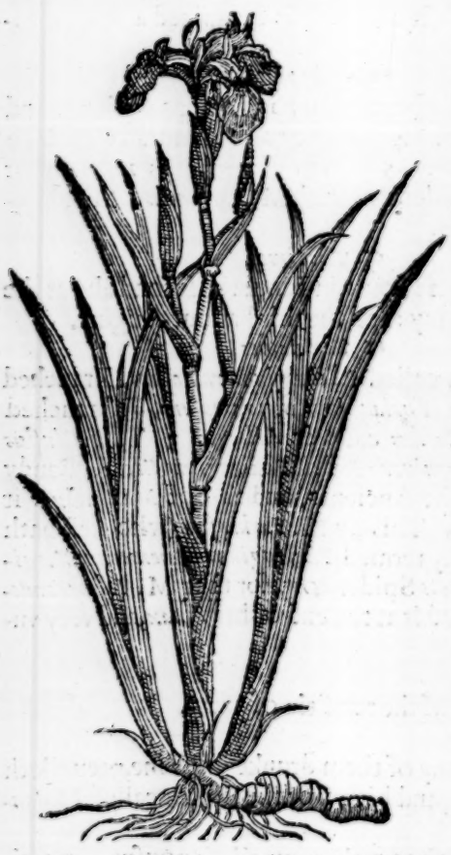
¶ *The*

¶ *The deſcription.*

1 THe common Floure de-luce hath long and large flaggy leaues like the blade of a ſword, with two edges, amongſt which ſpring vp ſmooth and plaine ſtalkes two foot long, bearing floures toward the top, compact of ſix leaues ioyned together, whereof three that ſtand vpright are bent inward one toward another; and in thoſe leaues that hang downward there are certaine rough or hairie welts, growing or riſing from the nether part of the leafe vpward, almoſt of a yellow colour. The roots be thicke, long, and knobby, with many hairy threds hanging thereat.

2 The water Floure de-luce, or Water flag, or Baſtard *Acorus*, is like vnto the garden Floure de-luce in roots, leaues, and ſtalkes, but the leaues are much longer, ſometimes of the height of foure cubits, and altogether narrower. The floure is of a perfect yellow colour, and the Root knobby like the other; but being cut, it ſeemeth to be of the colour of raw fleſh.

1 *Iris vulgaris.*
Floure de-luce.



2 *Iris paluſtris lutea.*
Water-flags, or Floure de-luce.

¶ *The place.*

The Water Floure de-luce or yellow flag proſpereth well in moiſt medows, and in the borders and brinks of riuers, ponds, and ſtanding lakes. And although it be a water plant of nature, yet being planted in gardens it proſpereth well.

¶ *The names.*

Floure de-luce is called in Greeke ἶρις: *Athenæus* and *Theophraſtus* reade ἶρις: as though they ſhould ſay, *Conſecratrix*; by which name it is alſo called of the Latines *Radix Marica*, or rather *Radix Naronica*, of the riuer Naron, by which the beſt and greateſt ſtore do grow. Whereupon *Nicander* in his Treacles commendeth it thus:

Iridem quam aluit Drilon, & Naronis ripa.

Which may thus be Engliſhed:

Iris, which *Drilon* water feeds,
And *Narons* bankes with other weeds.

The Italians, *Giglio azurro*: in Spaniſh, *Lilio Cardeno*: in French, *Flambe*: The Germanes, **Gilgen, Schwertel**: in Dutch, **Liſch.**

The ſecond is called in Latine, *Iris paluſtris lutea, Pſeudoacorus*, and *Acorus paluſtris*: in Engliſh, Water-

Water flags, Baſtard Floure de-luce, or Water Floure de-luce: and in the North they call them Seggs.

¶ *The nature.*

1 The roots of the Floure de-luce being as yet freſh and greene, and full of juyce, are hot almoſt in the fourth degree. The dried roots are hot and dry in the third degree, burning the throat and mouth of ſuch as taſte them.

2 The baſtard Floure de-luce his root is cold and dry in the third degree, and of an aſtringent or binding facultie.

¶ *The vertues.*

The root of the common Floure de-luce cleane waſhed, and ſtamped with a few drops of Roſe water, and laid plaiſter-wiſe vpon the face of man or woman, doth in two dayes at the moſt take away the blackneſſe or blewneſſe of any ſtroke or bruſe: ſo that if the skinne of the ſame woman or any other perſon be very tender and delicate, it ſhall be needfull that ye lay a piece of ſilke, ſindall, or a piece of fine laune betweene the plaiſter and the skinne; for otherwiſe in ſuch tender bodies it often cauſeth heate and inflammation. A

The iuyce of the ſame doth not onely mightily and vehemently draw forth choler, but moſt eſpecially watery humors, and is a ſpeciall and ſingular purgation for them that haue the Dropſie, if it be drunke in whay or ſome other liquor that may ſomewhat temper and alay his heate. B

The dry roots attenuate or make thinne thicke and tough humours, which are hardly and with difficultie purged away. C

They are good in a loch or licking medicine for ſhortneſſe of breath, an old cough, and all infirmities of the cheſt which riſe hereupon. D

They remedie thoſe that haue euill ſpleenes, and thoſe that are troubled with convulſions or cramps, biting of ſerpents, and the running of the reines, being drunke with vinegre, as ſaith *Dioſcorides*; and drunke with wine it bringeth downe the monethly courſes of women. E

The decoction is good in womens baths, for it mollifieth and openeth the matrix. F

Being boyled very ſoft, and laid to plaiſter-wiſe it mollifieth or ſoftneth the kings euil, and old hard ſwellings. G

‡ The roots of our ordinary flags are not (as before is deliuered) cold and dry in the third degree, nor yet in the ſecond, as *Dodonæus* affirmes; but hot and dry, and that at the leaſt in the ſecond degree, as any that throughly taſtes them will confeſſe. Neither are the faculties and vſe (as ſome would perſuade vs) to be neglected; for as *Pena* and *Lobell* affirme, though it haue no ſmell, nor great heat, yet by reaſon of other faculties it is much to be preferred before the *Galanga major*, or forreigne *Acorus* of ſhops, in many diſeaſes; for it imparts more heate and ſtrength to the ſtomacke and neighbouring parts than the other, which rather preyes vpon and diſſipates the innate heate and implanted ſtrength of thoſe parts. It bindes, ſtrengthens, and condenſes: it is good in bloudy flixes, and ſtayes the Courſes. ‡ H

CHAP. 40. *Of Floure de-luce of Florence.*

¶ *The deſcription.*

1 THe Floure de-luce of Florence, whoſe roots in ſhops and generally euery where are called *Ireos*, or *Orice* (whereof ſweet waters, ſweet pouders, and ſuch like are made) is altogether like vnto the common Floure de-luce, ſauing that the flowers of the *Ireos* is of a white colour, and the roots exceeding ſweet of ſmell, and the other of no ſmell at all.

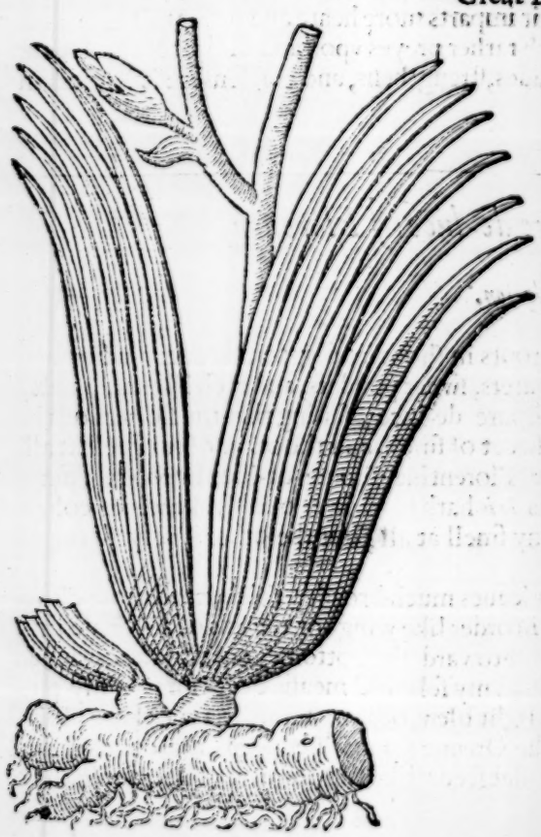
2 The white Floure de-luce is like vnto the Florentine Floure de-luce in roots, flaggy leaues, and ſtalkes; but they differ in that, that this *Iris* hath his flower of a bleake white colour declining to yellowneſſe; and the roots haue not any ſmell at all; but the other is very ſweet, as we haue ſaid.

3 The great Floure de-luce of Dalmatia hath leaues much broader, thicker, and more cloſely compact together than any of the other, and ſet in order like wings or the fins of a Whale fiſh, greene toward the top, and of a ſhining purple colour toward the bottome, euen to the ground: amongſt which riſeth vp a ſtalke of foure foot high, as my ſelfe did meaſure oft times in my garden: whereupon doth grow faire large floures of a light blew, or as we terme it, a watchet colour. The floures do ſmell exceeding ſweet, much like the Orenge floure. The ſeeds are contained in ſquare cods, wherein are packed together many flat ſeeds like the former. The root hath no ſmell at all.

1 *Iris Florentina.*
Floure de-luce of Florence.

2 *Iris alba.*
White Floure de-luce.

3 *Iris Dalmatica major.*
Great Floure de-luce of Dalmatia.



4 *Iris Dalmatica minor.*
Small Dalmatian *Iris.*

5 *Iris Biflora.*
Twice-flouring Floure de-luce.

6 *Iris Violacea.*
Violet Floure de-luce.

7 *Iris Pannonica.*
Auſtrian Floure de luce.

† 8 *Iris Camerarij.*
Germane Floure de-luce.

4 The ſmall Floure de-luce of Dalmatia is in ſhew like to the precedent, but rather reſembling *Iris biflora*, being both of one ſtature, ſmall and dwarfe plants in reſpect of the greater. The floures be of a more blew colour. They flower likewiſe in May as the others do; but beware that ye neuer caſt any cold water vpon them preſently taken out of a Wel; for their tenderneſſe is ſuch, that they wither immediatly, and rot away, as I my ſelfe haue proued: but thoſe which I left vnwatred at the ſame time liue and proſper to this day.

5 This kinde of Floure de-luce came firſt from Portugal to vs. It bringeth forth in the Spring time floures of a purple or violet colour, ſmelling like a violet, with a white hairy welt downe the middle. The root is thick and ſhort, ſtubborne or hard to breake. In leaues and ſhew it is like to the leſſer Floure de-luce of Dalmatia, but the leaues be more ſpred abroad, and it commonly hath but one ſtalke, which in Autumne floureth againe, and bringeth forth the like floures; for which cauſe it was called *Iris biflora*.

6 *Iris violacea* is like vnto the former, but much ſmaller, and the floure is of a more deepe violet colour.

7 *Carolus Cluſius*, that excellent and learned Father of Herbariſts, hath ſet forth in his Pannonicke Obſeruations the picture of this beautifull Floure de-luce, with great broad leaues, thicke and fat, of a purple colour neere vnto the ground, like the great Dalmatian Floure de-luce, which it doth very well reſemble. The root is very ſweet when it is dry, and ſtriueth with the Florentine *Iris* in ſweetneſſe. The floure is of all the other moſt confuſedly mixed with ſundry colours, inſomuch that my pen cannot ſet downe euery line or ſtreake, as it deſerueth. The three leaues that ſtand vpright do claſpe or embrace one another, and are of a yellow colour. The leaues that looke downward, about the edges are of a pale colour, the middle part of white, mixed with a line of purple, and hath many ſmall purple lines ſtripped ouer the ſaid white floure, euen to the brim of the pale coloured edge. It ſmelleth like the Hauthorne floures being lightly ſmelled vnto.

8 The Germane Floure de-luce, which *Camerarius* hath ſet forth in his Booke named *Hortus Medicus*, hath great thicke and knobby roots: the ſtalke is thicke and full of iuyce: the leaues be very broad in reſpect of all the reſt of the Floure de-luces. The floure groweth at the top of the ſtalke, conſiſting of ſix great leaues blew of colour, welted downe the middle, with white tending to yellow; at the bottome next the ſtalke it is white of colour, with ſome yellowneſſe fringed about the ſaid white, as alſo about the brims or edges, which greatly ſetteth forth his beautie; the which *Ioachimus Camerarius*, the ſonne of old *Camerarius* of Noremberg, had ſent him out of Hungarie, and did communicate one of the plants thereof to *Cluſius*; whoſe figure he hath moſt liuely ſet forth with this deſcription, differing ſomewhat from that which *Ioachimus* himſelfe did giue vnto me at his being in London. The leaues, ſaith he, are very large, twice ſo broad as any of the others. The ſtalke is ſingle and ſmooth; the floure groweth at the top, of a moſt bright ſhining blew colour, the middle rib tending to whiteneſſe, the three vpper leaues ſomewhat yellowiſh. The root is likewiſe ſweet as *Ireos*.

¶ *The place.*

Theſe kindes of Floure de-luces do grow wilde in Dalmatia, Goritia, and Piedmont; notwithſtanding our London gardens are very well ſtored with euery one of them.

¶ *The time.*

Their time of flouring anſwereth the other Floure de-luces.

¶ *The names.*

The Dalmatian Floure de-luce is called in Greeke of *Athenæus* and *Theophraſtes* ἶρις: it is named alſo ἶρις ἀπὸ τῆς, of the heauenly Bow or Rainbow: vpon the ſame occaſion θαυμαστὴ, or Admirable: for the Poets ſometime do call the Rainbow θαυμαντίαν: in Latine *Iris*, and in Engliſh Floure de-luce. Their ſeuerall titles do ſufficiently diſtinguiſh them, whereby they may be knowne one from another.

¶ *The*

¶ *The nature.*

The nature of theſe Floure de-luces are anſwerable to thoſe of the common kinde; that is to ſay, the dry roots are hot and dry in the latter end of the ſecond degree.

¶ *The vertues.*

The iuyce of theſe Floure de-luces doth not onely mightily and vehemently draw forth choler, but moſt eſpecially waterie humors, and is a ſingular good purgation for them that haue the Dropſie, if it be drunke in ſweet wort or whay.

The ſame are good for them that haue euill ſpleenes, or that are troubled with cramps or conuulſions, and for ſuch as are bit with Serpents. It profiteth alſo much thoſe that haue the Gonorrhea, or running of the reines, being drunke with Vineger, as *Dioſc.* ſaith; and drunke with Wine they bring downe the monethly termes.

CHAP. 42. *Of Variable Floure de-luces.*

1 *Iris lutea variegata.*
Variable Floure de-luce.

† 2 *Iris Chalcedonica.*
Turky Floure de-luce.

¶ *The deſcription.*

1 THat which is called the Floure de-luce of many colours loſeth his leaues in Winter, and in the Spring time recouereth them anew. I am not able to expreſſe the ſundrie colours and mixtures contained in this floure: it is mixed with purple, yellow, blacke, white, and a fringe or blacke thrum downe the middle of the lower leaues, of a whitiſh yellow, tipped or frized, and as it were a little raiſed vp; of a deep purple colour neere the ground.

2 The ſecond kinde hath long and narrow leaues of a blackiſh greene, like the ſtinking Gladdon; among which riſe vp ſtalkes two foot long, bearing at the top of euery ſtalke one floure compact of ſix great leaues: the three that ſtand vpright are confuſedly and very ſtrangely ſtripped, mixed with white and a duskiſh blacke colour. The three leaues that hang downeward are like a gaping hood, and are mixed in like manner, (but the white is nothing ſo bright as of the other) and are as it were ſhadowed ouer with a darke purple colour ſomewhat ſhining: ſo that

cording to my iudgement the whole floure is of the colour of a Ginny hen: a rare and beautifull floure to behold.

‡ 3 *Iris maritima Narbonenſis.* The Sea Floure de-luce.

4 *Iris ſylueſtris Bizantina.*
Wilde Bizantine Floure de-luce.

5 *Chamæiris Anguſtifolia.*
Narrow leafed Floure de-luce.

6 *Chamæiris tenuifolia.*
Graſſe Floure de-luce.

‡ 7 Ni

‡ 7 *Iris flore cæruleo obſoleto polyanthos.*
Narrow-leafed many-floured *Iris*.

‡ 8 *Chamæiris nivea aut Candida.*
White Dwarfe *Iris*.

‡ 9 *Chamæiris latifolia flore rubello.*
Red floured Dwarfe *Iris*.

‡ 10 *Chamæiris Lutea.*
Yellow Dwarfe *Iris.*

‡ 11 *Camæiris variegata.*
Varigated Dwarfe *Iris.*

3 The French, or rather Sea Floure de-luce (whereof there is alſo another of the ſame kinde altogether leſſer) haue their roots without any ſauour. In ſhew they differ little from the garden Floure de-luce, but that the leaues of theſe are altogether ſlenderer, and vnpleaſant in ſmell, growing plentifully in the rough crags of the rocks vnder the Alpes, and neere vnto the ſea ſide. The which *Pena* found in the graſſie grauelly grounds of the ſea coaſt neere to Montpellier. The learned Doctor *Aſſatius* a long time ſuppoſed it to be *Medium Dioſc. Matthiolus* deceiued himſelfe and others, in that he ſaid, That the root of this plant hath the ſent of the peach: but my ſelfe haue proued it to be without ſauour at all. It yeeldeth his floures in Iune, which are of all the reſt moſt like vnto the graſſe Floure de-luce. The taſte of his root is hot, bitter, and with much tenuitie of parts, as hath been found by phyſicall proofe.

‡ 4 This *Iris Bizantina* hath long narrow leaues like thoſe of the laſt deſcribed; very narrow, ſharpe pointed, hauing no vngratefull ſmell; the ſtalks are ſome cubit and an halfe in length, and ſomtimes more; at the top they are diuided into 2 or 3 branches that haue 2 or 3 floures a piece, like in ſhape to the floures of the broad leafed variegated bulbous *Iris*; they haue alſo a good ſmell: the ends of the hanging-downe leaues are of a darke colour; the other parts of them are variegated with white, purple, or violet colour. The three other leaues that ſtand vp are of a deepe violet or purple colour. The root is blackiſh, ſlender, hard, knotty. ‡

5 Narrow leafed Floure de-luce hath an infinite number of graſſie leaues much like vnto Reed, among which riſe vp many ſtalkes: on the ends of the ſame ſpring forth two, ſometimes three right ſweet and pleaſant floures, compact of nine leaues. Thoſe three that hang downward are greater than the reſt, of a purple colour, ſtripped with white and yellow; but thoſe three ſmall leaues that appeare next, are of a purple colour without mixture: thoſe three that ſtand vpright are of an horſe-fleſh colour, tipped with purple, and vnder each of theſe leaues appeare three ſmall browne aglets like the tongue of a ſmall bird.

6 The ſmall graſſie Floure de-luce differeth from the former in ſmalneſſe and in thinneſſe of leaues, and in that the ſtalkes are lower than the leaues, and the floures in ſhape and colour are like thoſe of the ſtinking Gladdon, but much leſſe.

‡ There are many other varieties of the broad leafed Floure de-luces beſides theſe mentioned by our Authour; as alſo of the narrow leafed, which here wee doe not intend to inſiſt vpon, but referre ſuch as are deſirous to trouble themſelues with theſe nicities, to *Cluſius* and others.

Not-

Notwithſtanding I judge it not amiſſe to giue the figures and briefe deſcriptions of ſome more of the Dwarfe Floure de-luces, as alſo of one of the narrower leafed.

7 This therefore which we giue you in the ſeuenth place is *Iris flore cæruleo obſoleto, &c. Lobelij.* The leaues of this are ſmall and long like thoſe of the wild *Bizantine* Floure de-luce; the root (which is not very big) hath many ſtrong threds or fibres comming out of it: the ſtalke (which is ſomewhat tall) diuides it ſelfe into two or three branches, whereon grow floures in ſhape like thoſe of the other Floure de-luces, but their colour is of an ouer-worne blew, or Aſh colour.

8 Many are the differences of the *Chamæirides latifoliæ*, or Broad leafed Dwarfe Floure de-luces, but their principall diſtinction is in their floures; for ſome haue flowers of violet or purple colour, ſome of white, other ſome are variegated with yellow and purple, &c. Therefore I will onely name the colour, and giue you their figure, becauſe their ſhapes differ little. This eighth therefore is *Chamæiris nivea aut Candida*, White Dwarfe *Iris*: The ninth, *Chamæiris latifolia flore rubello*, Red floured Dwarfe *Iris*: The tenth, *Camæiris lutea*, Yellow Dwarfe *Iris*: The eleuenth, *Chamæiris variegata*, Variegated Dwarfe *Iris*. The leaues and ſtalkes of theſe plants are vſually about a foot high; the floures, for the bigneſſe of the plants, large, and they floure betimes, as in April. And thus much I thinke may ſuffice for the names and deſcriptions of theſe Dwarfe varieties of Floure de-luces. ‡

¶ *The place.*

Theſe plants do grow in the gardens of London, amongſt Herbariſts and other Louers of Plants.

¶ *The nature.*

They floure from the end of March to the beginning of May.

¶ *The names.*

The Turky Floure de-luce is called in the Turkiſh tongue *Alaia Suſiani*, with this additament from the Italians, *Fiore Belle pintate*; in Engliſh, Floure de-luce. The reſt of the names haue bin touched in their titles and hiſtorie.

¶ *Their nature and vertues.*

The faculties and temperature of theſe rare and beautifull floures are referred to the other ſorts of Floure de-luces, whereunto they do very well accord.

There is an excellent oyle made of the floures and roots of Floure de-luce, of each a like quantitie, called *Oleum Irinum*, made after the ſame manner that oyle of Roſes, Lillies, and ſuch like be made: which oyle profiteth much to ſtrengthen the ſinewes and joints, helpeth the cramp proceeding of repletion, and the diſeaſe called in Greeke *Peripneumonia*. A

The floures of French Floure de-luce diſtilled with *Diatrion ſandalon*, and Cinnamon, and the water drunke, preuaileth greatly againſt the Dropſie, as *Hollerius* and *Geſner* teſtifie. B

Chap. 43. *Of ſtinking Gladdon.*

¶ *The deſcription.*

Stinking Gladdon hath long narrow leaues like *Iris*, but ſmaller, of a darke greene colour, and being rubbed, of a ſtinking ſmell very lothſome. The ſtalkes are many in number, and round toward the top, out of which do grow floures like the Floure de-luce, of an ouer-worne blew colour, or rather purple, with ſome yellow and red ſtreakes in the midſt. After the floures be vaded there come great huskes or cods, wherein is contained a red berry or ſeed as bigge as a peaſe. The root is long, and threddy vnderneath.

¶ *The place.*

Gladdon groweth in many gardens: I haue ſeene it wilde in many places, as in woods and ſhadowie places neere the ſea.

¶ *The time.*

The ſtinking Gladdon floureth in Auguſt, the ſeed whereof is ripe in September.

¶ *The names.*

Stinking Gladdon is called in Greeke ξιφίον, by *Dioſcorides*; and ἰρεσία by *Theophraſtus*, according to *Pena*: in Latine *Spatula fœtida* among the Apothecaries: it is called alſo *Xyris*: in Engliſh, ſtinking Gladdon, and Spurgewort.

¶ *The nature.*

Gladdon is hot and dry in the third degree.

¶ *The vertues.*

Such is the facultie of the roots of all the Irides before named, that being pounded they prouoke ſneeſing, and purge the head: generally all the kinds haue a heating & extenuating quality. A

They

B *Xyris.*
Stinking Gladdon.

They are effectuall againſt the cough; they eaſily digeſt and conſume the groſſe humors which are hardly concocted: they purge choler and tough flegme: they procure ſleepe, and helpe the gripings within the belly.

It helpeth the Kings Euill, and Buboes in the groine, as *Pliny* ſaith. If it be drunke in Wine it prouoketh the termes, and being put in Baths for women to ſit ouer, it prouoketh the like effects moſt exquiſitly. The root put in manner of a peſſarie haſtneth the birth. They couer with fleſh bones that be bare, being vſed in plaiſters. The roots boyled ſoft, and vſed plaiſterwiſe, ſoften all old hard tumours, and the ſwellings of the throat called *Strumæ*, that is, the Kings Euill; and emplaiſtered with honey it draweth out broken bones.

The meale thereof healeth all the rifts of the fundament, and the infirmities thereof called *Condilomata*; and openeth Hemorrhoides. The juice ſniffed or drawne vp into the noſe, prouoketh ſneeſing, and draweth downe by the noſe great ſtore of filthy excrements, which would fall into other parts by ſecret and hidden waies, and conueiances of the channels.

It profiteth being vſed in a peſſarie, to prouoke the termes, and will cauſe abortion.

It preuaileth much againſt all euill affections of the breſt and lungs, being taken in a little ſweet wine, with ſome Spiknard; or in Whay with a little Maſticke.

The Root of *Xyris* or Gladdon is of great force againſt wounds and fractures of the head; for it draweth out all thornes, ſtubs, prickes, and arrow-heads, without griefe; which qualitie it effecteth (as *Galen* ſaith) by reaſon of his tenuitie of parts, and of his attracting, drying, and digeſting facultie, which chiefely conſiſteth in the ſeed or fruit, which mightily prouoketh vrine.

H The root giuen in Wine, called in phyſicke *Paſſum*, profiteth much againſt Conuulſions, Ruptures, the paine of the huckle bones, the ſtrangury, and the flux of the belly. Where note, That whereas it is ſaid that the potion aboue named ſtayeth the flux of the belly, hauing a purging qualitie; it muſt be vnderſtood that it worketh in that manner as *Rhabarbarum* and *Aſarum* do, in that they concoct and take away the cauſe of the laske; otherwiſe no doubt it moueth vnto the ſtoole, as *Rheubarb*, *Aſarum*, and the other Irides do. Hereof the Countrey people of Somerſetſhire haue good experience, who vſe to drinke the decoction of this Root. Others do take the infuſion thereof in ale or ſuch like, wherewith they purge themſelues, and that vnto very good purpoſe and effect.

I The ſeed thereof mightily purgeth by vrine, as *Galen* ſaith, and the country people haue found it true.

Chap. 44. *Of Ginger.*

¶ *The deſcription.*

1 Ginger is moſt impatient of the coldneſſe of theſe our Northerne Regions, as my ſelfe haue found by proofe, for that there haue beene brought vnto me at ſeuerall times ſundry plants thereof, freſh, greene, and full of juyce, as well from the Weſt Indies, as from Barbary and other places; which haue ſprouted and budded forth greene leaues in my garden in the heate of Sommer, but as ſoone as it hath been but touched with the firſt ſharp blaſt of Winter, it hath preſently periſhed both blade and root. The true forme or picture hath not before this time beene ſet forth by any that hath written; but the World hath beene deceiued by a counterfeit figure, which the reuerend and learned Herbariſt *Matthias Lobell* did ſet forth in his Obſeruations. The forme whereof notwithſtanding I haue here expreſſed, with the true and vndoubted

doubted picture alſo, which I receiued from *Lobelius* his owne hands at the impreſſion hereof. The cauſe of whoſe former errour, as alſo the meanes whereby he got the knowledge of the true Ginger, may appeare by his owne words ſent vnto me in Latine, which I haue here inſerted. His words are theſe :

How hard and vncertaine it is to deſcribe in words the true proportion of Plants, (hauing no other guide than skilfull, but yet deceitfull formes of them, ſent from friends, or other meanes) they beſt do know who haue deepliest waded in this ſea of Simples. About thirty yeares paſt or more, an honeſt and expert Apothecarie *William Dries*, to ſatisfie my deſire, ſent me from Antwerpe to London the picture of Ginger, which he held to be truly and liuely drawne : I my ſelfe gaue him credit eaſily, becauſe I was not ignorant, that there had bin often Ginger roots brought greene, new, and full of juice, from the Indies to Antwerpe ; and further, that the ſame had budded and growne in the ſaid *Dries* Garden. But not many yeares after, I perceiued that the picture which was ſent me by my Friend was a counterfeit, and before that time had been drawne and ſet forth by an old Dutch Herbariſt. Therefore not ſuffering this error any further to ſpred abroad, (which I diſcouered not many yeares paſt at Fluſhing in Zeeland, in the Garden of *William* of Naſſau Prince of Orange, of famous memorie, through the means of a worthy perſon, if my memorie faile me not, called *Vander Mill* ; at what time he opened, and looſed his firſt young buds and ſhoots about the end of Sommer, reſembling in leaues, and ſtalkes of a foot high, the young and tender ſhoots of the common Reed, called *Harundo vallatoria*) I thought it conuenient to impart thus much vnto Maſter *Iohn Gerard*, an expert Herbariſt, and Maſter of happy ſucceſſe in Surgerie ; to the end he might let poſteritie know thus much, in the painefull and long laboured trauels which now he hath in hand, to the great good and benefit of his Countrey. The plant it ſelfe brought me to Middleborrough, and ſet in my Garden, periſhed through the hardneſſe of the Winter.

Thus much haue I ſet downe, truly tranſlated out of his owne words in Latine ; though too fauourably by him done to the commendation of my meane skill.

¶ *Zinziberis ficta Icon.*
The feigned figure of Ginger.

¶ *Zinziberis verior Icon.*
The true figure of Ginger.

¶ *The place.*

Ginger groweth in Spaine, Barbary, in the Canary Iſlands, and the Azores. Our men which ſacked Domingo in the Indies, digged it vp there in ſundry places wilde.

¶ *The*

¶ *The time.*

Ginger floriſheth in the hot time of Sommer, and loſeth his leaues in Winter.

¶ *The names.*

Ginger is called in Latine *Zinziber* and *Gingiber*: in Greeke, ζιγγίβερις and ζιγγίβερι: In French, *Gingembre.*

¶ *The nature.*

Ginger heateth and drieth in the third degree.

¶ *The vertues.*

A Ginger, as *Dioſcorides* reporteth, is right good with meate in ſauces, or otherwiſe in conditures: for it is of an heating and digeſting qualitie; it gently looſeth the belly, and is profitable for the ſtomacke, and effectually oppoſeth it ſelfe againſt all darkneſſe of the ſight; anſwering the qualities and effects of Pepper. It is to be conſidered, That canded, greene or condited Ginger is hot and moiſt in qualitie, prouoking Venerie: and being dried, it heateth and drieth in the third degree.

Chap. 45. *Of Aromaticall Reeds.*

2 *Acorus verus officinis falsò Calamus, cum julo.*
The true *Acorus* with his floure.

Acorus verus ſine julo.
The true *Acorus* without the floure.

¶ *The deſcription.*

1 THis ſweet-ſmelling Reed is of a darke dun colour, full of joints and knees, eaſie to be broken into ſmall ſplinters, hollow, and full of a certaine pith cobweb-wiſe, ſomewhat gummy in eating, and hanging in the teeth, and of a ſharpe bitter taſte. It is of the thickneſſe of the little finger, as *Lobelius* affirmeth of ſome which he had ſeene in Venice.

2 Baſtard Calamus hath flaggy leaues like vnto the Water floure de-luce or flagge, but narrower, three foot long; of a freſh greene colour, and aromaticke ſmell, which they keepe a long time, although they be dried. Now the ſtalke which beares the floure or fruit is much like another

ther leaſe, but onely from the fruit downwards, whereas it is ſomewhat thicker, and not ſo broad, but almoſt triangular. The floure is a long thing reſembling the Catſ-tailes which grow on Haſels; it is about the thickneſſe of an ordinarie Reed, ſome inch and halfe long, of a greeniſh yellow colour, curiouſly chequered, as if it were wrought with a needle with greene and yellow ſilke intermixt †. I haue not as yet ſeene it beare his tuft in my garden, and haue read that it is barren, and by proofe haue ſeene it ſo: yet for all that I beleeue *Cluſius*, who ſaith hee hath ſeene it beare his floure in that place where it doth grow naturally, although in England it is altogether barren. The root is ſweet in ſmell, and bitter in taſte, and like vnto the common Flagge, but ſmaller, and not ſo red.

3 *Calamus Aromaticus Antiquorum.*
The true Aromaticall Reed of the Antients.

‡ 3 I thinke it very fitting in this place to acquaint you with a Plant, which by the conjecture of the moſt learned (and that not without good reaſon) is iudged to be the true *Calamus* of the Ancients. *Cluſius* giues vs the hiſtorie thereof in his Notes vpon *Garcias ab Horto, lib.* 1. *ca.* 32. in theſe words: When as (ſaith he) this Hiſtorie was to be the third time printed, I very opportunely came to the knowledge of the true *Calamus Aromaticus*; the which the learned *Bernard Paludanus* the Friſian, returning from Syria and Ægypt, freely beſtowed vpon me, together with the fruit Habhel, and many other rare ſeeds, about the beginning of the yeare 1579. Now wee haue cauſed a figure to be exactly drawne by the fragments thereof (for that it ſeemes ſo exquiſitly to accord with *Dioſcorides* his deſcription.) In myne opinion it is rather to be iudged an vmbelliferous plant than a reedy; for it hath a ſtraight ſtalke parted with many knots or ioynts, otherwiſe ſmooth, hollow within, and inueſted on the inſide with a ſlender filme like as a Reed, and it breaketh into ſhiuers or ſplinters, as *Dioſcorides* hath written: it hath a ſmell ſufficiently ſtrong, and the taſte is gratefull, yet bitter, and pertaking of ſome aſtriction: The leaues, as by remaines of them might appeare, ſeeme by couples at euery ioynt to engirt the ſtalke: the root at the top is ſomewhat tuberous, and then ends in fibres. Twenty fiue yeares after *Paludanus* gaue me this *Calamus*, the learned *Anthony Coline* the Apothecarie (who lately tranſlated into French theſe Commentaries the fourth time ſet forth, *Anno* 1593) ſent me from Lyons pieces of the like Reed, certifying me withall, That he had made vſe thereof in his Compoſition of Treacle. Now theſe pieces, though in forme they reſembled thoſe I had from *Paludanus*, yet had they a more bitter taſte than his, nether did they partake of any aſtriction; which peraduenture was to be attributed to the age of one of the two. Thus much *Cluſius*. ‡

¶ *The place.*

The true *Calamus Aromaticus* groweth in Arabia, and likewiſe in Syria, eſpecially in the mooriſh grounds betweene the foot of Libanus † and another little hill, not the mountaine Antilibanus, as ſome haue thought, in a ſmall valley neere to a lake, whoſe plaſhes are dry in Sommer. *Pliny* 12. 22. †

Baſtard or falſe *Calamus* growes naturally at the foot of a hill neere to Pruſa a city of Bithynia, not far from a great lake. It proſpereth exceeding well in my garden, but as yet it beareth neither floures nor ſtalke. It groweth alſo in Candia, as *Pliny* reporteth: in Galatia likewiſe, and in many other places.

¶ *The time.*

They loſe their leaues in the beginning of Winter, and do recouer them againe in the Spring of the yeare. ‡ In May this yeare 1632, I receiued from the Worſhipfull Gentleman M. *Thomas Glynn* of Glynnlhivon in Carnaruanſhire, my very good friend, the pretty *Iulus*, or floure of this plant; which I could neuer ſee here about London, though it groweth with vs in many Gardens, and that in great plenty. ‡

¶ *The names.*

‡ The want of the true *Calamus* being ſupplied by *Acorus* as a *ſuccedaneum*, was the cauſe (as *Pena* and *Lobell* probably coniecture) that of a ſubſtitute it tooke the prime place vpon it; and being as it were made a Vice-Roy, would needs be King. But the falſeneſſe of the title was diſcouered

uered by *Matthiolus*, and others, and ſo it is ſent backe to its due place againe; though notwithſtanding it yet in ſhops retaines the title of *Calamus*.

1 The figure that by our Author was giuen for this, is ſuppoſed, and that (as I thinke truly) to be but a counterfeit, of *Matthiolus* his inuention; who therein hath beene followed (according to the cuſtome of the world) by diuers others. The deſcription is of a ſmall Reed called *Calamus oderatus Libani*, by *Lobell* in his Obſeruations, and figured in his *Irones*, *p.* 54.

2 This is called Ἄκορος and Ἄκορον by the Greekes: by ſome, according to *Apulcius*, Βραχυπόαι; and in Latine it is called *Acorus* and *Acorum*; and in ſhops, as I haue formerly ſaid, *Calamus Aromaticus*: for they vſually take *Galanga major*, (deſcribed by me, *Chap.* 26.) for *Acorus*. It may beſides the former names be fitly called in Engliſh, The ſweet Garden Flag.

3 This is iudged to be the Κάλαμος ἀρωματικὸς of *Dioſcorides*; the Κάλαμος θυώδης of *Theophraſtus*; that is, the true *Calamus Aromaticus* that ſhould be vſed in Compoſitions. ‡

¶ *The nature of the true Acorus, or our ſweet garden Flag.*

Dioſcorides ſaith, the roots haue an heating facultie: *Galen* and *Pliny* do affirme, that they haue thin and ſubtill parts, both hot and dry.

¶ *The vertues of the ſame.*

A The decoction of the root of *Calamus* drunke prouoketh vrine, helpeth the paine in the ſide, liuer, ſpleene, and breſt; convulſions, gripings, and burſtings; it eaſeth and helpeth the piſſing by drops.

B It is of great effect, being put in broth, or taken in fumes through a cloſe ſtoole, to prouoke womens naturall accidents.

C The iuyce ſtrained with a little honey, taketh away the dimnes of the eyes, and helpeth much againſt poyſon, the hardneſſe of the ſpleene, and all infirmities of the bloud.

D The root boyled in wine, ſtamped and applied plaiſterwiſe vnto the cods, doth wonderfully abate the ſwelling of the ſame, and helpeth all hardneſſe and collections of humors.

E The quantitie of two ſcruples and an halfe of the root drunke in foure ounces of Muskadel, helpeth them that be bruiſed with grieuous beating, or falls.

F The root is with good ſucceſſe mixed in counterpoyſons. In our age it is put into Eclegma's, that is, medicines for the lungs, and eſpecially when the lungs and cheſt are oppreſt with raw and cold humors.

G ‡ The root of this preſerued is very pleaſant to the taſte, and comfortable to the ſtomacke and heart; ſo that the Turks at Conſtantinople take it faſting in the morning, againſt the contagion of the corrupt aire. And the Tartars haue it in ſuch eſteeme, that they will not drinke Water (which is their vſuall drinke) vnleſſe they haue firſt ſteeped ſome of this root therein. ‡

¶ *The choice.*

The beſt *Acorus*, as *Dioſcorides* ſaith, is that which is ſubſtantiall, and well compact, white within, not rotten, full, and well ſmelling.

Pliny writeth, That thoſe which grow in Candia are better than thoſe of Pontus, and yet thoſe of Candia worſe than thoſe of the Eaſterne countries, or thoſe of England, although we haue no great quantitie thereof.

¶ *The faculties of the true Calamus out of Dioſcorides.*

H ‡ It being taken in drinke moueth vrine; wherefore boyled with the roots of graſſe or Smallage ſeeds, it helpeth ſuch as are hydropick, nephritick, troubled with the ſtrangurie, or bruiſed.

I It moues the Courſes, either drunke or otherwiſe applied. Alſo the fume thereof taken by the mouth in a pipe, either alone or with dried Turpentine, helpes coughs.

K It is boyled alſo in baths for women, and decoctions for Glyſters; and it enters into plaiſters and perfumes for the ſmells ſake. ‡

Chap. 46. *Of Corne.*

THus farre haue I diſcourſed vpon Graſſes, Ruſhes, Spartum, Flags, and Floure deluces: my next labour is to ſet downe for your better inſtruction, the hiſtorie of Corne, and the kindes thereof, vnder the name of Graine; which the Latines call *Cerialia ſemina*, or Bread-corne; the Grecians, σπέρματα and δημητρεία σπέρματα; of which wee purpoſe to diſcourſe. There belong to the hiſtorie of Graine all ſuch things as be made of Corne, as *Far*, *Condrus*, *Alica*, *Tragus*, *Amylum*, *Ptiſana*, *Polenta*, *Maza*, *Byne* or Malt, *Zythum*, and whatſoeuer are of that ſort. There be alſo ioyned vnto them many ſeeds, which *Theophraſtus* in his eighth booke placeth among the graines; as Millet, Sorgum, Panicke, Indian wheat; and ſuch like. *Galen* in his firſt booke of the Faculties of nouriſhments, reckoneth

vp

vp the diſeaſes of Graine, as well thoſe that come of the graine it ſelfe degenerating, or that are changed into ſome other kinde, and made worſe through the fault of the weather, or of the ſoile; as alſo ſuch as be cumberſome by growing among them, doe likewiſe fitly ſucceed the graines. And beginning with corne, we will firſt ſpeake of Wheat, and deſcribe it in the firſt place, becauſe it is preferred before all other corne.

1 *Triticum ſpica mutica.*
White Wheate.

¶ *The deſcription.*

1 THis kinde of Wheate which *Lobelius*, diſtinguiſhing it by the eare, calleth *Spica Mutica*, is the moſt principal of all other, whoſe eares are altogether bare or naked, without awnes or chaffie beards. The ſtalke riſeth from a threddy root, compact of many ſtrings, joynted or kneed at ſundry diſtances; from whence ſhoot forth graſſie blades and leaues like vnto Rie, but broader. The plant is ſo well knowne to many, and ſo profitable to all, that the meaneſt and moſt ignorant need no larger deſcription to know the ſame by.

2 The ſecond kinde of Wheat, in root, ſtalkes, joints, and blades, is like the precedent, differing onely in eare, and number of graines, whereof this kinde doth abound, hauing an eare conſiſting of many ranks, which ſeemeth to make the eare double or ſquare. The root and graine is like the other, but not bare and naked, but briſtled or bearded, with many ſmall and ſharpe eiles or awnes, not vnlike to thoſe of Barley.

3 Flat Wheat is like vnto the other kindes of Wheat in leaues, ſtalkes, and roots, but is bearded and bordered with rough and ſharpe ailes, wherein conſiſts the difference. ‡ I know not what our Author means by this flat Wheat, but I conjecture it to be the long rough eared Wheat, which hath blewiſh eares when as it is ripe, in other things reſembling the ordinary red wheat. ‡

4 The fourth kinde is like the laſt deſcribed, and thus differeth from it, in that, that this kind hath many ſmal ears comming forth of one great eare, & the beards hereof be ſhorter than of the former kind.

5 Bright wheate is like the ſecond before deſcribed, and differeth from it in that, that this kind is foure ſquare, ſomewhat bright and ſhining, the other not.

‡ I thinke it a very fit thing to adde in this place a rare obſeruation, of the tranſmutation of one ſpecies into another, in plants; which though it haue beene obſerued of ancient times, as by *Theophraſtus, de cauſ. plant. lib. 3. cap. 6.* whereas amongſt others hee mentioneth the change of Ζειὰ καὶ τίπτην, Spelt into oates: and by *Virgill* in theſe verſes;

Grandia ſæpe quibus mandauimus Hordea ſulcis,
Infelix Lolium, & ſteriles dominantur auenæ.

That is;

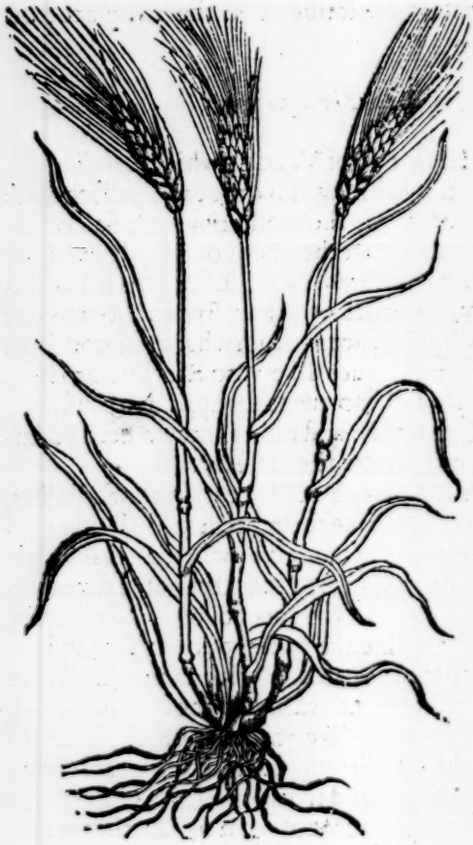
In furrowes where great Barley we did ſow,
Nothing but Darnel and poore Oats do grow;

yet none that I haue read haue obſerued, that two ſeuerall graines, perfect in each reſpect, did grow at any time in one eare: the which I ſaw this yeare 1632, in an eare of white Wheat, which was found by my very good Friend Maſter *Iohn Goodyer*, a man ſecond to none in his induſtrie and ſearching of plants, nor in his iudgement or knowledge of them. This eare of wheat was as large and faire as moſt are, and about the middle thereof grew three or foure perfect Oats in all reſpects: which being hard to be found, I held very worthy of ſetting downe, for ſome reaſons not to be inſiſted vpon in this place. ‡

¶ *The place.*

Wheat groweth almoſt in all the countries of the world that are inhabited and mannured, and requireth a fruitfull and fat ſoile, and rather Sunny and dry, than watery grounds and ſhadowie: for in a dry ground (as *Columella* reporteth) it groweth harder and better compact: in a moiſt and darke ſoile it degenerateth ſometime to be of another kinde.

2 *Triticum ariſtis circumvallatum.*
Bearded Wheat, or Red-Wheat.



A

¶ *The time.*

They are moſt commonly ſowen in the fall of the leafe, or Autumne: ſomtime in the Spring.

¶ *The names.*

Wheat is called of the Grecians πυρος: of the Latines, *Triticum*, and the white Wheate *Siligo*. *Triticum* doth generally ſignifie any kinde of Corne which is threſhed out of the eares, and made clean by fanning or ſuch ordinary meanes. The Germans call it **Weuſen**: in low Dutch, **Terwe**: in Italian, *Grano*: the Spaniards, *Trigo*: the French men, *Bled, ou Fourment*: in England we call the firſt, White-Wheat, and Flaxen Wheat. *Triticum Lucidum* is called Bright Wheat: Red Wheat is called in Kent, Duck-bill Wheate, and Normandy Wheat.

¶ *The nature.*

Wheat (ſaith *Galen*) is very much vſed of men, and with greateſt profit. Thoſe Wheats do nouriſh moſt which be hard, and haue their whole ſubſtance ſo cloſely compact as they can ſcarcely be bit aſunder; for ſuch doe nouriſh very much: and the contrary but little.

Wheat, as it is a medicine outwardly applied, is hot in the firſt degree, yet can it not manifeſtly either dry or moiſten. It hath alſo a certaine clammineſſe and ſtopping qualitie.

¶ *The vertues.*

Raw Wheat, ſaith *Dioſcorides*, being eaten, breedeth wormes in the belly: being chewed and applied, it doth cure the biting of mad dogs.

3 *Triticum Typhinum.*
Flat Wheat.

4 *Triticum multiplici ſpica.*
Double eared Wheat.

B The floure of wheat being boyled with honey and water, or with oyle and water, taketh away all inflammations, or hot ſwellings.

C The bran of Wheat boyled in ſtrong Vineger, clenſeth away ſcurfe and dry ſcales, and diſſolueth the beginning of all hot ſwellings, if it be laid vnto them. And boyled with the decoction of Rue, it ſlaketh the ſwellings in womens breſts.

D The graines of white Wheat, as *Pliny* writeth in his two and twentieth booke, and ſeuenth chapter, being dried brown, but not burnt, and the pouder thereof mixed with white wine is good for watering eyes, if it be laid thereto.

E The dried pouder of red Wheat boyled with vineger, helpeth the ſhrinking of ſinewes.

F The meale of Wheat mingled with the juice of Henbane, and plaiſterwiſe applied, appeaſeth inflam-

5 *Triticum lucidum.*
Bright Wheat.

inflammations, as *Ignis ſacer*, or Saint *Anthonies* Fire, and ſuch like, ſtaying the flux of humors to the ioynts, which the Grecians call *Rheumatiſmata*. Paſte made of fine meale, ſuch as Booke-binders vſe, helpeth ſuch as doe ſpit bloud, taken warme one ſpoonfull at once. The bran of wheat boiled in ſharpe vineger, and rubbed vpon them that be ſcruie and mangie, eaſeth the party very much.

The leauen made of Wheat hath vertue to G
heate and draw outward, it reſolueth, concocteth, and openeth all ſwellings, bunches, tumors, and felons, being mixed with ſalt.

The fine floure mixed with the yolke of an H
egge, honey, and a little ſaffron, doth draw and heale byles and ſuch like ſores, in children and in old people, very well and quickely. Take crums of wheaten bread one pound and an halfe, barley meale ℥ ij. Fennigreeke and Lineſeed of each an ounce, the leaues of Mallowes, Violets, Dwale, Sengreene, and Cotyledon, *ana* one handfull: boyle them in water and oyle vntill they be tender: then ſtampe them very ſmall in a ſtone morter, and adde thereto the yolks of three egges, oyle of Roſes, and oyle of Violets, *ana* ℥ ij. Incorporate them altogether, but if the inflammation grow to an Eryſipelas, then adde thereto the iuice of Nightſhade, Plantaine, and Henbane, *ana* ℥ ij. it eaſeth an Eryſipelas, or Saint *Anthonies* fire, and all inflammations very ſpeedily.

Slices of fine white bread laid to infuſe or I
ſteepe in Roſe water, and ſo applied vnto ſore eyes which haue many hot humors falling into them, doth eaſily defend the humour, and ceaſe the paine.

The oyle of wheat preſſed forth betweene two plates of hot iron, healeth the chaps and chinks K
of the hands, feet, and fundament, which come of cold, making ſmooth the hands, face, or any other part of the body.

The ſame vſed as a Balſame doth excellently heale wounds, and being put among ſalues or vn- L
guents, it cauſeth them to worke more effectually, eſpecially in old vlcers.

CHAP. 47. *Of Rie.*

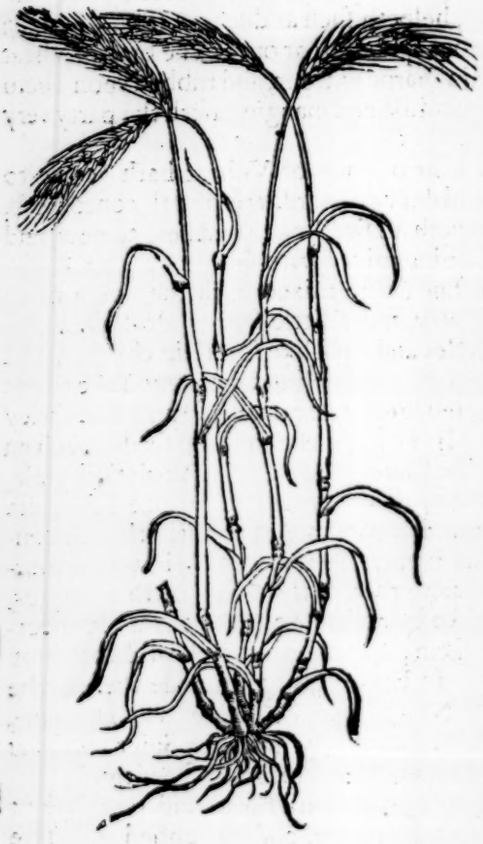
¶ *The deſcription.*

THe leafe of Rie when it firſt commeth vp, is ſomewhat reddiſh, afterward greene, as be the other graines. It groweth vp with many ſtalks, ſlenderer than thoſe of wheat, and longer, with knees or ioynts by certaine diſtances like vnto Wheat: the eares are orderly framed vp in rankes, and compaſſed about with ſhort beards, not ſharpe but blunt, which when it floureth ſtandeth vpright, and when it is filled vp with ſeed it leaneth and hangeth downward. The ſeed is long, blackiſh, ſlender, and naked, which eaſily falleth out of the huskes of it ſelfe. The roots be many, ſlender, and full of ſtrings.

¶ *The place.*

Rie groweth very plentifully in the moſt places of Germany and Polonia, as appeareth by the great quantitie brought into England in times of dearth, and ſcarcitie of corne, as hapned in the yeare 1596, and at other times, when there was a generall want of corne, by reaſon of the aboundance of raine that fell the yeare before; whereby great penurie enſued, as well of cattell and all other victuals, as of all manner of graine. It groweth likewiſe very wel in moſt places of England, eſpecially towards the North.

Secale.
Rie.



¶ *The time.*

It is for the moſt part ſowen in Autumne, and ſometimes in the Spring, which proueth to be a Graine more ſubiect to putrifaction than that which was ſowen in the fall of the leafe, by reaſon the Winter doth ouertake it before it can attaine to his perfect maturitie and ripeneſſe.

¶ *The names.*

Rie is called in high Dutch, **Rocken:** in Low-Dutch, **Rogge:** in Spaniſh, *Centeno:* in Italian, *Segala:* in French, *Seigle:* which ſoundeth after the old Latine name which in *Pliny* is *Secale* and *Farrago, lib. 18. cap. 16.*

¶ *The temperature.*

Rie as a medicine is hotter than wheat, and more forcible in heating, waſting, and conſuming away that whereto it is applied. It is of a more clammy and obſtructing nature than Wheat, and harder to digeſt; yet to ruſticke bodies that can well digeſt it, it yeelds good nouriſhment.

¶ *The vertues.*

Bread, or the leauen of Rie, as the Belgian Phyſitians affirme vpon their practiſe, doth more forcibly digeſt, draw, ripen, and breake all Apoſtumes, Botches, and Byles, than the leuen of Wheat.

Rie Meale bound to the head in a Linnen Cloath, doth aſſwage the long continuing paines thereof.

Chap. 48. *Of Spelt Corne.*

¶ *The deſcription.*

Spelt is like to Wheat in ſtalkes and eare: it groweth vp with a multitude of ſtalks which are kneed and joynted higher than thoſe of Barley: it bringeth forth a diſordered eare, for the moſt part without beards. The cornes be wrapped in certaine dry huskes, from which they cannot eaſily be purged, and are joyned together by couples in two chaffie huskes, out of which when they be taken they are like vnto wheat cornes: it hath alſo many roots as wheat hath, whereof it is a kinde.

¶ *The place.*

It groweth in fat and fertile moiſt ground.

¶ *The time.*

It is altered and changed into Wheat it ſelfe, as degenerating from bad to better, contrary to all other that do alter or change; eſpecially (as *Theophraſtus* ſaith) if it be clenſed, and ſo ſowen, but that not forthwith, but in the third yeare.

¶ *The names.*

The Grecians haue called it ζεια and ζειη: the Latines *Spelta:* in the Germane tongue **Spelt**, and **Sinkel:** in low Dutch, **Spelte:** in French, *Eſpeautre:* of moſt Italians, *Pirra, Farra:* of the Tuſcans, *Biada:* of the Millanois, *Alga:* in Engliſh, Spelt Corne. *Dioſcorides* maketh mention of two kindes of Spelt: one of which he names ἄπλη, or ſingle: another, διπλῆ, which brings forth two cornes ioyned together in a couple of huskes, as before in the deſcription is mentioned. That Spelt which *Dioſcorides* calls *Dicoccos*, is the ſame that *Theophr.* and *Galen* do name *Zea.* The moſt ancient Latines haue called *Zea* or *Spelta* by the name of *Far*, as *Dionyſius Halicarnaſſæus* doth ſufficiently teſtifie: The old Romans (ſaith he) did call ſacred marriages by the word confarreatio, becauſe the

Zea ſiue Spelta.
Spelt Corne.

the Bride and Bridegroome did eate of that *Far* which the Grecians do call ζέα. The ſame thing *Aſclepiades* affirmeth in *Galen*, in his ninth Booke according to the places affected, writing thus; *Farris quod Zea appellant*: that is to ſay, *Far* which is called *Zea*, &c. And this *Far* is alſo named of the Latines, *Ador*, *Adoreum*, and *Semen adoreum*.

¶ *The temper.*

Spelt, as *Dioſcorides* reporteth, nouriſheth more than Barley. *Galen* writeth in his Bookes of the Faculties of ſimple Medicines, Spelt is in all his temperature in a meane betweene Wheat and Barley, and may in vertue be referred to the kindes of Barley and Wheat, being indifferent to them both.

¶ *The vertues.*

The floure or meale of Spelt corne boyled in A
water with the pouder of red Saunders, and a little oyle of Roſes and Lillies, vnto the forme of a Pulteſſe, and applied hot, taketh away the ſwelling of the legs gotten by cold and long ſtanding.

‡ Spelt (ſaith *Turner*) is common about Weiſen- B
burgh in high Almanie, eight Dutch miles on this ſide Strausbourgh: and there all men vſe it for wheat; for there groweth no wheat at all: yet I neuer ſaw fairer and pleaſanter bread in any place in all my life, than I haue eaten there, made onely of this Spelt. The Corne is much leſſe than Wheat, and ſomewhat ſhorter than Rie, but nothing ſo blacke. ‡

Chap. 49. *Of Starch Corne.*

Triticum Amyleum.
Starch Corne.

¶ *The deſcription.*

THis other kind of *Spelta* or *Zea* is called of the Germane Herbariſts *Amyleum Frumentum*, or Starch corne; and is a kinde of grain ſowen to that end, or a three moneths graine, and is very like vnto wheat in ſtalke and ſeed; but the eare thereof is ſet round about, and made vp with two ranks, with certaine beards, almoſt after the manner of Barley, and the ſeed is cloſed vp in chaffie huskes, and is ſowen in the Spring.

¶ *The place.*

Amil corne, or Starch corne is ſowen in Germanie, Polonia, Denmarke, and other thoſe Eaſterne Regions, as well to feed their cattel and pullen with, as alſo to make ſtarch; for the which purpoſe it doth very fitly ſerue.

¶ *The time.*

It is ſowen in Autumne, or the fall of the leafe, and oftentimes in the Spring; and for that cauſe hath beene called *Trimeſtre*, or three months grain: it bringeth his ſeed to ripeneſſe in the beginning of Auguſt, and is ſowen in the Low-Countries in the Spring of the yeare.

¶ *The names.*

Becauſe the Germanes haue great vſe of it to make ſtarch with, they do call it **Amelcorn**: Wee

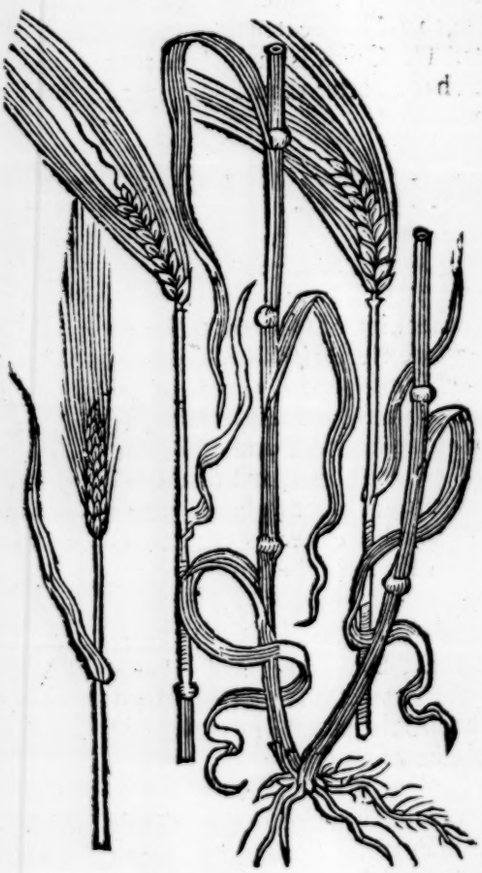
thinke good to name it in Latine *Amyleum frumentum:* in Engliſh it may be called Amelcorne, after the Germane word; and may likewiſe be called Starch Corne. *Tragus* and *Fuchſius* tooke it to be *Triticum trimeſtre*, or three moneths wheat; but it may rather be referred to the *Farra:* for *Columella* ſpeaketh of a graine called *Far Halicaſtrum*, which is ſowen in the Spring; and for that cauſe it is named *Trimeſtre*, or three moneths *Far*. If any be deſirous to learne the making of Starch, let them reade *Dodoneus* laſt edition, where they ſhall be fully taught; my ſelfe not willing to ſpend time about ſo vaine a thing, and not pertinent to the ſtory. It is vſed onely to feed cattell, pullen, and make ſtarch, and is in nature ſomewhat like to wheat or Barley.

Chap. 50. *Of Barley.*

¶ *The deſcription.*

Barley hath an helme or ſtraw which is ſhorter and more brittle than that of Wheat, and hath more joints; the leaues are broader and rougher; the eare is armed with long, rough, and prickly beards or ailes, and ſet about with ſundry rankes, ſometimes two, otherwhiles three, foure, or ſix at the moſt, according to *Theophraſtus*; but eight according to *Tragus*. The graine is included in a long chaffie huske: the roots be ſlender, and grow thicke together. Barley, as *Pliny* writeth, is of all graine the ſofteſt, and leaſt ſubiect to caſualtie, yeelding fruit very quickely and profitably.

1 *Hordeum Diſtichon.*
Common Barley.



2 *Hordeum Polyſtichum vernum.*
Beare Barley, or Barley Big.

1 The moſt vſuall Barley is that which hath but two rowes of Corne in the eare, each graine ſet iuſt oppoſite to other, and hauing his long awne at his end, is couered with a huske ſticking cloſe thereto.

2 This which commonly hath foure rowes of corne in the eare, and ſometimes more, as wee haue formerly deliuered, is not ſo vſually ſowen with vs; the eare is commonly ſhorter than the former, but the graine very like; ſo that none who knowes the former, but may eaſily know the later at the firſt ſight.

¶ *The place.*

They are sowen, as *Columella* teacheth, in loose and dry ground, and are well knowne all Europe through.

2 The second is sowen commonly in some parts of Yorke shire and the Bishopricke of Durham.

¶ *The names.*

1 The first is called of the Grecians κρίθη: in high Dutch, **Gersten:** in Low Dutch, **Gerst:** in Italian, *Orzo:* in Spanish, *Cenada:* in French, *Orge:* in English, Barley.

2 The second is called of the Grecians πολυστιχὸν, and also ἑξαστιχὸν: *Columella* calleth it *Galaticum*; and *Hippocrates*, ἀχλαδὴ κρίθη: of our English Northerne people, Big, and Big Barley. *Crimmon* (saith *Galen* in his Commentaries vpon the second booke of *Hippocrates* his Prognosticks) is the grosser part of Barley meale being grossely ground. Malt is well knowne in England, insomuch that the word needeth no interpretation; notwithstanding because these Workes may chance into the hands of Strangers, that neuer heard of such a word, or such a thing, by reason it is not euerie where made; I thought good to lay downe a word of the making thereof. First, it is steeped in water vntill it swell; then is it taken from the water, and laid (as they terme it) in a Couch; that is, spred vpon an euen floore the thickenesse of some foot and an halfe; and thus is it kept vntill it Come, that is, vntill it send forth two or three little strings or fangs at the end of each Corne: then it is spred vsually twice a day, each day thinner than other, for some eight or ten daies space, vntill it be pretty dry, and then it is dried vp with the heate of the fire, and so vsed. It is called in high Dutch, **Maltz:** in low Dutch, **Mout:** in Latine of later time, *Maltum:* which name is borrowed of the Germanes. *Aetius* a Greeke Physitian nameth Barley thus prepared, βύνη, or *Bine:* The which Author affirmeth, That a plaister of the meale of Malt is profitably laid vpon the swellings of the Dropsie. *Zythum*, as *Diodorus Siculus* affirmeth, is not onely made in Ægypt, but also in Galatia. The aire is so cold (saith he, writing of Galatia) that the country bringeth forth neither wine nor oyle; and therefore men are compelled to make a compound drinke of Barley, which they call *Zythum*. *Dioscorides* nameth one kinde of Barley drinke *Zythum*; another, *Curmi*. *Simeon Zethi* a later Grecian calleth this kind of drinke by an Arabicke name, ϛυκερα: in English we call it Beere and Ale which is made of Barley Malt.

¶ *The temperature.*

Barley, as *Galen* writeth in his booke of the Faculties of nourishments, is not of the same temperature that Wheat is; for Wheat doth manifestly heate, but contrariwise what medicine or bread soeuer is made of Barley, is found to haue a certaine force to coole and drye in the first degree, according to *Galen* in his booke of the faculties of Simples. It hath also a little abstersiue or cleansing qualitie, and doth dry somewhat more than Beane meale.

¶ *The vertues.*

Barley, saith *Dioscorides*, doth cleanse, prouoke vrine, breedeth windinesse, and is an enemie to the stomacke. A

Barley meale boyled in an honied water with figges, taketh away inflammations: with Pitch, Rosin, and Pigeons dung, it softneth and ripeneth hard swellings. B

With Melilot and Poppy seeds it taketh away the paine in the sides: it is a remedy against windinesse in the guts, being applied with Lineseed, Fœnugreeke, and Rue: with tarre, wax, oyle, and the vrine of a yong boy, it doth digest, soften, and ripe hard swellings in the throat, called the Kings Euill. C

Boyled with wine, myrtles, the barke of the pomegranate, wilde peares, and the leaues of brambles, it stoppeth the laske. D

Further, it serueth for *Ptisana*, *Polenta*, *Maza*, Malt, ale, and Beere. The making whereof if any be desirous to learne, let them reade *Lobelius Aduersaria*, in the chapter of Barley. But I thinke our London Beere-Brewers would scorne to learne to make beere of either French or Dutch, much lesse of me that can say nothing therein of mine owne experience more than by the Writings of others. But I may deliuer vnto you a Confection made thereof (as *Columella* did concerning sweet wine sodden to the halfe) which is this; Boyle strong ale till it come to the thickenesse of hony, or the forme of an vnguent or salue, which applied to the paines of the sinewes and joints (as hauing the propertie to abate aches and paines) may for want of better remedies be vsed for old and new sores, if it be made after this manner. E

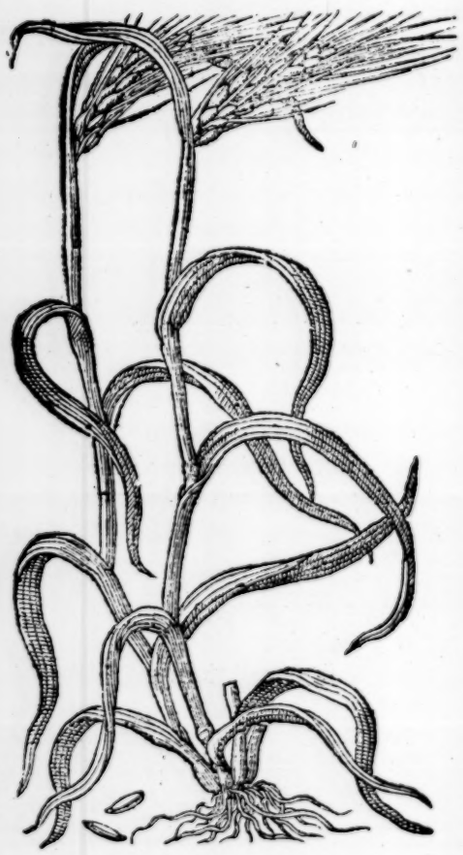
Take strong ale two pound, one Oxe gall, and boyle them to one pound with a soft fire, continually stirring it; adding thereto of Vineger one pound, of *Olibanum* one ounce, floures of Camomil and melilot of each ℥ i. Rue in fine pouder ℥s. a little hony, and a small quantitie of the pouder of Comin seed; boyle them all together to the forme of an vnguent, and so apply it. There be sundry sorts of Confections made of Barley, as *Polenta*, *Ptisana*, made of water and husked or hulled barley, and such like. *Polenta* is the meate made of parched Barley, which the Grecians doe properly F

perly call μᾶζα *Maza* is made of parched Barley tempered with water, after *Hippocrates* and *Xenophon*: *Cyrus* hauing called his ſouldiers together, exhorteth them to drinke water wherein parched Barley hath beene ſteeped, calling it by the ſame name, *Maza*. *Heſychius* doth interpret μᾶζα to be Barley meale mixed with water and oyle.

Barley meale boyled in water with garden Nightſhade, the leaues of garden Poppie, the pouder of Fœnugreeke and Lineſeed, and a little Hogs greaſe, is good againſt all hot and burning ſwellings, and preuaileth againſt the Dropſie, being applied vpon the belly.

Chap. 51. *Of Naked Barley.*

Hordeum nudum.
Naked Barley.



A

¶ *The deſcription.*

Hordeum nudum is called *Zeopyrum*, and *Tritico-Speltum*, becauſe it is like to *Zea*, otherwiſe called *Spelta*, and is like to that which is called French Barley, whereof is made that noble drinke for ſicke Folkes, called *Ptiſana*. The plant is altogether like vnto Spelt, ſauing that the eares are rounder, the eiles or beards rougher and longer, and the ſeed or graine naked without huskes, like to wheat, the which in it's yellowiſh colour it ſomewhat reſembles.

¶ *The place.*

‡ It is ſowne in ſundry places of Germany, for the ſame vſes as Barley is.

¶ *The names.*

It is called *Hordeum Nudum*, for that the Corne is without huske, and reſembleth Barley. In Greeke it is called ζείαπυρος, becauſe it participateth in ſimilitude and nature with *Zea*, that is, Spelt, and *Puros*, (that is) wheat. ‡

¶ *The vertues.*

This Barley boyled in water cooleth vnnaturall and hot burning choler. In vehement feuers you may adde thereto the ſeeds of white Poppie and Lettuſe, not onely to coole, but alſo to prouoke ſleepe.

B Againſt the ſhortneſſe of the breath, and paines of the breſt, may be added to all the foreſaid, figs, raiſins of the Sunne, liquorice, and Anniſe ſeed.

C Being boyled in the Whay of Milke, with the leaues of Sorrell, Marigolds, and Scabious, it quencheth thirſt, and cooleth the heate of the inflamed Liuer, being drunke firſt in the morning, and laſt to bedward.

Chap.

Hordeum Spurium.
Wall Barley.

CHAP. 52.

Of Wall Barley.

¶ *The deſcription.*

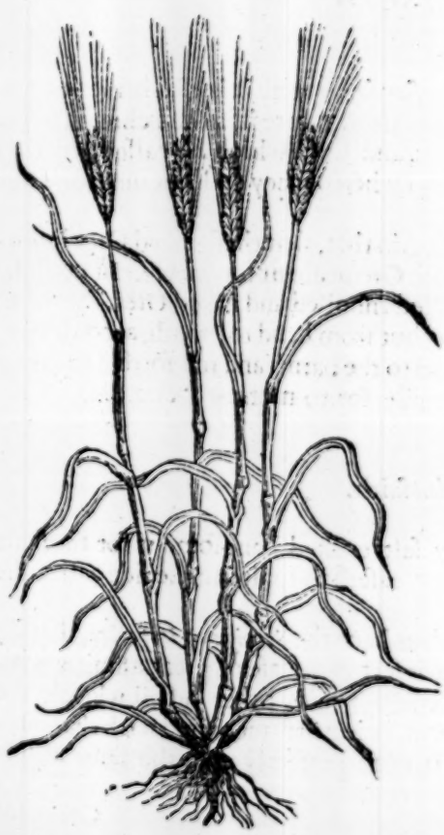
THis kinde of wilde Barley, called of the Latines *Hordeum Spurium*; is called of *Pliny*, *Holcus*; in Engliſh, Wall Barley, Way Barley, or after old Engliſh Writers, Way Bennet. It groweth vpon mud walls and ſtony places by the wayes ſides; very well reſembling Selfe-ſowed Barley, yet the blades are rather like graſſe than Barley. ‡ This groweth ſome foot and better in height, with graſſie leaues, the eare is very like that of Rie, and the corne both in colour and ſhape abſolutely reſembles it; ſo that it cannot be fitlier named than by calling it wilde Rie, or Rie graſſe. ‡

¶ *The vertues.*

This Baſtard wilde Barley ſtamped and applied vnto places wanting haire, doth cauſe it to grow and come forth; whereupon in old time it was called *Riſtida.* A

CHAP. 53. *Of Saint Peters Corne.*

1 *Brizamonococcos.* S. Peters Corne.



2 *Feſtuca Italica.* Hauer Graſſe.

¶ *The*

¶ *The deſcription.*

† 1 BRiza is a Corne whoſe leaues, ſtalkes, and eares are leſſe than Spelt; the eare reſembles our ordinary Barley, the corne growing in two rowes, with awnes at the top, and huskes vpon it not eaſily to be gotten off. In colour it much reſembles barley; yet *Tragus* ſaith it is of a blackiſh red colour.

2 This *Ægilops* in leaues and ſtalkes reſembles wheat or barley, and it growes ſome two handfuls high, hauing a little eare or two at the top of the ſtalke, wherein are incloſed two or three ſeeds a little ſmaller than Barley, hauing each of them his awne at his end. Theſe ſeeds are wrapped in a creſted filme or skinne, out of which the awnes put themſelues forth.

Matthiolus ſaith, That he by his owne triall hath found this to be true, That as *Lolium*, which is our common Darnel, is certainly knowne to be a ſeed degenerate from wheat, being found for the moſt part among wheat, or where wheat hath been: ſo is *Feſtuca* a ſeed or grain degenerating from barley, and is found among Barley, or where barley hath beene.

‡ ¶ *The place.*

1 Briza is ſowen in ſome parts of Germany and France; and my memorie deceiues me if I haue not often times found many eares thereof amongſt ordinarie barley, when as I liued in the further ſide of Lincolneſhire, and they there called it Brant Barley.

2 This *Ægilops* growes commonly amongſt their Barley in Italy and other hot countries. ‡

¶ *The names.*

1 *Briza Monococcos*, after *Lobelius*, is called by *Tabernamontanus*, *Zea Monococcos*: in Engliſh, Saint *Peters* Corne, or Brant Barley.

2 *Feſtuca* of Narbone in France is called Αἰγίλωψ: in Latine, *Ægilops Narbonenſis*, according to the Greeke: in Engliſh, Hauer-graſſe.

¶ *The nature.*

They are of qualitie ſomewhat ſharpe, hauing facultie to digeſt.

¶ *The vertues.*

A The iuice of *Feſtuca* mixed with Barley meale dried, and at times of need moiſtned with Roſe water, applied plaiſterwiſe, healeth the diſeaſe called *Ægilops*, or Fiſtula in the corner of the eye: it mollifieth and diſperſeth hard lumps, and aſſwageth the ſwellings in the joynts.

Chap. 54. *Of Otes.*

¶ *The deſcription.*

1 *Auena Veſca*, Common Otes, is called *Veſca, à Veſcendo*, becauſe it is vſed in many countries to make ſundry ſorts of bread, as in Lancaſhire, where it is their chiefeſt bread corne for Iannocks, Hauer cakes, Tharffe cakes, and thoſe which are called generally Oten cakes; and for the moſt part they call the graine Hauer, whereof they do likewiſe make drink for want of Barley.

2 *Auena Nuda* is like vnto the common Otes; differing in that, that theſe naked Otes immediately as they be threſhed, without helpe of a Mill become Otemeale fit for our vſe. In conſideration whereof in Northfolke and Southfolke they are called vnhulled and naked Otes. Some of thoſe good houſe-wiues that delight not to haue any thing but from hand to mouth, according to our Engliſh prouerbe, may (whiles their pot doth ſeeth) go to the barne, and rub forth with their hands ſufficient for that preſent time, not willing to prouide for to morrow, according as the Scripture ſpeaketh, but let the next day bring with it.

¶ *The nature.*

Otes are dry and ſomewhat cold of temperature, as *Galen* ſaith.

¶ *The vertues.*

A Common Otes put into a linnen bag, with a little bay ſalt quilted handſomely for the ſame purpoſe, and made hot in a frying pan, and applied very hot, eaſeth the paine in the ſide called the ſtitch, or collicke in the belly.

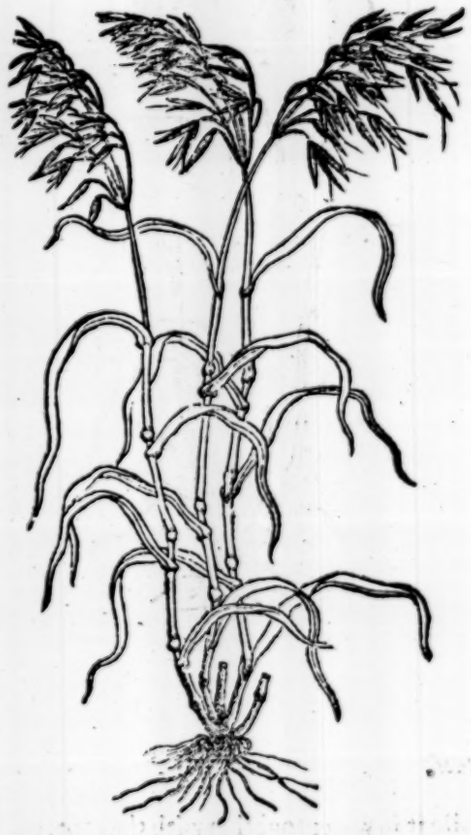
B If Otes be boyled in water, and the hands or feet of ſuch as haue the *Serpigo* or *Impetigo*, that is, certaine chaps, chinks, or rifts in the palmes of the hands or feet (a diſeaſe of great affinitie with the pocks) be holden ouer the fume or ſmoke thereof in ſome bowle or other veſſell wherein the Otes are put, and the Patient couered with blankets to ſweat, being firſt annointed with that ointment or vnction vſually applied *contra Morbum Gallicum*: it doth perfectly cure the ſame in ſixe times ſo annointing and ſweating.

Otemeale

Otemeale is good for to make a faire and wel coloured maid to looke like a cake of tallow, especially if she take next her stomacke a good draught of strong vineger after it. C

Otemeale vsed as a Cataplasme dries and moderately discusses, and that without biting; for it hath somewhat a coole temper, with some astriction, so that it is good against scourings. D

1 *Auena Vesca.*
Common Otes.



2 *Auena Nuda.*
Naked Otes.

CHAP. 55. *Of Wilde Otes.*

The description.

1 *Bromos sterilis*, called likewise *Auena fatua*, which the Italians do call by a very apt name *Vena vana*, and *Auena Cassa*, (in English, Barren Otes, or wilde Otes) hath like leaues and stalkes as our Common Otes; but the heads are rougher, sharpe, many little sharpe huskes making each eare.

† 2 There is also another kinde of *Bromos* or wilde Otes, which *Dodoneus* calleth *Festuca altera*, not differing from the former wilde Otes in stalkes and leaues, but the heads are thicker, and more compact, each particular eare (as I may terme it) consisting of two rowes of seed handsomly compact and ioyned together; being broader next the straw, and narrower as it comes to an end.

‡ ¶ *The time and place.*

‡ The first in Iuly and August may be found almost in euery hedge, the later is to be found in great plenty in most Ric.

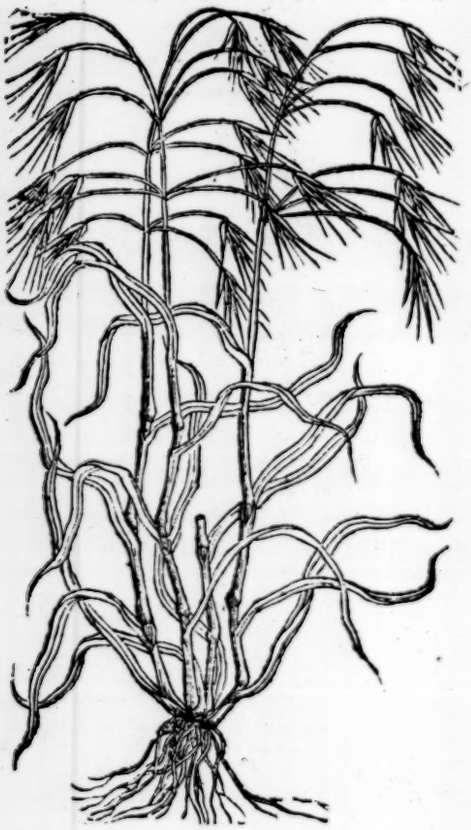
¶ *The names.*

1 This is called in Greeke βρῶμος ἄγριος: in Latine, *Bromos stirilis* by *Lobell*: *Ægylops prima* by *Matthiolus*: in English, Wilde-Otes, or Hedge-Otes.

2 *Lobell* calls this *Bromos sterilis altera*: *Dodonæus* termes it *Festuca altera*: in Brabant they call it **Drauich**: in English, Drauke.

1 *Bromes*

1 *Bromos ſterilis.*
Wilde Otes.



2 *Bromos altera.*
Drauke, or ſmall wilde Otes.

¶ *The nature and vertues.*

A 1 It hath a drying facultie (as *Dioſcorides* ſaith.) Boile it in water together with the roots vntill two parts of three be conſumed; then ſtraine it out, and adde to the decoction a quantitie of honey equall thereto: ſo boile it vntill it acquire the thickneſſe of thin honey. This medicine is good againſt the *Ozæna* and filthy vlcers of the noſe, dipping a linnen cloth therein, and putting it vp into the noſthrils; ſome adde thereto Aloes finely poudred, and ſo vſe it.

B Alſo boiled in Wine with dried Roſe leaues, it is good againſt a ſtinking breath. ☙

Chap. 56. *Of Bearded Wilde Otes.*

¶ *The deſcription.*

Æ*Gylops Bromoides Belgarum* is a Plant indifferently partaking of the nature of *Ægilops* and *Bromos*. It is in ſhew like to the naked Otes. The ſeed is ſharpe, hairy, and ſomewhat long, and of a reddiſh colour, incloſed in yellowiſh chaffie huskes like as Otes, and may be Engliſhed, Creſted or bearded Otes. I haue found it often among Barley and Rie in ſundry grounds. This is likewiſe vnprofitable and hurtfull to Corne; whereof is no mention made by the Antients worthy the noting.

1 *Ægylops*

† *Ægilops Bromoides.*
Bearded Wilde Otes.

CHAP. 57. *Of Burnt Corne.*

¶ *The description.*

1 *Hordeum vstum*, or *Vstilago Hordei*, is that burnt or blasted Barley which is altogether vnprofitable and good for nothing, an enemy vnto corne; for that in stead of an eare with corne, there is nothing else but blacke dust, which spoileth bread, or whatsoeuer is made thereof.

2 Burnt Otes, or *Vstilago Auenæ*, or *Auenacea*, is likewise an vnprofitable Plant, degenerating from Otes, as the other from Barley, Rie, and Wheat. It were in vaine to make a long harueſt of such euill corne, considering it is not possessed with one good qualitie. And therefore thus much shall suffice for the description.

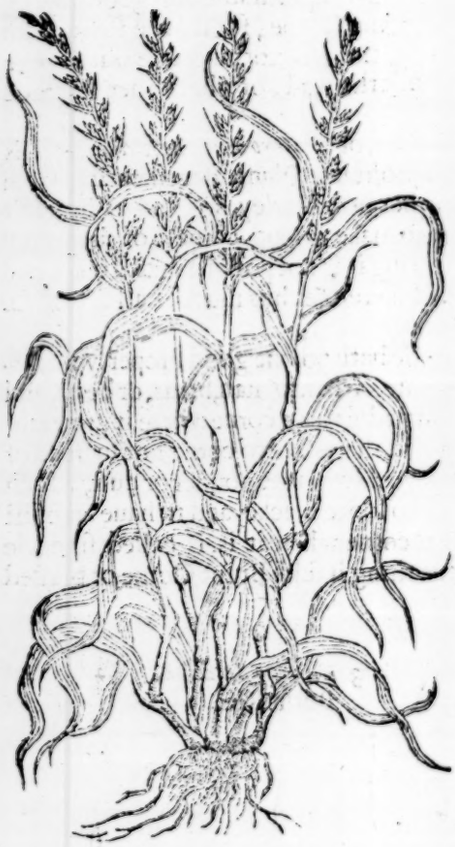
3 Burnt Rie hath no one good property in phisicke, appropriate either to man, birds, or beast, and is a hurtfull maladie to all corne where it groweth, hauing an eare in shape like to corne, but in stead of graine it doth yeeld a blacke pouder or dust, which causeth bread to looke blacke, and to haue an euill taste: and that corne where it is, is called smootie corne, and the thing it selfe Burnt Corne, or blasted corne.

1 *Hordeum vstum, siue vstilago hordei.* Burnt Barley. 2 *Vstilago Auenacea.* Burnt Otes.

3 *Vstilago Secalina.*
Burnt Rie.

Chap. 58. *Of Darnell.*

1 *Lolium album.*
White Darnell.



2 *Lolium rubrum.*
Red Darnell.

¶ *The deſcription.*

1 AMong the hurtfull weeds Darnell is the firſt. It bringeth forth leaues or ſtalkes like thoſe of wheat or barley, yet rougher, with a long eare made vp of many little ones, euery particular one whereof containeth two or three graines leſſer than thoſe of wheat, ſcarcely any chaffie huske to couer them with; by reaſon whereof they are eaſily ſhaken out and ſcattered abroad.

2 Red Darnell is likewiſe an vnprofitable corne or graſſe, hauing leaues like barly. The joints of the ſtraw or ſtalke are ſometimes of a reddiſh colour, bearing at the top a ſmall and tender eare, flat, and much in forme reſembling the former.

¶ *The place.*

They grow in fields among wheat and barley, of the corrupt and bad ſeed, as *Galen* ſaith, eſpecially in a moiſt and dankiſh ſoile.

¶ *The time.*

They ſpring and flouriſh with the corne, and in Auguſt the ſeed is ripe.

¶ *The names.*

1 Darnell is called in Greeke, αἶρα: in the Arabian Tongue, *Zizania* and *Sceylen*: In French, *Yuray*: in Italian, *Loglio*: in low Dutch, **Dolick**: in Engliſh, Darnell: of ſome, Iuray, and Raye: and of ſome of the Latines, *Triticum temulentum*.

2 Red Darnell is called in Greeke φοῖνιξ, or *Phœnix*, becauſe of the crimſon colour: in Latine, *Lolium Rubrum*, and *Lolium Murinum*: of ſome, *Hordeum Murinum*, and *Triticum Murinum*: in Dutch, **Wuyſe cozen**: in Engliſh, Red Darnell, or great Darnell Graſſe.

¶ *The temperature.*

Darnell is hot in the third degree, and dry in the ſecond. Red Darnell drieth without ſharpeneſſe, as *Galen* ſaith.

¶ *The*

¶ *The vertues.*

The seed of Darnell, Pigeons dung, oile Oliue, and pouder of Lineseed, boiled to the forme of a plaister, consume wennes, hard lumpes, and such like excrescenses in any part of the body. A

The new bread wherein Darnel is, eaten hot, causeth drunkennesse: in like manner doth beere or ale wherein the seed is fallen, or put into the Malt. B

Darnell taken with red wine stayeth the flux of the belly, and the ouermuch flowing of womens termes. C

Dioscorides saith, That Darnell meale doth stay and keepe backe eating sores, Gangrenes, and putrified vlcers; and being boyled with Radish roots, salt, brimstone, and vineger, it cureth spreading scabs, and dangerous tetters, called in Greeke, λειχῆνες, and leprous or naughty scurfe. D

The seed of Darnell ginen in white or Rhenish wine, prouoketh the flowers or menses. E

A fume made thereof with parched barly meale, myrrh, saffron, and frankinsence, made in form of a pultesse, and applied vpon the belly, helps conception, and causeth easie deliuerance of childbearing. F

Red Darnell (as *Dioscorides* writeth) being drunke in sowre or harsh red Wine, stoppeth the laske, and the ouermuch flowing of the flowers or menses, and is a remedie for those that pisse in bed. G

¶ *The danger.*

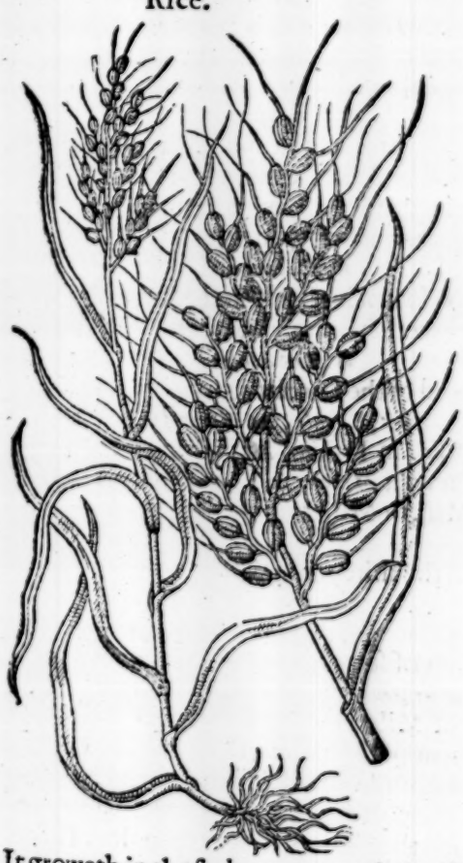
Darnell hurteth the eyes, and maketh them dim, if it happen in corne either for bread or drinke: which thing *Ouid* in his first booke *Fastorum* hath mentioned, in this verse:

Et careant lolijs oculos vitiantibus agri.

And hereupon it seemeth that the old prouerbe came, That such as are dimme sighted should be said, *Lolio victitare.*

CHAP. 59. *Of Rice.*

Oryza.
Rice.



¶ *The description.*

RIce is like vnto Darnell in shew, as *Theophrastus* saith: it bringeth not forth an eare, like corne, but a certaine mane or plume, as Mill, or Millet, or rather like Panick. The leaues, as *Pliny* writeth, are fat and full of substance, like to the blades of leeks, but broader: but (if neither the soile nor climate did alter the same) the plants of Rice that did grow in my garden had leaues soft and grassie like barly. The floure did not shew it selfe with me, by reason of the iniurie of our vnseasonable yere 1596. *Theophrastus* concludeth, that it hath a floure of a purple colour. But, saith my Author, Rice hath leaues like vnto Dogs grasse or Barley, a small straw or stem full of ioynts like corne: at the top whereof groweth a bush or tuft farre vnlike to barley or Darnell, garnished with round knobs like small gooseberries, wherein the seed or graine is contained: euery such round knob hath one small rough aile, taile, or beard like vnto barley hanging thereat. *Aristobulus*, as *Strabo* reporteth, sheweth, That Rice growes in water in Bactria, and neere Babylon, and is two yards high, and hath many eares, and bringeth forth plenty of seed. It is reaped at the setting of the seuen starres, and purged as Spelt and Otemeale, or hulled as French Barley.

¶ *The place.*

It groweth in the territories of the Bactrians, in Babylon, in Susium, and in the lower part of Syria. It groweth in those dayes not onely in those countries before named, but also in the fortunate Islands, and in Spaine, from whence it is brought vnto vs, purged and prepared as we see, after the manner of French Barley. It prospereth best in fenny and waterish places.

¶ *The time.*

It is ſowen in the Spring in India, as *Eratoſthenes* witneſſeth, when it is moiſtned with Sommer ſhowers.

¶ *The names.*

The Grecians call it ὄρυζα, or as *Theophraſtus* ſaith, ὄρυζον: the Latines keepe the Greeke word *Oryza*: in French it is called *Riz*: in the Germane tongue, Reiß, and Rys: in Engliſh, Rice.

¶ *The temperature and vertues.*

Galen ſaith, That all men vſe to ſtay the belly with this graine, being boiled after the ſame manner that *Chondrus* is. In England we vſe to make with milke and Rice a certaine food or pottage, which doth both meanly binde the belly, and alſo nouriſh. Many other good kindes of food is made with this graine, as thoſe that are skilfull in cookerie can tell.

Chap. 60. *Of Millet.*

Milium.
Mill, or Millet.

¶ *The deſcription.*

Milium riſeth vp with many hairy ſtalkes knotted or jointed like wheat. The leaues are long, and like the leaues of the Common Reed. It bringeth forth on the top of the ſtalke a ſpoky buſh or mane, called in Greeke φοῖνιξ, like the plume or feather of the Pole reed, hanging downewards, of colour for the moſt part yellow or white; in which groweth the ſeed, ſmall, hard, and gliſtering, couered with a few thinne huskes, out of which it eaſily falleth. The roots be many, and grow deep in the ground.

2 *Milium nigrum* is like vnto the former, ſauing that the eare or plume of this plant is more looſe and large, and the ſeed ſomewhat bigger, of a ſhining blacke colour.

¶ *The place.*

It loueth light and looſe mould, and proſpereth beſt in a moiſt and rainy time. And after *Columella*, it groweth in greateſt aboundance in Campania. I haue of it yearely in my garden.

¶ *The time.*

It is to be ſowen in Aprill and May, and not before, for it ioyeth in warme weather.

¶ *The names.*

It is named of the Grecians, μελίνη: of ſome, μελίνις: and of *Hippocrates*, *Paſpale*, as *Hermolaus* ſaith: In Spaniſh, *Mijo*: in Italian, *Miglio*: in High-Dutch, Hirz: in French, *Millet*: in Low-Dutch, Hirs: in Engliſh, Mill, or Millet.

¶ *The temper.*

It is cold in the firſt degree, as *Galen* writeth, and dry in the third, or in the later end of the ſecond, and is of a thinne ſubſtance.

¶ *The vertues.*

A The meale of Mill mixed with tarre is laid to the bitings of ſerpents, and all venomous beaſts.

B There is a drinke made hereof bearing the name of *Sirupus Ambroſij*, or *Ambroſe* his ſyrup, which procureth ſweat, and quencheth thirſt, vſed in the city of Milan in Tertian agues. The receit whereof *Henricus Raniſzonius* in his booke of the gouernment of health ſetteth downe in this manner: Take (ſaith he) of vnhusked Mill a ſufficient quantitie, boile it till it be broken; then take fiue ounces of the hot decoction, and adde thereto two ounces of the beſt white wine, and ſo giue it hot vnto the patient, being well couered with clothes, and then he will ſweat throughly. This is likewiſe commended by *Iohannes Heurneus*, in his booke of Practiſe.

C Millet parched, and ſo put hot into a linnen bag, and applied, helpes the griping paines of the belly, or any other paine occaſioned by cold.

Chap.

CHAP. 61. *Of Turkie Corne.*

1 *Frumentum Aſiaticum.*
Corne of Aſia.

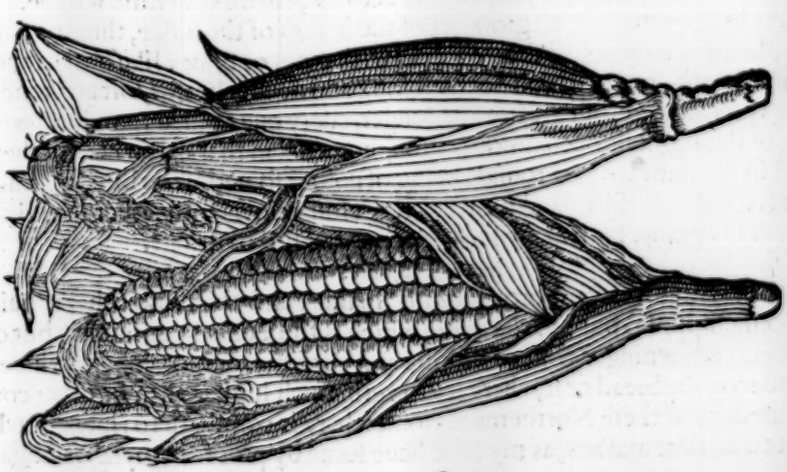
2 *Frumentum Turcicum,*
Turkie Corne.

¶ *The kindes.*

OF Turkie cornes there be diuers ſorts, notwithſtanding of one ſtocke or kindred, conſiſting of ſundry coloured graines, wherein the difference is eaſie to be diſcerned, and for the better explanation of the ſame, I haue ſet forth to your view certaine eares of different colours, in their full and perfect ripeneſſe, and ſuch as they ſhew themſelues to be when their skinne or filme doth open it ſelfe in the time of gathering.

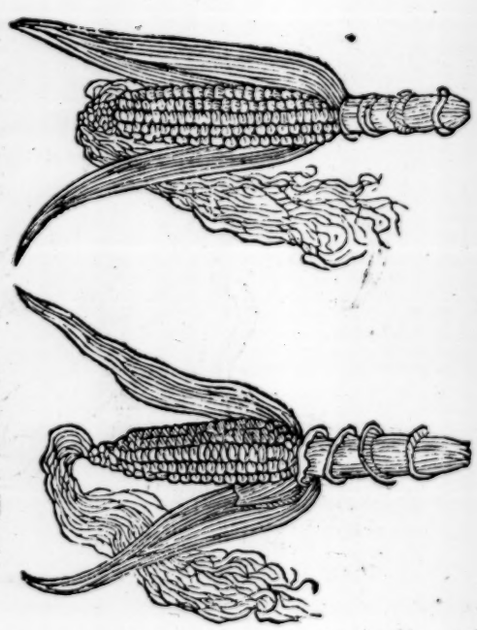
The forme of the eares of Turky Wheat.

3 *Frumenti Indici ſpica.*
Turkie wheat in the huske, as alſo naked or bare.



¶ *The deſcription.*

1 Corne of Aſia beareth a long great ſtem or ſtalke, couered with great leaues like the great Cane reed, but much broader, and of a darke browniſh colour towards the bottome: at the top of the ſtalkes grow idle or barren tufts like the common Reed, ſometimes of one colour, and ſometimes of another. Thoſe eares which are fruitfull do grow vpon the ſides of the ſtalkes, among the leaues, which are thicke and great, ſo couered with skins or filmes, that a man cannot ſee them vntill ripeneſſe haue diſcouered them. The graine is of ſundrie colours, ſometimes red, and ſometimes white, and yellow, as my ſelfe haue ſeene in myne owne garden, where it hath come to ripeneſſe.



5 *Frumentum Indicum rubrum.* Red Turky wheat.

4 *Frumentum Indicum luteum.* Yellow Turky wheat.

6 *Frumentum Indicum cæruleum.* Blew Turky wheat.

2 The ſtalke of Turky Wheat is like that of the Reed, full of ſpongie pith, ſet with many ioynts, fiue or ſix foot high, bigge beneath, and now and then of a purple colour, and by little and little ſmall aboue: the leaues are broad, long, ſet with vaines like thoſe of the Reed. The eares on the top of the ſtalke be a ſpanne long, like vnto the feather top of the common Reed, diuided into many plumes hanging downward, empty and barren without ſeed, yet blooming as Rie doth. The floure is either white, yellow, or purple, that is to ſay, euen as the fruit will be. The Fruit is contained in very bigge eares, which grow out of the ioynts of the ſtalke, three or foure from one ſtalke, orderly placed one aboue another, couered with cotes or filmes like huskes and leaues, as if it were a certaine ſheath; out of which do ſtand long and ſlender beards, ſoft and tender, like thoſe laces that grow vpon Sauorie, but greater and longer, euery one faſtned vpon his owne ſeed. The ſeeds are great, of the bigneſſe of common peaſon, cornered in that part whereby they are faſtned to the eare, and in the outward part round: being of colour ſometimes white, now and then yellow, purple, or red; of taſte ſweet and pleaſant, very cloſely ioyned together in eight or tenne orders or rankes. This graine hath many roots, ſtrong, and full of ſtrings.

¶ *The place.*

Theſe kindes of graine were firſt brought into Spaine, and then into other prouinces of Europe: not (as ſome ſuppoſe) out of Aſia *minor*, which is the Turks Dominions, but out of America and the Iſlands adioyning, as out of Florida and Virginia, or Norembega, where they vſe to ſow or ſet it, and to make bread of it, where it groweth much higher than in other countries. It is planted in the gardens of theſe Northerne regions, where it commeth to ripeneſſe when the ſommer falleth out to be faire and hot, as my ſelfe haue ſeene by proofe in myne owne garden.

¶ *The*

¶ *The time.*

It is ſowen in theſe countries in March and Aprill, and the fruit is ripe in September.

¶ *The names.*

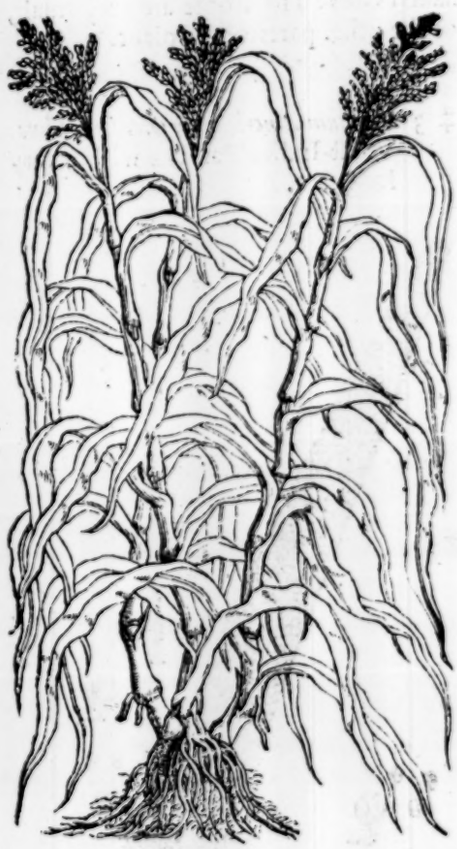
† Turky wheat is called of ſome *Frumentum Turcicum*, and *Milium Indicum*, as alſo *Maizum*, and *Maiz*, or *Mays*. It in all probabilitie was vnknowne to the antient both Greeke and Latine Authors. In Engliſh it is called Turky corne, and Turky wheat. The Inhabitants of America and the Iſlands adioyning, as alſo of the Eaſt and Weſt Indies, do call it *Mais*: the Virginians, *Pagatowr*.

¶ *The temperature and vertues.*

Turky wheat doth nouriſh far leſſe than either wheat, rie, barley, or otes. The bread which is made thereof is meanly white, without bran: it is hard and dry as Biſket is, and hath in it no clammineſſe at all; for which cauſe it is of hard digeſtion, and yeeldeth to the body little or no nouriſhment; it ſlowly deſcendeth, and bindeth the belly, as that doth which is made of Mill or Panick. We haue as yet no certaine proofe or experience concerning the vertues of this kinde of Corne; although the barbarous Indians, which know no better, are conſtrained to make a vertue of neceſſitie, and thinke it a good food: whereas we may eaſily iudge, that it nouriſheth but little, and is of hard and euill digeſtion, a more conuenient food for ſwine than for men.

CHAP. 62. *Of Turkie Millet.*

Sorghum.
Turky Millet.



¶ *The deſcription.*

TVrky Millet is a ſtranger in England. It hath many high ſtalkes, thicke, and jointed commonly with ſome nine ioynts, beſet with many long and broad leaues like Turky Wheat: at the top whereof groweth a great and large tuft or eare like the great Reed. The ſeed is round and ſharpe pointed, of the bigneſſe of a Lentill, ſometimes red, and now and then of a fuller blacke colour. It is faſtned with a multitude of ſtrong ſlender roots like vnto threds: the whole plant hath the forme of a Reed: the ſtalkes and eares when the ſeed is ripe are red.

¶ *The place.*

It ioyeth in a fat and moiſt ground: it groweth in Italy, Spaine, and other hot regions.

¶ *The time.*

This is one of the Sommer graines, and is ripe in Autumne.

¶ *The names.*

The Millanois and other people of Lombardy call it *Melegua*, and *Melega*: in Latine, *Melica*: in Hetruria, *Saggina*: in other places of Italy, *Sorgho*: in Portugal, *Milium Saburrum*: in Engliſh, Turky Mill, or Turky Hirſſe.

‡ This ſeemes to be the *Milium* which was brought into Italy out of India, in the reigne of the Emperour *Nero*: the which is deſcribed by *Pliny*, *lib.* 18. *cap.* 7. ‡

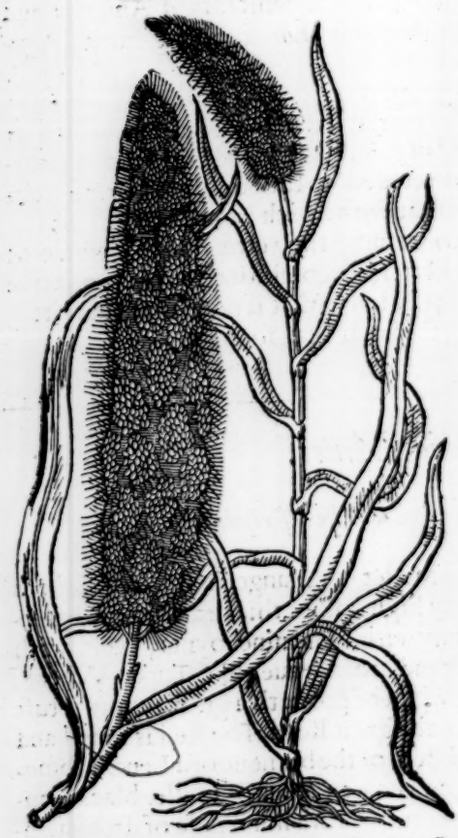
¶ *The temperature and vertues.*

The ſeed of Turky Mill is like vnto Panicke in taſte and temperature. The country People ſometimes make bread hereof, but it is brittle, and of little nouriſhment, and for the moſt part it ſerueth to fatten hens and pigeons with.

CHAP.

Chap. 63. *Of Panick.*

1 *Panicum Indicum*
Indian Panick.



2 *Panicum Cæruleum.* Blew Panicke.

¶ *The kindes.*

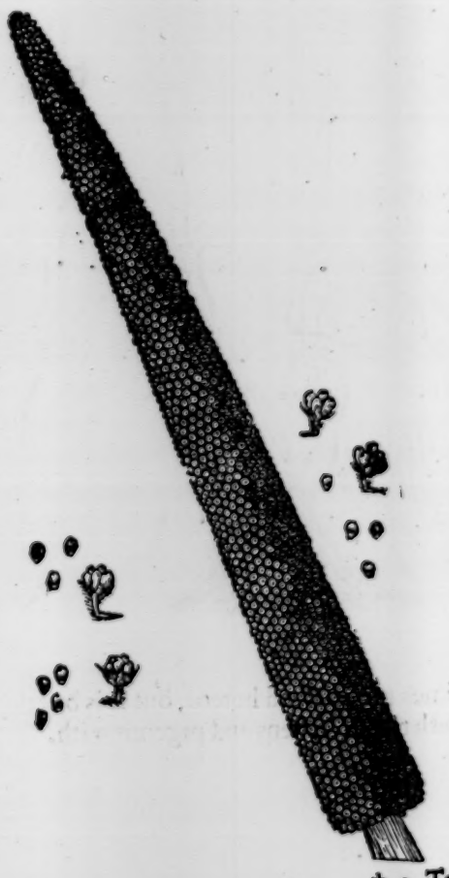
THere be ſundry ſorts of Panicke, although of the Antients there haue beene ſet downe but two, that is to ſay, the wilde or field Panicke, and the garden or manured Panicke.

¶ *The deſcrip tin.*

1 THe Panick of India groweth vp like Millet, whoſe ſtraw is knotty, or full of ioynts; the eares be round, and hanging downward, in which is contained a white or yellowiſh ſeed, like Canarie ſeed, or *Alpiſti*.

2 Blew Panick hath a reddiſh ſtalke like to Sugar cane, as tall as a man, thicker than a finger, full of a fungous pith, of a pale colour: the ſtalkes be vpright and knotty; theſe that grow neere the root are of a purple colour: on the top of the ſtalk commeth forth a ſpike or eare like the water Cats Taile, but of a blew or purple colour. The Seed is like to naked Otes: The Roots are very ſmall, in reſpect of the other parts of the plant.

‡ 3 *Panicum Americanum ſpica longiſſimo.*
Weſt-Indian Panicke with a very long eare.



‡ 3 To

‡ 3 To theſe may be added another Weſt-Indian Panicke, ſent to *Cluſius* from M. *Iames Garret* of London. The eare hereof was thicke, cloſe, compact and made Taper-faſhion, ſmaller at the one end than at the other; the length thereof was more than a foot & halfe. The ſhape of the ſeed is much like the laſt deſcribed, but that many of them together are contained in one hairie huske, which is faſtned to a very ſhort ſtalke, as you may ſee repreſented apart by the ſide of the figure ‡

4 *Panicum vulgare.*
Common or Germane Panicke.

5 *Panicum ſylueſtre.*
Wild Panicke.

4 Germane Panicke hath many hairy roots growing thicke together like vnto wheat, as is all the reſt of the plant, as well leaues or blades, as ſtraw or ſtalke. The eare groweth at the top ſingle, not vnlike to Indian Panicke, but much leſſer. The graines are contained in chaffie ſcales, red declining to tawny.

5 The wilde Panicke groweth vp with long reeden ſtalkes, full of ioynts, ſet with long leaues like thoſe of *Sorghum*, or Indian Panicke: the tuft or feather-like top is like vnto the common reed, or the eare of the graſſe called *Iſchæmon*, or *Manna* graſſe. The root is ſmall and threddy.

¶ *The place and time.*

The kindes of Panick are ſowen in the Spring, and are ripe in the beginning of Auguſt. They proſper beſt in hot and dry Regions, and wither for the moſt part with much watering, as doth Mil and Turky wheat: they quickly come to ripeneſſe, and may be kept good a long time.

¶ *The names.*

Panick is called in Greeke [illegible], and [illegible] *Diocles* the Phyſition nameth it *Mel Frugum*: the Spaniards, *Panizo*: the Latines, *Panicum*, of *Pannicula*: in Engliſh, Indian Panicke, or Otemeale.

¶ *The temperature.*

Panicks nouriſh little, and are driers, as *Galen* ſaith.

¶ *The vertues.*

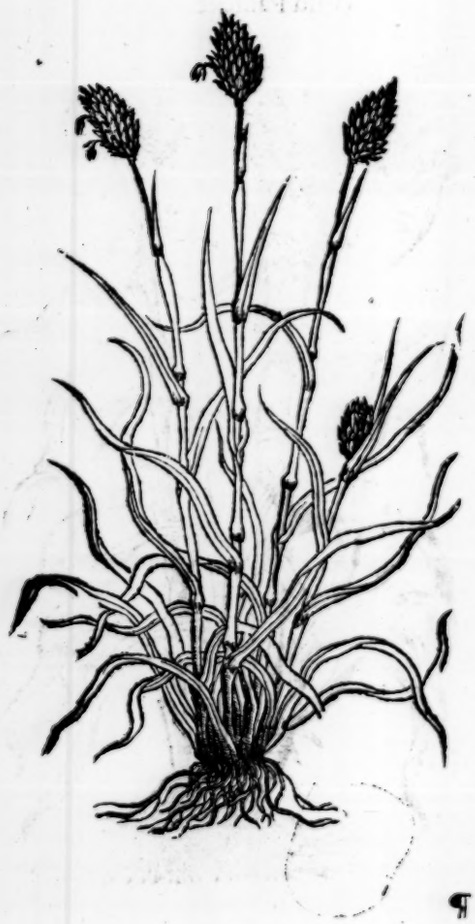
Panicke ſtoppeth the laske, as Millet doth, being boyled (as *Pliny* reporteth) in Goats milke, and drunke twice in a day. Outwardly in Pulteſſes or otherwiſe, it dries and cooles. A

Bread made of Panick nouriſheth little, and is cold and dry, very brittle, hauing in it neither clammineſſe nor fatneſſe; and therefore it drieth a moiſt belly. B

Chap.

Chap. 64. *Of Canary ſeed, or Pety Panicke.*

1 *Phalaris.*
Canarie ſeed.



2 *Phalaris pratenſis.*
Quaking graſſe.

¶ *The deſcription.*

1 CAnarie ſeed, or Canarie graſſe after ſome, hath many ſmall hairy roots, from which ariſe ſmall ſtrawie ſtalkes ioynted like corne, whereupon do grow leaues like thoſe of Barley, which the whole plant doth very well reſemble. The ſmall chaffie eare groweth at the top of the ſtalke, wherein is contained ſmall ſeeds like thoſe of Panicke, of a yellowiſh colour, and ſhining.

2 Shakers, or Quaking Graſſe groweth to the height of halfe a foot, and ſometimes higher, when it groweth in fertile medowes. The ſtalke is very ſmall and benty, ſet with many graſſie leaues like the common medow graſſe, bearing at the top a buſh or tuft of flat ſcaly pouches, like thoſe of Shepheards purſe, but thicker, of a browne colour, ſet vpon the moſt ſmall and weake hairy foot ſtalkes that may be found, whereupon thoſe ſmall pouches do hang: by meanes of which ſmall hairy ſtrings, the knaps which are the floures do continually tremble and ſhake, in ſuch ſort that it is not poſſible with the moſt ſtedfaſt hand to hold it from ſhaking.

‡ 3 There is alſo another Graſſie plant which may fitly be referred to theſe: the leaues and ſtalkes reſemble the laſt deſcribed, but the heads are about the length and bredth of a ſmall Hop, and handſomely compact of light ſcaly filmes much like thereto; whence ſome haue termed it *Gramen Lupuli glumis.* The colour of this pretty head when it commeth to ripeneſſe is white. ‡

¶ *The place.*

1 Canarie ſeed groweth naturally in Spaine, and alſo in the Fortunate or Canary Iſlands, and doth grow in England or any other of theſe cold Regions, if it be ſowen therein.

2 Quaking

3 *Phalaris pratenſis altera.*
Pearle Graſſe.

2 Quaking *Phalaris* groweth in fertile paſtures, and in dry medowes.

3 This growes naturally in ſome parts of Spaine, and it is ſowen yearely in many of our London Gardens.

¶ *The time.*

1 3 Theſe Canarie ſeeds are ſowen in May, and are ripe in Auguſt.

¶ *The names.*

1 Canary ſeed, or Canarie corne is called of the Grecians, Φαλαρὶς: the Latines retaining the ſame name *Phalaris*: in the Iſlands of Canarie, *Alpiſti*: in Engliſh, Cana rie ſeed, and Canary graſſe.

2 *Phalaris pratenſis* is called alſo *Gramen tremulum*: in Cheſhire about Nantwich, Quakers and Shakers: in ſome places, Cow-quakes.

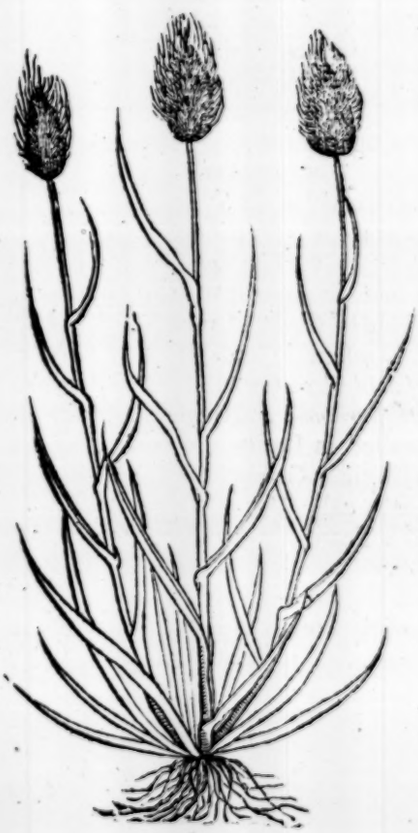
3 This by ſome is termed *Phalaris altera*: *Cluſius* calleth it *Gramen Amourettes majus*: *Bauhine, Gramen tremulum maximum*: In Engliſh they call it Pearle-Graſſe, and Garden-Quakers.

¶ *The nature and vertues.*

I finde not any thing ſet downe as touching the temperature of *Phalaris*, notwithſtanding it is thought to be of the nature of Millet.

The iuyce and ſeed, as *Galen* ſaith, are thought to be profitably drunke againſt the paines of the bladder. Apothecaries for want of Millet doe vſe the ſame with good ſucceſſe in fomentations; for in dry fomentations it ſerueth in ſtead thereof, and is his *ſuccedaneum*, or *quid pro quo*. We vſe it in England alſo to feed the Canarie Birds. A

Alopecuros.
Fox-taile.



CHAP. 65.

Of Fox-Taile.

¶ *The deſcription.*

1 FOx-taile hath many graſſie leaues or blades, rough and hairy, like vnto thoſe of Barley, but leſſe and ſhorter. The ſtalke is likewiſe ſoft and hairy; whereupon doth grow a ſmall ſpike or eare, ſoft, and very downy, briſtled with very ſmall haires in ſhape, like vnto a Fox-taile, whereof it tooke his name, which dieth at the approch of Winter, and recouereth it ſelfe the next yeare by falling of his ſeed.

‡ There is one or two varieties of this Plant in the largeneſſe and ſmalneſſe of the eare.

2 Beſides theſe forementioned ſtrangers, there is alſo another which growes naturally in many watry Salt places of this kingdome, as in Kent by Dartford, in Eſſex, &c. The ſtalkes of this plant are graſſy, and ſome two foot high, with leaues like Wheat or Dogs Graſſe. The eare is very large, being commonly foure or fiue inches long, downy, ſoft like ſilke, and of a brownish colour. ‡

¶ *The*

¶ *The place.*

1 This kinde of Fox-taile Graſſe groweth in England, onely in gardens.

¶ *The time.*

1 This ſpringeth vp in May, of the ſeed that was ſcattered the yere before, and beareth his taile with his ſeed in Iune.

2 This beares his head in Iuly.

¶ *The names.*

1 There hath not beene more ſaid of the antient or later writers, as touching the name, than is ſet downe, by which they called it in Greeke *Alopecuros*; that is in Latine, *Cauda vulpis*: in Engliſh, Fox-taile.

2 This by *Lobell* is called *Alopecuros altera maxima Anglica paludoſa*; that is, The large Engliſh Marſh Fox-taile.

¶ *The temperature and vertues.*

I finde not any thing extant worthy the memorie, either of his nature or vertues.

Chap. 66. *Of Iobs Teares.*

Lachrima Iob.
Iobs Teares.

¶ *The deſcription.*

Iobs Teares hath many knotty ſtalks, proceeding from a tuft of threddy roots, two foot high, ſet with great broad leaues like vnto thoſe of reed; amongſt which leaues come forth many ſmall branches like ſtraw of corne: on the end whereof doth grow a gray ſhining ſeed or graine hard to breake, and like in ſhape to the ſeeds of Gromell, but greater, and of the ſame colour, whereof I hold it a kinde: euery of which grains are bored through the middeſt like a bead, and out of the hole commeth a ſmall idle or barren chaffie eare like vnto that of Darnell.

¶ *The place.*

It is brought from Italy and the countries adjoyning, into theſe countries, where it doth grow very well, but ſeldome commeth to ripeneſſe; yet my ſelfe had ripe ſeed thereof in my garden, the Sommer being very hot.

¶ *The time.*

It is ſowen early in the Spring, or elſe the winter will ouertake it before it come to ripeneſſe.

¶ *The names.*

Diuers haue thought it to be *Lithoſpermi ſpecies*, or a kinde of Gromell, which the ſeed doth very notably reſemble, and doth not much differ from *Dioſcorides* his Gromell. Some thinke it *Plinies Lithoſpermum*; and therefore it may verie aptly be called in Latine, *Arundo Lithoſpermos*, that is in Engliſh, Gromell reed, as *Geſner* ſaith. It is generally called *Lachrima Iob*, and *Lachrima Iobi*: of ſome it is called *Dioſpiros*: in Engliſh it is called *Iobs* Teares, or *Iobs* Drops, for that euery graine reſembleth the drop or teare that falleth from the eye.

¶ *The nature and vertues.*

There is no mention made of this herbe for the vſe of phyſicke: onely in France and thoſe places (where it is plentifully growing) they do make beads, bracelets, and chaines thereof, as we do with pomander and ſuch like.

CHAP. 67. *Of Buck-wheat.*

Tragopyron.
Buckwheat, or Bucke.

¶ *The deſcription.*

BVck-wheat may very well be placed among the kinds of graine or corne, for that oftentimes in time of neceſſitie bread is made thereof, mixed among other graine. It hath round fat ſtalkes ſomewhat creſted, ſmooth and reddiſh, which is diuided in many armes or branches, whereupon do grow ſmooth and ſoft leaues in ſhape like thoſe of Iuie or one of the Bindeweeds, not much vnlike Baſil, wherof *Tabernamontanus* called it *Ocymum Cereale*: The floures be ſmall, white, and cluſtred together in one or moe tufts or vmbels, ſlightly daſht ouer here & there with a flouriſh of light Carnation colour. The ſeeds are of a darke blackiſh colour, triangle, or three ſquare like the ſeed of blacke Bindeweed, The root is ſmall and threddy.

¶ *The place.*

It proſpereth very wel in any ground, be it neuer ſo dry or barren, where it is commonly ſowen to ſerue as it were in ſtead of a dunging. It quickly commeth vp, and is very ſoone ripe: it is verie common in and about the Namptwich in Cheſhire, where they ſow it as well for food for their cattell, pullen, and ſuch like, as to the vſe aforeſaid. It groweth likewiſe in Lancaſhire, and in ſome parts of our South country, about London in Middleſex, as alſo in Kent and Eſſex.

¶ *The time.*

This baſe kinde of graine is ſowen in Aprill and the beginning of May, and is ripe in the beginning of Auguſt.

¶ *The names.*

Buck-wheat is called of the high Almaines, **Heydencozn**: of the baſe Almaines, **Buckenweidt**; that is to ſay, *Hirci triticum*, or Goats wheat: of ſome, *Fagi triticum*, Beech Wheat: In Greeke, ἰρύσμον, by *Theophraſtus*; and by late Writers, πυρυμίον: in Latine, *Fago triticum*, taken from the faſhion of the ſeed or fruit of the Beech tree. It is called alſo *Fegopyrum*, and *Tragopyron*: In Engliſh, French wheat, Bullimong, and Buck-wheat: In French, *Dragee aux cheueaux*.

¶ *The temper.*

Buck-wheat nouriſheth leſſe than Wheat, Rie, Barley, or Otes, yet more than either Mill or Panicke.

¶ *The vertues.*

Bread made of the meale of Buck-wheat is of eaſie digeſtion, and ſpeedily paſſeth through the belly, but yeeldeth little nouriſhment.

Chap. 68. *Of Cow Wheat.*

¶ 1 *Melampyrum album.*
White Cow-wheat.

‡ 2 *Melampyrum purpureum.*
Purple Cow-wheat.

¶ 3 *Melampyrum cæruleum.*
Blew Cow-wheat.

¶ 4 *Melampyrum luteum.*
Yellow Cow-wheat.

¶ *The deſcription.*

1 *Melampyrum* growes vpright, with a ſtraight ſtalke, hauing other ſmall ſtalkes comming from the ſame, of a foot long. The leaues are long and narrow, and of a darke colour. On the top of the branches grow buſhy or ſpikie eares full of floures and ſmall leaues mixed together, and much jagged, the whole eare reſembling a Foxe-taile. This eare

eare beginneth to floure below, and ſo vpward by little and little vnto the top: the ſmall leaues before the opening of the floures, and likewiſe the buds of the floures, are white of colour. Then come vp broad husks, wherein are encloſed two ſeeds ſomewhat like wheat, but ſmaller and browner. The root is of a woody ſubſtance.

‡ 2 3 Theſe two are like the former in ſtalkes and leaues, but different in the colour of their floures, the which in the one are purple, and in the other blew. *Cluſius* calls theſe, as alſo the *Crataogonon* treated of in the next Chapter, by the names of *Parietariæ ſylveſtres*. ‡

4 Of this kinde there is another called *Melampyrum luteum*, which groweth neere vnto the ground, with leaues not much vnlike Harts horne, among which riſeth vp a ſmall ſtraw with an eare at the top like *Alopecuros*, the common Fox-taile, but of a yellow colour.

¶ *The place.*

1 The firſt groweth among corne, and in paſture grounds that be fruitfull: it groweth plentifully in the paſtures about London.

The reſt are ſtrangers in England.

¶ *The time.*

They floure in Iune and Iuly.

¶ *The names.*

Melampyrum is called of ſome *Triticum vaccinium*: in Engliſh, Cow-wheat, and Horſe-floure: in Greeke, μελάμπυρον: The fourth is called *Melampyrum luteum*: in Engliſh, Yellow Cow-wheat.

¶ *The danger.*

The ſeed of Cow Wheat raiſeth vp fumes, and is hot and dry of nature, which being taken in meats and drinks in the manner of Darnell, troubleth the braine, cauſing drunkenneſſe and headache.

CHAP. 69. *Of Wilde Cow-Wheat.*

1 *Crataogonon album.*
Wilde Cow-wheat.

¶ *The deſcription.*

1 THe firſt kinde of wilde Cow-Wheat *Cluſius* in his Pannonick hiſtory calls *Parietaria ſylveſtris*, or wilde Pellitorie: which name, according to his owne words, if it do not fitly anſwer the Plant, hee knoweth not what to cal it, for that the Latines haue not giuen any name thereunto: yet becauſe ſome haue ſo called it, he retaineth the ſame name. Notwithſtanding he referreth it vnto the kindes of *Melampyrum*, or Cow-wheat, or vnto *Crataogonon*, the wilde Cow-wheat, which it doth very wel anſwer in diuers points. It hath an hairy foure ſquare ſtalke, very tender, weake, and eaſie to breake, not able to ſtand vpright without the helpe of his neighbours that dwell about him, a foot high or more; whereupon do grow long thin leaues, ſharp pointed, and oftentimes lightly ſnipt about the edges, of a darke purpliſh colour, ſometimes greeniſh, ſet by couples one oppoſite againſt the other; among the which come forth two floures at one ioynt, long and hollow, ſomewhat gaping like the floures of a dead nettle, at the firſt of a pale yellow, and after of a bright golden colour; which do floure by degrees, firſt a few, and then more, by meanes whereof it is long in flouring. Which being paſt, there ſucceed ſmall cups or ſeed veſſels, wherein is contained browne ſeed not vnlike to wheat. The whole plant is hairy, not differing from the plant Stichwort.

2 Red leafed wilde Cow-wheat is like vnto the former, ſauing that the leaues be narrower, and the tuft of leaues more iagged. The ſtalkes and leaues are of a reddiſh horſe-fleſh colour. The

floures in forme are like the other, but in colour differing; for that the hollow part of the floure with the heele or ſpurre is of a purple colour, the reſt of the floure yellow. The ſeed and veſſels are like the precedent.

3 *Crataogonon Euphroſine.*
Eyebright Cow-wheat.

¶ *The deſcription.*

3 This kinde of wilde Cow-wheat *Tabernamontanus* hath ſet forth vnder the title of *Odontites*: others haue taken it to be a kinde of *Euphraſia* or Eyebright, becauſe it doth in ſome ſort reſemble it, eſpecially in his floures. The ſtalks of this plant are ſmall, woody, rough, and ſquare. The leaues are indented about the edges, ſharpe pointed, and in moſt points reſembling the former Cow-wheat; ſo that of neceſſitie it muſt be of the ſame kinde, and not a kinde of Eyebright, as hath beene ſet downe by ſome.

¶ *The place.*

Theſe wilde kindes of Cow-wheat doe grow commonly in fertile paſtures, and buſhy Copſes, or low woods, and among buſhes vpon barren heaths and ſuch like places.

The two firſt doe grow vpon Hampſted heath neere London, among the Iuniper buſhes and bilberry buſhes in all the parts of the ſaid heath, and in euery part of England where I haue trauelled.

¶ *The time.*

They floure from the beginning of May, to the end of Auguſt.

¶ *The names.*

1 The firſt is called of *Lobelius, Crataogonon*: and of *Tabernamontanus*, *Milium Syluaticum*, or Wood Millet, and *Alſine ſyluatica*, or Wood-Chickweed.

2 The ſecond hath the ſame titles: in Engliſh, Wilde Cow-wheat.

3 The laſt is called by *Tabernamontanus, Odontites*: of *Dodonæus, Euphraſia altera*, and *Euphroſine*. *Hippocrates* called the wilde Cow-wheat, *Polycarpum*, and *Polycritum*.

¶ *The nature and vertues.*

There is not much ſet downe either of the nature or vertues of theſe plants: onely it is reported that the ſeeds do cauſe giddineſſe and drunkenneſſe as Darnell doth.

The ſeed of *Crataogonon* made in fine pouder, and giuen in broth or otherwiſe, mightily prouoketh Venerie.

Some write, that it will likewiſe cauſe women to bring forth male children.

† See the vertues attributed to *Crataogonon* by *Dioſcorides* before, Chap. 38. B.

Chap. 70. *Of White Aſphodill.*

¶ *The kindes.*

HAuing finiſhed the kindes of corne, it followeth to ſhew vnto you the ſundry ſorts of Aſphodils, whereof ſome haue bulbous roots, other tuberous or knobby roots, ſome of yellow colour, and ſome of mixt colours: notwithſtanding *Dioſcorides* maketh mention but of one Aſphodill, but *Pliny* ſetteth downe two; which *Dionyſius* confirmeth, ſaying, That there is the male and female Aſphodil. The latter age hath obſerued many more beſides the bulbed one, of which *Galen* maketh mention.

1 *Aſphodelus*

1 *Aſphodelus non ramoſus.*
White Aſphodill.

2 *Aſphodelus ramoſus.*
Branched Aſphodill.

¶ *The deſcription.*

1 THe white Aſphodill hath many long and narrow leaues like thoſe of leeks, ſharpe pointed. The ſtalke is round, ſmooth, naked, and without leaues, two cubits high, garniſhed from the middle vpward with a number of floures ſtarre-faſhion, made of fiue leaues apiece; the colour white, with ſome darke purple ſtreakes drawne downe the backe-ſide. Within the floures be certaine ſmall chiues. The floures being paſt, there ſpring vp little round heads, wherein are contained hard, blacke, and 3 ſquare ſeeds like thoſe of Buck-wheat or Stauef-acre. The toot is compact of many knobby roots growing out of one head, like thoſe of the Peonie, full of juyce, with a ſmall bitterneſſe and binding taſte.

2 Branched Aſphodill agreeth well with the former deſcription, ſauing that this hath many branches or armes growing out of the ſtalke, whereon the floures do grow, and the other hath not any branch at all, wherein conſiſteth the difference.

3 Aſphodill with the reddiſh floure groweth vp in roots, ſtalke, leafe, and manner of growing like the precedent, ſauing that the floures of this be of a dark red color, & the others white, which ſetteth forth the difference, if there be any ſuch difference, or any ſuch plant at all: for I haue conferred with many moſt excellent men in the knowledge of plants, but none of them can giue mee certaine knowledge of any ſuch, but tell me they haue heard it reported that ſuch a one there is, and ſo haue I alſo; but certainly I cannot ſet downe any thing of this plant vntill I heare more certaintie: for as yet I giue no credit to my Authour, which for reuerence of his perſon I forbeare to name.

4 The yellow Aſphodill hath many roots growing out of one head, made of ſundry tough, fat, and oleous yellow ſprigs, or groſſe ſtrings, from the which riſe vp many graſſy leaues, thick and groſſe, tending to ſquareneſſe; among the which commeth vp a ſtrong thicke ſtalke ſet with the like leaues euen to the floures, but leſſe: vpon the which do grow ſtarre-like yellow floures, otherwiſe like the white Aſphodill.

3 *Aſphodelus flore rubente.*
Red Aſphodill.

4 *Aſphodelus luteus.*
Yellow Aſphodill.

‡ 5 *Aſphodelus minimus.* Dwarfe Aſphodil.

‡ 5 Beſides theſe there is an Aſphodill which *Cluſius* for the ſmalneſſe calls *Aſphodelus minimus.* The roots thereof are knotty and tuberous, reſembling thoſe of the formerly deſcribed, but leſſe: from theſe ariſe fiue or ſixe very narrow and long leaues; in the middeſt of which growes vp a ſtalk of the height of a foot, round and without branches, bearing at the top thereof a ſpoke of floures, conſiſting of ſix white leaues a piece, each of which hath a ſtreake running alongſt it, both on the inſide and outſide, like as the firſt deſcribed. It floures in the beginning of Iuly, when as the reſt are paſt their floures. It loſeth the leaues in Winter, and gets new ones againe in the beginning of Aprill. ‡

¶ *The time and place.*

They floure in May and Iune, beginning below, and ſo flouring vpward: and they grow naturally in France, Italy, Spaine, and moſt of them in our London Gardens.

¶ *The names.*

Aſphodill is called in Latine, *Aſphodelus, Albucum, albucus*, and *Haſtula Regia*: in Greeke, ἀσφόδελος: in Engliſh, Aſphodill, not Daffodil, for Daffodill is *Narciſſus*, another plant differing from Aſphodill. *Pliny* writeth, That the ſtalke with the floures is called *Anthericos*; and the root, that is to ſay, the bulbs *Aſphodelus.*

Of

Of this Aſphodill *Heſiod* maketh mention in his Works, where he ſaith, that fooles know not how much good there is in the Mallow and in the Aſphodill, becauſe the roots of Aſphodill are good to be eaten. Yet *Galen* doth not beleeue that he meant of this Aſphodill, but of that bulbed one, whereof we will make mention hereafter. And he himſelfe teſtifieth, that the bulbes thereof are not to be eaten without very long ſeething; and therefore it is not like that *Heſiod* hath commended any ſuch: for he ſeemeth to vnderſtand by the Mallow and the Aſphodil, ſuch kinde of food as is eaſily prepared, and ſoone made ready.

¶ *The nature.*

Theſe kindes of Aſphodils be hot and dry almoſt in the third degree.

¶ *The vertues.*

After the opinion of *Dioſcorides* and *Aetius*, the roots of Aſphodill eaten, prouoke vrine and the A
termes effectually, eſpecially being ſtamped and ſtrained with wine, and drunke.

One dram thereof taken in wine in manner before rehearſed, helpeth the paine in the ſides, rup- B
tures, conuulſions, and the old cough.

The roots boiled in dregs of wine cure foule eating vlcers, all inflammations of the dugges or C
ſtones, and eaſeth the felon, being put thereto as a pulteſſe.

The iuyce of the root boyled in old ſweet Wine, together with a little myrrh and ſaffron, ma- D
keth an excellent Collyrie profitable for the eyes.

Galen ſaith, the roots burnt to aſhes, and mixed with the greaſe of a ducke, helpeth the *Alopecia,* E
and bringeth haire againe that was fallen by that diſeaſe.

The weight of a dram thereof taken with wine helpeth the drawing together of ſinews, cramps, F
and burſtings,

The like quantitie taken in broth prouoketh vomit, and helpeth thoſe that are bitten with any G
venomous beaſts.

The iuyce of the root cleanſeth and taketh away the white morphew, if the face be annointed H
therewith; but firſt the place muſt be chafed and wel rubbed with a courſe linnen cloath.

Chap. 71. *Of the Kings Speare.*

1 *Aſphodelus luteus minor.* The Kings Speare. 2 *Aſphodelus Lancaſtria.* Lancaſhire Aſphodil.

3 Aſphod.

‡ 3 *Aſphodelus Lancaſtriæ verus.*
The true Lancaſhire Aſphodil.

¶ *The deſcription.*

1 THe leaues of the Kings Speare are long, narrow, and chamfered or furrowed, of a blewiſh greene colour. The ſtalk is round, of a cubit high. The floures which grow thereon from the middle to the top are very many, in ſhape like to the floures of the other; which being paſt, there come in place thereof little round heads or ſeed-veſſels, wherein the ſeed is contained. The roots in like manner are very many, long, and ſlender, ſmaller than thoſe of the other yellow ſort. Vpon the ſides whereof grow forth certaine ſtrings, by which the plant it ſelfe is eaſily encreaſed and multiplied.

2 There is found in theſe dayes a certaine waterie or mariſh Aſphodill like vnto this laſt deſcribed, in ſtalke and floures, without any difference at all. It bringeth forth leaues of a beautifull greene ſomwhat chamfered, like to thoſe of the Floure de-luce, or corne-flag, but narrower, not full a ſpan long. The ſtalke is ſtrait, a foot high, whereupon grow the floures, conſiſting of ſixe ſmall leaues: in the middle whereof come forth ſmall yellow chiues or threds. The ſeed is very ſmall, contained in long ſharpe pointed cods. The root is long, ioynted, and creepeth as graſſe doth, with many ſmall ſtrings.

‡ 3 Beſides the laſt deſcribed (which our Author I feare miſtaking, termed *Aſphodelus Lancaſtriæ*) there is another water Aſphodill, which growes in many rotten mooriſh grounds in this kingdome, and in Lancaſhire is vſed by women to die their haire of a yellowiſh colour, and therefore by them it is termed Maiden-haire, if we may beleeue *Lobell.*) This plant hath leaues of ſome two inches and an halfe, or three inches long, being ſomewhat broad at the bottome, and ſo ſharper towards their ends. The ſtalke ſeldome attaines to the height of a foot, and it is ſmooth without any leaues thereon; the top thereof is adorned with pretty yellow ſtar-like floures, whereto ſucceed longiſh little cods, vſually three, yet ſometimes foure or fiue ſquare, and in theſe there is contained a ſmall red ſeed. The root conſiſts onely of a few ſmall ſtrings. ‡

¶ *The place.*

1 The ſmall yellow Aſphodill groweth not of it ſelfe wilde in theſe parts, notwithſtanding we haue great plenty thereof in our London gardens.

2 The Lancaſhire Aſphodill groweth in moiſt and mariſh places neere vnto the Towne of Lancaſter, in the mooriſh grounds there, as alſo neere vnto Maudſley and Martom, two Villages not farre from thence; where it was found by a Worſhipfull and learned Gentleman, a diligent ſearcher of ſimples, and feruent louer of plants, M. *Thomas Hesket*, who brought the plants thereof vnto me for the encreaſe of my garden.

I receiued ſome plants thereof likewiſe from Maſter *Thomas Edwards*, Apothecarie in Exceſter, learned and skilfull in his profeſſion, as alſo in the knowledge of plants. He found this Aſphodill at the foot of a hill in the Weſt part of England, called Bagſhot hill, neere vnto a village of the ſame name.

‡ This Aſphodill figured and deſcribed out of *Dodonæus*, and called *Aſphodelus Lancaſtriæ* by our Author, growes in an heath ſome two miles from Bruges in Flanders, and diuers other places of the Low-countries; but whether it grow in Lancaſhire or no, I can ſay nothing of certaintie: but I am certaine, that which I haue deſcribed in the third place growes in many places of the Weſt of England; and this yeare 1632, my kinde friend M. *George Bowles* ſent mee ſome plants thereof, which I keepe yet growing. *Lobell* alſo affirmes this to be the Lancaſhire Aſphodill.

¶ *The time.*

They floure in May and Iune: moſt of the leaues thereof remaine greene in the Winter, if it be not extreme cold.

¶ *The names.*

Some of the later Herbariſts thinke this yellow Aſphodill to be *Iphyon* of *Theophraſtus*, and others

others iudge it to be *Erizambac* of the Arabians. In Latine it is called *Aſphodelus luteus*: of ſome it is called *Haſtula Regia*. We haue Engliſhed it, the Speare for a King, or ſmall yellow Aſphodill.

2 The Lancaſhire Aſphodill is called in Latine, *Aſphodelus Lancaſtriæ*; and may likewiſe be called *Aſphodelus paluſtris*, or *Pſeudoaſphodelus luteus*, or the Baſtard yellow Aſphodill.

‡ 3 This is *Aſphodelus minimus luteus paluſtris Scoticus & Lancaſtrienſis*, of *Lobell*; and the *Pſeudoaſphodelus pumilio folijs Iridis*, of *Cluſius*, as farre as I can iudge; although *Bauhine* diſtinguiſheth them. ‡

¶ *The temperature and vertues.*

It is not yet found out what vſe there is of any of them in nouriſhment or medicines.

CHAP. 72. *Of Onion Aſphodill.*

Aſphodelus Bulboſus.
Onion Aſphodill.

¶ *The deſcription.*

THe bulbed Aſphodill hath a round bulbus or Onion root, with ſome fibres hanging thereat; from the which come vp many graſſie leaues, very well reſembling the Leeke; among the which leaues there riſeth vp a naked or ſmooth ſtem, garniſhed toward the top with many ſtar-like floures, of a whitiſh greene on the inſide, and wholly greene without, conſiſting of ſix little leaues ſharpe pointed, with certaine chiues or threads in the middle. After the floure is paſt there ſucceedeth a ſmall knop or head three ſquare, wherein lieth the ſeed.

¶ *The place.*

It groweth in the gardens of Herbariſts in London, and not elſewhere that I know of, for it is not very common.

¶ *The time.*

It floureth in Iune and Iuly, and ſomewhat after.

¶ *The names.*

The ſtalke and floures being like to thoſe of the Aſphodill before mentioned, do ſhew it to be *Aſphodeli ſpecies*, or a kinde of Aſphodill; for which cauſe alſo it ſeemeth to be that Aſphodil of which *Galen* hath made mention in his ſecond book of the Faculties of nouriſhments, in theſe words; The root of Aſphodill is in a manner like to the root of Squill, or Sea Onion, as well in ſhape as bitternes. Notwithſtanding, ſaith *Galen*, my ſelfe haue known certaine countrymen, who in time of famine could not with many boilings and ſteepings make it fit to be eaten. It is called of *Dodonæus*, *Aſphodelus fœmina*, and *Aſphodelus Bulboſus*, *Hyacintho-Aſphodelus*, and *Aſphodelus Hyacinthinus* by *Lobell*, and that rightly; for that the root is like the Hyacinth, and the floures like the Aſphodill: and therefore as it doth participate of both kindes, ſo likewiſe doth the name: in Engliſh we may call it Bulbed Aſphodill. *Cluſius* calls it *Ornithogalum majus*, and that fitly.

¶ *The nature.*

The round rooted Aſphodil, according to *Galen*, hath the ſame temperature and vertue that *Aron*, *Ariſarum*, and *Dracontium* haue, namely an abſterſiue and cleanſing qualitie.

¶ *The vertues.*

The yong ſprouts or ſprings thereof is a ſingular medicine againſt the yellow Iaundiſe, for that the root is of power to make thin and open. A

Galen ſaith, that the aſhes of this Bulbe mixed with oile or hens greaſe cureth the falling of the haire in an *Alopecia* or ſcalld head. B

Chap.

Chap. 73. *Of Yellow Lillies.*

¶ *The kindes.*

Becauſe we ſhall haue occaſion hereafter to ſpeake of certaine Cloued or Bulbed Lillies, wee will in this chapter entreat onely of another kinde not bulbed, which likewiſe is of two ſorts, differing principally in their roots; for in floures they are Lillies, but in roots Aſphodils, participating as it were of both, though neerer approching vnto Aſphodils than Lillies.

1 *Lilium non bulboſum.*
The yellow Lillie.

2 *Lilium non bulboſum Phœniceum.*
The Day-Lillie.

¶ *The deſcription.*

1 The yellow Lillie hath very long flaggie leaues, chamfered or channelled, hollow in the middeſt like a gutter; among the which riſeth vp a naked or bare ſtalke, two cubits high, branched toward the top, with ſundry brittle armes or branches, whereon do grow many goodly floures like vnto thoſe of the common white Lillie in ſhape and proportion, of a ſhining yellow colour; which being paſt, there ſucceed three cornered huskes or cods, full of blacke ſhining ſeeds like thoſe of the Peonie. The root conſiſteth of many knobs or tuberous clogs, proceeding from one head, like thoſe of the white Aſphodill or Peonie.

2 The Day-Lillie hath ſtalkes and leaues like the former. The floures be like the white Lillie in ſhape, of an Orenge tawny colour: of which floures much might be ſaid which I omit. But in briefe, this plant bringeth forth in the morning his bud, which at noone is full blowne, or ſpred abroad; and the ſame day in the euening it ſhuts it ſelfe, and in a ſhort time after becomes as rotten and ſtinking as if it had beene trodden in a dunghill a moneth together, in foule and rainie weather: which is the cauſe that the ſeed ſeldome followes, as in the other of his kinde, not bringing forth any at all that I could euer obſerue; according to the old prouerbe, Soone ripe, ſoone rotten. His roots are like the former.

¶ *The*

¶ *The place.*

Theſe Lillies do grow in my garden, as alſo in the gardens of Herbariſts, and louers of fine and rare plants; but not wilde in England, as in other countries.

¶ *The time.*

Theſe Lillies do floure ſomewhat before the other Lillies, and the yellow Lillie the ſooneſt.

¶ *The names.*

Diuers do call this kinde of Lillie, *Liliaſphodelus*, *Liliago*, and alſo *Liliaſtrum*, but moſt commonly *Lilium non bulboſum*: In Engliſh, Liriconſancie, and yellow Lillie. The old Herbariſts name it *Hemerocallis*: for they haue two kindes of *Hemerocallis*; the one a ſhrub or woody plant, as witneſſeth *Theophraſtus*, in his ſixth booke of the hiſtorie of Plants. *Pliny* ſetteth downe the ſame ſhrub among thoſe plants, the leaues whereof onely do ſerue for garlands.

The other *Hemerocallis* which they ſet downe, is a Floure which periſheth at night, and buddeth at the Sunne riſing, according to *Athenæus*; and therefore it is fitly called ἡμεροκαλὶς; that is, Faire or beautifull for a day: and ſo we in Engliſh may rightly terme it the Day-Lillie, or Lillie for a day.

¶ *The nature.*

The nature is rather referred to the Aſphodils than to Lillies.

¶ *The vertues.*

Dioſcorides ſaith, That the root ſtamped with honey, and a mother peſſarie made thereof with wooll, and put vp, bringeth forth water and bloud. A

The leaues ſtamped and applied do allay hot ſwellings in the dugges, after womens trauell in childe-bearing, and likewiſe taketh away the inflammation of the eyes. B

The roots and the leaues be laid with good ſucceſſe vpon burnings and ſcaldings. C

Chap. 73. *Of Bulbed Floure de-Luce.*

‡ 1 *Iris Bulboſa Latifolia.*
Broad leaued Bulbous Floure de-luce.

2 *Iris Bulboſa Anglica.*
Onion Floure de-Luce.

¶ Thi

¶ *The kindes.*

Like as we haue ſet downe ſundry ſorts of Floure de-luces, with flaggy leaues, and tuberous or knobby roots, varying very notably in ſundry reſpects, which we haue diſtinguiſhed in their proper Chapters: it reſteth that in like manner we ſet forth vnto your view certaine bulbous or Onion-rooted Floure de-luces, which in this place do offer themſelues vnto our conſideration, whereof there be alſo ſundry ſorts, ſorted into one chapter as followeth.

3 *Iris Bulboſa flore vario.*
Changeable Floure de-luce.

‡ 4 *Iris Bulboſa verſicolor Polyclonos.*
Many branched changeable Floure de-luce.

¶ *The deſcription.*

‡ 1 THe firſt of theſe, whoſe figure here we giue you vnder the name of *Iris Bulboſa Latifolia*, hath leaues ſomewhat like thoſe of the Day-Lillie, ſoft, and ſomewhat paliſh greene, with the vnder ſides ſomewhat whiter; amongſt which there riſeth vp a ſtalk bearing at the top thereof a Floure a little in ſhape different from the formerly deſcribed Floure de-luces. The colour thereof is blew; the number of the leaues whereof it conſiſts, nine: three of theſe are little, and come out at the bottome of the Floure as ſoone as it is opened; three more are large, and being narrow at their bottome, become broader by little and little, vntill they come to turne downwards, whereas then they are ſhapen ſomewhat roundiſh or obtuſe. In the middeſt of theſe there runnes vp a yellow variegated line to the place whereas they bend backe. The three other leaues are arched like as in other Floures of this kinde, and diuided at their vpper end, and containe in them three threads of a whitiſh blew colour.

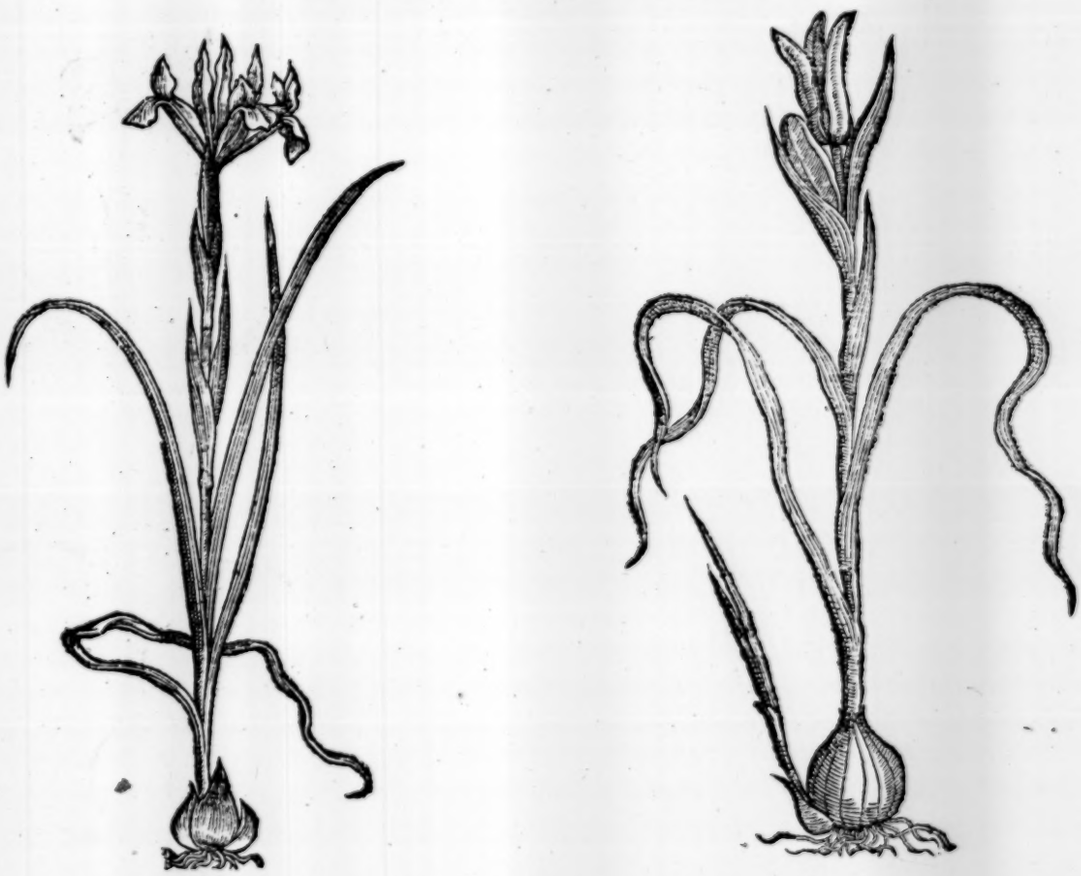
This is called *Iris Bulboſa Latifolia*, by *Cluſius*; and *Hyacinthus Poetarum Latifolius*, by *Lobell*.

It floures in Ianuarie and Februarie, whereas it growes naturally, as it doth in diuers places of Portugall and Spaine. It is a tender plant, and ſeldome thriues well in our gardens. ‡

2 Onion Floure de-luce hath long narrow blades or leaues, creſted, chamfered, or ſtreaked on the backe ſide as it were welted; below ſomewhat round, opening it ſelfe toward the top, yet remaining as it were halfe round, whereby it reſembleth an hollow trough or gutter. In the bottome of the hollowneſſe it tendeth to whiteneſſe; and among theſe leaues do riſe vp a ſtalke of a cubit high; at the top whereof groweth a faire blew Floure, not differing in ſhape from the common

mon Floure de-luce: the which being paſt, there come in the place thereof long thicke cods or ſeed-veſſels, wherein is contained yellowiſh ſeed of the bigneſſe of a tare or fitch. The root is round like an Onion, couered ouer with certaine browne skinnes or filmes. Of this kind there are ſome fiue or ſix varieties, cauſed by the various colours of the Floures.

5 *Iris Bulboſa Flore luteo cum flore & ſemine.*
Yellow bulbed Floure de-luce in floure and ſeed.



3 Changeable Floure de-luce hath leaues, ſtalkes, and Roots like the former, but leſſer. The Floure hath likewiſe the forme of the Floure de-luce, that is to ſay, it conſiſteth of ſixe greater leaues, and three leſſer; the greater leaues fold backward and hang downward, the leſſer ſtand vpright; and in the middle of the leaues there riſeth vp a yellow welt, white about the brimmes, and ſhadowed all ouer with a waſh of thinne blew tending to a Watchet colour. Toward the ſtalke they are ſtripped ouer with a light purple colour, and likewiſe amongſt the hollow places of thoſe that ſtand vpright (which cannot be expreſſed in the figure) there is the ſame faire purple colour; the ſmell and ſauour very ſweet and pleaſant. The root is Onion faſhion, or bulbous like the other.

‡ 4 There is alſo another variegated Floure de-luce, much like this laſt deſcribed, in the colour of the Floure; but each plant produceth more branches and Floures, whence it is termed *Iris Bulboſa verſicolor polyclonos*, Many-branched changeable Floure de-luce. ‡

5 Of which kinde or ſort there is another in my Garden, which I receiued from my Brother *Iames Garret* Apothecarie, far more beautifull than the laſt deſcribed; the which is daſht ouer, in ſtead of the blew or watchet colour, with a moſt pleaſant gold yellow colour, of ſmell exceeding ſweet, with bulbed roots like thoſe of the other ſort.

6 It is reported, that there is in the garden of the Prince Elector the Lantgraue of Heſſen, one of this ſort or kinde, with white Floures, the which as yet I haue not ſeene.

‡ Beſides theſe ſorts mentioned by our Author, there are of the narrow leaued bulbous Floure de-luces, ſome twenty foure or more varieties, which in ſhape of roots, leaues, and Floures differ very little, or almoſt nothing at all; ſo that he which knows one of theſe may preſently know the reſt. Wherefore becauſe it is a thing no more pertinent to a generall hiſtorie of Plants, to inſiſt vpon theſe accidentall nicities, than for him that writes a hiſtorie of Beaſts to deſcribe all the colours, and their mixtures, in Horſes, Dogs, and the like; I refer ſuch as are deſirous to informe them-

themſelues of thoſe varieties, to ſuch as haue onely and purpoſely treated of Floures and their diuerſities, as *De-Bry*, *Swerts*, and our Countreyman M. *Parkinſon*, who in his *Paradiſus terreſtris*, ſet forth in Engliſh, *Anno* 1629. hath iudiciouſly and exactly comprehended all that hath beene deliuered by others in this nature. ‡

‡ 6 *Iris Bulboſa flore cinereo.*
Aſh-coloured Floure de-luce.

‡ 7 *Iris Bulboſa flore albido.*
Whitiſh Floure de-luce.

¶ *The place.*

The ſecond of theſe bulbed Floure de-luces growes wilde, or of it ſelfe, in the corne fields of the Weſt parts of England, as about Bathe and Wells, and thoſe places adiacent; from whence they were firſt brought into London, where they be naturaliſed, and encreaſe in great plenty in our London gardens.

The other ſorts do grow naturally in Spaine and Italy wilde, from whence we haue had Plants for our London gardens, whereof they do greatly abound.

¶ *The time.*

They floure in Iune and Iuly, and ſeldome after.

¶ *The names.*

The Bulbed Floure de-luce is called of *Lobelius*, *Iris Bulboſa*, and alſo *Hyacinthus flore Iridis*: of ſome, *Hyacinthus Poetarum*; and peraduenture it is the ſame that *Apuleius* mentioneth in the one and twentieth Chapter, ſaying, That *Iris*, named among the old Writers *Hieris*, may alſo be called, and not vnproperly, *Hierobulbus*, or *Hieribulbus*: as though you ſhould ſay, *Iris Bulboſa*, or Bulbed Ireos; vnleſſe you would haue ἱερόβολβος, called a greater or larger Bulbe: for it is certaine, that great and huge things were called of the Antients, ἱερὰ, or *Sacra*: in Engliſh, Holy.

¶ *The nature.*

The nature of theſe Bulbed Floure de-luces are referred to the kindes of Aſphodils.

¶ *The vertues.*

Take, ſaith *Apuleius*, of the herbe *Hierobulbus* ſix ℥. Goats ſuet as much, Oile of Alcanna one
A pound; mix them together, being firſt ſtamped in a ſtone morter, it taketh away the paine of the Gout.

Moreouer, if a woman do vſe to waſh her face with the decoction of the root, mixed with the
B meale of Lupines, it forthwith cleanſeth away the freckles & morphew, and ſuch like deformities.

Chap.

CHAP. 75. *Of Spaniſh Nut.*

1 *Siſyrichium majus.* Spaniſh Nut.

‡ 2 *Siſyrichium minus.* Small Spaniſh Nut.

3 *Iris Tuberoſa.* Veluet Floure de-luce.

¶ *The deſcription.*

1 SPaniſh Nut hath ſmall graſſie leaues like thoſe of the Starres of Bethlem, or *Ornithogalum*; among which riſeth vp a ſmall ſtalke of halfe a foot high, garniſhed with the like leaues, but ſhorter. The Floures grow at the top, of a skie colour, in ſhape reſembling the Floure de-luce, or common *Iris*; but the leaues that turne downe are each of them marked with a yellowiſh ſpot: they fade quickely, and being paſt, there ſucceed ſmall cods with ſeeds as ſmall as thoſe of Turneps. The root is round, compoſed of two bulbes, the one lying vpon the other as thoſe of the Corne flag vſually do; and they are couered with a skinne or filme in ſhape like a Net. The Bulbe is ſweet in taſte, and may be eaten before any other bulbed Root.

2 There is ſet forth another of this kinde, ſomewhat leſſer, with Floures that ſmell ſweeter than the former.

3 Veluet Floure de-luce hath many long ſquare leaues, ſpongeous or full of pith, trailing vpon the ground, in ſhape like to the leaues of Ruſhes: among which riſeth vp a ſtalke of a foot high,

high, bearing at the top a Floure like the Floure de-luce. The lower leaues that turne downward are of a perfect blacke colour, ſoft and ſmooth as is blacke Veluet; the blackneſſe is welted about with greeniſh yellow, or as wee terme it a Gooſe-turd greene; of which colour the vppermoſt leaues do conſiſt: which being paſt, there followeth a great knob or creſted ſeed veſſell of the bigneſſe of a mans thumbe, wherein is contained round white ſeed as bigge as the Fetch or tare. The root conſiſteth of many knobby bunches like fingers.

¶ *The place.*

Theſe baſtard kindes of Floure de-luces are ſtrangers in England, except it be among ſome few diligent Herbariſts in London, who haue them in their gardens, where they increaſe exceedingly; eſpecially the laſt deſcribed, which is ſaid to grow wilde about Conſtantinople, Morea, and Greece: from whence it hath beene tranſported into Italy, where it hath beene taken for *Hermodactylus*, and by ſome expreſt or ſet forth in writing vnder the title *Hermodactylus*; whereas in truth it hath no ſemblance at all with *Hermodactylus*.

¶ *The time.*

The wilde or Baſtard Floure de-luces do floure from May to the end of Iune.

¶ *The names.*

1 2 Theſe bulbed baſtard Floure de-luces, which we haue Engliſhed Spaniſh Nuts, are called in Spaine, *Nozelhas*; that is, little Nuts: the leſſer ſort *Parua Nozelha*, and *Macuca*: wee take it to be that kinde of nouriſhing Bulbe which is named in Greeke, κονόπας: of *Pliny*, *Siſynrichium*.

‡ 3 Some, as *Vlyſſes Aldroandus*, would haue this to be *Louchitis Prior*, of *Dioſcor*. *Matthiolus* makes it *Hermodactylus verus*, or the true Hermodactill: *Dodonæus* and *Lobell* more fitly refer it to the Floure de-luces, and call it *Iris tuberoſa*. ‡

¶ *The nature and vertues.*

Of theſe kindes of Floure de-luces there hath beene little or nothing at all left in writing concerning their natures or vertues; only the Spaniſh nut is eaten at the tables of rich and delicious, nay vitious perſons, in ſallads or otherwiſe, to procure luſt and lecherie.

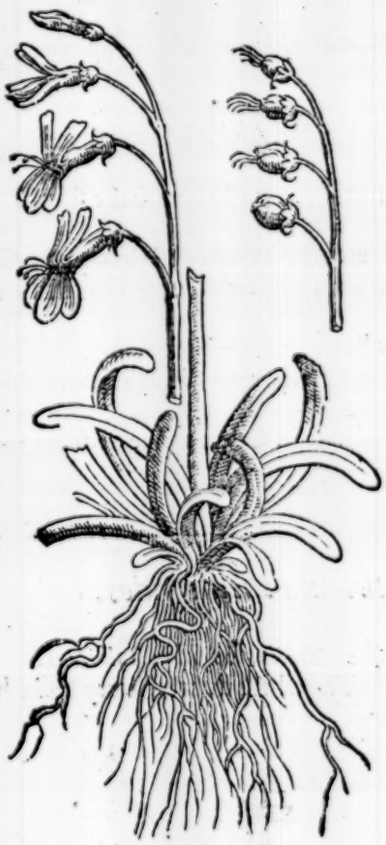
Chap. 76. *Of Corne-Flagge.*

1 *Gladiolus Narbonenſis.*
French Corne-Flag, or Sword-Flag.

2 *Gladiolus Italicus.*
Italian Corne-Flag, or Sword-Flag.

‡ 4 *Gladi.*

‡ 4 *Gladiolus Lacuſtris.*
Water Sword-Flag.



¶ *The deſcription.*

1 FRench Corne-Flagge hath ſmall ſtiffe leaues, ribbed or chamfered with long nerues or ſinewes running through the ſame, in ſhape like thoſe of the ſmall Floure deluce, or the blade of a ſword, ſharpe pointed, of an ouer-worne greene colour, among the which riſeth vp a ſtiffe brittle ſtalke two cubits high, whereupon doe grow in comely order many faire purple Floures, gaping like thoſe of Snapdragon, or not much differing from the Fox-Gloue, called in Latine *Digitalis*. After them come round knobbie ſeed-veſſels, full of chaffie ſeed, very light, of a browne reddiſh colour. The root conſiſteth of two Bulbes, one ſet vpon the other; the vppermoſt whereof in the beginning of the Spring is leſſer, and more ful of juice; the lower greater, but more looſe and lithie, which a little while after periſheth.

2 Italian Corn-Flag hath long narrow leaues with many ribbes or nerues running through the ſame: the ſtalke is ſtiffe and brittle, whereupon do grow Floures orderly placed vpon one ſide of the ſtalke, whereas the precedent hath his floures placed on both the ſides of the ſtalke, in ſhape and colour like the former, as are alſo the roots, but ſeldome ſeene one aboue another, as in the former.

3 There is a third ſort of Corne-Flag which agreeth with the laſt deſcribed in euerie point, ſauing that the Floures of this are of a pale colour, as it were betweene white, and that which we call Maidens Bluſh.

‡ 4 This Water Sword-Flag, deſcribed by *Cluſius* in his *Cur. Poſt.* hath leaues about a ſpan long, thicke and hollow, with a partition in their middles, like as wee ſee in the cods of Stocke-Gillouers, and the like: their colour is greene, and taſte ſweet, ſo that they are an acceptable food to the wilde Ducks ducking downe to the bottome of the water; for they ſometimes lie ſome ells vnder water: which notwithſtanding is ouer-topt by the ſtalke, which ſprings vp from among theſe leaues, and beares Floures of colour white, larger than thoſe of Stock-Gillouers, but in that hollow part that is next the ſtalke they are of a blewiſh colour, almoſt in ſhape reſembling the Floures of the Corne-Flag, yet not abſolutely like them. They conſiſt of fiue leaues, whereof the two vppermoſt are reflected towards the ſtalke; the three other being broader hang downewards. After the floures there follow round pointed veſſels filled with red ſeed. It floures at the end of Iuly.

It was found in ſome places of Weſt-Friſeland, by *Iohn Dortman* a learned Apothecary of Groningen. It growes in waters which haue pure grauell at the bottome, and that bring forth no plant beſides.

Cluſius, and *Dortman* who ſent it him, call it *Gladiolus Lacuſtris*, or *Stagnalis*. ‡

¶ *The place.*

Theſe kindes of Corne-Flags grow in medowes, and in earable grounds among corne, in many places of Italy, as alſo in the parts of France bordering thereunto. Neither are the fields of Auſtria and Morauia without them, as *Cordus* writeth. We haue great plenty of them in our London Gardens, eſpecially for the garniſhing and decking them vp with their ſeemly Floures.

¶ *The time.*

They floure from May to the end of Iuly.

¶ *The names.*

Corne-Flag is called in Greeke ξιφιον: in Latine, *Gladiolus*; and of ſome, *Enſis*: of others, ξιφιον, and *Gladiolus Segetalis*. *Theophraſtus* in his diſcourſe of *Phaſganum* maketh it the ſame with *Xiphion*. *Valerius Cordus* calleth Corne-Flag *Victorialis famina*: others, *Victorialis rotunda*: in the Germane

Tongue, **Seigwurtz**: yet we muſt make a difference betweene *Gladiolus* and *Victorialis longa*; for that is a kinde of Garlicke found vpon the higheſt Alpiſh mountaines, which is likewiſe called of the Germanes **Seigwurtz**. The Floures of Corne-Flag are called of the Italians, *Monacuccio*: in Engliſh, Corne-Flag, Corne-Sedge, Sword-Flag, Corne Gladin: in French, *Glais*.

¶ *The nature.*

The root of Corne-Flag, as *Galen* ſaith, is of force to draw, waſte, or conſume away, and dry, as alſo of a ſubtill and digeſting qualitie.

¶ *The vertues.*

A The root ſtamped with the pouder of Frankincenſe and wine, and applied, draweth forth ſplinters and thornes that ſticke faſt in the fleſh.

B Being ſtamped with the meale of Darnell and honied water, doth waſte and make ſubtill hard lumps, nodes, and ſwellings, being emplaiſtred.

C Some affirme, that the vpper root prouoketh bodily luſt, and the lower cauſeth barrenneſſe.

D The vpper root drunke in water is profitable againſt that kinde of burſting in children called *Enterocele*.

E The root of Corne-Flag ſtamped with hogs greaſe and wheaten meale, hath been found by late Practitioners in phyſicke and Surgerie, to be a certaine and approued remedie againſt the *Struma Scrophulæ*, and ſuch like ſwellings in the throat.

F The cods with the ſeed dried and beaten into pouder, and drunk in Goats milke or Aſſes milke, preſently taketh away the paine of the Collicke.

Chap. 77. *Of Starry Hyacinths and their kindes.*

1 *Hyacinthus ſtellatus Fuchſij.*
Starry Iacinth.

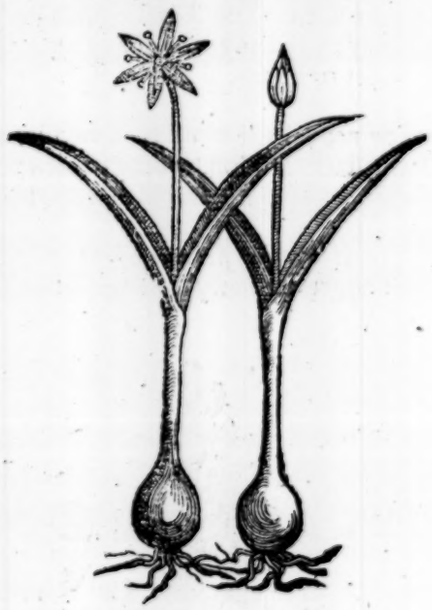
‡ 2 *Hyacinthus ſtellaris albicans.*
The white floured ſtarry Iacinth.

¶ *The kindes.*

THere be likewiſe bulbous or Onion rooted plants that do orderly ſucceed, whereof ſome are to be eaten, as Onions, Garlicke, Leekes, and Ciues; notwithſtanding I am firſt to entreat of

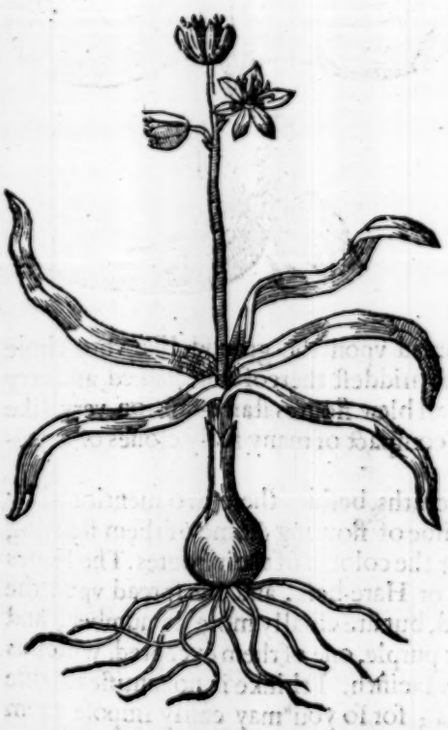
of thoſe bulbed roots, whoſe faire and beautifull Floures are receiued for their grace and ornament in gardens and garlands: the firſt are the Hyacinths, whereof there is found at this day diuers ſorts, differing very notably in many points, as ſhall be declared in their ſeueral deſcriptions.

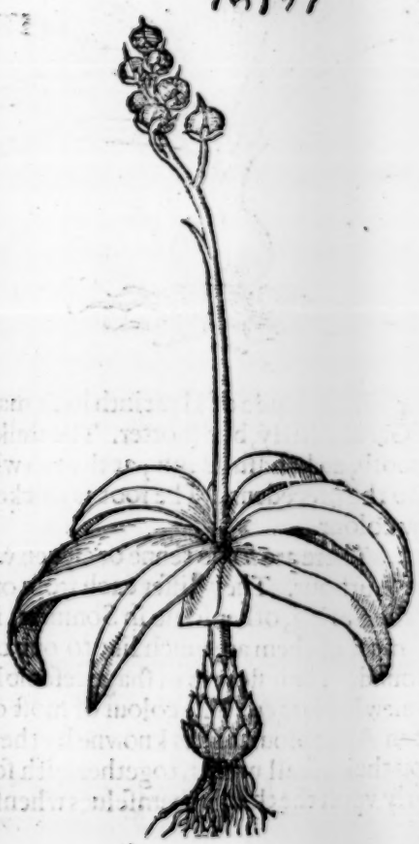
‡ 3 *Hyacinthus ſtellatus bifolius.*
Two-leaued ſtarry Iacinth.



4 *Hyacinthus ſtellatus Lilifolius cum flore & ſemine.*
The Lilly leaued ſtarry Iacinth in floure and ſeed.

‡ 6 *Hyacinthus ſtellaris Byzantinus.*
The ſtarry Iacinth of Conſtantinople.





¶ 7b2

¶ *The deſcription.*

1 THe firſt kinde of Iacinth hath three very fat thicke browne leaues, hollow like a little trough, very brittle, of the length of a finger: among which ſhoot vp fat, thick browniſh ſtalkes, ſoft and very tender, and full of juyce; whereupon do grow many ſmall blew Floures conſiſting of ſix little leaues ſpred abroad like a ſtarre. The ſeed is contained in ſmall round bullets, which are ſo ponderous or heauy that they lie trailing vpon the ground. The root is bulbous or Onion faſhion, couered with browniſh ſcales or filmes.

2 There is alſo a white floured one of this kinde.

3 There is found another of this kinde which ſeldome or neuer hath more than two leaues. The roots are bulbed like the other. The Floures be whitiſh, ſtarre-faſhion, tending to blewneſſe, which I receiued of *Robinus* of Paris.

‡ 8 *Hyacinthus ſtellaris* Someri.
Somers ſtarry Iacinth.

‡ 9 *Hyacinthus ſtellatus æſtivus major.*
The greater ſtarry Summer Iacinth.

4 This kinde of Hyacinth hath many broad leaues ſpread vpon the ground, like vnto thoſe of Garden Lilly, but ſhorter. The ſtalkes do riſe out of the middeſt thereof bare, naked, and very ſmooth, an handfull high; at the top whereof do grow ſmall blew floures ſtarre-faſhion, very like vnto the precedent. The root is thicke and full of juyce, compact of many ſcaly cloues of a yellow colour.

‡ There are ſome tenne or eleuen varieties of ſtarry Iacinths, beſides theſe two mentioned by our Authour. They differ each from other either in the time of flouring (ſome of them flouring in the Spring, other ſome in Sommer) in their bigneſſe, or the colours of their floures. The leaues of moſt of them are much like to our ordinarie Iacinth, or Hare-bels, and lie ſpread vpon the ground. Their floures in ſhape reſemble the laſt deſcribed, but are vſually more in number, and ſomewhat larger. The colour of moſt of them are blew or purple, one of them excepted, which is of an Aſh colour, and is knowne by the name of *Somers* his Iacinth. I thinke it not amiſſe to giue you their vſuall names, together with ſome of their figures; for ſo you may eaſily impoſe them truly vpon the things themſelues whenſoeuer you ſhall ſee them.

5 Hya-

5 *Hyacinthus ſtellaris Byzantinus nigra radice, flore cæruleo.*
The blew ſtarry Iacinth of Conſtantinople, with the blacke root.

6 *Hyacinthus ſtellatus Byzantinus major flore cæruleo.*
The greater blew ſtarry Iacinth of Conſtantiple.

7 *Hyacinthus ſtellatus Byzantinus alter flore boraginis.*
The other blew ſtarry Iacinth of Conſtantinople, with Floures ſomewhat reſembling Borage.

8 *Hyacinthus ſtellaris æſtivus, ſiue exoticus* Someri *flore cinereo.*
Aſh coloured ſtarry Iacinth, or *Somers* Iacinth.

9 *Hyacinthus ſtellatus æſtivus major.*
The greater ſtarry Sommer Iacinth.

10 *Hyacinthus ſtellatus æſtivus minor.*
The leſſer ſtarry Summer Iacinth.

11 *Hyacinthus ſtellaris* Poreti *flore cæruleo ſtrijs purpureis.*
Porets ſtarry Iacinth with blew Floures, hauing purple ſtreakes alongſt their middles.

12 *Hyacinthus Hiſpanicus ſtellaris flore ſaturè cæruleo.*
The Spaniſh ſtarry Iacinth with deepe blew floures.

13 There is another ſtarry Iacinth more large and beautifull than any of theſe before mentioned. The leaues are broad and not very long, ſpread vpon the ground, and in the midſt of them there riſeth vp a ſtalke which at the top beareth a great ſpoke of faire ſtarry floures, which firſt begin to open themſelues below, and ſo ſhew themſelues by little and little to the top of the ſtalke. The vſuall ſort hereof hath blew or purple floures. There is alſo a ſort hereof which hath fleſh-coloured floures, and another with white Floures: This is called *Hyacinthus ſtellatus Peruanus,* The ſtarry Iacinth of Peru.

10 *Hyacinthus ſtellatus æſtivus minor.*
The leſſer ſtarry Summer Iacinth.

13 *Hyacinthus Peruanus.*
Hyacinth of Peru.

Thoſe who are ſtudious in varieties of Floures, and require larger deſcriptions of theſe, may haue recourſe to the Workes of the learned *Carolus Cluſius* in Latine, or to M. *Parkinſons* Worke in Engliſh, where they may haue full ſatisfaction. ‡

¶ *The place.*

The three firſt mentioned Plants grow in many places of Germany in woods and mountaines, as *Fuchſius* and *Geſner* do teſtifie: In Bohemia alſo vpon diuers bankes that are full of Herbes. In England

England we cheriſh moſt of theſe mentioned in this place, in our gardens, onely for the beauty of their floures.

¶ *The time.*

The three firſt begin to floure in the midſt of Ianuarie, and bring forth their ſeed in May. The other floures in the Spring.

¶ *The names.*

1 The firſt of theſe Hyacinths is called *Hyacinthus ſtellatus*, or *Stellaris Fuchſij*, of the ſtarre-like Floures: *Narciſſus cæruleus Bockij*: of ſome, *Flos Martius ſtellatus*.

3 This by *Lobell* is thought to be *Hyacinthus Bifolius*, of *Theophraſtus*: *Tragus* calls it *Narciſſus cæruleus*: and *Fuchſius*, *Hyacinthus cæruleus minor mas*. Wee may call it in Engliſh, The ſmall two leaued ſtarrie Iacinth.

4 The Lilly Hyacinth is called *Hyacinthus Germanicus Liliflorus*, or Germane Hyacinth, taken from the countrey where it naturally groweth wilde.

‡ ¶ *The vertues.*

‡ The faculties of the ſtarry Hyacinths are not written of by any. But the Lilly leaued Iacinth, (which growes naturally in a hill in Aquitaine called *Hos*, where the Herdmen call it *Sarabuz*) is ſaid by them to cauſe the heads of ſuch cattell as feed thereon to ſwell exceedingly, and then kils them: which ſhewes it hath a maligne and poyſonous qualitie. *Cluſ.* ‡

Chap. 78. *Of Autumne Hyacinths.*

1 *Hyacinthus Autumnalis minor.*
Small Autumne Iacinth.

2 *Hyacinthus Autumnalis major.*
Great Autumne Iacinth.

¶ *The deſcription.*

1 AVtumne Iacinth is the leaſt of all the Iacinths: it hath ſmall narrow graſſy leaues ſpread abroad vpon the ground; in the middeſt whereof ſpringeth vp a ſmall naked ſtalke an handfull high, ſet from the middle to the top with many ſmall ſtarre-like blew floures, hauing certaine ſmall looſe chiues in the middle. The ſeed is blacke contained in ſmall huskes: the root is bulbous.

2 The

2 The great Winter Iacinth is like vnto the precedent, in leaues, ſtalkes, and floures, not differing in any one point but in greatneſſe.

‡ 3 To theſe I thinke it not amiſſe to adde another ſmall Hyacinth, more different from theſe laſt deſcribed in the time of the flouring, than in ſhape. The root of it is little, ſmall, white, longiſh, with a few fibres at the bottome; the leaues are ſmall and long like the laſt deſcribed. The ſtalke, which is ſcarce an handfull high, is adorned at the top with three or foure ſtarry floures of a blewiſh Aſh colour, each floure conſiſting of ſix little leaues, with ſix chiues and their pointals, of a darke blew, and a peſtill in the middeſt. It floures in Aprill. ‡

¶ *The place.*

† The greater Autumne Iacinth growes not wilde in England, but it is to be found in ſome gardens.

The firſt or leſſer growes wilde in diuers places of England, as vpon a banke by the Thames ſide betweene Chelſey and London. †

¶ *The time.*

They floure in the end of Auguſt, and in September, and ſometimes after.

¶ *The names.*

1 The firſt is called *Hyacinthus Autumnalis minor*, or the leſſer Autumne Iacinth, and Winter Iacinth.

2 The ſecond, *Hyacinthus Autumnalis major*, the great Autumne Iacinth, or Winter Iacinth.

3 This is called by *Lobell*, *Hyacinthus parvulus ſtellaris vernus*, The ſmall ſtarry Spring Iacinth.

CHAP. 79. *Of the Engliſh Iacinth, or Hare-Bels.*

1 *Hyacinthus Anglicus.*
Engliſh Hare-bels.

2 *Hyacinthus albus Anglicus.*
White Engliſh Hare-bels

¶ *The deſcription.*

1 THe blew Hare-bels or Engliſh Iacinth is very common throughout all England. It hath long narrow leaues leaning towards the ground, among the which ſpring vp naked

or

or bare ſtalkes loden with many hollow blew Floures, of a ſtrong ſweet ſmell, ſomewhat ſtuffing the head: after which come the coddes or round knobs, containing a great quantitie of ſmall blacke ſhining ſeed. The root is bulbous, full of a ſlimy glewiſh juyce, which wil ſerue to ſet feathers vpon arrowes in ſtead of glew, or to paſte bookes with: whereof is made the beſt ſtarch next vnto that of Wake-robin roots.

4 *Hyacinthus Orientalis cæruleus.*
The blew Orientall Iacinth.

5 *Hyacinthus Orientalis Polyanthos.*
Many floured Orientall Iacinth.

2 The white Engliſh Iacinth is altogether like vnto the precedent, ſauing that the leaues hereof are ſomewhat broader, the Floures more open, and very white of colour.

3 There is found wilde in many places of England, another ſort, which hath Floures of a faire carnation colour, which maketh a difference from the other.

‡ There are alſo ſundry other varieties of this ſort, but I thinke it vnneceſſarie to inſiſt vpon them, their difference is ſo little, conſiſting not in their ſhape, but in the colour of their Floures.‡

The blew Hare-bels grow wilde in woods, copſes, and in the borders of fields euery where thorow England.

The other two are not ſo common, yet do they grow in the woods by Colcheſter in Eſſex, in the fields and woods by South-fleet, neere vnto Graues-end in Kent, as alſo in a piece of ground by Canturbury called the Clapper, in the fields by Bathe, about the woods by Warrington in Lancaſhire, and other places.

¶ *The time.*

They floure from the beginning of May vnto the end of Iune.

¶ *The names.*

1 The firſt of our Engliſh Hyacinths is called *Hyacinthus Anglicus*, for that it is thought to grow more plentifully in England than elſewhere; of *Dodonæus*, *Hyacinthus non ſcriptus*, or the vnwritten Iacinth.

2 The ſecond, *Hyacinthus Belgicus candidus*, or the Low-Countrey Hyacinth with white Floures.

‡ 3 This third is called *Hyacinthus Anglicus, aut Belgicus Flore incarnato*, Carnation Harebels.

‡ 6 *Hyacinthus*

‡ 6 *Hyacinthus Orientalis polyanthos alter.*
The other many-Floured Oriental Iacinth.

‡ 7 *Hyacinthus Orientalis purpureo rubeus.*
Reddiſh purple Oriental Iacinth.

‡ 8 *Hyacinthus Orientalis albus.*
White Oriental Iacinth.

‡ 9 *Hyacinthus Brumalis.*
Winter Iacinth.

¶ *The Deſcription.*

4 The Orientall Iacinth hath great leaues, thicke, fat, and full of juyce, deepely hollowed in the middle like a trough: from the middle of thoſe leaues riſeth vp a ſtalke two hands high, bare without leaues, very ſmooth, ſoft, and full of juice, loden toward the top with many faire blew Floures, hollow like a bell, greater than the Engliſh Iacinth, but otherwiſe like them. The root is great, bulbous, or Onion faſhion, couered with many ſcaly reddiſh filmes or pillings, ſuch as couer Onions.

5 The Iacinth with many Floures (for ſo doth the word *Polyanthos* import) hath very many large and broad leaues, ſhort and very thicke, fat, or full of ſlimy juyce: from the middle whereof riſe vp ſtrong thicke groſſe ſtalkes, bare and naked, ſet from the middle to the top with many blew or skie coloured Floures growing for the moſt part vpon one ſide of the ſtalke. The root is great, thicke, and full of ſlimy juyce.

‡ 10 *Hyacinthus Orientalis caule folioſo*
Orientall Iacinth with leaues on the ſtalke.

‡ 11 *Hyacinthus Orientalis flore pleno.*
The double floured Oriental Iacinth.

‡ 6 There is another like the former in each reſpect, ſauing that the floures are wholly white on the inſide, and white alſo on the outſide, but three of the out-leaues are of a pale whitiſh yellow. Theſe floures ſmell ſweet as the former, and the heads wherein the ſeeds are contained are of a lighter greene colour. ‡

7 There is come vnto vs from beyond the ſeas diuers other ſorts, whoſe figures are not extant with vs; of which there is one like vnto the firſt of theſe Oriental Iacinths, ſauing that the floures thereof are purple coloured; whence it is termed *Hyacinthus purpuro rubeus*.

8 Likewiſe there is another called *Orientalis albus*, differing alſo from the others in colour of the floures, for that theſe are very white, and the others blew.

9 There is another called *Hyacinthus Brumalis*, or winter Iacinth: it is like the others in ſhape, but differeth in the time of flouring.

‡ 10 There is another Hyacinth belonging rather to this place than any other, for that in root, leaues, floures, and ſeeds it reſembles the firſt deſcribed Oriental Iacinth; but in one reſpect it differs not onely from them, but alſo from all other Iacinths: which is, it hath a leauie ſtalke, hauing ſometimes one, and otherwhiles two narrow long leaues comming forth at the bottome of the

‡ 14 *Hyacinthus obſoleto flore Hiſpanicus major.*
The greater dusky floured Spaniſh Iacinth.

‡ 15 *Hyacinthus minor Hiſpanicus.*
The leſſer Spaniſh Iacinth.

‡ 16 *Hyacinthus Indicus tuberoſus.*
The tuberous rooted Indian Iacinth.

the ſetting on of the floure. Whereupon *Cluſius* calls it *Hyacinthus Orientalis caule folioſo:* That is, the Oriental Hyacinth with leaues on the ſtalke.

¶ *Of double floured Oriental Hyacinths.*

Of this kindred there are two or three more varieties, whereof I wil giue you the deſcription of the moſt notable, and the names of the other two; which, with that I ſhall deliuer of this, may ſerue for ſufficient deſcription. The firſt of theſe (which *Cluſius* calls *Hyacinthus Orientalis ſubvireſcente flore*, or, the greeniſh floured double Orientall Iacinth) hath leaues, roots, and ſeeds like vnto the formerly deſcribed Oriental Iacinths; but the floures (wherin the difference conſiſts) are at the firſt, before they be open, greene, and then on the out ſide next to the ſtalke of a whitiſh blew; and they conſiſt of ſix leaues whoſe tips are whitiſh, yet retaining ſome manifeſt greenes: then out of the midſt of the floure comes forth another floure conſiſting of three leaues, whitiſh on their inner ſide, yet keeping the great veine or ſtreake vpon the outer ſide, each floure hauing in the middle a few chiues with blackiſh pendants. It floures in Aprill.

12 This varietie of the laſt deſcribed is called *Hyacinthus Orientalis flore caruleo pleno*, The double blew Orientall Iacinth

13 This, *Hyacinthus Orientalis candidiſsimus flore pleno*, The milke-white double Orientall Iacinth.

14 This, which *Cluſius* calls *Hyacinthus obſoletior Hiſpanicus*, hath leaues ſomewhat narrower, and more flexible than the *Muſcari*, with a white veine running alongſt the inſide of them: among theſe leaues there riſeth vp a ſtalke of ſome foot high, bearing ſome fifteene or ſixteene floures, more or leſſe, in ſhape much like the ordinarie Engliſh, conſiſting of ſix leaues, three ſtanding much out, and the other three little or nothing. Theſe floures are of a very dusky colour, as it were mixt with purple, yellow, and greene: they haue no ſmell. The ſeed, which is contained in triangular heads, is ſmooth, blacke, ſcaly, and round. It floures in Iune.

15 The leſſer Spaniſh Hyacinth hath leaues like the Grape-floure, and ſmall floures ſhaped like the Orientall Iacinth, ſome are of colour blew, and other ſome white. The ſeeds are contained in three cornered ſeed-veſſels. I haue giuen the figure of the white and blew together, with their ſeed-veſſels.

16 This Indian Iacinth with the tuberous root (ſaith *Cluſius*) hath many long narrow ſharpe pointed leaues ſpread vpon the ground, being ſomewhat like to thoſe of Garlicke, and in the middeſt of theſe riſe vp many round firme ſtalkes of ſome two cubits high, and oft times higher, ſometimes exceeding the thickneſſe of ones little finger; which is the reaſon that oftentimes, vnleſſe they be borne vp by ſomething, they lie along vpon the ground. Theſe ſtalkes are at certaine ſpaces ingirt with leaues which end in ſharpe points. The tops of theſe ſtalkes are adorned with many white floures, ſomewhat in ſhape reſembling thoſe of the Orientall Iacinth. The roots are knotty or tuberous, with diuers fibres comming out of them. ‡

¶ *The place.*

Theſe kindes of Iacinths haue beene brought from beyond the Seas, ſome out of one countrey, and ſome out of others, eſpecially from the Eaſt countries, whereof they tooke their names *Orientalis*.

¶ *The time.*

They floure from the end of Ianuarie vnto the end of Aprill.

¶ *The nature.*

The Hyacinths mentioned in this Chapter do lightly cleanſe and binde; the ſeeds are dry in the third degree; but the roots are dry in the firſt degree, and cold in the ſecond.

¶ *The vertues.*

A The Root of Hyacinth boyled in Wine and drunke, ſtoppeth the belly, prouoketh vrine, and helpeth againſt the venomous bitings of the field Spider.

B The ſeed is of the ſame vertue, and is of greater force in ſtopping the laske and bloudy flix. Being drunke in wine it preuaileth againſt the falling ſickneſſe.

C The roots, after the opinion of *Dioſcorides*, being beaten and applied with white Wine, hinder or keepe backe the growth of haires.

D ‡ The ſeed giuen with Southerne-wood in Wine is good againſt the Iaundice. ‡

Chap. 80. *Of Faire haired Iacinth.*

¶ *The Deſcription.*

1 The Faire haired Iacinth hath long fat leaues, hollowed alongſt the inſide, trough faſhion, as are moſt of the Hyacinths, of a darke greene colour tending to redneſſe. The ſtalke riſeth out of the middeſt of the leaues, bare and naked, ſoft and full of ſlimie juyce, which are beſet round about with many ſmall floures of an ouerworne purple colour: The top of the ſpike conſiſteth of a number of faire ſhining purple floures, in manner of a tuft or buſh of haires, whereof it tooke his name *Comoſus*, or faire haired. The ſeed is contained in ſmall bullets, of a ſhining blacke colour, as are moſt of thoſe of the Hyacinths. The roots are bulbous or Onion faſhion, full of ſlimy juyce, with ſome hairy threads faſtned vnto their bottome.

2 White haired Iacinth differeth not from the precedent in roots, ſtalkes, leaues, or ſeed. The floures hereof are of a darke white colour, with ſome blackneſſe in the hollow part of them, which ſetteth forth the difference.

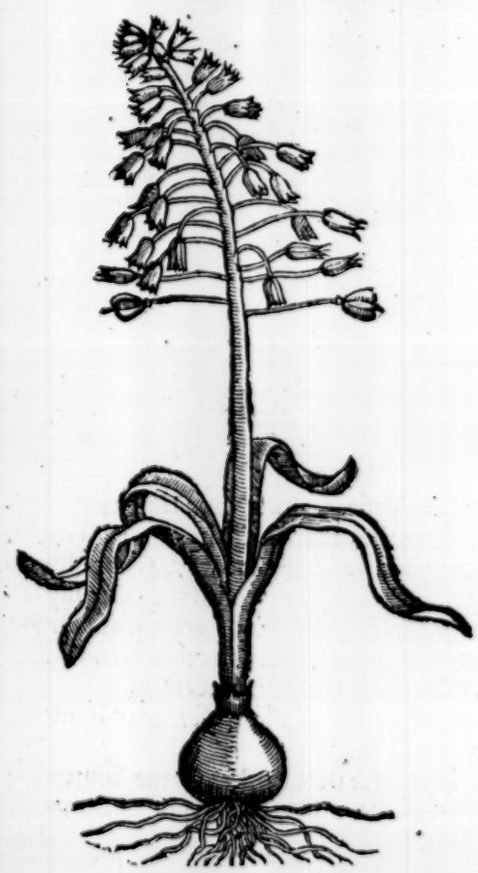
3 Of this kinde I receiued another ſort from Conſtantinople, reſembling the firſt hairy Hyacinth very notably: but differeth in that, that this is altogether greater, as well in leaues, roots, and floures, as alſo is of greater beauty without all compariſon.

1 *Hya-*

1 *Hyacinthus comoſus.*
Faire haired Iacinth.

2 *Hyacinthus comoſus albus:*
White haired Iacinth.

‡ 3 *Hyacinthus comoſus Bizantinus.*
Faire-haired Iacinth of Conſtantinople.



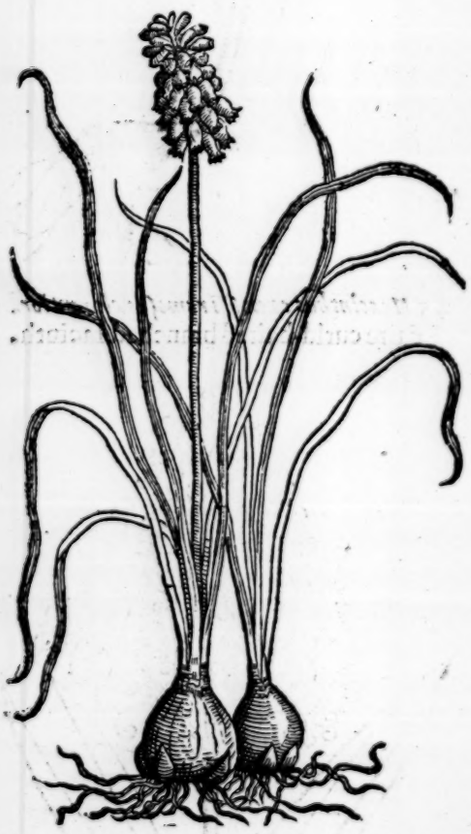
‡ 5 *Hyacinthus comoſus ramoſus elegantior.*
Faire curld-haired branched Iacinth.

‡ 4 There are two other more beautifull haired Iacinths nouriſhed in the gardens of our prime Floriſts. The firſt of theſe hath roots and leaues reſembling the laſt deſcribed: the ſtalke commonly riſeth to the height of a foot, and it is diuided into many branches on euery ſide, which are ſmall and threddy; and then at the end as it were of theſe threddy branches there come forth many ſmaller threds of a darke purple colour, and theſe ſpread and diuaricate themſelues diuers wayes, much after the manner of the next deſcribed; yet the threds are neither of ſo pleaſing a colour, neither ſo many in number, nor ſo finely curled. This is called *Hyacinthus comoſus ramoſus purpureus*, The faire haired branched Iacinth.

5 This is a moſt beautiful and elegant plant, and in his leaues and roots he differs little from the laſt deſcribed; but his ſtalke, which is as high as the former, is diuided into very many ſlender branches, which ſubdiuided into great plenty of curled threads variouſly ſpread abroad, make a very pleaſant ſhew. The colour alſo is a light blew, and the floures vſually grow ſo, that they are moſt dilated at the bottome, and ſo ſtraiten by little and little after the manner of a Pyramide. Theſe floures keepe their beautie long, but are ſucceeded by no ſeeds that yet could be obſerned. This by *Fabius Columna* (who firſt made mention hereof in writing) is called *Hyacinthus Sanneſius panniculoſa coma*: By others, *Hyacinthus comoſus ramoſus elegantior*, The faire curld-haire Iacinth.

Theſe floure in May. ‡

6 Hyacinthus botryoides cæruleus.
Blew Grape-floure.



7 Hyacinthus botryoides cæruleus major.
Great Grape-floure.

6 The ſmall Grape floure hath many long fat and weake leaues trailing vpon the ground, hollow in the middle like a little trough, full of ſlimie juyce like the other Iacinths; amongſt which come forth thicke ſoft ſmooth and weake ſtalkes, leaning this way and that way, as not able to ſtand vpright by reaſon it is ſurcharged with very heauy floures on his top, conſiſting of many little bottle-like blew floures, cloſely thruſt or packed together like a bunch of grapes, of a ſtrong ſmell, yet not vnpleaſant, ſomewhat reſembling the ſauour of the Orange. The root is round and bulbous, ſet about with infinite young cloues or roots, whereby it greatly increaſeth.

7 The great Grape-floure is very like vnto the ſmaller of his kinde. The difference conſiſteth, in that this plant is altogether greater, but the leaues are not ſo long.

8 The sky-coloured Grape-floure hath a few leanes in reſpect of the other Grape-floures, the which are ſhorter, fuller of juyce, ſtiffe and vpright, whereas the others traile vpon the ground.

The

The floures grow at the top, thruſt or packt together like a bunch of Grapes, of a pleaſant bright sky colour, euery little bottle-like floure ſet about the hollow entrance with ſmall white ſpots not eaſie to be perceiued. The roots are like the former.

8 *Hyacinthus Botryoides cæruleus major.*
Great Grape-floure.

9 The white Grape-floure differeth not from the sky-coloured Iacinth, but in colour of the floure: for this Iacinth is of a pleaſant white colour tending to yellownes, tipped about the hollow part with White, whiter than White it ſelfe; otherwiſe there is no difference.

¶ *The Place.*

Theſe plants are kept in gardens for the beautie of their floures, wherewith our London gardens do abound.

¶ *The Time.*

They floure from Februarie to the end of May.

¶ *The Names.*

The Grape-floure is called *Hyacinthus Botryoides*, and *Hyacinthus Neoticorum Dodonæi*: of ſome, *Bulbus Eſculentus*, *Hyacinthus ſylueſtris cordi*, *Hyacinthus exiguus Tragi*. Some iudge them to be *Bulbine*, of *Pliny*.

† *The faire haired Iacinth deſcribed in the firſt place is the* Hyacinthus of *Dioſcorides and the Antients.*†

¶ *The Nature and Vertues.*

† *The vertues ſet downe in the precedent Chapter properly belong to that kinde of Hyacinth which is deſcribed in the firſt place in this Chapter.*

Chap. 81. *Of Muſcari, or Musked Grape-floure.*

¶ *The Deſcription.*

1 YEllow Muſcarie hath fiue or ſix long leaues ſpread vpon the ground, thicke, fat, and full of ſlimie juyce, turning and winding themſelues crookedly this way & that way, hollowed alongſt the middle like a trough, as are thoſe of faire haired Iacinth, which at the firſt budding or ſpringing vp are of a purpliſh colour; but being growne to perfection, become of a darke greene colour: amongſt the which leaues riſe vp naked, thicke, and fat ſtalkes, infirme and weake in reſpect of the thickneſſe and greatneſſe thereof, lying alſo vpon the ground as do the leaues; ſet from the middle to the top on euery ſide with many yellow floures, euerie one made like a ſmall pitcher or little box, with a narrow mouth, exceeding ſweet of ſmell like the ſauor of muske, whereof it tooke the name *Muſcari*. The ſeed is incloſed in puffed or blowne vp cods, confuſedly made without order, of a fat and ſpongeous ſubſtance, wherein is contained round blacke ſeed. The root is bulbous or onion faſhion, whereunto are annexed certaine fat and thicke ſtrings like thoſe of Dogs graſſe.

2 Aſh-coloured *Muſcari* or grape-floure, hath large and fat leaues like the precedent, not differing in any point, ſauing that theſe leaues at their firſt ſpringing vp are of a pale dusky colour like aſhes. The floures are likewiſe ſweet, but of a pale bleake colour, wherein conſiſteth the difference,

¶ *The*

1 *Muſcari flavum.*
Yellow musked Grape-floure.

2 *Muſcari Cluſij.*
Aſh-coloured Grape-floure.

Muſcari caulis ſiliquis onuſtus.
The ſtalke of Muſcari hanged with the ſeed-veſſels.

¶ *The Place.*

Theſe Plants came from beyond the Thracian Boſphorus, out of Aſia, and from about Conſtantinople, and by the meanes of Friends haue been brought into theſe parts of Europe, whereof our London gardens are poſſeſſed.

¶ *The Time.*

They floure in March and Aprill, and ſometimes after.

¶ *The Names.*

They are called generally *Muſcari*: In the Turky Tongue, *Muſchoromi*, *Muſcurimi*, *Tipcadi*, and *Dipcadi*, of their pleaſant ſweet ſmell: Of *Matthiolus*, *Bulbus Vomitorius*. Theſe plants may be referred vnto the Iacinths, whereof vndoubtedly they be kindes.

¶ *The Nature and Vertues.*

There hath not as yet any thing beene touched concerning the nature or vertues of theſe Plants, onely they are kept and maintained in gardens for the pleaſant ſmell of their floures, but not for their beauty, for that many ſtinking field floures do in beautie farre ſurpaſſe them. But it ſhould ſeem that *Matthiolus* called them *Vomitorius*, in that he ſuppoſed they procure vomiting; which of other Authors hath not bin remembred.

Chap.

CHAP. 82. *Of Woolly Bulbus.*

Bulbus Eriophorus.
Woolly Iacinth.

¶ *The Deſcription.*

THere hath fallen out to be here inſerted a bulbous plant conſiſting of many Bulbes, which hath paſſed currant amongſt all our late Writers. The which I am to ſet forth to the view of our Nation, as others haue done in ſundry languages to theirs, as a kind of the Iacinths, which in roots and leaues it doth very wel reſemble; called of the Grecians, Ἐριοφορος: in Latine, *Laniferus*, becauſe of his aboundance of Wooll-reſembling ſubſtance, wherewith the whole Plant is in euery part full fraught, as well roots, leaues, as ſtalkes. The leaues are broad, thicke, fat full of juyce, and of a ſpider-like web when they be broken. Among theſe leaues riſeth vp a ſtalke two cubits high, much like vnto the ſtalke of Squilla or Sea-Onion; and from the middle to the top it is beſet round about with many ſmall ſtarre-like blew floures without ſmell, very like to the floures of Aſphodill; beginning to floure at the bottome, and ſo vpward by degrees, whereby it is long before it hath done flouring: which floures the learned Phyſitian of Vienna, *Iohannes Aicholzius*, deſired long to ſee; who brought it firſt from Conſtantinople, and planted it in his Garden, where he nouriſhed it tenne yeares with great curioſitie: which time being expired, thinking it to be a barren plant, he ſent it to *Carolus Cluſius*, with whom in ſome few yeres it did beare ſuch floures as before deſcribed, but neuer ſince to this day. This painefull Herbariſt would gladly haue ſeene the ſeed that ſhould ſucceed theſe floures; but they being of a nature quickly ſubiect to periſh, decay, and fade, began preſently to pine away, leauing onely a few chaffie and idle ſeed-veſſels without fruit. My ſelfe hath beene poſſeſſed with this plant at the leaſt twelue yeares, whereof I haue yearely great encreaſe of new roots, but I did neuer ſee any token of budding or flouring to this day: notwithſtanding I ſhall be content to ſuffer it in ſome baſe place or other of my garden, to ſtand as the cipher o at the end of the figures, to attend his time and leiſure, as thoſe men of famous memorie haue done. Of whoſe temperature and vertues there hath not any thing beene ſaid, but kept in gardens to the end aforeſaid.

CHAP. 83. *Of two feigned Plants.*

¶ *The Deſcription.*

1 I Haue thought it conuenient to conclude this hiſtorie of the Hyacinths with theſe two bulbous Plants, receiued by tradition from others, though generally holden for feigned and adulterine. Their pictures I could willingly haue omitted in this hiſtorie, if the curious eye could elſewhere haue found them drawne and deſcribed in our Engliſh Tongue: but becauſe I finde them in none, I will lay them downe here, to the end that it may ſerue for excuſe to others who ſhall come after, which liſt not to deſcribe them, being as I ſaid condemned for feined and adulterine, nakedly drawne onely. And the firſt of them is called *Bulbus* Ἀστρωτος: by others, *Bulbus Bombycinus Commentitius*. The deſcription conſiſteth of theſe points, *viz.* The floures (ſaith the Author) are no leſſe ſtrange than wonderfull. The leaues and roots are like to thoſe of Hyacinths,

cinths, which hath cauſed it to occupie this place. The floures reſemble the Daffodils or Narciſſus. The whole plant conſiſteth of a woolly or flockie matter: which deſcription with the Picture was ſent vnto *Dodonæus* by *Iohannes Aicholzius*. It may be that *Aicholzius* receiued inſtructions from the Indies, of a plant called in Greeke ναξάδιον, which groweth in India, whereof *Theophraſtus* and *Athenæus* do write in this manner, ſaying, The floure is like the *Narciſſus*, conſiſting of a flockie or woolly ſubſtance, which by him ſeemeth to be the deſcription of our bombaſt Iacinth.

1 *Bulbus Bombicinus Commentitius.*
Falſe bumbaſte Iacinth.

2 *Tigridis flos.*
The floure of Tygris.

2 The ſecond feigned picture hath beene taken of the Diſcouerer and others of later time, to be a kinde of Dragons not ſeene of any that haue written thereof; which hath moued them to thinke it a feigned picture likewiſe; notwithſtanding you ſhall receiue the deſcription thereof as it hath come to my hands. The root (ſaith my Author) is bulbous or Onion faſhion, outwardly blacke; from the which ſpring vp long leaues, ſharpe pointed, narrow, and of a freſh greene colour: in the middeſt of which leaues riſe vp naked or bare ſtalkes, at the top whereof groweth a pleaſant yellow floure, ſtained with many ſmall red ſpots here and there confuſedly caſt abroad: and in the middeſt of the floure thruſteth forth a long red tongue or ſtile, which in time groweth to be the cod or ſeed-veſſell, crooked or wreathed, wherein is the ſeed. The vertues and temperature are not to be ſpoken of, conſidering that we aſſuredly perſuade our ſelues that there are no ſuch plants, but meere fictions and deuices, as we terme them, to giue his friend a gudgeon.

‡ Though theſe two haue beene thought commentitious or feigned, yet *Bauhinus* ſeemeth to vindicate the latter, and *Iohn Theodore de Bry* in his *Florilegium* hath ſet it forth. He giues two Figures thereof, this which we here giue you being the one; but the other is farre more elegant, and better reſembles a naturall plant. The leaues (as *Bauhine* ſaith) are like the ſword-flag, the root like a leeke, the floures (according to *De Bries* Figure) grow ſometimes two or three of a ſtalke: the floure conſiſts of two leaues, and a long ſtile or peſtill: each of theſe leaues is diuided into three parts, the vttermoſt being broad and large, and the innermoſt much narrower and ſharper: the tongue or ſtile that comes forth of the midſt of the floure is long, and at the end diuided into three crooked forked points. All that *De Bry* ſaith thereof is this; *Flos Tigridis rubet egregiè circa medium tamen pallet, albuſque eſt & maculatus; ex Mexico à Caſparo Bauhino.* That is; *Flos Tigridis* is wondrous red, yet is it pale and whitiſh about the middle, and alſo ſpotted; it came from about Mexico, I had it from *Caſpar Bauhine.* ‡

Chap.

CHAP. 84. *Of Daffodils.*

¶ *The Kindes.*

DAffodill, or *Narciſſus*, according to *Dioſcorides*, is of two ſorts: the floures of both are white, the one hauing in the middle a purple circle or coronet; the other with a yellow cup circle or coronet. Since whoſe time there hath been ſundry others deſcribed, as ſhall be ſet forth in their proper places.

1 *Narciſſus medio purpureus.*
Purple circled Daffodill.

‡ 4 *Narciſſus medio croceus ſerotinus Polyanthos.*
The late many floured Daffodill with the Saffron-coloured middle.

¶ *The Deſcription.*

1 THe firſt of the Daffodils is that with the purple crowne or circle, hauing ſmall narrow leaues, thicke, fat, and full of ſlimie juyce; among the which riſeth vp a naked ſtalke, ſmooth and hollow, of a foot high, bearing at the top a faire milk-white floure growing forth of a hood or thinne filme, ſuch as the floures of onions are wrapped in: in the middeſt of which floure is a round circle or ſmall coronet of a yellowiſh colour, purfled or bordered about the edge of the ſaid ring or circle with a pleaſant purple colour; which beeing paſt, there followeth a thicke knob or button, wherein is contained blacke round ſeed. The root is white, bulbous or Onion faſhion.

2 The ſecond kinde of Daffodill agreeth with the precedent in euery reſpect, ſauing that this Daffodill floureth in the beginning of Februarie, and the other not vntill Aprill, and is ſomewhat leſſer. It is called *Narciſſus medio purpureus præcox*; That is, Timely purple ringed Daffodill. The next may haue the addition *præcocior*, More timely: and the laſt in place, but firſt in time, *præcociſſimus*, Moſt timely, or very early flouring Daffodill.

3 The

‡ 5 *Narciſſus medio-purpureus flore pleno.*
Double floured purple circled Daffodill.

6 *Narciſſus minor ſerotinus.*
The late flouring ſmall Daffodill.

7 *Narciſſus medioluteus.*
Primroſe Pearles, or the common white Daffodill.

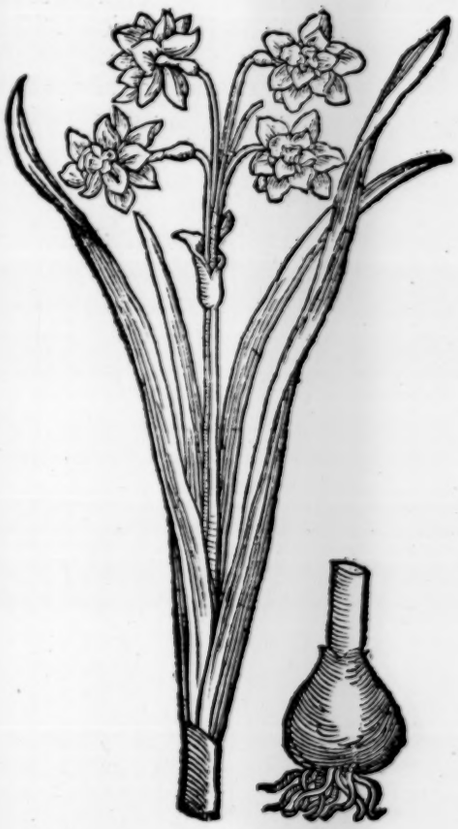
8 *Narciſſus medioluteus polyanthos.*
French Daffodill.

9 Nar.

9 *Narciſſus Piſanus.*
Italian Daffodill.

‡ 11 *Narciſſus flore pleno albo.*
The other double white Daffodill.

10 *Narciſſus albus multiplex.*
The double white Daffodill of Conſtantinople.



‡ 12 *Narciſſus flore pleno, medio luteo.*
Double white Daffodil with the middle yellow.

3 The third kind of Daffodil with the pnrple ring or circle in the middle, hath many ſmall narrow leaues, very flat, crookedly bending toward the top; among which riſeth vp a ſlender bare ſtalke, at whoſe top doth grow a faire and pleaſant floure, like vnto thoſe before deſcribed, but leſſer, and floureth ſooner, wherein conſiſteth the difference.

‡ There is alſo another ſomewhat leſſe, and flouring ſomewhat earlier than the laſt deſcribed.

4 This in roots, leaues, and ſtalkes differeth very little from the laſt mentioned kindes; but it beares many floures vpon one ſtalke, the out-leaues being like the former, white, but the cup or ring in the middle of a ſaffron colour, with diuers yellow threds contained therein.

5 To theſe may be added another mentioned by *Cluſius*, which differs from theſe onely in the floures; for this hath floures conſiſting of ſix large leaues fairely ſpread abroad, within which are other ſix leaues not ſo large as the former, and then many other little leaues mixed with threds comming forth of the middle. Now there are purple welts which runne betweene the firſt and ſecond ranke of leaues, in the floure, and ſo in the reſt. This floures in May; and it is *Narciſſus pleno flore quintus*, of *Cluſius*. ‡

‡ 13 *Narciſſus flore pleno, medio verſicolore.*
Double Daffodill with a diuers coloured middle.

14 *Narciſſus totus albus.*
Milke white Daffodill.

6 This late flouring Daffodill hath many fat thicke leaues, full of juice, among the which riſeth vp a naked ſtalke, on the top whereof groweth a faire white floure, hauing in the middle a ring or yellow circle. The ſeed groweth in knobby ſeed veſſels. The root is bulbous or Onion faſhion. It floureth later than the others before deſcribed, that is to ſay, in Aprill and May.

7 The ſeuenth kinde of Daffodill is that ſort of *Narciſſus* or Primeroſe peereleſſe that is moſt common in our countrey gardens, generally knowne euery where. It hath long fat and thicke leaues, full of a ſlimie juice; among which riſeth vp a bare thicke ſtalke, hollow within and full of juice. The floure groweth at the top, of a yellowiſh white colour, with a yellow crowne or circle in the middle; and floureth in the moneth of Aprill, and ſometimes ſooner. The root is bulbous faſhion.

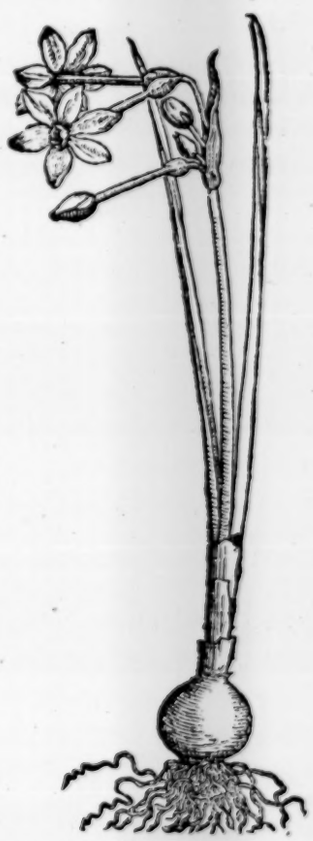
8 The eighth Daffodill hath many broad and thicke leaues, fat and full of juice, hollow and ſpongeous. The ſtalkes, floures, and roots are like the former, and differeth in that, that this plant bringeth

bringeth forth many floures vpon one ſtalk, and the other fewer, and not of ſo perfect a ſweet ſmel, but more offenſiue and ſtuffing the head. It hath this addition, *Polyanthos*, that is, of many floures, wherein eſpecially conſiſteth the difference.

9 The Italian Daffodill is very like the former, the which to diſtinguiſh in words, that they may be knowne one from another, is impoſſible. Their floures, leaues, and roots are like, ſauing that the floures of this are ſweeter and more in number.

15 *Narciſſus Iuncifolius præcox.*
Ruſh Daffodill, or *Iunquilia.*

16 *Narciſſus Iuncifolius ſerotinus.*
Late flouring Ruſh Daffodill.



10 The double white Daffodill of Conſtantinople was ſent into England vnto the right honourable the Lord Treaſurer, among other bulbed floures: whoſe roots when they were planted in our London gardens, did bring forth beautifull floures, very white and double, with ſome yellowneſſe mixed in the middle leaues, pleaſant and ſweet in ſmell, but ſince that time we neuer could by any induſtrie or manuring bring them vnto flouring againe. So that it ſhould appeare, when they were diſcharged of that birth or burthen which they had begotten in their owne country, and not finding that matter, ſoile, or clymate to beget more floures, they remaine euer ſince barren and fruitleſſe. Beſides, we found by experience, that thoſe plants which in Autumne did ſhoot forth leaues, did bring forth no floures at all; and the others that appeared not vntill the Spring, did flouriſh and beare their floures. The ſtalks, leaues, and roots are like vnto the other kindes of Daffodils. It is called of the Turks, *Giul Catamer lale*; That is, *Narciſſus* with double floures. Notwithſtanding we haue receiued from beyond the ſeas, as well from the Low Countries, as alſo from France, another ſort of greater beautie, which from yeare to yeare doth yeeld forth moſt pleaſant double floures, and great encreaſe of roots, very like as well in ſtalkes as other parts of the plant, vnto the other ſorts of Daffodils. It differeth onely in the floures, which are very double and thicke thruſt together, as are the floures of our double Primroſe, hauing in the middle of the floure ſome few chiues or welts of a bright purple colour, and the other mixed with yellow as aforeſaid.

‡ 11 This alſo with double white floures, which *Cluſius* ſets forth in the ſixth place, is of the ſame kinde with the laſt deſcribed; but it beares but one or two floures vpon a ſtalke, whereas the other hath many.

12 This, which is *Cluſius* his *Narciſſus flore pleno* 2. is in roots, leaues, and ſtalkes very like the

precedent; but the floures are compoſed of ſix large white out-leaues; but the middle is filled with many faire yellow little leaues much like to the double yellow wall-floure. They ſmel ſweet like as the laſt mentioned.

13 This differs from the laſt mentioned onely in that it is leſſe, and that the middle of the floure within the yellow cup is filled with longiſh narrow little leaues, as it were croſſing each other. Their colour is white, but mixed with ſome greene on the outſide, and yellow on the inſide. ‡

14 The milke white Daffodill differeth not from the common white Daffodill, or Primroſe peereleſſe, in leaues, ſtalkes, roots, or floures, ſauing that the floures of this plant hath not any other colour in the floure but white, whereas all the others are mixed with one colour or other.

‡ 17 *Narciſſus juncifolius Roſeoluteus.*
Roſe or round floured *Iunquilia.*

‡ 18 *Narciſſus juncifolius amplo calice.*
White *Iunquilia* with the large cup.

‡ 19 *Narciſſus juncifolius reflexus flore albo.*
The white reflex *Iunquilia.*

15 The Ruſh Daffodill hath long, narrow, and thicke leaues, very ſmooth and flexible, almoſt round like Ruſhes, whereof it tooke his ſyrname *Iuncifolius* or Ruſhie. It ſpringeth vp in the beginning of Ianuarie, at which time alſo the floures doe ſhoot forth their buds at the top of ſmall ruſhy ſtalkes, ſometimes two, and often more vpon one ſtalke, made of ſix ſmall yellow leaues. The cup or crowne in the middle is likewiſe yellow, in ſhape reſembling the other Daffodills, but ſmaller, and of a ſtrong ſweet ſmell. The root is bulbed, white within, and couered with a blacke skin or filme.

16 This Ruſh Daffodil is like vnto the precedent in each reſpect, ſauing that it is altogether leſſer, and longer before it come to flouring. There is alſo a white floured one of this kinde.

‡ 17 There

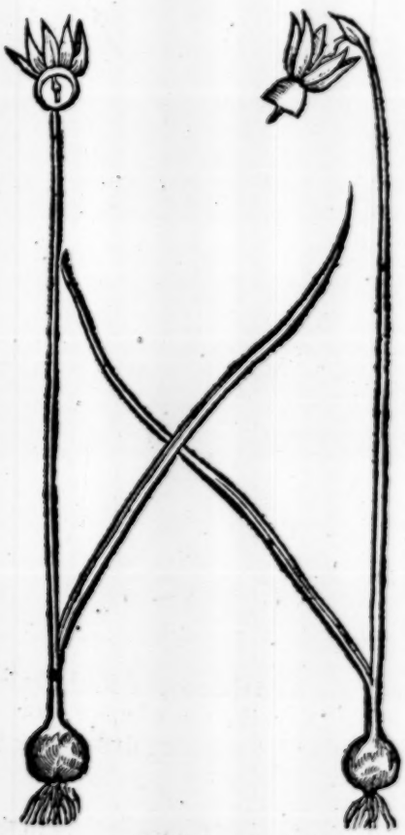
‡ 17 There is alſo another Ruſh Daffodill or *Iunquilia*, with floures not ſharpe pointed, but round with a little cup in the middle: the colour is yellow or elſe white. This is *Lobels Narciſſus juncifolius flore rotundæ circinitatis roſeo.*

18 There is alſo ahother *Iunquilia* whoſe leaues and ſtalkes are like thoſe of the firſt deſcribed Ruſhy Daffodill, but the cup in the middeſt of the floure is much larger. The colour of the floure is commonly white. *Cluſius* calls this *Narciſſus 1 Iuncifolius amplo calice.*

19 There are three or foure reflex *Iunquila's*, whoſe cups hang downe, and the ſixe incompaſſing leaues turne vp or backe, whence they take their names. The floures of the firſt are yellow; thoſe of the ſecond all white, the cup of the third is yellow, and the reflex leaues white. The fourth hath a white cup, and yellow reflex leaues. This ſeemes to be *Lobels Narciſſus montanus minimus coronatus.*

20 This is like to the ordinarie leſſer *Iunquilia*, but that the floures are very double, conſiſting of many long and large leaues mixed together; the ſhorter leaues are obtuſe, as if they were clipt off. They are wholly yellow. ‡

‡ 19 *Narciſſus Iuncifolius reflexus minor.*
The leſſer reflex *Iunquilia.*



‡ 20 *Narciſſus juncifolius multiplex.*
The double *Iunquilia.*

21 The Perſian Daffodill hath no ſtalke at all, but onely a ſmall and tender foot ſtalke of an inch high, ſuch as the Saffron floure hath: vpon which ſhort and tender ſtalk doth ſtand a yellowiſh floure conſiſting of ſix ſmall leaues; of which the three innermoſt are narrower than thoſe on the out ſide. In the middle of the floure doth grow forth a long ſtile or pointall, ſet about with many ſmall chiues or threds. The whole floure is of an vnpleaſant ſmel, much like to Poppy. The leaues riſe vp a little before the floure, long, ſmooth, and ſhining. The root is bulbed, thicke, and groſſe, blackiſh on the out ſide, and pale within, with ſome threds hanging at the lower part.

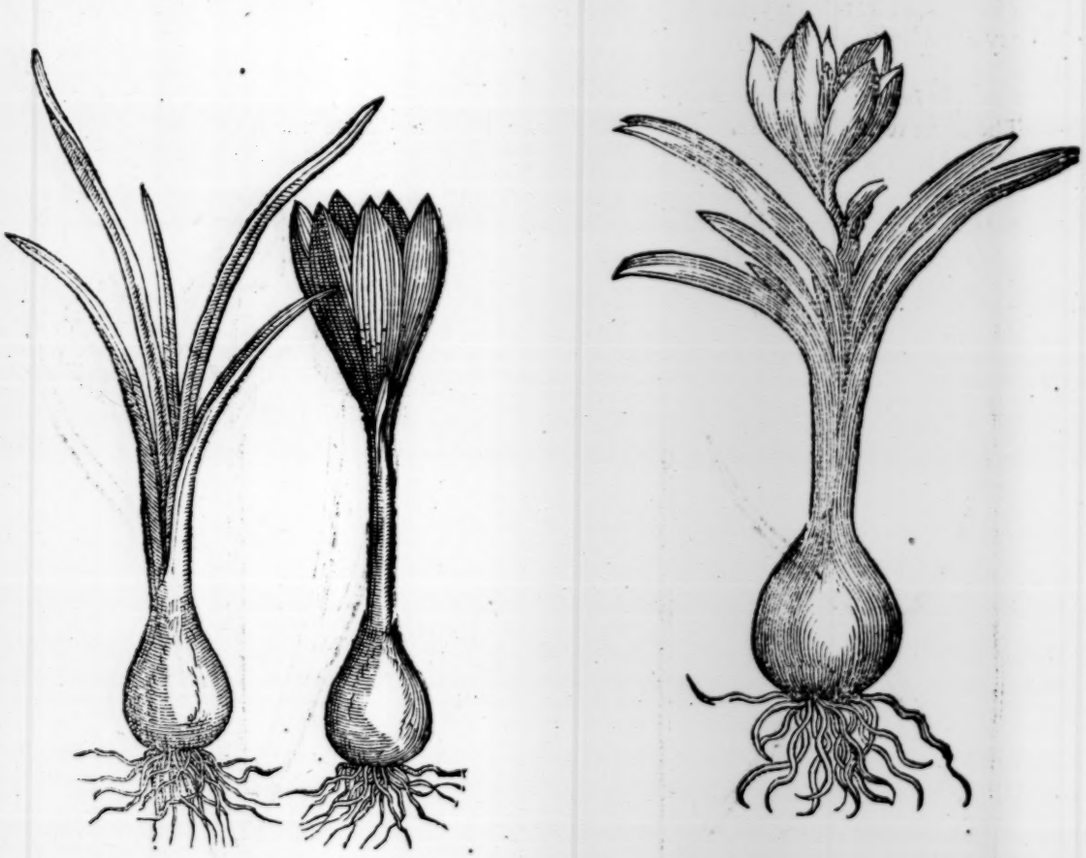
22 The Autumne Daffodill bringeth forth long ſmooth, glittering leaues, of a deepe greene colour: among which riſeth vp a ſhort ſtalke, bearing at the top one floure and no more, reſembling the floure of Mead Saffron or common Saffron, conſiſting of ſix leaues of a bright ſhining yellow colour; in the middle whereof ſtand ſix threds or chiues, and alſo a peſtell or clapper yellow likewiſe. The root is thicke and groſſe like vnto the precedent.

‡ 23 To this laſt may be adioyned another which in ſhape ſomewhat reſembles it. The leaues

leaues are ſmooth, greene, growing ſtraight vp, and almoſt a fingers breadth; among which riſeth vp a ſtalke a little more than halfe a foot in height; at the top of which groweth forth a yellow floure not much vnlike that of the laſt deſcribed Autumne Narciſſe: it conſiſteth of ſixe leaues ſome inch and halfe in length, and ſome halfe inch broad, ſharpe pointed, the three inner leaues being ſomewhat longer than the outer. There grow forth out of the middeſt of the floure three whitiſh chiues, tipt with yellow, and a peſtell in the midſt of them longer than any of them. The root conſiſts of many coats, with fibres comming forth of the bottome thereof like others of this kinde. It floures in Februarie. ‡

21 *Narciſſus Perſicus.*
The Perſian Daffodill.

22 *Narciſſus Autumnalis major.*
The great Winter Daffodill.



24 Small Winter Daffodill hath a bulbous root, much like vnto the root of Ruſh Daffodil, but leſſer: from the which riſeth vp a naked ſtalke without leaues, on the top whereof groweth a ſmall white floure with a yellow circle in the middle, ſweet in ſmell, ſomething ſtuffing the head as do the other Daffodils.

¶ *The Place.*

The Daffodils with purple coronets do grow wilde in ſundry places of France, chiefly in Bourgondie, and in Suitzerland in medowes.

The Ruſh Daffodill groweth wilde in ſundry places of Spaine, among graſſe and other herbes. *Dioſcorides* ſaith, That they be eſpecially found vpon mountaines. *Theocritus* affirmeth the Daffodils to grow in medowes, in his nineteenth *Eidyl.* or twentieth, according to ſome editions: where he writeth, That the faire Ladie *Europa* entring with her Nymphs into the medowes, did gather the ſweet ſmelling Daffodils; in theſe Verſes:

Αὐτ', ἐπεὶ ἐς λειμῶνα, &c.

Which we may Engliſh thus:

But when the Girles were come into
The medowes flouring all in ſight,
That Wench with theſe, this Wench with thoſe
Trim floures, themſelues did all delight:
She with the Narciſſe *good in ſent,*
And ſhe with Hyacinths *content.*

Bur

But it is not greatly to our purpose particularly to seeke out their places of growing wilde, seeing that we haue them all and euery of them in our London gardens, in great aboundance. The common white Daffodill groweth wilde in fields and sides of Woods in the West parts of England.

¶ *The Time.*

They floure for the most part in the Spring, that is, from the beginning of Februarie vnto the end of Aprill.

The Persian and Winter Daffodils do floure in September and October.

‡ 23 *Narcissus vernus præcocior flauo flore.*
The timely Spring yellow Daffodill.

24 *Narcissus Autumnalis minor.*
Small Winter Daffodill.

¶ *The Names.*

Although their names be set forth in their seuerall titles, which may serue for their appellations and distinctions; notwithstanding it shall not be impertinent to adde a supply of names, as also the cause why they are so called.

The Persian Daffodill is called in the Sclauonian or Turkish tongue, *Zaremcada Persiana*, and *Zaremcatta*, as for the most part all other sorts of Daffodils are. Notwithstanding the double floured Daffodill they name *Giul catamer lale*: Which name they generally giue vnto all double floures.

The common white Daffodil with the yellow circle they call *Serin Cade*, that is to say, the kings Chalice; and *Deue bohini*, which is to say, Camels necke, or as we do say of a thing with long spindle shinnes, Long-shankes, vrging it from the long necke of the floure.

The Rush Daffodill is called of some *Ionquillias*, of the similitude the leaues haue with Rushes. Of *Dioscorides*, *Bulbus Vomitorius*, or Vomiting Bulbe, according to *Dodonæus*.

Generally all the kindes are comprehended vnder this name *Narcissus*, called of the Grecians Νάρκισσος: in Dutch, **Narcissen**: in Spanish, *Iennetten*: in English, Daffodilly, Daffodowndilly, and Primerose peereles.

Sophocles nameth them the garland of the infernal gods, because they that are departed and dulled with death, should worthily be crowned with a dulling floure.

Of the first and second Daffodill *Ouid* hath made mention in the third booke of his *Metamorphosis*,

phoſis, where hee deſcribeth the transformation of the faire boy *Narciſſus* into a floure of his own name; ſaying,

Nuſquam corpus erat, croceum pro corpore florem
Inueniunt, foliis medium cingentibus albis.
But as for body none remain'd; in ſtead whereof they found
A yellow floure, with milke white leaues ingirting of it round.

Pliny and *Plutarch* affirme, as partly hath been touched before, that their narcoticke quality was the very cauſe of the name *Narciſſus*, that is, a qualitie cauſing ſleepineſſe; which in Greekes is ναρκωσις: or of the fiſh Torpedo, called in Greeke νάρκη, which benummes the hands of them that touch him, as being hurtfull to the ſinewes; and bringeth dulneſſe to the head, which properly belongeth to the Narciſſes, whoſe ſmell cauſeth drowſineſſe.

¶ *The Nature.*

The roots of Narciſſus are hot and dry in the ſecond degree.

¶ *The Vertues.*

A *Galen* ſaith, That the roots of *Narciſſus* haue ſuch wonderfull qualities in drying, that they conſound and glew together very great wounds, yea and ſuch gaſhes or cuts as happen about the veins, ſinewes, and tendons. They haue alſo a certaine cleanſing and attracting facultie.

B The roots of *Narciſſus* ſtamped with honey, and applied plaiſter-wiſe, helpeth them that are burned with fire, and ioyneth together ſinewes that are cut in ſunder.

C Being vſed in manner aforeſaid, it helpeth the great wrenches of the ankles, the aches and pains of the ioynts.

D The ſame applied with hony and nettle ſeed helpeth Sun burning and the morphew.

E The ſame ſtamped with barrowes greaſe and leuen of rie bread, haſteneth to maturation hard impoſtumes, which are not eaſily brought to ripeneſſe.

F Being ſtamped with the meale of Darnell and honey, it draweth forth thornes and ſtubs out of any part of the body.

G The root, by the experiment of *Apuleius*, ſtamped and ſtrained, and giuen in drinke, helpeth the cough and collicke, and thoſe that be entred into a ptiſicke.

H The roots whether they be eaten or drunken, do moue vomit; and being mingled with Vineger and nettle ſeed, taketh away lentiles and ſpots in the face.

Chap. 85. *Of the Baſtard Daffodill.*

¶ *The Deſcription.*

1 THe double yellow Daffodill hath ſmall ſmooth narrow leaues, of a darke greene colour; among which riſeth vp a naked hollow ſtalke of two hands high, bearing at the top a faire and beautifull yellow floure, of a pleaſant ſweet ſmell: it ſheddeth his floure, but there followeth no ſeed at all, as it hapneth in many other double floures. The root is ſmall, bulbous, or onion faſhion, like vnto the other Daffodils, but much ſmaller.

2 The common yellow Daffodill or Daffodowndilly is ſo well knowne to all that it needeth no deſcription.

3 We haue in our London gardens another ſort of this common kind, which naturally groweth in Spaine, very like vnto our beſt knowne Daffodill in ſhape and proportion, but altogether fairer, greater, and laſteth longer before the floure doth fall or fade.

‡ 4 This hath leaues and roots like the laſt deſcribed, but ſomewhat leſſe; the floure alſo is in ſhape not vnlike that of the precedent, but leſſe, growing vpon a weake ſlender greene ſtalke, of ſome fingers length: the ſeed is contained in three cornered, yet almoſt round heads. The root is ſmall, bulbous, and blacke on the outſide.

5 This hath a longiſh bulbous root, ſomwhat blacke on the outſide, from which riſe vp leaues not ſo long nor broad as thoſe of the laſt deſcribed: in the midſt of theſe leaues ſprings vp a ſtalk, ſlender, and ſome halfe foot in height; at the top of which, forth of a whitiſh filme, breakes forth a floure like in ſhape to the common Daffodill, but leſſe, and wholly white, with the brim of the cup welted about. It floures in Aprill, and ripens the ſeeds in Iune. ‡

¶ *The Place.*

The double yellow Daffodill I receiued from *Robinus* of Paris, which he procured by meanes of friends from Orleance and other parts of France.

The

1 *Pſeudonarciſſus luteus multiplex.*
Double yellow Daffodill.

2 *Pſeudonarciſſus Anglicus.*
Common yellow Daffodill.

‡ 3 *Pſeudonarciſſus Hiſpanicus.*
The Spaniſh yellow Daffodill.

‡ 4 *Pſeudonarciſſus minor Hiſpanicus.*
The leſſer Spaniſh Daffodill.

The

‡ 5 *Pſeudonarciſſus albo flore.*
White Baſtard Daffodill.

The yellow Engliſh Daffodill groweth almoſt euerie where through England. The yellow Spaniſh Daffodill doth likewiſe decke vp our London Gardens, where they increaſe infinitely.

¶ *The time.*

The double Daffodill ſendeth forth his leaues in the beginning of Februarie, and his floures in Aprill.

¶ *The Names.*

The firſt is called *Pſeudonarciſſus multiplex*, and *Narciſſus luteus Polyanthos*: in Engliſh, the double yellow Daffodill, or *Narciſſus*.

The common ſort are called in Dutch, **Geel Spoyckel bloemen**: in Engliſh, yellow Daffodill, Daffodilly, and Daffodowndilly.

¶ *The Temperature.*

The temperature is referred vnto the kindes of *Narciſſus*.

¶ *The Vertues.*

Touching the vertues hereof, it is found out by experiment of ſome of the later Phyſitians, that the decoction of the roots of this yellow Daffodill do purge by ſiege tough and flegmaticke humors, and alſo wateriſh, and is good for them that are full of raw humors, eſpecially if there be added thereto a little aniſe ſeed and ginger, which will correct the churliſh hardneſſe of the working.

The diſtilled water of Daffodils doth cure the Palſie, if the Patient be bathed and rubbed with the ſayd liquor by the fire. It hath beene proued by an eſpeciall and truſty Friend of myne, a man learned, and a diligent ſearcher of nature, M. *Nicholas Belſon*, ſometimes of Kings Colledge in Cambridge.

Chap. 86. *Of diuers other Daffodils or Narciſſes.*

‡ THere are beſides the forementioned ſorts of Daffodils, ſundry others, ſome of which may be referred to them; other ſome not. I do not intend an exact enumeration of them, it being a thing not ſo fitting for a hiſtorie of Plants, as for a Florilegie, or booke of floures. Now thoſe that require all their figures, and more exact deſcriptions, may finde ſatisfaction in the late Worke of my kinde friend M. *Iohn Parkinſon*, which is intitled *Paradiſus terreſtris*: for in other Florilegies, as in that of *De Bry*, *Swertz*, &c. you haue barely the names and figures, but in this are both figures, and an exact hiſtorie or declaration of them. Therefore I in this place will but onely briefely deſcribe and name ſome of the rareſt that are preſerued in our choice gardens, and a few others whereof yet they are not poſſeſt.

¶ *The Deſcriptions.*

1 The firſt of theſe, which for the largeneſſe is called *Nonpareille*, hath long broad leaues and roots like the other Daffodils. The floure conſiſts of ſix very large leaues of a pale yellow colour, with a very large cup, but not very long: this cup is yellower than the incompaſſing leaues, narrower alſo at the bottome than at the top, and vneuenly cut about the edges. This is called *Narciſſus omnium maximus*, or *Nonpareille*; the figure well expreſſeth the floure, but that it is ſomewhat too little. There is a varietie of this with the open leaues & cup both yellow, which makes the difference. There is alſo another *Nonpareille*, whoſe floures are all white, and the ſix leaues that ſtand ſpred abroad are vſually a little folded, or turned in at their ends.

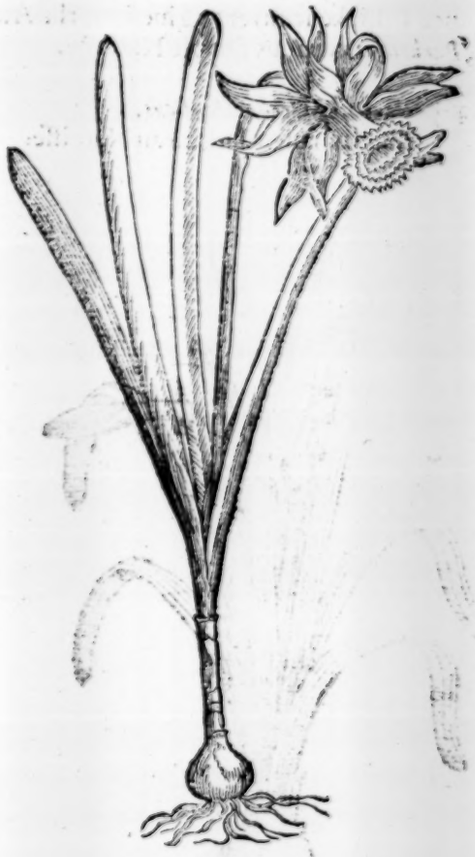
2 Beſides theſe former there are foure or fiue double yellow Daffodils, which I cannot paſſe ouer in ſilence; the firſt is that, which is vulgarly amongſt Floriſts knowne by the name of *Robines*

Narciſſe

Narciſſe; and it may be was the ſame our Author in the precedent chapter mentions he receiued from *Robine*; but he giuing the figure of another, and a deſcription not well fitting this, I can affirme nothing of certaintie. This double Narciſſe of *Robine* growes with a ſtalke ſome foot in height, and the floure is very double, of a pale yellow colour, and it ſeemes commonly to diuide it ſelfe into ſome ſix partitions, the leaues of the floure lying one vpon another euen to the middle of the floure. This may be called *Narciſſus pallidus multiplex Robini*, *Robines* double pale Narciſſe.

‡ 1 *Narciſſus omnium maximus.*
The *Nonpareille* Daffodill.

‡ 3 *Pſeudonarciſſus flore pleno.*
The double yellow Daffodill.



3 The next to this is that which from our Author, the firſt obſeruer thereof, is vulgarly called *Gerrards* Narciſſe: the leaues and root do not much differ from the ordinarie Daffodill; the ſtalk is ſcarce a foot high, bearing at the top thereof a floure very double; the ſixe outmoſt leaues are of the ſame yellow colour as the ordinarie one is; thoſe that are next are commonly as deepe as the tube or trunke of the ſingle one, and amongſt them are mixed alſo other paler coloured leaues, with ſome green ſtripes here & there among thoſe leaues: theſe floures are ſomtimes all contained in a trunk like that of the ſingle one, the ſixe out-leaues excepted: other whiles this incloſure is is broke, and then the floure ſtands faire open like as that of the laſt deſcribed. *Lobel* in the ſecond part of his *Aduerſaria* tells, That our Author Maſter *Gerrard* found this in Wiltſhire, growing in the garden of a poore old woman, in which place formerly a Cunning man (as they vulgarly terme him) had dwelt.

This may be called in Latine, according to the Engliſh, *Narciſſus multiplex Gerardi*, *Gerrards* double Narciſſe.

The figure we here giue you is expreſſed ſomewhat too tall, and the floure is not altogether ſo double as it ought to be.

4 There are alſo two or three double yellow Daffodils yet remaining. The firſt of theſe is called *Wilmots* Narciſſe, (from Maſter *Wilmot*, late of Bow) and this hath a very faire double & large yellow floure compoſed of deeper and paler yellow leaues orderly mixed.

The ſecond (which is called *Tradeſcants* Narciſſe, from Maſter *Iohn Tradeſcant* of South-Lambeth) is the largeſt and ſtatelieſt of all the reſt; in the largeneſſe of the floures it exceeds *Wilmots*, which otherwiſe it much reſembles; ſome of the leaues whereof the floure conſiſts are ſharp poin-

This

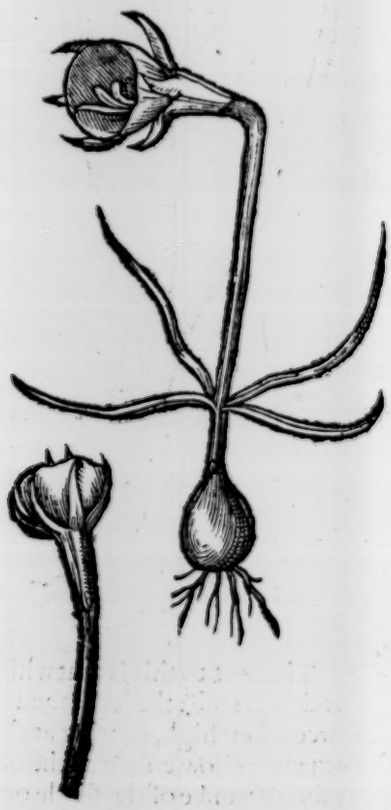
ted, and theſe are of a paler colour; other ſome are much more obtuſe, and theſe are of a deeper and fairer yellow.

This may be called *Narciſſus Roſeus* Tradeſcanti, *Tradeſcants* Roſe Daffodill.

The third M. *Parkinſon* challengeth to himſelfe; which is a floure to be reſpected, not ſo much for the beautie, as for the various compoſure thereof, for ſome of the leaues are long and ſharpe pointed, others obtuſe and curled, a third ſort long and narrow, and vſually ſome few hollow, and in ſhape reſembling a horne; the vtmoſt leaues are commonly ſtreaked, and of a yellowiſh green; the next to them fold themſelues vp ronnd, and are vſually yellow, yet ſometimes they are edged with greene. There is a deepe yellow peſtill diuided into three parts, vſually in the midſt of this floure. It floures in the end of March. I vſually (before M. *Parkinſon* ſet forth his Florilegie, or garden of floures) called this floure *Narciſſus* πολύμορφος, by reaſon of its various ſhape and colour: but ſince I thinke it fitter to giue it to the Author, and terme it *Narciſſus multiplex varius* Parkinſoni, *Parkinſons* various double Narciſſe.

‡ 5 *Narciſſus Iacobæus Indicus.*
The Indian or Iacobæan Narciſſe.

‡ 6 *Narciſſus juncifolius montanus minimus.*
The leaſt Ruſh-leaued Mountaine Narciſſe.



5 Now come I to treat of ſome more rarely to be found in our gardens, if at all. That which takes the firſt place is by *Cluſius* called *Narciſſus Iacobæus Indicus*, the Indian or Iacobæan Narciſſe. The root hereof is much like to an ordinarie onion, the leaues are broad like the other Narciſſes, the ſtalke is ſmooth, round, hollow, and without knots, at the top whereof, out of a certaine skinny huske comes forth a faire red floure like that of the flouring Indian reed, but that the leaues of this are ſomewhat larger, and it hath ſix chiues or threds in the middle thereof of the ſame colour as the floure, and they are adorned with browniſh pendants; in the midſt of theſe there ſtands a little farther out than the reſt, a three forked ſtile, vnder which ſucceeds a triangular head, after the falling of the floure.

This giues his floure in Iune or Iuly.

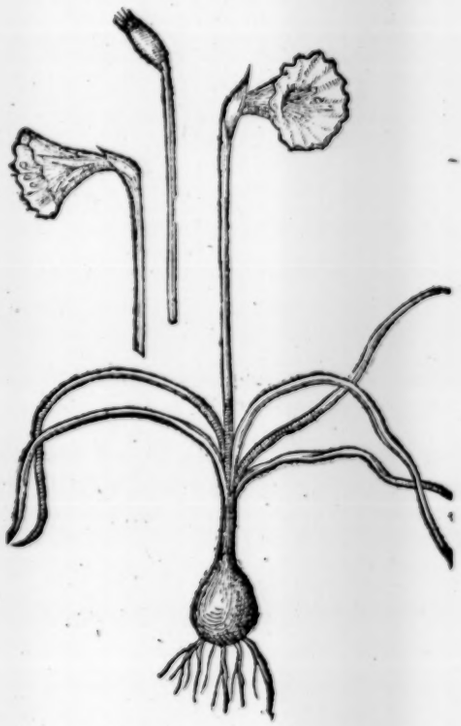
6 This *Lobell* calls *Narciſſus montanus juncifolius minimus*, The leaſt Ruſh-leaued mountaine Narciſſe. The leaues of this are like the *Iunquilia*; the ſtalke is ſhort, the floure yellow, with the ſix winged leaues ſmall and paler coloured, the cup open and large to the bigneſſe of the floure.

7 This

7 This alſo is much like the former; but the ſix incompaſſing leaues are of a greeniſh faint yellow colour; the cup is indented, or vnequally curled about the edges, but yellow like the precedent. *Lobell* calls this *Narciſſus montanus juncifolius flore fimbriato*, The mountaine Ruſh-leaued Narciſſe with an indented or curled cup.

‡ 7 *Narciſſus montanus juncifolius flore fimbriato,*
The mountaine Ruſh leaued Narciſſe with an indented or curled cup.

‡ 8 *Narciſſus omnium minimus montanus albus.*
The leaſt mountaine white Narciſſe.



8 The leaues of this are as ſmall as the Autumne Iacinth, the ſtalke ſome handfull high, and the floure like the laſt deſcribed, but it is of a whitiſh colour. *Lobell* calls this laſt deſcribed, *Narciſſus omnium minimus montanus albus*, The leaſt mountaine white Narciſſe. Theſe three laſt vſually floure in Februarie. ‡

CHAP. 87. *Of Tulipa, or the Dalmatian Cap.*

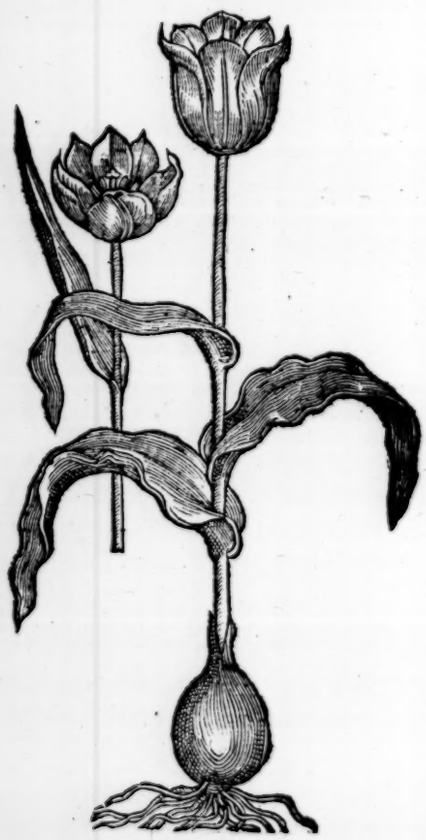
¶ *The Kindes.*

TVlipa, or the Dalmatian Cap is a ſtrange and forreine floure, one of the number of thebulbed floures, whereof there be ſundry ſorts, ſome greater, ſome leſſer, with which all ſtudious and painefull Herbariſts deſire to be better acquainted, becauſe of that excellent diuerſitie of moſt braue floures which it beareth. Of this there be two chiefe and generall kindes, *viz. Præcox* and *Serotina*; the one doth beare his floures timely, the other later. To theſe two we will adde another ſort called *Media*, flouring betweene both the others. And from theſe three ſorts, as from their heads, all other kindes do proceed, which are almoſt infinite in number. Notwithſtanding, my louing friend M. *Iames Garret*, a curious ſearcher of Simples, and learned Apothecary of London, hath vndertaken to finde out, if it were poſſible, the infinite ſorts, by diligent ſowing of their ſeeds, and by planting thoſe of his owne propagation, and by others receiued from his Friends

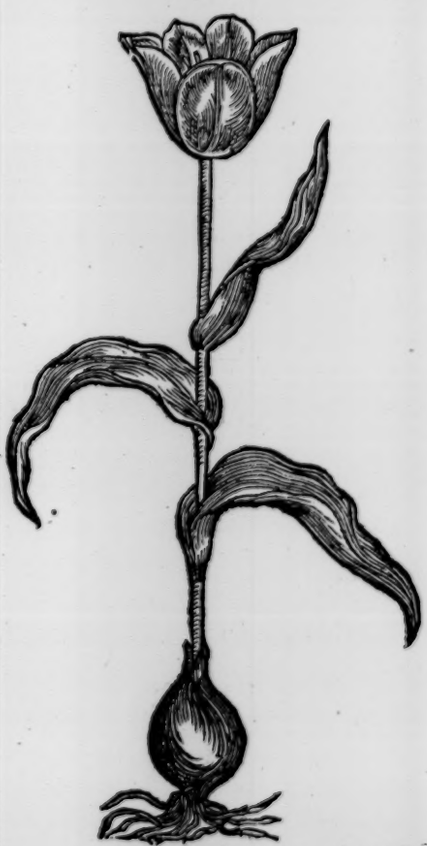
1 *Tulipa Bononienſis.*
Italian Tulipa.

2 *Tulipa Narbonenſis.*
French Tulipa.

3 *Tulipa præcox tota lutea.*
Timely flouring Tulipa.

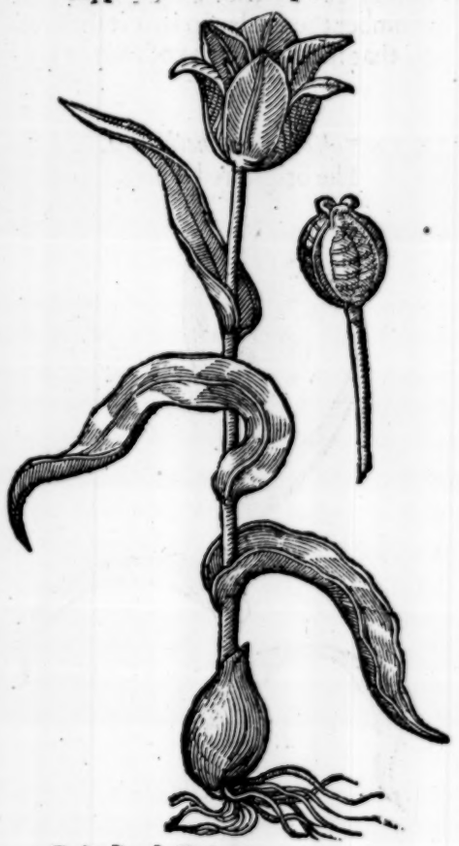


4 *Tulipa Coccinea ſerotina.*
Late flouring Tulipa.



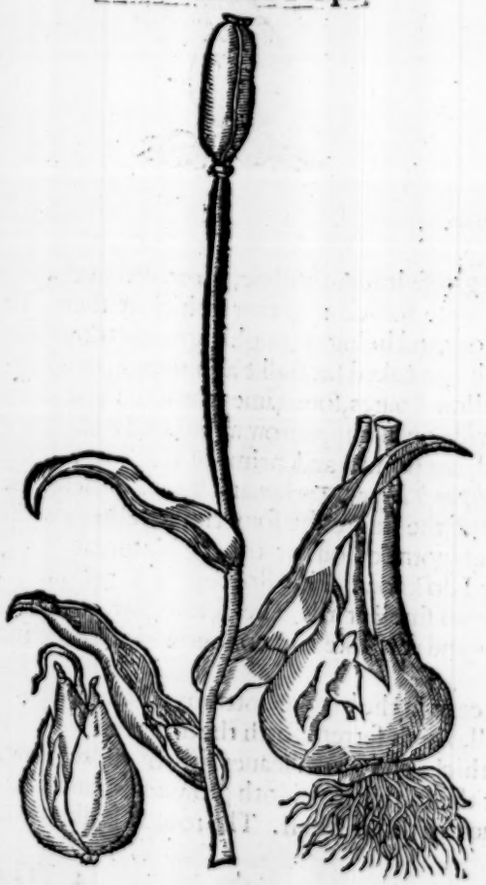
5 *Tulipa*

5 *Tulipa media ſanguinea albis oris.*
Apple bloome Tulipa.

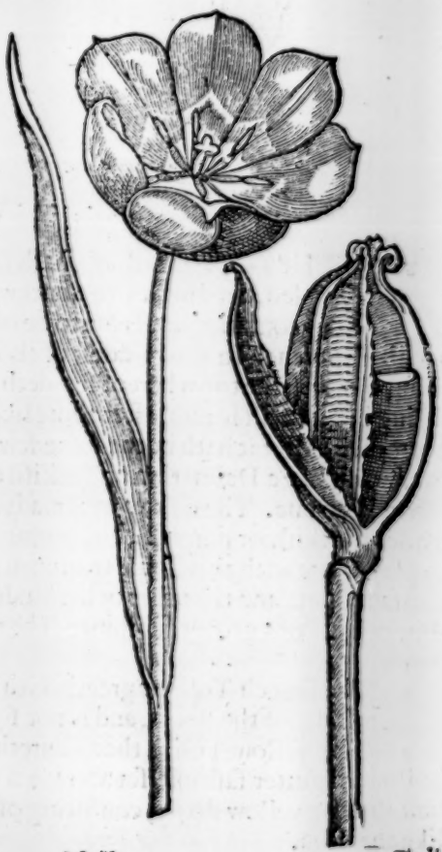


6 *Tulipa Candida ſuaue rubentibus oris.*
Bluſh coloured Tulipa.

7 *Tulipa bulbifera.*
Bulbous ſtalked Tulipa.

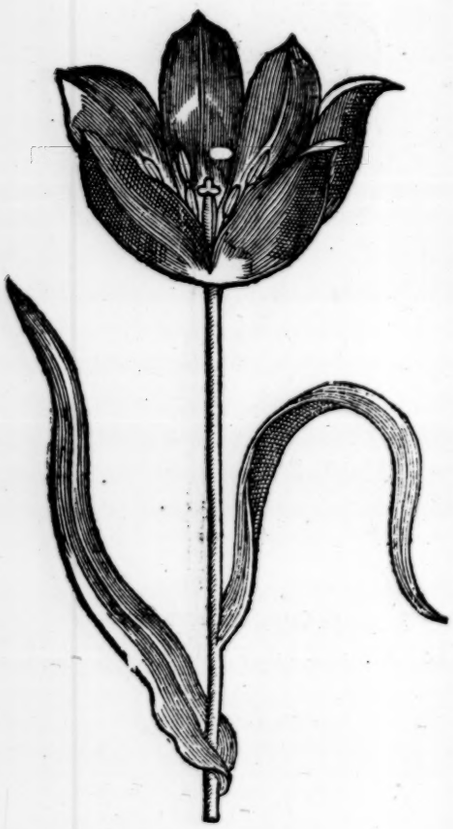


‡ 8 *Tulipa ſanguinea luteo fundo.*
The bloud-red Tulip with a yellow bottome.

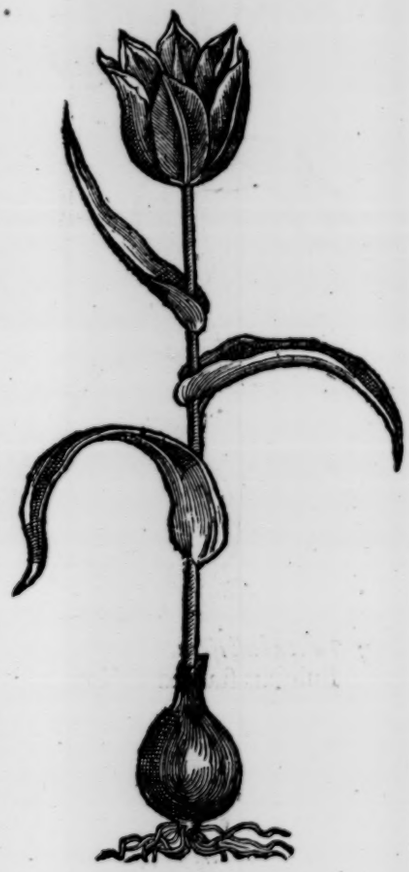


beyond the ſeas for the ſpace of twenty yeares, not being yet able to attaine to the end of his trauell, for that each new yeare bringeth forth new plants of ſundry colours, not before ſeene: all which to deſcribe particularly were to roll *Siſiphus* ſtone, or number the ſands. So that it ſhall ſuffice to ſpeake of and deſcribe a few, referring the reſt to ſome that meane to write of *Tulipa* a particular volume.

‡ 9 *Tulipa purpurea.*
The purple Tulip.



‡ 10 *Tulipa rubra amethiſtina.*
The bright red Tulip.



¶ *The Deſcription.*

1 THe *Tulipa* of Bolonia hath fat, thicke, and groſſe leaues, hollow, furrowed or chanelled, bending a little backward, and as it were folded together: which at their firſt comming vp ſeeme to be of a reddiſh colour, and being throughly growne turne into a whitiſh greene. In the middeſt of thoſe leaues riſeth vp a naked fat ſtalke a foot high, or ſomething more, on the top whereof ſtandeth one or two yellow floures, ſometimes three or more, conſiſting of ſix ſmall leaues, after a ſort like to a deepe wide open cup, narrow aboue, and wide in the bottome. After it hath beene ſome few dayes floured, the points and brims of the floure turne backward, like a Dalmatian or Turkiſh cap, called *Tulipan*, *Tolepan*, *Turban*, and *Turſan*, whereof it tooke his name. The chiues or threads in the middle of the floures be ſometimes yellow, otherwhiles blackiſh or purpliſh, but commonly of one ouer-worne colour or other, Nature ſeeming to play more with this floure than with any other that I do know. This floure is of a reaſonable pleaſant ſmell, and the other of his kinde haue little or no ſmell at all. The ſeed is flat, ſmooth, ſhining, and of a griſtly ſubſtance. The root is bulbous, and very like to a common onion of Saint *Omers*.

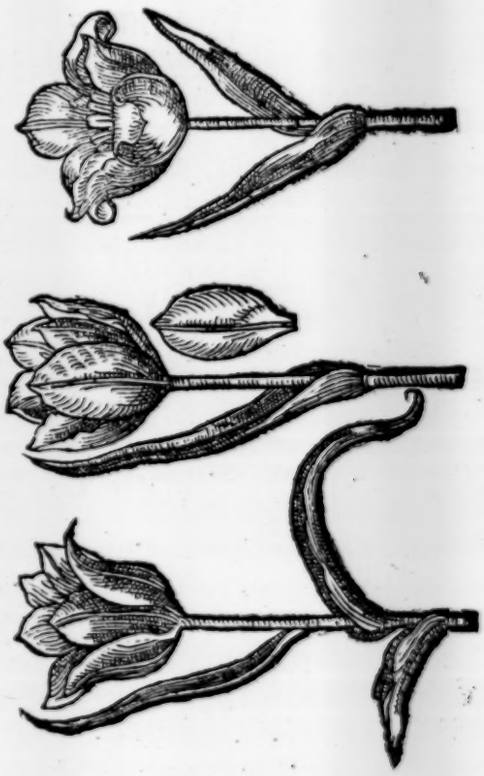
2 The French Tulipa agreeth with the former, except in the blacke bottome which this hath in the middle of the floure, and is not ſo ſweet of ſmell, which ſetteth forth the difference.

3 The yellow Tulipa that floureth timely hath thicke and groſſe leaues full of iuyce, long, hollow, or gutter faſhion, ſet about a tender ſtalke, at the top whereof doth grow a faire and pleaſant ſhining yellow floure, conſiſting of ſix ſmall leaues without ſmell. The root is bulbous or like an onion.

4 The

‡ 11 *Tulipa flore albo ſtrijs purpureis.*
The white Tulip with purple ſtreakes.

‡ 12 *Tulipa flore albo oris dilute rubentibus.*
The white Tulip with light red edges.
‡ 13 *Tulipa flore pallido.* The ſtraw-coloured Tulip.
‡ 14 *Tulipa flammea ſtrijs flaueſcentibus.*
The flame coloured Tulip with yellowiſh ſtreakes.



‡ 15 *Tulipa polyclanos minor ſerotina flore rubro vel flauo*, Cluſij.
The leſſer many-branched late Tulip of *Cluſius*, with red, or elſe yellow floures.

‡ 16 *Tulipa ſerotina polyclados major flo. flauo fundo nigro*, Cluſij.
Cluſius his greater many branched Tulip with a yellow floure, and blacke bottome.

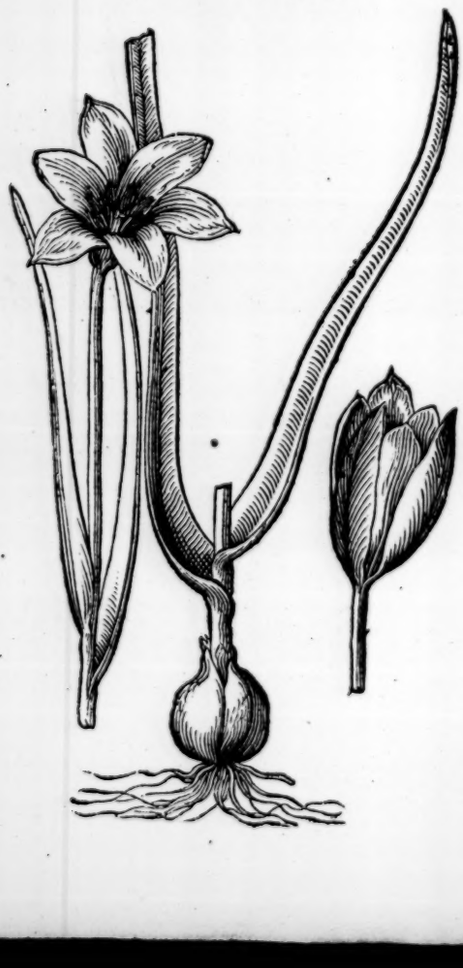
‡ 17 *Tulipa pumilio obſcure rubens oris virentibus.*
The dwarfe Tulip with darke red floures edged with greene.

‡ 18 *Tulipa pumilio flore purpurascenti intus candido.*
The Dwarfe Tulip with a purpliſh floure, white within.

‡ 19 *Tulipa pumilio lutea.*
The yellow Dwarfe Tulip.

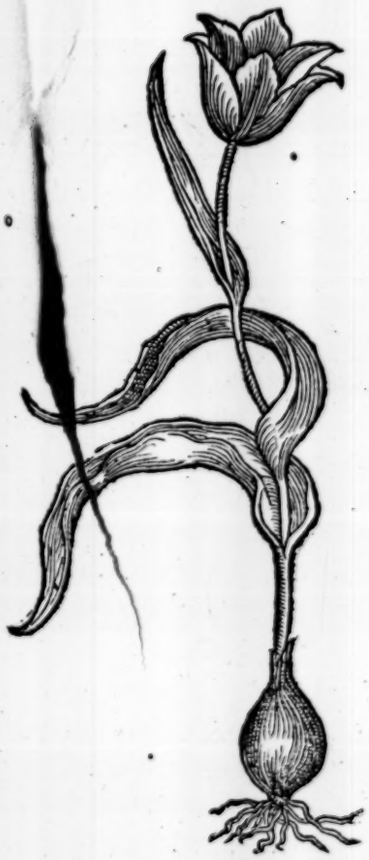
‡ 21 *Tulipa aurea oris rubentibus.*
The gold yellow with red edges.

‡ 20 *Tulipa Perſica flore rubro, oris albidis elegans.*
The pretty Perſian Tulip hauing a red floure with whitiſh edges.

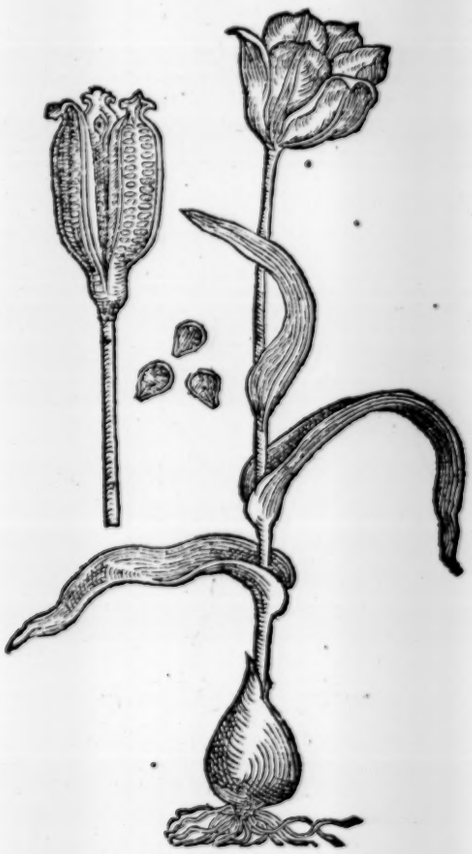


he fourth kinde of Tulipa, that floureth later, hath leaues, ſtalks, and roots like vnto the it. The floures hereof be of a skarlet colour, welted or bordered about the edges with e middle part is like vnto a hart tending to whiteneſſe, ſpotted in the ſame whitenes with kles or ſpots. The ſeed is contained in ſquare cods, flat, tough, and ſinewie.

22 *Tulipa miniata.*
The Vermilion Tulip.



‡ 23 *Tulipa albo & rubro ſtriatus.*
The white and red ſtriped Tulip.



5 The fift ſort of Tulipa, which is neither of the timely ones, nor of the later flouring ſort, but one that buddeth forth his moſt beautifull floures betweene both. It agreeth with the laſt deſcribed Tulipa, in leaues, ſtalkes, roots, and ſeed, but differeth in floures. The floure conſiſteth of ſix ſmall leaues ioyned together at the bottome: the middle of which leaues are of a pleaſant bloudy colour, the edges be bordered with white, and the bottome next vnto the ſtalke is likewiſe white; the whole floure reſembling in colour the bloſſomes of an Apple tree.

6 The ſixth hath leaues, roots, ſtalkes, and ſeed like vnto the former, but much greater in euery point. The floures hereof are white, daſht about the brimmes or edges with a red or bluſh colour. The middle part is ſtripped confuſedly with the ſame mixture, wherein is the difference.

7 *Carolus Cluſius* ſetteth forth in his Pannonicke hiſtorie a kinde of Tulipa that beareth faire red floures, blacke in the bottome, with a peſtell in the middle of an ouer-worne greeniſh colour; ofwhich ſort there happeneth ſome to haue yellow floures, agreeing with the others before touched: but this bringeth forth encreaſe of root in the boſome of his loweſt leafe next to the ſtalke, contrarie to all the other kindes of Tulipa.

8 *Lobelius* in his learned Obſeruations hath ſet forth many other ſorts; one he calleth *Tulipa Chalcedonica*, or the Turky Tulipa, ſaying it is the leaſt of the ſmall kindes or Dwarſe Tulipa's, whoſe floure is of a ſanguine red colour, vpon a yellow ground, agreeing with the others in roote, leafe, and ſtalke.

9 He hath likewiſe ſet forth another; his floure is like the Lilly in proportion, but in colour of a fine purple.

10 We may alſo behold another ſort altogether greater than any of the reſt, whoſe floure is in colour like the ſtone called *Amethiſt*, not vnlike to the floures of Peonie.

11 We haue likewiſe another of greater beauty, and very much deſired of all, with white floures daſht on the backſide, with a light waſh of watchet colour.

12 There

‡ 24 *Tulipa luteo & rubro ſtriatus.*
The red and yellow Fooles coat.

‡ 25 *Tulipa flore coloris ſulphur*
The ſulphur-coloured

‡ 26 *Tulipa rubra oris pallidis.*
The red Tulip with pale edges.

12 There is another alſo in our London gardens, of a ſnow white colour; the edges ſlightly waſht ouer with a little of that we call bluſh colour.

13 We haue another like the former, ſauing that his floure is of a ſtraw colour.

14 There is another to be ſeene with a floure mixed with ſtreaks of red and yellow, reſembling a flame of fire, wherupon we haue called it Flambant.

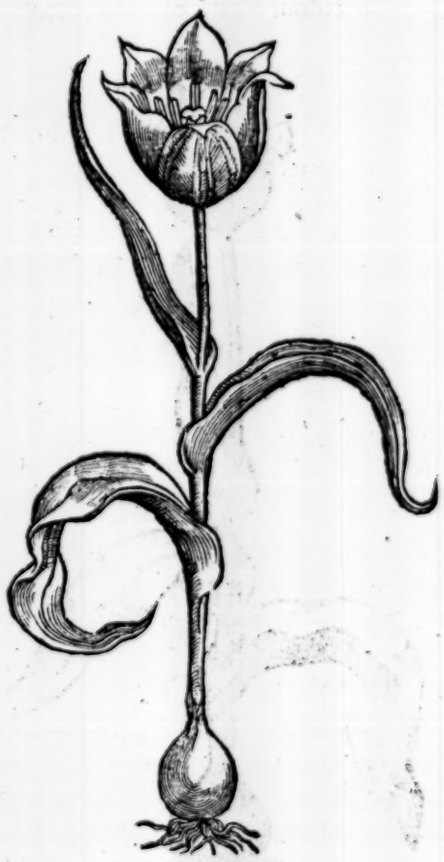
There be likewiſe ſo many more differing ſo notably in colour of their floures, although in leaues, ſtalke, and roots for the moſt part one like another, that (as I ſaid before) to ſpeake of them ſeuerally would require a peculiar volume.

‡ Therefore not to trouble you any further, I haue giuen you onely the figures and names of the notableſt differences which are in ſhape; as, the dwarfe Tulipa's, and the branched ones, together with the colour of their floures, contained in their titles, that you need not far to ſeeke it. ‡

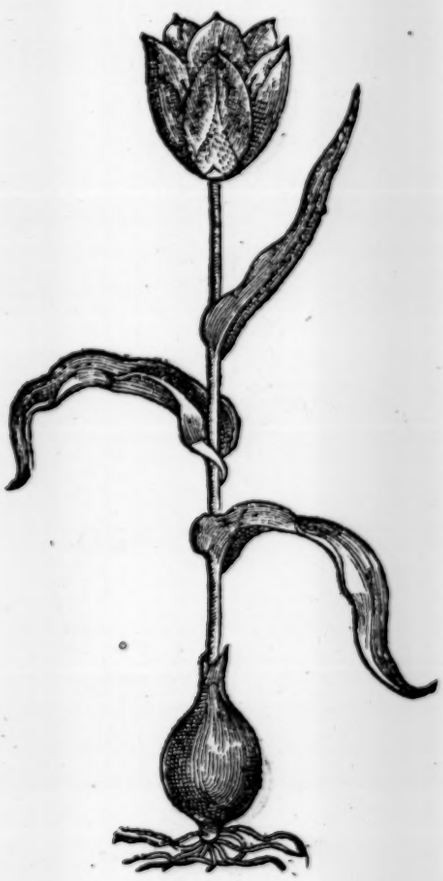
There be a ſort greater than the reſt, which in forme are like; the leaues whereof are thicke, long, broad, now and then ſomewhat folded in the edges; in the middeſt whereof doth riſe vp a ſtalk a foot high, or ſomthing higher, vpon which ſtandeth onely one floure bolt vpright, conſiſting of ſix leaues, after a ſort like to a deepe wide cup of this forme, *viz.* the bottome turned vpwards, with threads

threds or chiues in the middle, of the colour of Saffron. The colour of the floure is ſometimes yellow, ſometimes white, now and then as it were of a light purple, and many times red; and in this there is no ſmall varieties of colours, for the edges of the leaues, and oftentimes the nailes or lower part of the leaues are now & then otherwiſe coloured than the leaues themſelues, and many times there doth runne all along theſe ſtreakes ſome other colours. They haue no ſmell at all that can be perceiued. The roots of theſe are likewiſe bulbed, or Onion faſhion; euery of the which to ſet forth ſeuerally would trouble the writer, and wearie the Reader; ſo that, what hath bin ſaid ſhall ſuffice touching the deſcription of Tulipa's. ‡ True it is that our Author here affirmes, The varieties of theſe floures are ſo infinite, that it would both tyre the Writer and Reader to recount them. Yet for that ſome are more in loue with floures than with Plants in generall, I haue thought good to direct them where they may finde ſomewhat more at large of this Plant: Let ſuch therefore as deſire further ſatisfaction herein haue recourſe to the Florilegies of *De Bry*, *Swerts*, *Robin*, or to M. *Parkinſon*, who hath not onely largely treated of the floures in particular, but alſo of the ordering of them. ‡

‡ 27 *Tulipa lutea ſerotina.*
The late flouring yellow Tulip.



‡ 28 *Tulipa ſerotina lutea guttis ſanguineis fundo nigro.*
The late Yellow with ſanguine ſpots and a blacke bottome.



¶ *The Place.*

Tulipa groweth wilde in Thracia, Cappadocia, and Italy; in Bizantia about Conſtantinople, at Tripolis and Alepo in Syria. They are now common in all the gardens of ſuch as affect floures, all ouer England.

¶ *The Time.*

They floure from the end of Februarie vnto the beginning of May, and ſomewhat after; although *Augerius Busbequius* in his journey to Conſtantinople, ſaw between Hadrianople and Conſtantinople, great aboundance of them in floure euery where, euen in the middeſt of Winter, in the moneth of Ianuarie, which that warme and temperate climate may ſeeme to performe.

¶ *The*

The Names.

The later Herbariſts by a Turkiſh and ſtrange name call it *Tulipa*, of the Dalmatian Cap called Tulipa, the forme whereof, the floure when it is open ſeemeth to repreſent.

It is called in Engliſh after the Turkiſh name Tulipa, or it may be called Dalmatian Cap, or the Turkes Cap. What name the antient Writers gaue it is not certainly knowne. A man might ſuſpect it to be μυῶν, if it were a Bulbe that might be eaten, and were of force to make milke cruddy; for *Theophraſtus* reckoneth it among thoſe Bulbes that may be eaten: and it is an herbe, as *Heſychius* ſaith, wherewith milke is crudded. *Conradus Geſnerus* and diuers others haue taken *Tulipa* to be that *Satyrium* which is ſyrnamed *Erythronium*, becauſe one kinde hath a red floure; or altogether a certaine kinde of *Satyrium*: with which it doth agree reaſonable well, if in *Dioſcorides* his deſcription we may in ſtead of λιπαίνω, reade κριπαίνω or λειοπαίνω; for ſuch miſtakes are frequent in antient and moderne Authors, both in writing and printing. In the Turky Tongue it is called *Café lalé*, *Cauále lalé*, and likewiſe *Turban* and *Turfan*, of the Turks Cap ſo called, as beforeſaid of *Lobelius*.

‡ 29 *Tulipa Holias alba ſtrijs & punctis ſanguineis.*

The white Holias with ſanguine ſpots and ſtreakes.

‡ 30 *Tulipa media ſature purpurea fundo ſubcæruleo.*

A middle Tulip of a deepe Purple colour with a blewiſh bottome.

‡ I do verily thinke that theſe are the κρίνα τοῦ ἀγροῦ, the Lillies of the field mentioned by our Sauiour, *Mat.* 6. 28, 29. for he ſaith, That *Solomon* in all his royaltie was not arayed like one of theſe. The reaſons that induce me to thinke thus are theſe: Firſt, their ſhape; for their floures reſemble Lillies, and in theſe places whereas our Sauiour was conuerſant they grow wilde in the fields. Secondly, the infinite varietie of colour, which is to be found more in this than any other ſort of floure: and thirdly, the wondrous beautie and mixtures of theſe floures. This is my opinion, and theſe my reaſons, which any may either approue of or gainſay as he ſhall thinke good. ‡

¶ *The Temperature and Vertues.*

There hath not beene any thing ſet downe of the antient or later Writers as touching the Nature or Vertues of the Tulipa's, but they are eſteemed eſpecially for the beauty of their floures.

‡ The

‡ The roots preſerued with ſugar, or otherwiſe dreſſed, may be eaten, and are no vnpleaſant A nor any way offenſiue meat, but rather good and nouriſhing. ‡

CHAP. 88. *Of Bulbous Violets.*

¶ *The Kindes.*

THeophraſtus hath mentioned one kinde of bulbous *Leucoion*, which *Gaza* tranſlates *Viola alba*, or the white Violet. Of this *Viola Theophraſti*, or *Theophraſtus* his Violet, we haue obſerued three ſorts, whereof ſome bring forth many floures and leaues, others fewer; ſome floure very early, and others later, as ſhall be declared.

1 *Leucoium bulboſum præcox minus.*
Timely flouring bulbous Violet.

‡ 2 *Leucoium bulboſum præcox Byzantinum.*
The Byzantine early bulbous Violet.

¶ *The Deſcription.*

1 THe firſt of theſe bulbous Violets riſeth out of the ground, with two ſmall leaues flat and creſted, of an ouerworne greene colour, betweene the which riſeth vp a ſmall and tender ſtalke of two hands high; at the top whereof commeth forth of a skinny hood a ſmall white floure of the bigneſſe of a Violet, compact of ſix leaues, three bigger, and three leſſer, tipped at the points with a light greene: the ſmaller are faſhioned into the vulgar forme of a heart, and pretily edged about with greene; the other three leaues are longer, and ſharpe pointed. The whole floure hangeth downe his head, by reaſon of the weake foot ſtalke whereon it groweth. The root is ſmall, white, and bulbous.

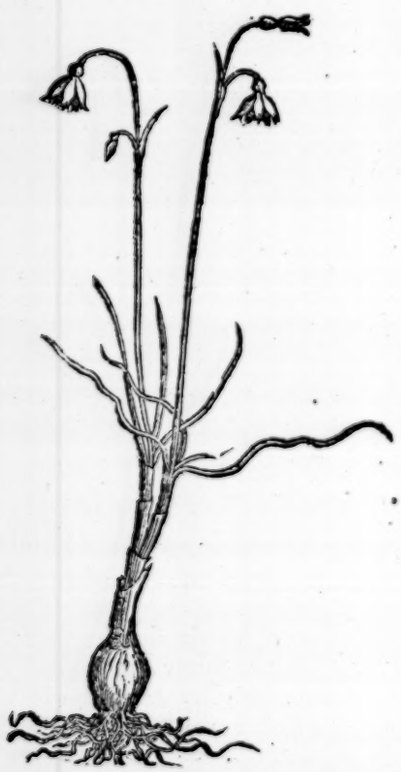
‡ 2 There are two varieties of this kind which differ little in ſhape, but the firſt hath a floure as bigge againe as the ordinarie one, and *Cluſius* calls it *Leucoium bulboſum præcox Byzantinum*, The greater early Conſtantinopolitan bulbous Violet. The other is mentioned by *Lobel*, and differs onely in colour of floures; wherefore he calls it *Leucoium triphyllum flore cæruleo*, The blew floured bulbous Violet.

3 The

3 *Leucoium bulboſum ſerotinum.*
Late flouring bulbous Violet.

4 *Leucoium bulboſum majus polyanthemum.*
The many floured great bulbous violet.

‡ 5 *Leucoium bulboſum Autumnale minimum.*
The leaſt Autumne bulbous Violet.



3 The third ſort of bulbed Violets hath narrow leaues like thoſe of the leeke, but leſſer and ſmoother, not vnlike to the leaues of the baſtard Daffodill. The ſtalks be ſlender and naked, two hands high, whereupon doe grow faire white floures, tipped with a yellowiſh greene colour, with many ſmall chiues or threds in the middeſt of the floure. The ſeed is contained in ſmal round buttons. The root is white and bulbous.

4 The great bulbed Violet is like vnto the third in ſtalke and leaues, yet greater and higher. It bringeth forth on euery ſtalke not one floure onely, but fiue or ſix, blowing or flouring one after another, altogether like the other floures in forme and bigneſſe.

‡ 5 This ſmall bulbous plant may be annexed to the former, the root is ſmall, compact of many coats: the leaues are alſo ſmall, and the ſtalke an handfull high, at the top whereof there hang downe one or two ſmall white floures conſiſting of ſix leaues a piece, much reſembling the laſt deſcribed, but farre leſſe. It floures in Autumne.

6 Beſides theſe, *Cluſius* makes mention of a ſmall one much like this, and it floures in the Spring, and the floures are ſomewhat reddiſh nigh the ſtalke, and ſmell ſweet. *Cluſius* cals this, *Leucoium bulboſum vernum minimum*, The ſmalleſt Spring bulbous Violet. ‡

¶ *The*

¶ *The Place.*

Theſe plants do grow wilde in Italy and the places adiacent. Notwithſtanding our London gardens haue taken poſſeſſion of moſt of them many yeares paſt.

¶ *The Time.*

The firſt floureth in the beginning of Ianuary; the ſecond in September; and the third in May; the reſt at their ſeaſons mentioned in their deſcriptions.

¶ *The Names.*

† The firſt is called of *Theophraſtus*, [illegible]; which *Gaza* renders *Viola alba*, and *Viola Bulboſa*, or Bulbed Violet. *Lobelius* hath from the colour and ſhape called it *Leuconarciſſolirion*, and that very properly, conſidering how it doth as it were participate of two ſundry plants, that is to ſay, the root of the *Narciſſus*, the leaues of the ſmall Lilly, and the white colour; taking the firſt part *Leuco*, of his whiteneſſe; *Narciſſo*, of the likeneſſe the roots haue vnto *Narciſſus*; and *Lirium*, of the leaues of Lillies, as aforeſaid. In Engliſh we may call it the bulbous Violet; or after the Dutch name, **Somer ſotteken**s; that is, Sommer fooles, and **Duyfkens**. Some call them alſo Snow drops. This name *Leucoium*, without his Epithite *Bulboſum*, is taken for the Wall-floure, and ſtock Gilloſloure, by all moderne Writers.

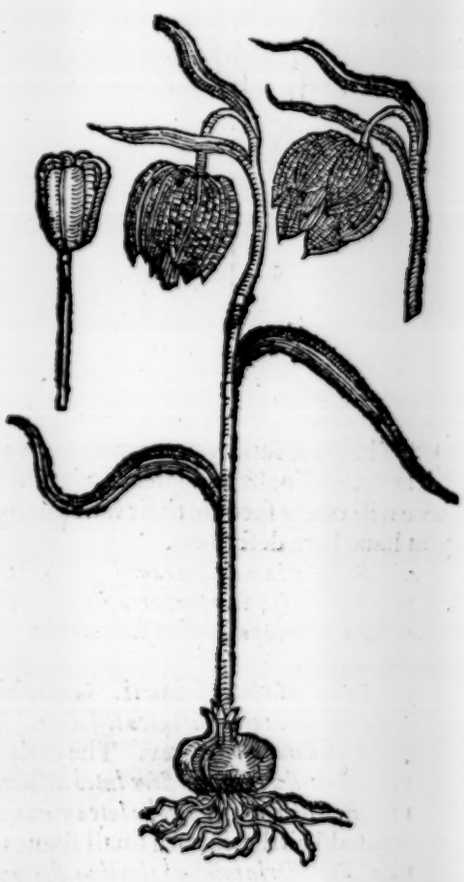
¶ *The Nature and Vertues.*

Touching the faculties of theſe bulbous Violets we haue nothing to ſay, ſeeing that nothing is ſet downe hereof by the antient Writers, nor any thing obſerued by the moderne, only they are maintained and cheriſhed in gardens for the beautie and rareneſſe of the floures, and ſweetneſſe of their ſmell.

CHAP. 89. *Of Turkie or Ginny-hen Floure.*

1 *Frittillaria.*
Checquered Daffodill.

2 *Frittillaria variegata.*
Changeable Checquered Daffodil.



¶ *The Deſcription.*

1 THe Checquered Daffodill, or Ginny-hen Floure, hath ſmall narrow graſſie leaues; among which there riſeth vp a ſtalke three hands high, hauing at the top one or two floures, and ſometimes three, which conſiſteth of ſix ſmall leaues checquered moſt ſtrangely: wherein Nature, or rather the Creator of all things, hath kept a very wonderfull order, ſurpaſſing (as in all other things) the curiouſeſt painting that Art can ſet downe. One ſquare is of a greeniſh yellow colour, the other purple, keeping the ſame order as well on the backſide of the floure, as on the inſide, although they are blackiſh in one ſquare, and of a Violet colour in an other; inſomuch that euery leafe ſeemeth to be the feather of a Ginny hen, whereof it tooke his name. The root is ſmall, white, and of the bigneſſe of halfe a garden beane.

2 The ſecond kinde of Checquered Daffodill is like vnto the former in each reſpect, ſauing that this hath his floure daſht ouer with a light purple, and is ſomewhat greater than the other, wherein conſiſteth the difference.

‡ 3 *Frittillaria Aquitanica minor flore luteo obſoleto.*
The leſſer darke yellow Fritillarie.

‡ 9 *Frittillaria alba præcox.*
The early white Fritillarie.

‡ There are ſundry differences and varieties of this floure, taken from the colour, largenes, doubleneſſe, earlineſſe and latenes of flouring, as alſo from the many or few branches bearing floures. We will onely ſpecifie their varieties by their names, ſeeing their forme differs little from thoſe you haue here deſcribed.

4 *Fritillaria maxima ramoſa purpurea.* The greateſt branched purple checquered Daffodill.
5 *Fritillaria flore purpureo pleno.* The double purple floured checquered Daffodill.
6 *Fritillaria polyanthos flauoviridis.* The yellowiſh greene many floured checquered Daffodill.
7 *Fritillaria lutea* Someri. *Somers* his yellow Checquered Daffodill.
8 *Fritillaria alba purpureo teſſulata.* The white Fritillarie checquered with purple.
9 *Fritillaria alba præcox.* The early white Fritillarie or Checquered Daffodill.
10 *Fritillaria minor flore luteo abſoleto.* The leſſer darke yellow Fritillarie.
11 *Fritillaria anguſtifolia lutea variegata paruo flore, & altera flore majore.* Narrow leaued yellow variegated Fritillarie with ſmall floures, and another with a larger floure.
12 *Fritillaria minima pluribus floribus.* The leaſt Fritillarie with many floures.

Fritillaria Hiſpanica vmbellifera. The Spaniſh Fritillarie with the floures ſtanding as it were in an vmbell. ‡

¶ *The Names.*

The Ginny hen floure is called of *Dodonæus, Flos Meleagris* : of *Lobelius, Lilio-narciſſus variegata,* for that it hath the floure of a Lilly, and the root of *Narciſſus*: it hath beene called *Fritillaria,* of the table or boord vpon which men play at Cheſſe, which ſquare checkers the floure doth very much reſemble; ſome thinking that it was named *Fritillus* : whereof there is no certaintie; for *Martialis* ſeemeth to call *Fritillus, Abacus,* or the Tables whereat men play at Dice, in the fifth Booke of his Epigrams, writing to *Galla.*

Iam triſtis, nucibus puer relictis,
Clamoſo reuocatur à magiſtro :
Et blando malè proditus Fritillo
Arcana modò raptus è popina
Ædilem rogat vdus aleator. &c.

The ſad Boy now his nuts caſt by,
Call'd vnto Schole by Maſters cry :
And the drunke Dicer now betray'd
By flattring Tables as he play'd,
Is from his ſecret tipling houſe drawne out,
Although the Officer he much beſought. &c.

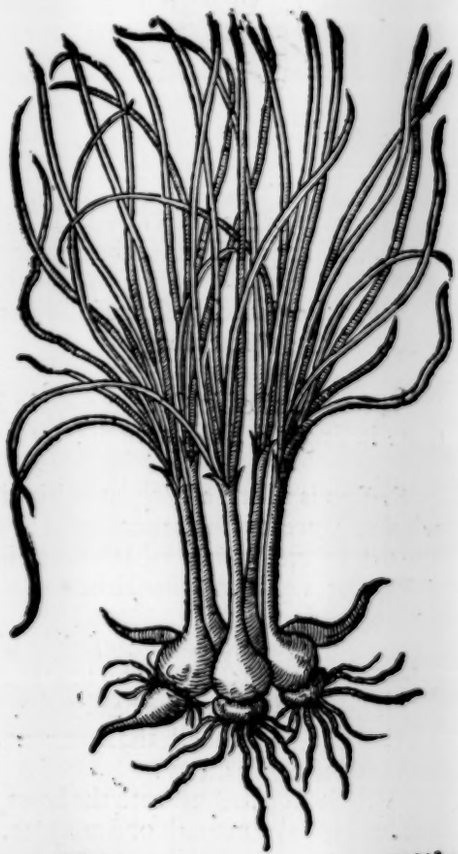
In Engliſh we may call it Turky-hen or Ginny-hen Floure, and alſo Checquered Daffodill, and Fritillarie, according to the Latine.

¶ *The Temperature and Vertues.*

Of the facultie of theſe pleaſant floures there is nothing ſet downe in the antient or later Writer, but are greatly eſteemed for the beautifying of our gardens, and the boſoms of the beautifull.

CHAP. 90. *Of true Saffron, and the wilde or Spring Saffrons.*

Crocus florens & ſine flore. Saffron with and without floure.



The Deſcription.

ALthough I haue expreſſed two pictures of Saffrons, as you ſee, yet are you to vnderſtand that theſe two do but ſet forth one kinde of plant, which could not ſo eaſily be perceiued by one picture as by two, becauſe his floure doth firſt riſe out of the ground nakedly in September, and his long ſmal graſſy leaues ſhortly after the floure, neuer bearing floure and leafe at once. The which to expreſſe, I thought it conuenient to ſet downe two pictures before you, with this deſcription, *viz.* The root is ſmall, round, and bulbous. The floure conſiſteth of ſixe ſmall blew leaues tending to purple, hauing in the middle many ſmall yellow ſtrings or threds; among which are two, three, or more thicke fat chiues of a fierie colour ſomewhat reddiſh, of a ſtrong ſmell when they be dried, which doth ſtuffe and trouble the head. The firſt picture ſetteth forth the Plant when it beareth floures, and the other expreſſeth nothing but leaues.

1 *Crocus vernus.*
Early flouring wilde Saffron.

2 *Crocus vernus minor.*
Small wilde Saffron.

¶ *The Place.*

Common, or the beſt knowne Saffron groweth plentifully in Cambridge-ſhire, Saffron-Walden, and other places thereabout, as corne in the fields.

¶ *The Time.*

Saffron beginneth to floure in September, and preſently after ſpring vp the leaues, and remaine greene all the Winter long.

¶ *The Names.*

Saffron is called in Greeke, κρόκος: in Latine, *Crocus*: in Mauritania, *Saffaran*: in Spaniſh, *Açafron*: in Engliſh, Saffron: in the Arabicke tongue, *Zahafaran*.

¶ *The Temperature.*

Saffron is a lirtle aſtringent or binding, but his hot qualitie doth ſo ouer-rule in it, that in the whole eſſence it is in the number of thoſe herbes which are hot in the ſecond degree, and drie in the firſt: therefore it alſo hath a certaine force to concoct, which is furthered by the ſmall aſtriction rhat is in it, as *Galen* ſaith.

¶ *The Vertues.*

A *Auicen* affirmeth that it cauſeth head-ache, and is hurtfull to the braine, which it cannot do by taking it now and then, but by too much vſing of it: for too much vſing of it cutteth off ſleepe, through want whereof the head and ſences are out of frame. But the moderate vſe of it is good for the head, and maketh the ſences more quicke and liuely, ſhaketh off heauy and drowſie ſleepe, and maketh a man merry.

B Alſo Saffron ſtrengthneth the heart, concocteth crude and raw humors of the cheſt, openeth the lungs, and remoueth obſtructions.

It is

‡ 3 *Crocus vernus flore luteo.*
Yellow Spring Saffron.

‡ 4 *Crocus vernus flore albo.*
White Spring Saffron.

‡ 5 *Crocus vernus flore purpureo.*
Purple Spring Saffron.

‡ 6 *Crocus montanus Autumnalis.*
Autumne mountaine Saffron.

C It is alſo ſuch a ſpeciall remedie for thoſe that haue conſumption of the lungs, and are, as wee terme it, at deaths doore, and almoſt paſt breathing, that it bringeth breath again, and prolongeth life for certaine dayes, if ten, or twentie graines at the moſt be giuen with new or ſweet Wine. For we haue found by often experience, that being taken in that ſort, it preſently and in a moment remoueth away difficultie of breathing, which moſt dangerouſly and ſuddenly hapneth.

D *Dioſcorides* teacheth, That being giuen in the ſame ſort it is alſo good againſt a ſurfet.

E It is commended againſt the ſtoppings of the liuer and gall, and againſt the yellow Iaundiſe: And hereupon *Dioſcorides* writeth, That it maketh a man well coloured. It is put into all drinkes that are made to helpe the diſeaſes of the intrailes, as the ſame Authour affirmeth, and into thoſe eſpecially which bring downe the floures, the birth, and the after burthen. It prouoketh vrine, ſtirreth fleſhly luſt, and is vſed in Cataplaſmes and pulteſſes for the matrix and fundament, and alſo in plaiſters and ſeare-cloaths which ſerue for old ſwellings and aches, and likewiſe for hot ſwellings that haue alſo in them S. Anthonies fire.

‡ 7 *Crocus montanus Autumnalis flore majore albido cæruleo.*
Autumne mountaine Saffron with a large whitiſh blew floure.

‡ 8 *Crocus Autumnalis flore albo.*
White Autumne Saffron.

F It is with good ſucceſſe put into compoſitions for infirmities of the eares.

G The eyes being annointed with the ſame diſſolued in milke, or fennell or roſe water, are preſerued from being hurt by the ſmall pox and meaſels, and are defended thereby from humours that would fall into them.

H The chiues ſteeped in water, ſerue to illumine or (as we ſay) limne pictures and imagerie, as alſo to colour ſundry meats and confections. It is with good ſucceſſe giuen to procure bodily luſt. The confections called *Crocomagna, Oxycroceum,* and *Diacurcuma,* with diuers other emplaiſters and electuaries cannot be made without this Saffron.

I The weight of tenne graines of Saffron, the kernels of Wall-nuts two ounces, Figges two ounces, Mithridate one dram, and a few ſage leaues, ſtamped together with a ſufficient quantitie of Pimpernell water, and made into a maſſe or lumpe, and kept in a glaſſe for your vſe, and thereof twelue graines giuen in the morning faſting, preſerueth from the Peſtilence, and expelleth it from thoſe that are infected.

¶ *The*

‡ 9 *Crocus vernus anguſtifolius flore violaceo.*
Narrow leaued Spring Saffron with a violet floure.

‡ 10 *Crocus vernus latifolius flore flauo ſtrijs violaceis.*
Broad leaued Spring Saffron with a yellow floure & purple ſtreaks.

‡ 11 *Crocus vernus latifolius ſtriatus flore duplici.*
Double floured ſtreaked Spring Saffron.

¶ *The Kindes of Spring Saffron*

OF wilde Saffrons there be ſundry ſorts, differing as well in the colour of the floures, as alſo in the time of their flouring. Of which, moſt of the figures ſhall be ſet forth vnto you.

¶ *The Deſcription of wilde Saffron.*

1 THe firſt kind of wilde Saffron hath ſmall ſhort graſſie leaues, furrowed or chanelled downe the midſt with a white line or ſtreake: among the leaues riſe vp ſmall floures in ſhape like vnto the common Saffron, but differing in colour; for this hath floures of mixt colours; that is to ſay, the ground of the floure is white, ſtripped vpon the backe with purple, and daſht ouer on the inſide with a bright ſhining murrey colour; the other not. In the middle of the floures come forth many yellowiſh chiues, without any ſmel of ſaffron at all. The root is ſmall, round, and couered with a browne skinne or filme like vnto the roots of common Saffron.

2 The ſecond wilde Saffron in leaues, roots, and floures is like vnto the precedent, but altogether leſſer, and the floures of this are of a purple violet colour.

3 We haue likewiſe in our London gardens another ſort, like vnto the other wilde Saffrons

in

‡ 12 *Crocus vernus latifolius flore purpureo.*
Broad leaued Spring Saffron with the purple floure.

‡ 13 *Crocus vernus flore cinereo ſtriato.*
Spring Saffron with an Aſh-coloured ſtreaked floure.

‡ 14 *Crocus vernus latifolius flore flauo-vario duplici.*
Broad leaued Spring Saffron with a double floure yellow & ſtreaked.

in euery point, ſauing that this hath floures of a moſt perfect ſhining yellow colour, ſeeming a far off to be a hot glowing cole of fire, which maketh the difference.

4 There is found among Herbariſts another ſort, not differing from the others, ſauing that this hath white floures, contrarie to all the reſt.

5 Louers of Plants haue gotten into their gardens one ſort hereof with purple or Violet coloured floures, in other reſpects like vnto the other.

6 Of theſe we haue another that floureth in the fall of the leafe, with floures like to the common Saffron, but deſtitute of thoſe chiues which yeeld the colour, ſmell, or taſte that the right manured Saffron hath.

‡ 7 And of this laſt kinde there is another with broader leaues, and the floure alſo is larger, with the leaues thereof not ſo ſharpe pointed, but more round; the colour being at the firſt whitiſh, but afterwards intermixt with ſome blewneſſe. ‡

8 There is alſo another of Autumne wild Saffrons with white floures, which ſets forth the diſtinction.

Many ſorts there are in our gardens beſides thoſe before ſpecified, which I thought needleſſe to entreat of, becauſe their vſe is not great. ‡ Therefore I will only giue the figures and names of ſome of the chiefe of them, and refer ſuch as delight to ſee or pleaſe themſelues with the varieties (for they are no ſpecificke differences) of theſe plants, to the gardens and the bookes of Floriſts, who are onely the preſeruers and admirers of theſe varieties, not ſought after for any vſe but delight. ‡

¶ *The*

¶ *The Place.*

All theſe wilde Saffrons we haue growing in our London Gardens. Thoſe which doe floure in Autumne do grow vpon certaine craggy rockes in Portugall, not far from the ſea ſide. The other haue been ſent ouer vnto vs, ſome out of Italy, and ſome out of Spaine, by the labour and diligence of that notable learned Herbariſt *Carolus Cluſius*; out of whoſe Obſeruations, and partly by ſeeing them in our owne gardens, we haue ſet downe their deſcriptions.

That pleaſant plant that bringeth forth yellow floures was ſent vnto me from *Robinus* of Paris, that painfull and moſt curious ſearcher of Simples.

¶ *The Time.*

They floure for the moſt part in Ianuarie and Februarie; that of the mountain excepted, which floureth in September.

¶ *The Names.*

All theſe Saffrons are vnprofitable, and therefore they be truly ſaid to be *Croci ſylueſtres*, or wild Saffrons: in Engliſh, Spring Saffrons, and vernall Saffrons.

¶ *The Temperature and Vertues.*

Of the faculties of theſe we haue nothing to ſet downe, for that as yet there is no knowne vſe of them in Phyſicke.

CHAP. 91. *Of Medow Saffron.*

¶ *The Kindes.*

THere be ſundry ſorts of Medow Saffrons differing very notably as well in the colour of their floures, as alſo in ſtature and Countrey, from whence they had their being, as ſhall be declared.

2 *Colchicum Anglicum Purpureum.*
Purple Engliſh Medow Saffron.

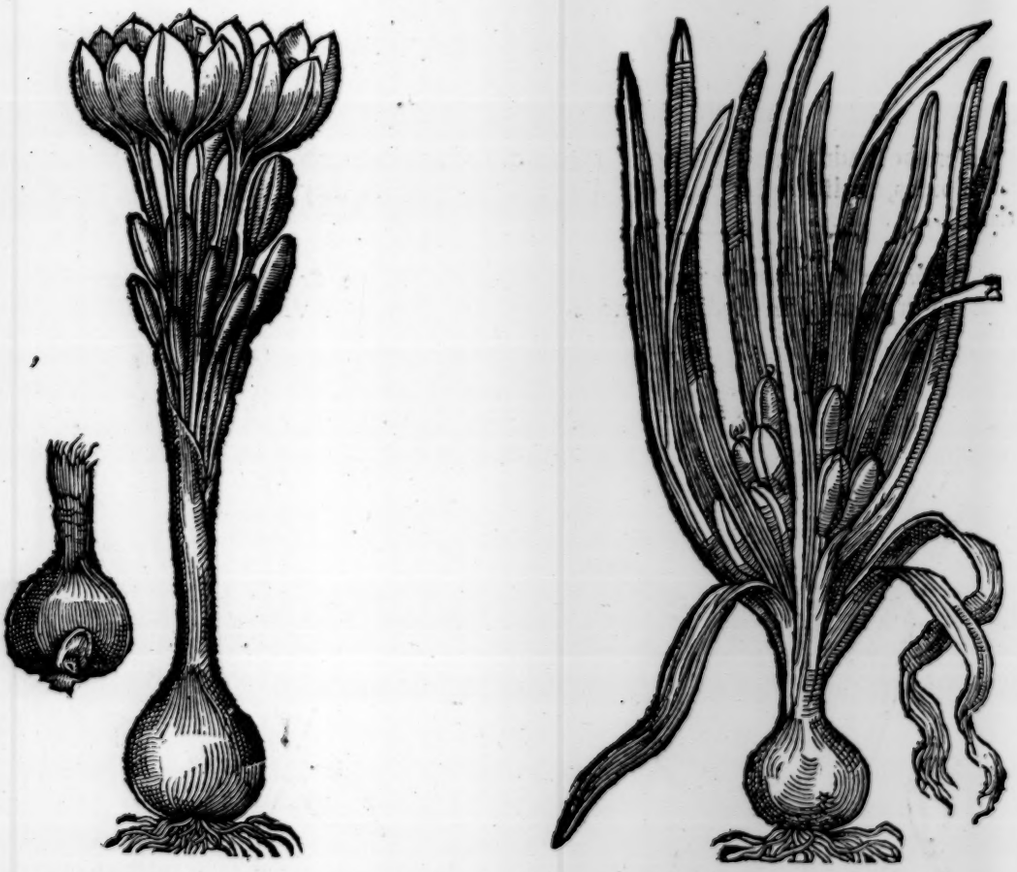
2 *Colchicum Anglicum album.*
White Engliſh Medow Saffron.

¶ *The*

¶ *The Deſcription.*

1 Medow Saffron hath three or foure leaues riſing immediately forth of the ground, long, broad, ſmooth, fat, much like to the leaues of the white Lilly in forme and ſmoothneſſe: in the middle whereof ſpring vp three or foure thicke cods of the bigneſſe of a ſmall Wall-nut, ſtanding vpon ſhort tender foot-ſtalkes three ſquare, and opening themſelues when they be ripe, full of ſeed ſomething round, and of a blackiſh red colour: and when this ſeed is ripe, the leaues together with the ſtalkes doe fade and fall away. In September the floures bud forth, before any leaues appeare, ſtanding vpon ſhort tender and whitiſh ſtemmes, like in forme and colour to the floures of Saffron, hauing in the middle ſmall chiues or threads of a pale yellow colour, altogether vnfit for meat or medicine. The root is round or bulbous, ſharper at the one end than at the other, flat on the one ſide, hauing a deepe clift or furrow in the ſame flat ſide when it floureth, and not at any time elſe: it is couered with blackiſh coats or filmes; it ſendeth downe vnto the loweſt part certaine ſtrings or threds. The root it ſelfe is full of a white ſubſtance, yeelding a juyce like milke, whileſt it is greene and newly digged out of the earth. It is in taſte ſweet, with a little bitterneſſe following, which draweth water out of the mouth.

3 *Colchicum Pannonicum florens & ſine flore.*
Hungary mede Saffron with and without Floure.



2 The ſecond kinde of Mede Saffron is like the precedent, differing onely in the colour of the floures, for that this plant doth bring forth white leaues, which of ſome hath beene taken for the true *Hermodactylus*; but in ſo doing they haue committed the greater error.

3 Theſe two figures expreſſe both but one and the ſelfe ſame plant, which is diſtinguiſhed becauſe it neuer beareth floures and leaues both at one time. So that the firſt figure ſets it forth when it is in leaues and ſeed, and the other when it floureth; and therefore one deſcription ſhall ſuffice for them both. In the Spring of the yeare it bringeth forth his leaues, thicke, fat, ſhining, and ſmooth, not vnlike the leaues of Lillies, which do continue greene vnto the end of Iune; at which time the leaues do wither away, but in the beginning of September there ſhooteth forth of the ground naked milke white floures without any greene leafe at all: but ſo ſoone as the Plant hath done bearing of floures, the root remaines in the ground, not ſending forth any thing vntill Februarie in the yeare following.

It

‡ It beares plentifull ſtore of reddiſh ſeed in looſe triangular heads. The root hereof is bigger than that of the laſt deſcribed. ‡

† 4 The ſmall medow Saffron hath three or foure thicke fat leaues narrower than any of the reſt. The floure appeareth in the fall of the leafe, in ſhape, colour, and manner of growing like the common mede Saffron, but of a more reddiſh purple colour, and altogether leſſer. The leaues in this, contrarie to the nature of theſe plants, preſently follow after the floure, and ſo continue all the Winter and Spring, euen vntill May or Iune. The root is bulbous, and not great; it is couered with many blackiſh red coats, and is white within.

‡ 5 This medow Saffron hath roots and leaues like to thoſe of the laſt deſcribed, but the leaues of the floure are longer and narrower, and the colour of them is white on the inſide, greene on the middle of the backe part, and the reſt thereof of a certaine fleſh colour.

4 *Colchicum montanum minus Hiſpanicum cum flore & ſemine.*
Small Spaniſh medow Saffron in floure and ſeed.

6 The medow Saffron of Illyria hath a great thicke and bulbous root, full of ſubſtance: from which riſeth vp a fat, thicke, and groſſe ſtalke, ſet about from the lower part to the top by equall diſtances, with long, thicke, and groſſe leaues, ſharpe pointed, not vnlike to the leaues of leekes; among which leaues do grow yellowiſh floures like vnto the Engliſh medow Saffron, but ſmaller.

7 The Aſſyrian medow Saffron hath a bulbous root, made as it were of two pieces; from the middle cleft whereof riſeth vp a ſoft and tender ſtalke ſet with faire broad leaues from the middle to the top: among which commeth forth one ſingle floure like vnto the common medow Saffron, or the white Anemone of *Matthiolus* deſcription.

8 The mountaine wilde Saffron is a baſe and low plant, but in ſhape altogether like the common medow Saffron, but much leſſer. The floures are ſmaller, and of a yellow colour, which ſetteth forth the difference. ‡ The leaues and roots (as *Cluſius* affirmes) are more like to the Narciſſes; and therefore he calls this *Narciſſus Autumnalis minor*, The leſſer Autumne Narciſſe. ‡

‡ 9 This, whoſe figure we here giue you, is by *Cluſius* called *Colchicum Byzantinum latifolium*, The broad leaued *Colchicum* of Conſtantinople. The leaues of this are not in forme and magnitude much vnlike to thoſe of the white Hellebor, neither leſſe neruous, yet more greene. It beares many floures in Autumne, ſo that there come ſometimes twenty from one root. Their forme and colour are much like the ordinarie ſort, but that theſe are larger, and haue thicker ſtalkes. They

are

are of a lighter purple without, and of a deeper on the inſide, and they are marked with certaine veines running alongſt theſe leaues. The roots and ſeeds of this plant are thrice as large as thoſe of the common kinde.

10 This hath roots and leaues like to the firſt deſcribed, but the floure is ſhorter, and growes vpon a ſhorter ſtalke, ſo that it riſes but little aboue the earth: the three inner leaues are of a reddiſh purple; the three out leaues are either wholly white, or purpliſh on the middle in the inſide, or ſtreaked with faire purple veins, or ſpotted with ſuch coloured ſpots: all the leaues of the floure are blunter and rounder than in the common kinde.

11 This in leaues, roots, manner and time of growing, as alſo in the colour of the floures, differs not from the firſt deſcribed, but the floures, as you may perceiue by the figure here expreſſed, are very double, and conſiſt of many leaues.

‡ 5 *Colchicum montanum minus verſicolore flore.*
The leſſer mountaine Saffron with a various coloured floure.

6 Colchicum Illyricum.
Greeke medow Saffron.

12 This *Colchicum* differs little from the firſt ordinarie one, but that the floures are ſomewhat leſſe, and the three out-leaues are ſomwhat bigger than the three inner leaues; the colour is a little deeper alſo than that of the common one; but that wherein the principall difference conſiſts, is, That this floures twice in a yeare, to wit, in the Spring and Autumne: and hence *Cluſius* hath called it *Colchicum biflorum*, Twice-flouring Mede Saffron.

13 This alſo in the ſhape of the root and leaues is not much different from the ordinary, but the leaues of the floure are longer and narrower, the colour alſo when they begin to open and ſhew themſelues, is white, but ſhortly after they are changed into a light purple: each leafe of the floure hath a white thread tipt with yellow growing out of it, and in the middle ſtands a white three forked one longer than the reſt. The floure growes vp between three or foure leaues narrower than thoſe of the ordinarie one, and broader than thoſe of the ſmall Spaniſh kinde. *Cluſius*, to whom we are beholden for this, as alſo for moſt of the reſt, calls it *Colchicum vernum*, or Spring Mede-Saffron, becauſe it then floures together with the Spring Saffrons and Dogs Tooth.

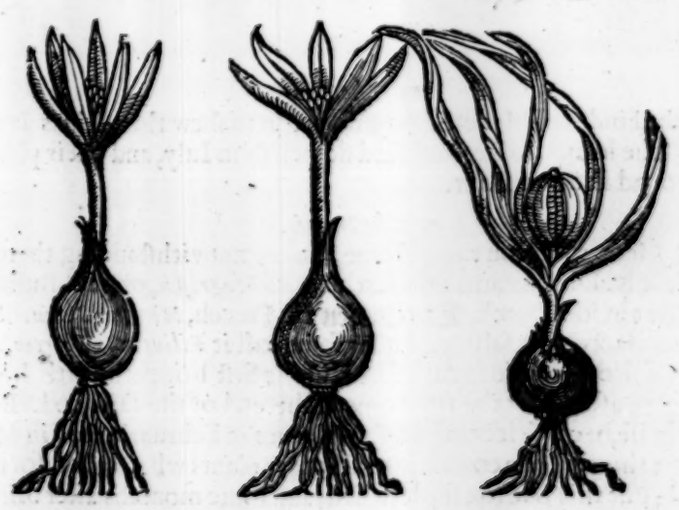
14 There are other Mede-Saffrons beſides theſe I haue mentioned, but becauſe they may be referred

7 *Colchicum Syriacum Alexandrinum.*
Aſſyrian Mede Saffron.

referred eaſily to ſome of theſe, for that their difference chiefely conſiſts either in the doubleneſſe or colour of the floures, whereof ſome are ſtriped, ſome fraided, others variegated, I will not inſiſt vpon them, but referre ſuch as deſire their further acquaintance to look into the gardens of our Floriſts, as M. *Parkinſons*, M. *Tuggies*, *&c.* or elſe into the booke of floures ſet forth not long ſince by M. *Parkinſon*, where they ſhall finde them largely treated of. Yet I cannot paſſe ouer in ſilence that curious *Colchicum* which is called by ſome, *Colchicum variegatum Chienſe*. The floure thereof is very beautiful, conſiſting of ſix pretty broad and ſharp pointed leaues, all curiouſly checkered ouer with deepe blew or purple, the reſt of the floure being of a light whitiſh colour: the leaues, that riſe vp in the Spring, are not very long, but ſomewhat broad and ſharpe pointed; the root is like others of this kinde. I haue giuen you an exact and large figure of this, as I tooke it from the growing floure ſome three yeares agone, it being at that time amongſt her Maieſties floures kept at Edgcombe in Surry, in the garden of my much honoured friend Sir *Iohn Tunſtall*, Gentleman Vſher vnto her Maieſtie.

15 I giue you here in this place the true Hermodactill of the ſhops, which probably by all is adiudged to this Tribe, though none can certainly ſay what floures or leaues it beares: the Roots are onely brought to vs, and from what place I cannot tell; yet I conjecture from ſome part of Syria or the adiacent countries. Now how hard it is to iudge of Plants by one part or particle, I ſhall ſhew you more at large when I come to treat of *Piſtolochia*, wherefore I will ſay nothing thereof in this place. Theſe roots, which wanting the maligne qualitie of *Colchicum*, either of their owne nature, or by drineſſe, are commonly about the bigneſſe of a Cheſnut, ſmooth, flattiſh, and ſharpe at the one end, but ſomewhat full at the other, and on the one ſide there is a little channell or hollowneſſe, as is in the roots of Mede-Saffron where the ſtalke of the floure comes vp. Their colour is either white, browne, or blackiſh on the outſide, and very white within, but thoſe are the beſt that are white both without and within, and may eaſily be made into a fine white meale or pouder. ‡

8 *Colchicum parvum montanum luteum.*
Yellow mountaine Saffron.

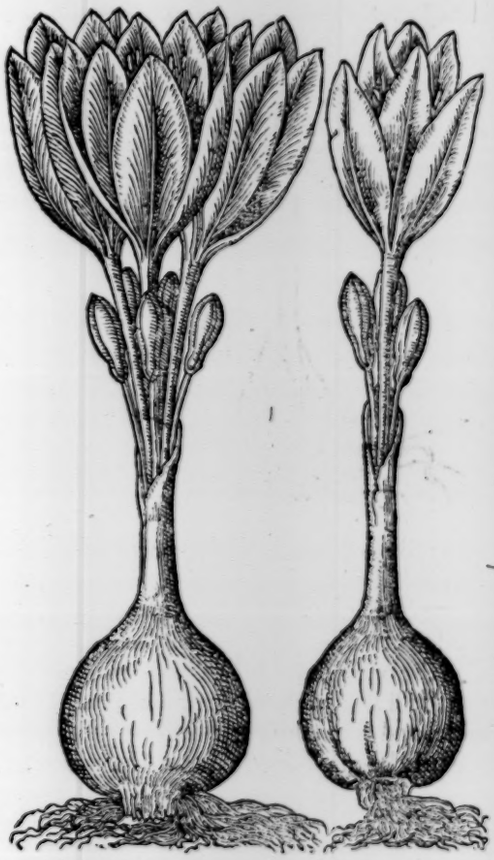


¶ *The Place.*

Medow Saffron, or *Colchicum*, groweth in Meſſinia, and in the Iſle of Colchis, whereof it tooke his name. The titles of the reſt do ſet forth their natiue countries; notwithſtanding our London gardens are poſſeſſed with the moſt part of them.

The two firſt do grow in England in great aboundance, in fat and fertile medowes, as about Vilford and Bathe, as alſo in the medowes neere to a ſmall village in the Weſt part of England, called Shepton Mallet, in the medowes about Briſtoll, in Kingſtroppe medow neere vnto a Water-mill as you go from Northampton to Holmeby Houſe, vpon the right hand of the way, and likewiſe in great plenty in Nobottle wood two miles from the ſaid towne of Northampton, and many other places. ‡ The reſt for the moſt part may be found in the gardens of the Floriſts among vs. ‡

‡ 9 *Colchicum latifolium*. Broad leaued Mede Saffron.



‡ 10 *Colchicum ver ſicolore flore*. Party-coloured Mede Saffron.

¶ *The Time.*

The leaues of all the kindes of Mede-Saffron do begin to ſhew themſelues in Februarie; The ſeed is ripe in Iune. The leaues, ſtalkes, and ſeed do periſh in Iuly, and their pleaſant floures doe come forth of the ground in September.

¶ *The Names.*

Dioſcorides calleth Medow Saffron Κολχικὸν: ſome, Ἐφήμερον: notwithſtanding there is another *Ephemeron* which is not deadly. Diuers name it in Latine *Bulbus agreſtis*, or wild Bulbe: in high Dutch it is called **Zeitlooſen**: in low Dutch, **Tilteloosen**: in French, *Mort au Chien*. Some haue taken it to be the true Hermodactyl, yet falſely. Other ſome call it *Filius ante Patrem*, although there is a kinde of *Lyſimachia* or Looſe-ſtrife ſo called, becauſe it firſt bringeth forth his long cods with ſeed, and then the floure after, or at the ſame time at the end of the ſaid cod. But in this Mede-Saffron it is far otherwiſe, becauſe it bringeth forth leaues in Februarie, ſeed in May, and floures in September, which is a thing cleane contrarie to all other plants whatſoeuer, for that they do firſt floure, and after ſeed; but this Saffron ſeedeth firſt, and foure moneths after brings forth floures: and therefore ſome haue thought this a fit name for it, *Filius ante Patrem*: and we accordingly may call

‡ 11 *Colchicum flore pleno.*
Double floured Mede-Saffron.

‡ 12 *Colchicum biflorum.*
Twice-flouring Mede-Saffron.

‡ 13 *Colchicum vernum.*
Spring Mede-Saffron.

‡ 14 *Colchicum variegatum Chienſe.*
Checquered Mede Saffron of Chio.

‡ 15 *Hermodactyli Officinarum.*
The true Hermodactyls of the ſhops.

call it, The Sonne before the Father.

‡ Our Author in this chapter was of many mindes; for firſt, in the deſcription of *Colchicum Anglicum*, being the ſecond, hee reproues ſuch as make that white floured *Colchicum* the true Hermodactyl. Then in the deſcription of the eighth he hath theſe words, which being omitted in that place I here ſet downe. *Of all theſe kindes* (ſaith he) *of Meadow Saffrons it hath not beene certainly knowne which hath been the true Hermodactyll; notwithſtanding wee haue certaine knowledge that the Illyrian Colchicum is the Phyſicall Hermodactyll.* Yet when he comes to ſpeake of the names, after that out of *Dodonæus* he had ſet downe the truth in theſe words; *But notwithſtanding that Hermodactyll which we do vſe in compound medicines, differeth from this* (to wit, *Colchicum*) *in many notable points, for that the true Hermodactyll hath a bulbe or round root, which being dried continueth very white within, and without not wrinkled at all, but full and ſmooth, of a meane hardneſſe*; and that he had out of the ſame Authour alledged the words of *Valerius Cordus* and *Auicen*, (which are here omitted) he concludes contrarie to the truth, his firſt admonition, and ſecond aſſertion, That the white Medow Saffron which we haue in the Weſt part of England, growing eſpecially about Shepton Mallet, is the Hermodactyll vſed in ſhops.

Thoſe we haue in ſhops ſeeme to be the Hermodactyls of *Paulus Ægineta*; yet not thoſe of *Nicholaus* and *Actuarius*, which were cordial, and increaſers of ſperme; the which the Authors of the *Aduerſaria, pag.* 55. thinke to be the *Behen album & rubrum* of the Arabians. And to theſe vnknowne ones are the vertues ſet downe by our Author in the third place vnder C, to be referred. ‡

¶ *The Temperature.*

Medow Saffron is hot and dry in the ſecond degree.

¶ *The Vertues of Hermodactyls.*

A † The roots of Hermodactyls are of force to purge, and are properly giuen (ſaith *Paulus*) to thoſe that haue the Gout, euen then when the humors are in flowing. And they are alſo hurtful to the ſtomacke.

B The ſame ſtamped, and mixed with the whites of egges, barley meale, and crums of bread, and applied plaiſterwiſe, eaſe the paine of the Gout, ſwellings and aches about the ioynts.

C The ſame ſtrengthneth, nouriſheth, and maketh good iuyce, encreaſeth ſperme or naturall ſeed, and is alſo good to cleanſe vlcers or rotten ſores.

¶ *The correction.*

The pouder of Ginger, long Pepper, Anniſe ſeed or Cumine ſeed, and a little Maſticke, correcteth the churliſh working of that Hermodactyll which is vſed in Shops. But thoſe which haue eaten of the common medow Saffron muſt drinke the milke of a cow, or elſe death preſently enſueth.

¶ *The Danger.*

The roots of all the ſorts of Mede Saffrons are very hurtfull to the ſtomacke, and being eaten they kill by choaking, as Muſhromes do, according vnto *Dioſcorides*; whereupon ſome haue called it *Colchicum ſtrangulatorium.*

† That which was ſet forth by our Author in the fourth place, vnder the title of *Colchicum montanum minus*, was nothing but the former *Colchicum minus* expreſſed in ſeed. The ninth and tenth were the ſame with the firſt and ſecond. The ſixth and ſeuenth, which are *Colchicum Illyricum* and *Syriacum* I haue left with their figures and hiſtorie, though they be ſuſpected to be counterfeits; and *Cluſius* probably geſſes, that the latter is the Apennine Tulip, the Painter making the leaues of the floure too round, and thoſe of the plant too broad and ſhort. †

Chap.

CHAP. 92. *Of Starre of Bethlem.*

¶ *The Kindes.*

THere be ſundry ſorts of wilde field Onions called Starres of Bethlehem, differing in ſtature, taſte, and ſmell, as ſhall be declared.

1 *Ornithogalum.*
Star of Bethlehem.

2 *Ornithogalum luteum, ſiue Cepa agraria.*
Yellow, or wilde Star of Bethlehem.

¶ *The Deſcription.*

1 OVr common Starre of Bethlehem hath many narrow leaues, thicke, fat, full of iuyce, and of a very greene colour, with a white ſtreake downe the middle of each leafe: among the which riſe vp ſmall naked ſtalkes, at the top whereof grow floures compact of ſix little leaues, ſtripped on the backeſide with lines of greene, the inſide being milke-white. Theſe floures open themſelues at the riſing of the Sunne, and ſhut againe at the Sun ſetting; whereupon this Plant hath beene called by ſome, *Bulbus Solſequius*. The floures being paſt, the ſeed doth follow incloſed in three cornered husks. The root is bulbous, white both within and without,

† 2 The ſecond ſort hath two or three graſſy leaues proceeding from a clouen bulbous root. The ſtalke riſeth vp in the middeſt naked, but toward the top there doe thruſt forth more leaues like vnto the other, but ſmaller and ſhorter; among which leaues do ſtep forth very ſmall, weake, and tender foot-ſtalkes. The floures of this are on the backeſide of a pale yellow ſtripped with greene, on the inſide of a bright ſhining yellow colour, with Saffron coloured threds in their middles. The ſeed is contained in triangular veſſels.

† 3 This Star of Hungarie, contrarie to the cuſtome of other plants of this kinde, ſendeth forth before Winter fiue or ſix leaues ſpread vpon the ground, narrow, and of ſome fingers length, ſomewhat whitiſh greene, and much reſembling the leaues of Gilloſloures, but ſomewhat roughiſh. In Aprill the leaues beginning to decay, amongſt them riſes vp a ſtalke bearing at the top a

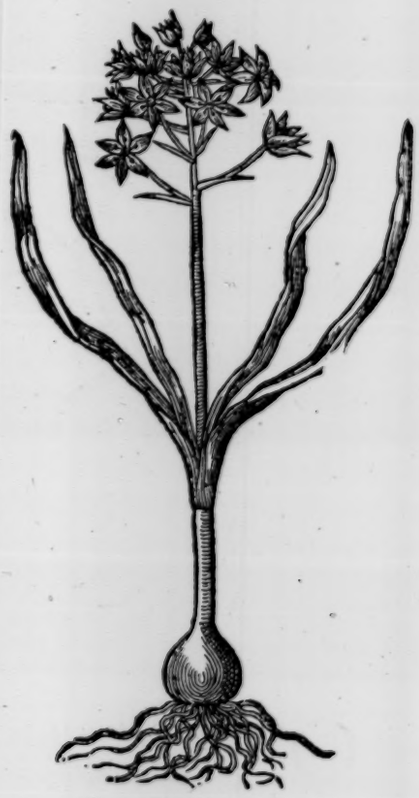
ſpoke of floures, which conſiſting of ſix leaues apiece ſhew themſelues open in May; they in colour are like the firſt deſcribed, as alſo in the greene ſtreake on the lower ſide of each leafe. The ſeed is blacke, round, and contained in triangular heads. The root is bulbous, long, and white. †

‡ 4 This fourth, which is the *Ornithogalum Hiſpanicum minus* of *Cluſius*, hath a little white root which ſends forth leaues like the common one, but narrower, and deſtitute of the white line wherwith the other are marked. The ſtalke is ſome two handfulls high, bearing at the top thereof ſome ſeuen or eight floures growing each aboue other, yet ſo, as that they ſeeme to make an vmbell: each of theſe floures hath ſix leaues of a whitiſh blew colour, with ſo many white chiues or threds, and a little blewiſh vmbone in the midſt. This floures in Aprill.

5 This fifth firſt ſends vp one onely leafe two or three inches long, narrow, and of a whitiſh colour, and of an acide taſte: nigh whereto riſeth vp a ſmall ſtalke ſome inch or two high, hauing one or two leaues thereon, betweene which come forth ſmall ſtar-floures, yellow within, and of a greeniſh purple without. The ſeed, which is reddiſh and ſmall, is contained in triangular heads. The root is white, round, and couered with an Aſh-coloured filme.

3 *Ornithogalum Pannonicum.*
Star of Hungary.

‡ 4 *Ornithogalum Hiſpanicum minus.*
The leſſer Spaniſh Star-floure.



6 I thinke it not amiſſe, hereto to adde another ſmall bulbous plant, which *Cluſius* calls *Bulbus μονόφυλλος*, The one leaued Bulbe. This from a ſmall root ſends forth one ruſh-leafe of ſome foot in length, which about two inches aboue the earth, being ſomewhat broader than in the other places, and guttered, ſends forth a little ſtalke ſome three inches long, whoſe top is ſet with three little floures, each ſtanding aboue other, about the bigneſſe here preſented vnto your view in the figure: each of thoſe conſiſteth of ſix very white leaues, and are not much vnlike the floures of the graſſe of Parnaſſus, but yet without leaues to ſuſtaine the floure, as it hath: ſix white threds tipt with yellow, and a three ſquare head with a white pointall poſſeſſe the middeſt of the floure; the ſmell thereof is ſomewhat like that of the floures of the Haw-thorne. It floures in the midſt of Iune.

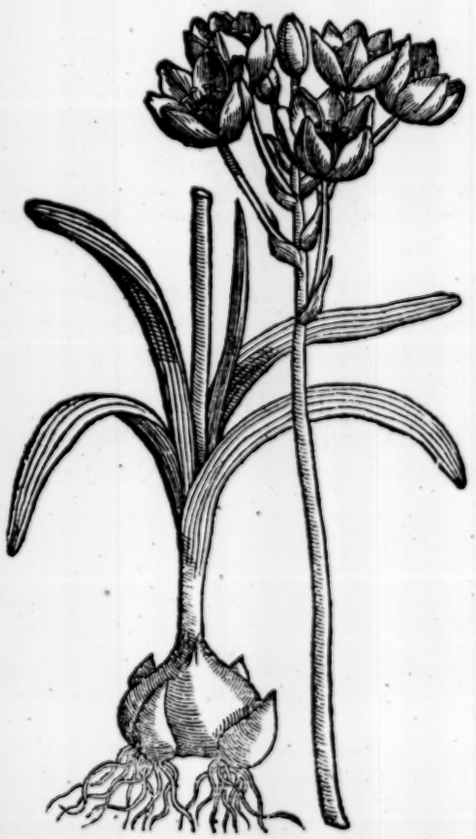
7 Hauing done with theſe two ſmall plants, I muſt acquaint you with three or foure larger, belonging alſo to this Claſſis. The firſt of theſe is that which *Dodonæus* calls *Ornithogalum majus*, and *Cluſius*, *Ornithogalum Arabicum*: This by *Lobel* and ſome others is called *Lilium Alexandrinum*,

or

‡ 5 *Ornithogalum luteum parvum.*
Dwarfe yellow Star of Bethlehem.

‡ 6 *Bulbus vnifolius.*
The one leaued Bulbe.

‡ 7 *Ornithogalum majus Arabicum.*
The great Arabicke Star-floure.



or the Lilly of Alexandria, as our Author calls it in the chapter of Cotton-graſſe. This faire, but tender plant, hath broad greene leaues comming from a large white flat bottomed root; amongſt which riſeth vp a ſtalke ſome cubit high, whoſe top is garniſhed with ſundry pretty large floures made of ſixe very white leaues, with a ſhining blackiſh head, ingirt with ſix white threds tipt with yellow. This floures in May.

8 This, which is commonly called *Ornithogalum ſpicatum*, hath large leaues and roots, and the ſtalke growes ſome cubit or more high, whereon grow many ſtarre-floures in ſhape and colour like thoſe of the ordinarie, but larger, and they begin to floure below, and floure vpwards to the top. There is a larger ſort of this *Spicatum*, whoſe floures are not ſtreaked with greene on their backes. There is alſo a leſſer, differing from the firſt of theſe onely in bigneſſe.

9 This Neapolitan hath three or foure long leaues not much vnlike thoſe of the Hyacinths, but narrower, the ſtalke is pretty thicke, ſome foot high, and hath vſually growing theron ſome fiue or ſix floures hanging one way, though their ſtalkes grow alternately out of each ſide of the maine ſtemme. Theſe floures are compoſed of ſix leaues, being about an inch long, and ſome quarter of an inch broad, white within, and of an Aſh-coloured greene without, with white edges,

the

the middle of the floure is poſſeſſed by another little floure, conſiſting alſo of ſix little leaues, hauing in them ſix threads headed with yellow, and a white pointall. A blacke wrinkled ſeed is contained in three cornered heads, which by reaſon of their bigneſſe weigh downe the ſtalke. This floures in Aprill. ‡

‡ 8 *Ornithogalum ſpicatum.*
Spike faſhioned Star-floure.

‡ 9 *Ornithogalum Neapolitanum.*
The Neapolitan Star-floure.

¶ *The Place.*

Stars of Bethlehem, or Star-floures, eſpecially the firſt and ſecond, grow in ſundry places that lie open to the aire, not onely in Germany and the Low-countries, but alſo in England, and in our gardens very common. The yellow kinde *Lobell* found in Somerſet-ſhire in the corne fields. The reſt are ſtrangers in England; yet we haue moſt of them, as the third, fourth, eighth, and ninth, in ſome of our choice gardens.

¶ *The Time.*

Theſe kindes of bulbed plants do floure from Aprill to the end of May.

¶ *The Names.*

Touching the names, *Dioſcorides* calls it Ὀρνίθογαλον: *Pliny*, *Ornithogale:* in high Dutch it is called **Feldz wibel, Ackerz wibel:** as you ſhould ſay, *Cepa agraria:* in Engliſh, Stars of Bethlehem.

‡ The reſt are named in their titles and hiſtory; but *Cluſius* queſtions whether the *Bulbus unifolius* be not *Bulbine* of *Theophraſtus*, 7. *hiſt.* 13. *Bauhinus* ſeemes to affirme the *Spicatum* to be *Moly* of *Dioſcorides* and *Theophraſtus*, and *Epimedium* of *Pliny*.

¶ *The Nature.*

Theſe are temperate in heate and drineſſe.

¶ *The Vertues.*

A The vertues of moſt of them are vnknowne; yet *Hieronymus Tragus* writeth, That the root of the Star of Bethlehem roſted in hot embers, and applied with honey in manner of a Cataplaſme or pulteſſe, healeth old eating vlcers, and ſoftens and diſcuſſes hard tumors.

The roots, ſaith *Dioſcorides*, are eaten both raw and boyled.

† That which was the ſecond of our Author, vnder the title of *Cepa agraria*, and the third vnder *Ornithogalum luteum* were figures of the ſame plant, but in the latter, as *Bauhine* obſerues, the bottome leaues are omitted, becauſe they fall away when as it is growne vp to floure. †

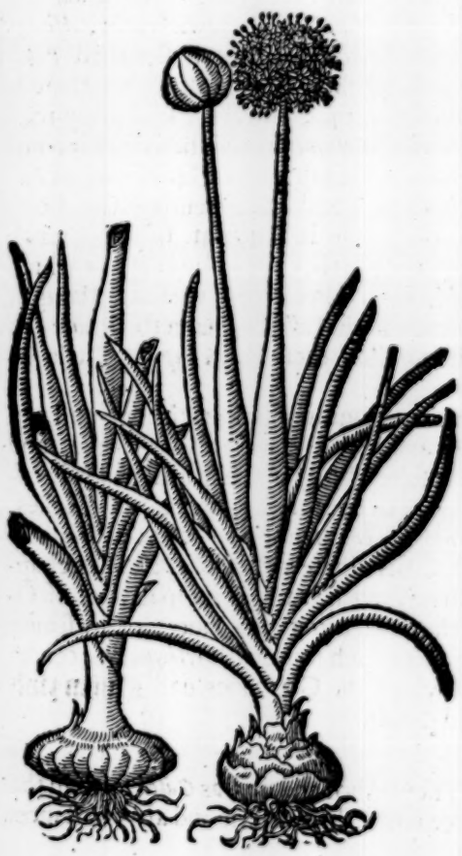
Chap.

Chap. 93. *Of Onions.*

¶ *The Kindes.*

There be, ſaith *Theophraſtus*, diuers ſorts of Onions, which haue their ſyr-names of the places where they grow: ſome alſo leſſer, others greater; ſome be round, and diuers others long; but none wilde, as *Pliny* writeth.

1 *Cepa alba.*
White Onions.



‡ 3 *Cepa Hiſpanica oblonga.*
Longiſh Spaniſh Onions.

¶ *The Deſcription.*

1 The Onion hath narrow leaues, and hollow within; the ſtalke is ſingle, round, biggeſt in the middle, on the top whereof groweth a round head couered with a thinne skin or filme, which being broken, there appeare little white floures made vp in forme of a ball, and afterward blacke ſeed three cornered, wrapped in thinne white skinnes. In ſtead of the root there is a bulbe or round head compact of many coats, which oftentimes becommeth great in manner of a Turnep, many times long like an egge. To be briefe, it is couered with very fine skinnes for the moſt part of a whitiſh colour.

2 The red Onion differeth not from the former but in ſharpneſſe and redneſſe of the roots, in other reſpects there is no difference at all.

‡ 3 There is alſo a Spaniſh kinde, whoſe root is longer than the other, but in other reſpects very little different.

‡ 4 There is alſo another ſmall kinde of Onion, called by *Lobel, Aſcalonitis Antiquorum*, or Scallions; this hath but ſmall roots, growing many together: the leaues are like to Onions, but leſſe. It ſeldome beares either ſtalke, floure, or ſeed. It is vſed to be eaten in ſallads.

¶ *The*

¶ *The Place.*

The Onion requireth a fat ground well digged and dunged, as *Palladius* ſaith. It is cheriſhed euery where in kitchen gardens: it is now and then in beds ſowne alone, and many times mixed with other herbes, as with Lettuce, Parſeneps, and Carrets. *Palladius* liketh well that it ſhould be ſowne with Sauory, becauſe, ſaith *Pliny*, it proſpereth the better, and is more wholeſome.

‡ 4 *Aſcalonitides.*
Scallions.

¶ *The Time.*

It is ſowne in March or Aprill, and ſomtimes in September.

¶ *The Names.*

The Onion is called in Greeke, Κρόμμυον: in Latine, *Cepa*, and many times *Cepe* in the neuter gender: the ſhops keepe that name. The old Writers haue giuen vnto this many ſyr-names of the places where they grow, for ſome are named *Cipriæ*, *Sardiæ*, *Creticæ*, *Samothraciæ*, *Aſcaloniæ*, of a towne in Iudea, otherwiſe called *Pompeiana*: in Engliſh, Onions. Moreouer, there is one named *Mariſca*, which the Countrey-men call *Vnio*, ſaith *Columella*; and thereupon it commeth that the French men call it *Oignon*, as *Ruellius* thinketh: and peraduenture the Low-Dutch men name it **Aueuim**, of the French word corrupted: they are called *Setaniæ* which are very little and ſweet; and theſe are thought to be thoſe which *Palladius* nameth *Cepullæ*, as though he called them *parvæ Cepæ*, or little Onions.

There is an Onion which is without an head or bulbe, and hath as it were a long necke, and ſpends it ſelfe wholly in the leaues, and it is often cropped or cut for the pot like the Leekes. This *Theophraſtus* names Πράσον: of this *Pliny* alſo writeth, in his nineteenth booke, and ſixt chapter. There is with vs two principall ſorts of Onions, the one ſeruing for a ſauce, or to ſeaſon meate with, which ſome call *Gethyon*, and others *Pallacana*: and the other is the headed or common Onion, which the Germanes call **Ouion zwibel**: the Italians, *Cipolla*: the Spaniards, *Cebolla*, *Ceba*, and *Cebola*.

¶ *The Temperature.*

All Onions are ſharpe, and moue teares by the ſmell. They be hot and dry, as *Galen* ſaith, in the fourth degree, but not ſo extreme hot as Garlick. The iuyce is of a thin waterie and airy ſubſtance: the reſt is of thicke parts.

¶ *The Vertues.*

A The Onions do bite, attenuate, or make thinne, and cauſe drineſſe: being boyled they doe loſe their ſharpeneſſe, eſpecially if the water be twice or thrice changed, and yet for all that they doe not loſe their attenuating qualitie.

B they alſo breake winde, prouoke vrine, and be more ſoluble boyled than raw; and raw they nouriſh not at all, and but a little though they be boyled.

C They be naught for thoſe that are cholericke, but good for ſuch as are replete with raw and flegmaticke humors; and for women that haue their termes ſtayed vpon a cold cauſe, by reaſon they open the paſſages that are ſtopped.

D *Galen* writeth, That they prouoke the Hemorrhoides to bleed if they be laid vnto them, either by themſelues, or ſtamped with vineger.

E The iuyce of Onions ſniffed vp into the noſe, purgeth the head, and draweth forth raw flegmaticke humors.

F Stamped with ſalt, rew, and honey, and ſo applied, they are good againſt the biting of a mad Dog.

G Roſted in the embers, and applied, they ripen and breake cold Apoſtumes, Biles, and ſuch like.

The

The iuyce of Onions mixed with the decoction of Pennirial, and annointed vpon the goutie member with a feather, or a cloath wet therein, and applied, eaſeth the ſame very much. H

The iuice annointed vpon a pild or bald head in the ſunne, bringing againe the haire very ſpeedily. I

The iuyce taketh away the heate of ſcalding with water or oyle, as alſo burning with fire and gun-pouder, as is ſet forth by a very skilfull Chirurgion named Maſter *William Clowes*, one of the Queens Chirurgions; and before him by *Ambroſe Parey*, in his Treatiſe of wounds made by gun ſhot. K

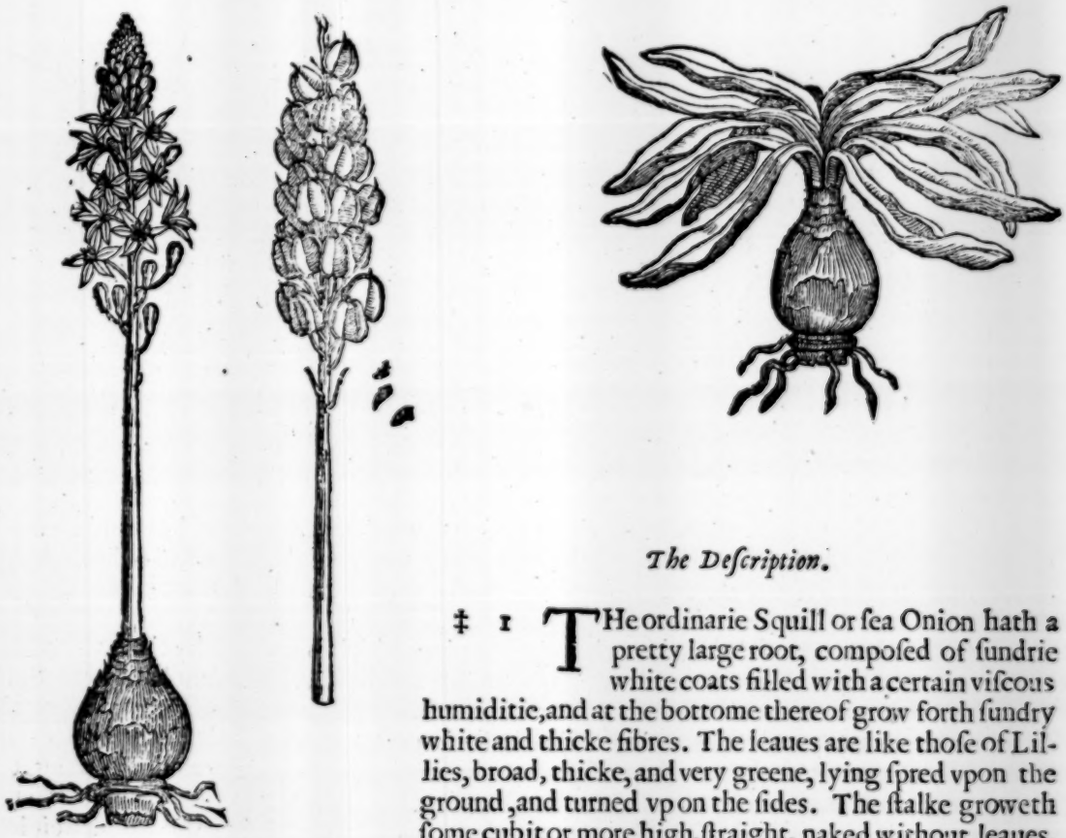
Onions ſliced, and dipped in the iuyce of Sorrell, and giuen vnto the ſicke of a tertian Ague, to eate, take away the fit in once or twice ſo taking them. L

¶ *The Hurts.*

The Onion being eaten, yea though it be boyled, cauſeth head-ache, hurteth the eyes, and maketh a man dimme ſighted, dulleth the ſences, ingendreth windineſſe, and prouoketh ouermuch ſleepe, eſpecially being eaten raw.

CHAP. 94. *Of Squils, or Sea-Onions.*

‡ 1 *Scilla Hiſpanica vulgaris.* The common Spaniſh Squill.



The Deſcription.

‡ 1 THe ordinarie Squill or ſea Onion hath a pretty large root, compoſed of ſundrie white coats filled with a certain viſcous humiditie, and at the bottome thereof grow forth ſundry white and thicke fibres. The leaues are like thoſe of Lillies, broad, thicke, and very greene, lying ſpred vpon the ground, and turned vp on the ſides. The ſtalke groweth ſome cubit or more high, ſtraight, naked without leaues, beautified at the top with many ſtarre-faſhioned floures, very like thoſe of the bigger *Ornithogalum*. The ſeed is contained in chaffie three cornered ſeed-veſſels, being it ſelfe alſo black, ſmooth, and chaffie. It floures in Auguſt and September, and the ſeed is ripe in October. The leaues ſpring vp in Nouember and December, after that the ſeed is ripe, and ſtalke decayed. ‡

2 The great Sea Onion, which *Cluſius* hath ſet forth in his Spaniſh hiſtorie, hath very great and broad leaues, as *Dioſcorides* ſaith, longer than thoſe of the Lilly, but narrower. The bulbe or headed root is very great, conſiſting of many coats or ſcaly filmes of a reddiſh colour. The floure is ſometimes yellow, ſometimes purple, and ſometimes of a light blew. ‡ *Cluſius* ſaith it is like that of the former, I thinke he meanes both in ſhape and colour. ‡

3 The ſea-Onion of Valentia, or rather the ſea Daffodill, hath many long and fat leaues, and narrow like thoſe of Narciſſus, but ſmoother and weaker, lying vpon the ground; among which riſeth vp a ſtalke a foot high, bare and naked, bearing at the top a tuft of white floures, in ſhape like

vnto

vnto our common yellow Daffodil. The ſeed is incloſed in thicke knobby huskes, blacke, flat, and thicke, very ſoft, in ſhape like vnto the ſeeds of *Ariſtolochia longa*, or long Birth-wort. The root is great, white, long, and bulbous.

4 Red floured Sea Daffodill, or ſea Onion, hath a great bulbe or root like to the precedent; the leaues long, fat, and ſharpe pointed, the ſtalke bare and naked, bearing at the top ſundry faire red floures in ſhape like to the laſt deſcribed.

2 *Pancratium Cluſij.*
Great Squill, or Sea Onion.

3 *Pancratium Marinum.*
Sea Onion of Valentia.

5 The yellow floured ſea Daffodill, or ſea Onion, hath many thicke fat leaues like vnto the common Squill or ſea Onion, among which riſeth vp a tender ſtraight ſtalke full of iuyce, bearing at the top many floures like the common yellow Daffodill. The ſeed and root is like the precedent.

‡ 6 To theſe may fitly be added that elegant plant which is knowne by the name of *Narciſſus tertius* of *Matthiolus*, and may be called White Sea Daffodill. This plant hath large roots, as bigge ſometimes as the ordinarie Squill; the leaues are like thoſe of other Daffodils, but broader, rounder pointed, and not very long. The ſtalke is pretty thicke, being ſometimes round, otherwhiles cornered, at the top whereof grow many large white floures: each floure is thus compoſed; it hath ſix long white leaues, in the midſt growes forth a white pointall which is incompaſſed by a welt or cap diuided into ſix parts, which ſix are againe by threes diuided into eighteen iagges or diuiſions, a white thred tipt with greene, of an inch long, comming forth of the middle of each diuiſion. This floureth in the end of May. It is ſaid to grow naturally about the ſea coaſt of Illyria. ‡

¶ *The Place.*

The firſt is found in Spaine and Italy, not far from the ſea ſide.

The ſecond alſo neere vnto the ſea, in Italy, Spaine, and Valentia. I haue had plants of them brought me from ſundry parts of the Mediterranean ſea ſide, as alſo from Conſtantinople, where it is numbred among the kindes of Narciſſus.

The third groweth in the ſands of the ſea, in moſt places of the coaſt of Narbone, and about Montpellier.

The fourth groweth plentifully about the coaſts of Tripolis and Aleppo, neere to the ſea, and alſo in the ſalt marſhes that are ſandie and lie open to the aire.

¶ *The*

¶ *The Time.*

They floure from May to the end of Iuly, and their ſeed is ripe in the end of Auguſt.

¶ *The Names.*

The firſt is called of the Grecians, σκίλλα: and of the Latines alſo *Scilla*: the Apothecaries name it *Squilla*: Diuers, *Cepa muris*: the Germanes, **Meer zwibel**: the Spaniards, *Cebolla albarrana*: the French-men, *Oignon de mer*: in Engliſh, Squill, and Sea Onion.

‡ The ſecond is called πανκράτιον, and *Scilla rubra major*.

3, 4, 5. Theſe are all figures of the ſame plant, but the leaſt (which is the worſt) is the figure of the *Aduerſaria*, where it is called *Pancratium marinum*: *Dodonæus* calls it *Narciſſus marinus*: and *Cluſius*, *Hemerocallis Valentina*; and it is iudged to be the ἡμεροκαλὶς of *Theoporaſtus*, *Lib. 6. Hiſt. cap. 1.* The Spaniards call this *Amores mios*: the Turkes, *Conzambach*: the Italians, *Giglio marino*. Theſe three (as I ſaid) differ no otherwiſe than in the colour of their floures.

The ſixth is *Narciſſus tertius*, or *Conſtantinopolitanus*, of *Matthiolus*: *Cluſius* calls it *Lilionarciſſus Hemerocallidis facie*. ‡

4 *Pancratium floribus rubris.*
Red floured ſea Daffodill.

‡ 6 *Narciſſus tertius Matthioli.*
The white ſea Daffodill.

¶ *The Temperature.*

The ſea Onion is hot in the ſecond degree, and cutteth very much, as *Galen* ſaith. It is beſt when it is taken baked or roſted, for ſo the vehemencie of it is taken away.

¶ *The Vertues of Squills.*

The root is to be couered with paſte or clay, (as *Dioſcorides* teacheth) and then put into an ouen to be baked, or elſe buried in hot embers till ſuch time as it be throughly roſted: for not being ſo baked or roſted it is very hurtfull to the inner parts. A

It is likewiſe baked in an earthen pot cloſe couered and ſet in an ouen. That is to be taken eſpecially which is in the midſt, which being cut in pieces muſt be boyled, but the water is ſtill to be changed, till ſuch time as it is neither bitter nor ſharpe: then muſt the pieces be hanged on a thread, and dried in the ſhadow, ſo that no one piece touch another. ‡ Thus vſed it loſeth moſt of the ſtrength; therefore it is better to vſe it lightly dried, without any other preparation. ‡ B

C Theſe ſlices of the Squill are vſed to make oyle, wine, or vineger of Squill. Of this vineger of Squill is made an Oxymel. The vſe whereof is to cut thicke, tough, and clammy humors, as alſo to be vſed in vomits.

D This Onion roſted or baked is mixed with potions and other medicines which prouoke vrine, and open the ſtoppings of the liuer and ſpleene, and is alſo put into treacles. It is giuen to thoſe that haue the Dropſie, the yellow Iaundiſe, and to ſuch as are tormented with the gripings of the belly, and is vſed in a licking medicine againſt an old rotten cough, and for ſhortneſſe of breath.

E One part of this Onion being mixed with eight parts of ſalt, and taken in the morning faſting to the quantitie of a ſpoonefull or two, looſeth the belly.

F The inner part of Squilla boyled with oyle and turpentine, is with great profit applied to the chaps or chil-blanes of the feet or heeles.

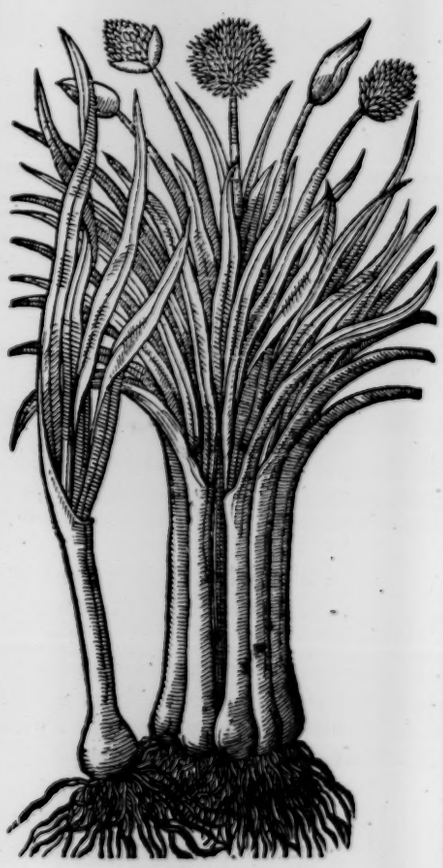
G It driueth forth long and round wormes if it be giuen with honey and oyle.

‡ The *Pancratium marinum*, or *Hemerocallis Valentina* (ſaith *Cluſius*) when as I liued with *Rondeletius*, at Montpellier, was called *Scilla*; and the Apothecaries thereof made the trochiſces for the compoſition of Treacle: afterwards it began to be called *Pancratium flore Lilij*. *Rondeletius* alſo was wont to tell this following ſtory concerning the poyſonous and maligne qualitie thereof. There were two Fiſhermen, whereof the one lent vnto the other (whom he hated) his knife, poyſoned with the iuyce of this Hemerocallis, for to cut his meate withall; he ſuſpecting no treachery cut his victuals therewith, and ſo eat them, the other abſtaining therefrom, and ſaying that he had no ſtomacke. Some few dayes after, he that did eate the victuals died; which ſhewed the ſtrong and deadly qualitie of this plant: which therefore (as *Cluſius* ſaith) cannot be the *Scilla Epimenidia* of *Pliny*, which was eatable, and without malignitie ‡

Chap. 95. *Of Leekes.*

¶ *Porrum capitatum.*
Headed, or ſet Leeke.

‡ 2 *Porrum ſectivum aut tonſile.*
Cut, or vnſet Leeke.



¶ The

¶ *The Deſcription.*

1 THe leaues or the blades of the Leeke be long, ſomewhat broad, and very many, hauing a keele or creſt in the backſide, in ſmell and taſte like to the Onion. The ſtalks, if the blades be not often cut, do in the ſecond or third yeare grow vp round, bringing forth on the top floures made vp in a round head or ball as doth the Onion. The ſeeds are like. The bulbe or root is long and ſlender, eſpecially of the vnſet Leeke. That of the other Leeke is thicker and greater.

‡ 2 Moſt Writers diſtinguiſh the common Leeke into *Porrum capitatum & ſectivum*; and *Lobel* giues theſe two figures wherewith we here preſent you. Now both theſe grow of the ſame ſeed, and they differ onely in culture; for that which is often cut for the vſe of the kitchen is called *Sectivum*: the other, which is headed, is not cut, but ſpared, and remoued in Autumne. ‡

¶ *The Place.*

It requireth a meane earth, fat, well dunged and digged. It is very common euery where in other countries, as well as in England.

¶ *The Time.*

It may be ſowne in March or Aprill, and it to be remoued in September or October.

¶ *The Names.*

The Grecians call it πράσον: the Latines, *Porrum*. The Emperour *Nero* had great pleaſure in this root, and therefore he was called in ſcorne, *Porrophagus*. But *Palladius* in the maſculine gender called it *Porrus*: the Germanes, **Lauch**: the Brabanders, **Poreue**: the Spaniards, *Puerro*: the French, *Porreau*: the Engliſh-men, Leeke, or Leekes.

¶ *The Temperature.*

The Leeke is hot and dry, and doth attenuate or make thinne as doth the Onion.

¶ *The Vertues.*

Being boyled it is leſſe hurtfull, by reaſon that it loſeth a great part of his ſharpeneſſe: and yet being ſo vſed it yeeldeth no good iuyce. But being taken with cold herbes his too hot quality is tempered.

Being boyled and eaten with Ptiſana or barley creame, it concocteth and bringeth vp raw humors that lie in the cheſt. Some affirme it to be good in a loch or licking medicine, to cleanſe the pipes of the lungs. A

The iuyce drunke with honey is profitable againſt the bitings of venomous beaſts, and likewiſe the leaues ſtamped and laid thereupon. B

The ſame iuyce, with vineger, frankincenſe, and milke, or oyle of roſes, dropped into the eares, mitigateth their paine, and is good for the noyſe in them. C

Two drams of the ſeed, with the like weight of myrtill berries drunk, ſtop the ſpitting of bloud which hath continued a long time. The ſame ingredients put into Wine keepe it from ſouring, and being alreadie ſoure, amend the ſame, as diuers write. It cutteth and attenuateth groſſe and tough humors. D

‡ *Lobel* commends the following Loch as very effectuall againſt phlegmatick Squinances, and other cold catarrhes which are like to cauſe ſuffocation. This is the deſcription thereof; Take blanched almonds three ounces, foure figges, ſoft *Bdellium* halfe an ounce, iuyce of Liquorice, two ounces, of ſugar candy diſſolued in a ſufficient quantitie of iuyce of Leekes, and boyled in *Balneo* to the height of a Syrup, as much as ſhall be requiſit to make the reſt into the forme of an *Eclegma*. ‡ E

¶ *The Hurts.*

It heateth the body, ingendreth naughty bloud, cauſeth troubleſome and terrible dreames, offendeth the eyes, dulleth the ſight, hurteth thoſe that are by nature hot and cholericke, and is noyſome to the ſtomacke, and breedeth windineſſe.

CHAP. 96.

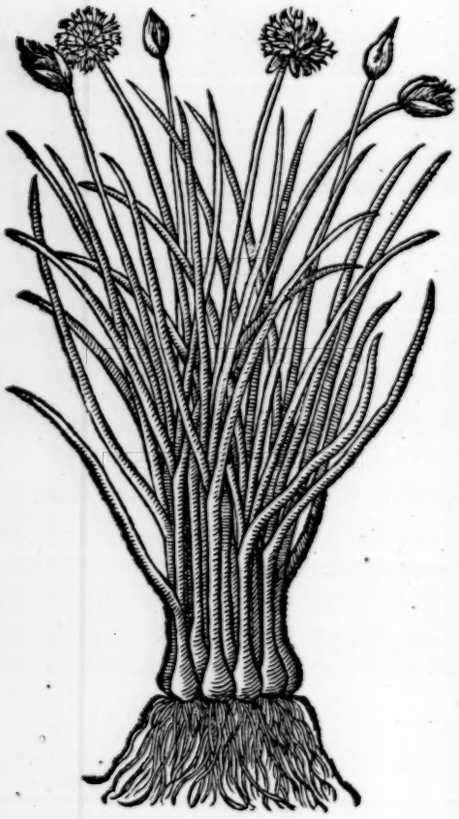
Of Ciues or Chiues, and wilde Leekes.

¶ *The Kindes.*

THere be diuers kindes of Leekes, ſome wilde, and ſome of the garden, as ſhall be declared.

Thoſe called Ciues haue beene taken of ſome for a kinde of wilde Onion: but all the Authors that I haue beene acquainted with, do accord that there is not any wild Onion.

1 *Schænopraſon.*
Ciues or Chiues.



2 *Porrum vitigineum.*
French Leekes, or Vine Leekes.

3 *Ampelopraſon ſiue porrum ſilueſtre.*
Wilde Leeke.

¶ *The Deſcription.*

1 Ciues bring forth many leaues about a hand-full high, long, ſlender, round, like to little ruſhes; amongſt which grow vp ſmall and tender ſtalkes, ſending forth certaine knops with floures like thoſe of the Onion, but much leſſer. They haue many little bulbes or headed roots faſtned together: out of which grow downe into the earth a great number of little ſtrings, and it hath both the ſmell and taſte of the Onion and Leeke, as it were participating of both.

2 The Vine Leeke or French Leeke groweth vp with blades like thoſe of Leekes: the ſtalke is a cubit high, on the top whereof ſtandeth a round head or button, couered at the firſt with a thinne skinne, which being broken, the floures and ſeeds come forth like thoſe of the Onion. The bulbe or headed root is round, hard, and ſound, which is quickly multiplied by ſending forth many bulbes.

‡ 3 The wilde Leeke hath leaues much like vnto thoſe of Crow-garlicke, but larger, and more acride. The floures and ſeeds alſo reſemble thoſe of the Crow-garlicke, the ſeeds being about the bigneſſe of cornes of wheat, with ſmal ſtrings comming forth at their ends. ‡

¶ *The*

¶ *The Time and Place.*

1 Ciues are ſet in gardens, they flouriſh long, and continue many yeares, they ſuffer the cold of Winter. They are cut and polled often, as is the vnſet Leeke.

2 The Vine-leeke groweth of it ſelfe in Vineyards, and neere vnto Vines in hot regions, wherof it both tooke the name Vine-Leeke, and French Leeke. It beareth his greene leaues in Winter, and withereth away in the Sommer. It groweth in moſt gardens of England.

‡ Thus farre our Author deſcribes and intimates to you a garden Leeke, much like the ordinarie in all reſpects, but ſomewhat larger. But the following names belong to the wilde Leeke, which here we giue you in the third place. ‡

¶ *The Names.*

Ciues are called in Greeke, σκοροδοπρασον, *Shænopraſum*: in Dutch, **Bieſloock**, as though you ſhould ſay, *Iunceum Porrum*, or Ruſh Leeke: in Engliſh, Ciues, Chiues, Ciuet and Sweth: in French, *Brelles*.

† 2 The Vine-leeke, or rather wild Leeke, is called in Greeke, Ἀμπελοπρασον, of the place where it naturally groweth: it may be called in Latine, *Porrum Vitium*, or *Vitigineum Porrum*: in Engliſh, after the Greeke and Latine, Vine Leeke, or French Leeke.

¶ *The Temperature.*

Ciues are like in facultie vnto the Leeke, hot and dry. The Vine leeke heateth more than doth the other Leeke.

¶ *The Vertues.*

Ciues attenuate or make thinne, open, prouoke vrine, ingender hot and groſſe vapours, and are hurtfull to the eyes and braine. They cauſe troubleſome dreames, and worke all the effects that the Leeke doth.

The Vine-leeke, or Ampelopraſon, prouoketh vrine mightily, and bringeth downe the floures. B It cureth the bitings of venomous beaſts, as *Dioſcorides* writeth.

† The figure of *Ampelopraſum* was in the firſt place, in the Chapter next but one, by the name of *Allium ſylueſtre*.

CHAP. 97. *Of Garlicke.*

¶ *The Deſcription.*

1 THe bulbe or head of Garlicke is couered with moſt thinne skinnes or filmes of a very light white purple colour, conſiſting of many cloues ſeuered one from another, vnder which in the ground below groweth a taſſell of threddy fibres: it hath long greene leaues like thoſe of the Leeke, among which riſeth vp a ſtalke at the end of the ſecond or third yeare, whereupon doth grow a tuft of floures couered with a white skinne, in which, being broken when it is ripe, appeareth round blacke ſeeds.

‡ 2 There is alſo another Garlicke which growes wilde in ſome places of Germanie and France, which in ſhape much reſembles the ordinarie, but the cloues of the roots are ſmaller and redder. The floure is alſo of a more duskie and darke colour than the ordinarie. ‡

¶ *The Place and Times.*

Garlick is ſeldome ſowne of ſeed, but planted in gardens of the ſmall cloues in Nouember and December, and ſometimes in Februarie and March.

¶ *The Names.*

It is called in Latine, *Allium*: in Greeke, σκορδον: The Apothecaries keepe the Latine name: the Germanes call it **Knoblauch**: the Low Dutch, **Look**: the Spaniards, *Aios*, *Alho*: the Italians, *Aglio*: the French, *Ail* or *Auze*: the Bohemians, *Czeſnek*: the Engliſh, Garlicke, and poore mans Treacle.

¶ *The Temperature.*

Garlicke is very ſharpe, hot, and dry, as *Galen* ſaith, in the fourth degree, and exulcerateth the skinne by raiſing bliſters.

¶ *The Vertues.*

Being eaten, it heateth the body extremely, attenuateth and maketh thinne thicke and groſſe A humors; cutteth ſuch as are tough and clammy, digeſteth and conſumeth them; alſo openeth obſtructions, is an enemie to all cold poyſons, and to the bitings of venomous beaſts: and therefore *Galen* nameth it *Theriaca Ruſticorum*, or the husbaudmans Treacle.

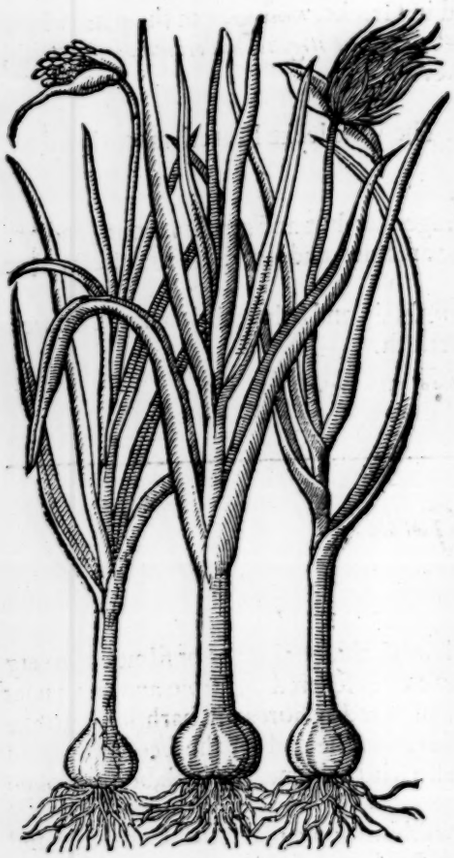
It yeeldeth to the body no nouriſhment at all, it ingendreth naughty and ſharpe bloud. There- B

fore ſuch as are of a hot complexion muſt eſpecially abſtaine from it. But if it be boyled in water vntill ſuch time as it hath loſt his ſharpeneſſe, it is the leſſe forcible, and retaineth no longer his euill iuyce, as *Galen* ſaith.

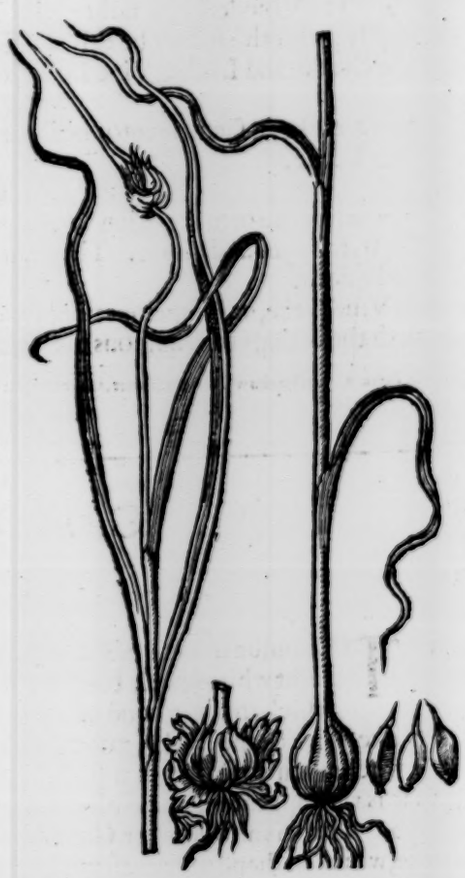
C It taketh away the roughneſſe of the throat, it helpeth an old cough, it prouoketh vrine, it breaketh and conſumeth winde, and is alſo a remedie for the Dropſie which procceedeth of a cold cauſe.

D It killeth wormes in the belly, and driueth them forth. The milke alſo wherein it hath beene ſodden is giuen to yong children with good ſucceſſe againſt the wormes.

1 *Allium.*
Garlicke.



‡ 2 *Allium ſyluestre rubentibus nucleis.*
Wilde Garlicke with red cloues.



E It helpeth a very cold ſtomacke, and is a preſeruatiue againſt the contagious and peſtilent aire.

F The decoction of Garlick vſed for a bath to ſit ouer, bringeth downe the floures and ſecondines or after-burthen, as *Dioſcorides* ſaith.

G It taketh away the morphew, tetters, or ring-wormes, ſcabbed heads in children, dandraffe and ſcurfe, tempered with honey, and the parts anointed therewith.

H With Fig leaues and Cumin it is laid on againſt the bitings of the Mouſe called in Greeke, μυγάλη: in Engliſh, a Shrew.

Chap.

Chap. 98. *Of Crow-Garlicke and Ramſons.*

¶ *The Deſcription.*

1 THe wilde Garlicke or Crow-garlicke hath ſmall tough leaues like vnto ruſhes, ſmooth and hollow within; among which groweth vp a naked ſtalke, round, ſlipperie, hard and ſound: on the top whereof, after the floures be gone, grow little ſeeds made vp in a round cluſter like ſmall kernels, hauing the ſmell and taſte of Garlick. In ſtead of a root there is a bulbe or round head without any cloues at all.

2 Ramſons do ſend forth two or three broad longiſh leaues ſharpe pointed, ſmooth, and of a light greene colour. The ſtalke is a ſpan high, ſmooth and ſlender, bearing at the top a cluſter of white ſtar-faſhioned floures. In ſtead of a root it hath a long ſlender bulbe, which ſendeth downe a multitude of ſtrings, and is couered with skinnes or thicke coats.

† 1 *Allium ſylueſtre.*
Crow Garlicke.

2 *Allium vrſinum.*
Ramſons.

¶ *The Time.*

They ſpring vp in Aprill and May. Their ſeed is ripe in Auguſt.

¶ *The Place.*

The Crow Garlicke groweth in fertile paſtures in all parts of England. I found it in great plentie in the fields called the Mantels, on the backſide of Iſlington by London.

Ramſons grow in the Woods and borders of fields vnder hedges, among the buſhes. I found it in the next field vnto Boobies barne, vnder that hedge that bordereth vpon the lane; and alſo vpon the left hand, vnder an hedge adioyning to a lane that leadeth to Hampſted, both places neere London.

¶ *The*

¶ *The Names.*

Both of them be wilde Garlicke, and may be called in Latine, *Allium ſylueſtria:* in Greeke, σκόροδα ἄγρια: The firſt, by *Dodonæus* and *Lobell* is called *Allium ſylueſtre tenuifolium.*

Ramſons are named of the later practioners, *Allium Vrſinum*, or Beares Garlicke: *Allium latifolium*, and *Moly Hippocraticum*: in Engliſh, Ramſons, Ramſies, and Buckrams.

¶ *The Nature.*

The temperatures of theſe wilde Garlickes are referred vnto thoſe of the gardens.

¶ *The Vertues.*

A Wilde Garlicke, or Crow-Garlicke, as *Galen* ſaith, is ſtronger and of more force than the garden Garlicke.

B The leaues of Ramſons be ſtamped and eaten of diuers in the Low-countries, with fiſh for a ſauce, euen as we do eate greene-ſauce made with ſorrell.

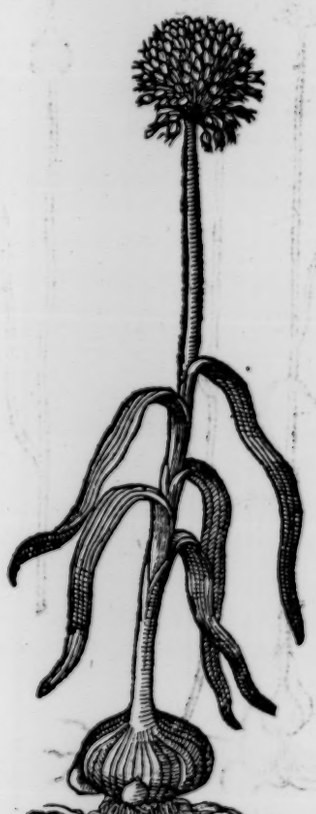
C The ſame leaues may very well be eaten in April and May with butter, of ſuch as are of a ſtrong conſtitution, and labouring men.

D The diſtilled water drunke breaketh the ſtone, and driueth it forth, and prouoketh vrine.

Chap. 99. *Of Mountaine Garlicks:*

1 *Scorodopraſum.*
Great mountaine Garlicke.

‡ 2 *Scorodopraſum primum Cluſij.*
Cluſius his great mountaine Garlicke.



¶ *The Deſcription.*

1 2 THe great Mountaine Garlicke hath long and broad leaues like thoſe of Leekes, but much greater and longer, embracing or claſping about a great thicke ſtalke, ſoft and full of juyce, bigger than a mans finger, and bare toward the top; vpon which is ſet a great head bigger than a tenniſe ball, couered with a skinne after the manner of an Onion. The skinne when it commeth to perfection breaketh, and diſcouereth a great multitude of whitiſh floures; which being paſt, blacke ſeeds follow, incloſed in a three cornered huske. The root is bulbous, of the bigneſſe of a great Onion. The whole plant ſmelleth very ſtrong like vnto Garlick,

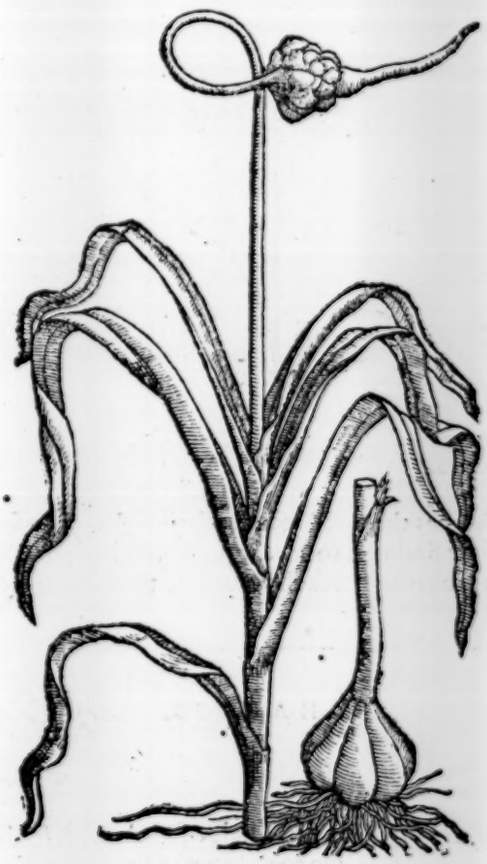
Garlicke, and is in ſhew a Leeke, whereupon it was called *Scorodopraſum*, as if we ſhould ſay, Garlicke Leeke; participating of the Leeke and Garlicke, or rather a degenerate Garlicke growne monſtrous.

‡ I cannot certainely determine what difference there may be betweene the plants expreſſed by the firſt figure, which is our Authors, and the ſecond figure which is taken out of *Cluſius*. Now the hiſtorie which *Cluſius* giues vs to the ſecond, the ſame is (out of him) giuen by our Author to the firſt: ſo that by this reaſon they are of one and the ſame plant. To the which opinion I rather incline, than affirme the contrarie with *Bauhine*, who diſtinguiſhing them, puts the firſt amongſt the Leekes, vnder the name of *Porrum folio latiſſimo*: following *Tabernamontanus*, who firſt gaue this figure, vnder the name of *Porrum Syriacum*.

3 This plant is leſſer in all the parts than the former; the root is ſet about with longer and ſlenderer bulbes wrapped in browniſh skinnes; the floures and leaues are like, yet ſmaller than Garlicke.

‡ 3 *Scorodopraſum minus.*
The leſſer leeke-leaued Garlicke.

‡ 4 *Ophioſcoridon.*
Vipers Garlike.



4 The third, which *Cluſius* makes his ſecond *Scorodopraſum*, hath ſtalkes ſome two cubits high, hauing many leaues like thoſe of Leekes from the bottome of the ſtalke to the middle thereof; their ſmell is betweene that of Leekes and Garlicke; the reſt of the ſtalke is naked, green, ſmooth, ſuſtaining at the top a head compoſed of many bulbes, couered with a whitiſh skinne ending in a long greene point; which skinne by the growth of the bulbes being broken, they ſhew themſelues, being firſt of a purpliſh, and afterwards of a whitiſh colour, amongſt which are ſome floures. The top of the ſtalke at firſt twines it ſelfe, ſo that it in ſome ſort repreſents a ſerpent; then by little it vntwines againe, and beares the head ſtraight vp. The root conſiſts of many cloues much like that of Garlicke. ‡

5 The broad leaued Mountaine Garlicke, or rather the Mountaine Ramſons, riſeth vp with a ſtalke a cubit high, a finger thicke, yet very weake, full of a ſpongeous ſubſtance, neere to the bottome of a purpliſh colour, and greene aboue, bearing at the top a multitude of ſmall whitiſh floures, ſomewhat gaping, ſtar-faſhion. The leaues are three or floure, broad ribbed like the leaues of great Gentian, reſembling thoſe of Ramſons, but greater. The root is great and long, couered with many ſcaly coats and hairy ſtrings.

¶ The

5 *Allium Alpinum latifolium, ſeu Victorialis.*
Broad leaued Mountaine Garlicke.

¶ *The Place.*

The great mountaine Garlicke growes about Conſtantinople, as ſaith *Cluſius*. I receiued a plant of it from M. *Thomas Edwards* Apothecary of Exceſter, who found it growing in the Weſt parts of England.

Victorialis groweth in the mountaines of Germany, as ſaith *Carolus Cluſius*, and is yet a ſtranger in England for any thing that I do know.

‡. ¶ *The Time.*

‡ Moſt of theſe plants floure in the months of Iune and Iuly.

¶ *The Names.*

Of the firſt and ſecond I haue ſpoken already. The third is *Scorodopraſſum minus* of *Lobell*. The fourth is *Allium ſatiuum ſecundum* of *Dodonæus*, and *Scorodopraſum ſecundum* of *Cluſius*. The fifth is *Allium anguinum* of *Matthiolus*; *Ophioſcoridon* of *Lobell*, and *Victorialis* of *Cluſius* and others, as alſo *Allium Alpinum*. The Germanes call it **Seigwurtz**.

¶ *The Temper.*

They are of a middle temper between Leekes and Garlicke.

¶ *Their Vertues.*

Scorodopraſum, as it partakes of the temper, ſo alſo of the vertues of Leekes and Garlicke; that is, it attenuates groſſe and tough matter, helpes expectoration, &c.

Victorialis is like Garlicke in the operation thereof. Some (as *Camerarius* writeth) hang the root thereof about the necks of their cattell being falne blinde, by what occaſion ſoeuer it happen, and perſuade themſelues that by this meanes they will recouer their ſight. Thoſe that worke in the mines in Germany affirme, That they find this root very powerfull in defending them from the aſſaults of impure ſpirits or diuels, which often in ſuch places are troubleſome vnto them. *Cluſ.* ‡

Chap. 100. *Of Moly, or the Sorcerers Garlicke.*

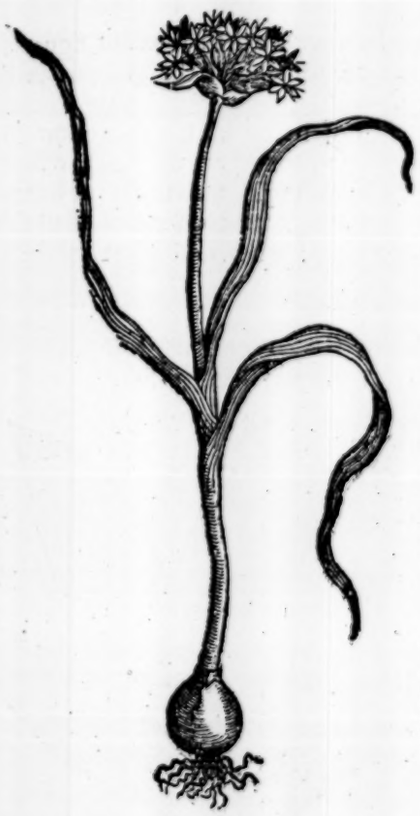
¶ *The Deſcription.*

1 THe firſt kinde of Moly hath for his root a little whitiſh bulbe ſomewhat long, not vnlike to the root of the vnſet Leeke, which ſendeth forth leaues like the blades of corne or graſſe: among which doth riſe vp a ſlender weake ſtalke, fat and full of iuyce, at the top whereof commeth forth of a skinny filme a bundle of milke-white floures, not vnlike to thoſe of Ramſons. The whole plant hath the ſmell and taſte of Garlicke, whereof no doubt it is a kinde.

2 Serpents Moly hath likewiſe a ſmall bulbous root with ſome fibres faſtned to the bottom, from which riſe vp weake graſſie leaues of a ſhining greene colour, crookedly winding and turning themſelues toward the point like the taile of a Serpent, whereof it tooke his name: the ſtalke is tough, thicke, and full of iuyce, at the top whereof ſtandeth a cluſter of ſmall red bulbes, like vnto the ſmalleſt cloue of Garlicke, before they be pilled from their skinne. And among thoſe bulbes there do thruſt forth ſmall and weake foot-ſtalkes, euery one bearing at the end one ſmall white floure tending to a purple colour: which being paſt, the bulbes do fall downe vpon the ground, where they without helpe do take hold and root, and thereby greatly encreaſe, as alſo by the infinite bulbes that the root doth caſt off: all the whole plant doth ſmell and taſte of Garlick, whereof it is alſo a kinde.

3 *Homers* Moly hath very thicke leaues, broad toward the bottome, ſharpe at the point, and hollowed

1 *Moly Dioſcorideum.*
Dioſcorides his Moly.



2 *Moly Serpentinum.*
Serpents Moly.

3 *Moly Homericum.*
Homers Moly.

hollowed like a trough or gutter, in the boſome of which leaues neere vnto the bottome commeth forth a certaine round bulbe or ball of a gooſe-turd greene colour: which being ripe and ſet in the ground groweth and becommeth a faire plant ſuch as is the mother. Among thoſe leaues riſeth vp a naked ſmooth thicke ſtalke, of two cubits high, as ſtrong as a ſmall walking ſtaffe: at the top of the ſtalke ſtandeth a bundle of faire whitiſh floures, daſhed ouer with a waſh of purple colour, ſmelling like the floures of Onions. When they be ripe there appeareth a blacke ſeed wrapped in a white skinne or huske. The root is great and bulbous, couered with a blackiſh skinne on the outſide, and white within, and of the bigneſſe of a great Onion.

4 Indian Moly hath verythicke fat ſhort leaues, and ſharpe pointed; in the boſome wherof commeth forth a thicke knobby bulbe like that of *Homers* Moly. The ſtalke is alſo like the precedent, bearing at the top a cluſter of ſcaly bulbes included in a large thinne skin or filme. The root is great, bulbous faſhion, and full of iuyce.

5 *Caucaſon*, or withering Moly, hath a very great bulbous root, greater than that of *Homers* Moly, and fuller of a ſlimie iuyce; from which do ariſe three or foure great thicke and broad leaues withered alwaie at the point;

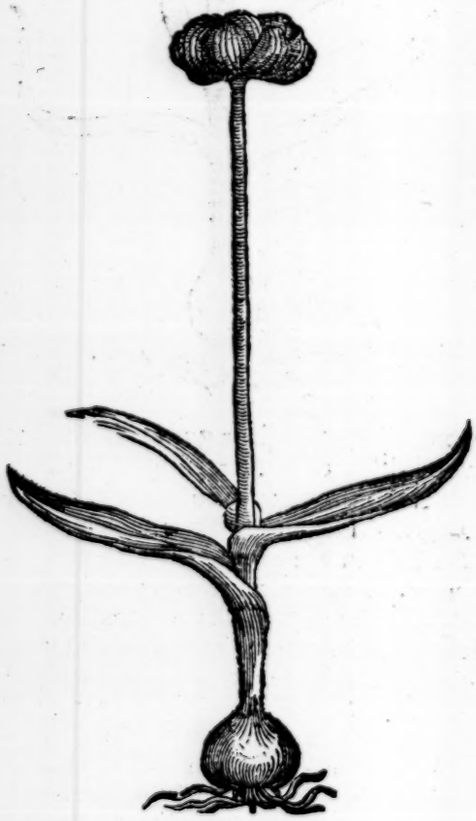
wherein

wherein conſiſteth the difference betweene theſe leaues and thoſe of *Homers* Moly, which are not ſo. In the middle of the leaues riſeth vp a bunch of ſmooth greeniſh bulbes ſet vpon a tender foot-ſtalke, in ſhape and bigneſſe like to a great garden Worme, which being ripe and planted in the earth, do alſo grow vnto a faire plant like vnto their mother.

‡ Theſe two laſt mentioned (according to *Bauhine*, and I thinke the truth) are but figures of one and the ſame plant; the later whereof is the better, and more agreeing to the growing of the plant.

6 To theſe may be fitly added two other Molyes: the firſt of theſe, which is the yellow Moly, hath roots whitiſh and round, commonly two of them growing together; the leaues which it ſends forth are long and broad, and ſomwhat reſemble thoſe of the Tulip, and vſually are but two in number; betweene which riſes vp a ſtalke ſome foot high, bearing at the top an vmbell of faire yellow ſtar-like floures tipt on their lower ſides with a little greene. The whole plant ſmelleth of Garlicke.

4 *Moly Indicum.*
Indian Moly.



5 *Caucaſon.*
Withering Moly.

7 This little Moly hath a root about the bigneſſe of an Haſell nut, white, with ſome fibres hanging thereat; the ſtalke is of an handfull or little more in height, the top thereof is adorned with an vmbel of ten or twelue white floures, each of which conſiſts of ſix leaues, not ſharpe pointed, but turned round, and pretty large, conſidering the bigneſſe of the plant. This plant hath alſo vſually but two leaues, and thoſe like thoſe of Leekes, but far leſſe. ‡

¶ *The Place.*

† Theſe plants grow in the garden of M. *Iohn Parkinſon* Apothecarie, and with M. *Iohn Tradeſcant* and ſome others, ſtudious in the knowledge of plants.

¶ *The Time.*

They ſpring forth of the ground in Februarie, and bring forth their floures, fruit, and ſeed in the end of Auguſt.

¶ *The Names.*

† Some haue deriued the name *Moly* from theſe Greeke words, Μολυνω τους νοσους: that is, to driue away diſeaſes. It may probably be argued to belong to a certaine bulbous plant, and that a kind

of

of Garlicke, by the words μόλοζα, and μῶλυξ. The former, *Galen* in his *Lexicon* of ſome of the difficulter words vſed by *Hippocrates*, thus expounds: [illegible] That is, *Moliza* is a Garlicke hauing a ſimple or ſingle head, and not to be parted or diſtinguiſhed into cloues: ſome terme it *Moly*. *Erotianus* in his *Lexicon* expounds the later thus: μῶλυξ (ſaith hee) [illegible], &c. That is; *Molyx* is a head of Garlicke, round, and not to be parted into cloues. ‡

¶ *The Names in particular.*

‡ 1 This is called *Moly* by *Matthiolus*; *Moly Anguſtifolium* by *Dodonæus*; *Moly Dioſcoridem* by *Lobel* and *Cluſius*.

2 This, *Moly Serpentinum vocatum*, by *Lobel* and the Author of the *Hiſt. Lugd.*

3 This ſame is thought to be the *Moly* of *Theophraſtus* and *Pliny*, by *Dodonæus*, *Cluſius*, &c. and ſome alſo would haue it to be that of *Homer*, mentioned in his twentieth *Odyſſ.* *Lobel* calleth it *Moly Liliflorum*.

4 5 The fourth and fifth being one, are called *Caucaſon*, and *Moly Indicum* by *Lobel*, *Cluſius*, and others.

6 This is *Moly Montanum latifolium flauo flore* of *Cluſius*, and *Moly luteum* of *Lobel*, *Aduerſar. par.* 2.

7 This ſame is *Moly minus* of *Cluſius*. ‡

‡ 6 *Moly latifolium flore flauo.*
Broad leaued Moly with the yellow floure.

‡ 7 *Moly minus flore albo.*
Dwarfe white floured Moly.

¶ *The Temperature and Vertues.*

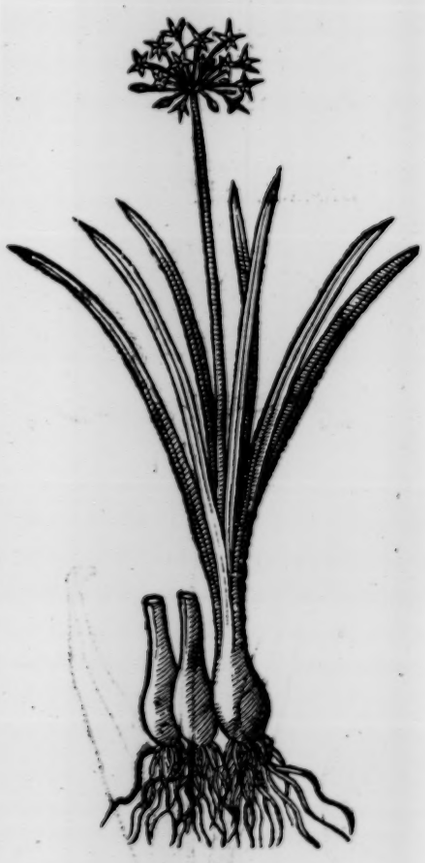
Theſe Molyes are very hot, approching to the nature of Garlicke, and I doubt not but in time ſome excellent man or other will find out as many good vertues of them, as their ſtately and comely proportion ſhould ſeeme to be poſſeſſed with. But for my part, I haue neither proued, nor heard of others, nor found in the writings of the Antients, any thing touching their faculties. Only *Dioſcorides* reporteth, That they are of maruellous efficacie to bring downe the termes, if one of them be ſtamped with oyle of Floure de-luce according to art, and vſed in manner of a peſſarie or mother ſuppoſitorie.

‡ Chap. 79. *Of diuers other Molyes.*

‡ BEſides the Garlickes and Molyes formerly mentioned by our Author, and thoſe I haue in this Edition added, there are diuers others, which, mentioned by *Cluſius*, and belonging vnto this Tribe, I haue thought good in this place to ſet forth. Now for that they are more than conueniently could be added to the former chapters, (which are ſufficiently large) I thought it not amiſſe to allot them a place by themſelues.

‡ 1 *Moly Narciſſinis foliis primum.*
The firſt Narciſſe-leaued Moly.

‡ 2 *Moly Narciſſinis foliis ſecundum.*
The ſecond Narciſſe-leaued Moly.



¶ *The Deſcription.*

‡ 1 THis, which in face nigheſt repreſents the Molyes deſcribed in the laſt Chapter, hath a root made of many ſcales, like as an Onion in the vpper part, but the lower part is knotty, and runnes in the ground like as *Solomons* Seale; the Onion-like part hath many fibres hanging thereat; the leaues are like thoſe of the white Narciſſe, very greene and ſhining, amongſt which riſeth vp a ſtalke of a cubit high, naked, firme, greene, and creſted; at the top come forth many floures conſiſting of ſix purpliſh leaues, with as many chiues on their inſides: after which follow three ſquare heads, opening when they are ripe, and containing a round blacke ſeed.

2 This other being of the ſame kinde, and but a varietie of the former, hath ſofter and more Aſh-coloured leaues, with the floures of a lighter colour. Both theſe floure at the end of Iune, or in Iuly.

3 This hath fiue or ſix leaues equally as broad as thoſe of the laſt deſcribed, but not ſo long, being ſomewhat twined, greene, and ſhining. The ſtalke is ſome foot in length, ſmaller than that of the former, but not leſſe ſtiffe, creſted, and bearing in a round head many floures, in manner of growing and ſhape like thoſe of the former, but of a more elegant purple colour. In ſeed and root it

‡ 3 *Moly Narciſſinis foliis tertium.*
The third Narciſſe-leaued Moly.

‡ 4 *Moly montanum latifolium* 1. *Cluſij.*
The firſt broad leaued mountaine Moly.

‡ 5 *Moly montanum ſecundum Cluſij.*
The ſecond mountaine Moly.

it reſembles the precedent. There is alſo a varietie of this kinde, with leaues longer and narrower, neither ſo much twined, the ſtalks weaker, and floures much lighter coloured.

This floures later than the former, to wit, in Iuly and Auguſt.

All theſe plants grow naturally in Leitenberg and other hills neere to Vienna in Auſtria, where they were firſt found and obſerued by *Carolus Cluſius*.

4 This hath a ſtalke ſome two cubits high, which euen to the middle is incompaſſed with leaues much longer and broader than thoſe of Garlicke, and very like thoſe of the Leeke: on the top of the ſmooth and ruſh-like ſtalke groweth a tuft conſiſting of many darke purple coloured bulbs growing cloſe together, from amongſt which come forth pretty long ſtalkes bearing light purple ſtarre-faſhioned floures, which are ſucceeded by three cornered ſeed-veſſels. The root is bulbous, large, conſiſting of many cloues, and hauing many white fibres growing forth thereof. Moreouer, there grow out certain round bulbes about the root, almoſt like thoſe which grow in the head, and being planted apart, they produce plants of the ſame kinde. This is *Allium, ſiue Moly montanum latifolium* 1. *Cluſij*.

5 This hath a ſmooth round greene ſtalke ſome cubit high, whereon doe grow moſt com-

monly three leaues narrower than thoſe of the former, and as it were graſſy. The top of the ſtalke ſuſtaines a head wrapped in two lax filmes, each of them running out with a ſharpe point like two hornes, which opening themſelues, there appeare many ſmall bulbes heaped together, amongſt which are floures compoſed of ſix purpliſh little leaues, and faſtned to long ſtalkes. The root is round and white, with many long white fibres hanging thereat. *Cluſius* calls this, *Allium, ſiue Moly montanum ſecundum.* And this is *Lobels Ampelopraſon proliferum.*

6 Like to the laſt deſcribed is this in height and ſhape of the ſtalke and leaues, as alſo in the forked or horned skinne inuoluing the head, which conſiſteth of many ſmall bulbes of a reddiſh greene colour, and ending in a long greene point; amongſt which, vpon long and ſlender ſtalkes hang downe floures like in forme and magnitude to the former, but of a whitiſh colour, with a darke purple ſtreake alongſt the middle, and vpon the edges of each leafe. The root is round and white, like that of the laſt deſcribed. This *Cluſius* giues vnder the title of *Allium ſiue Moly montanum tertium.*

‡ 6 *Moly montanum* 3. *Cluſ.*
The third mountaine Moly.

‡ 7 *Moly montani quarti ſpec.* 1. *Cluſ.*
The fourth mountaine Moly; the firſt ſort thereof.

7 This alſo hath three ruſhy leaues, with a round ſtalke of ſome cubit high, whoſe top is likewiſe adorned with a forked membrane, containing many pale coloured floures hanging vpon long ſtalkes, each floure conſiſting of ſix little leaues, with the like number of chiues, and a peſtil in the midſt. This tuft of floures cut off with the top of the ſtalke, and carried into a chamber, wil yeeld a pleaſant ſmell (like that which is found in the floures in the earlier *Cyclamen*) but it will quickly decay. After theſe floures are paſt ſucceed three cornered heads containing a blacke ſmall ſeed, not much vnlike Gillofloure ſeed. The root is round like the former, ſometimes yeelding off-ſets. This is *Alij montani* 4. *ſpecies* 1. of *Cluſius.*

8 There is another kinde of this laſt deſcribed, which growes to almoſt the ſame height, and hath like leaues, and the head ingirt with the like skinny long pointed huskes; but the floures of this are of a very darke colour. The roots are like the former, with off-ſets by their ſide. This is

Cluſius

Cluſius his *Moly montani quarti ſpecies ſecunda.* The roots of the three laſt deſcribed ſmell of garlick, but the leaues haue rather an hearby or graſſe-like ſmell.

The fifth and ſixth of theſe grow naturally in the Styrian and Auſtrian Alpes. The ſeuenth growes about Presburg in Hungarie, about Niclaſpurg in Morauia, but moſt aboundantly about the Baths in Baden.

‡ 8 *Moly montani quarti ſpecies ſecunda Cluſij.*
The ſecond kinde of the fourth mountaine Moly.

‡ 9 *Moly montanum quintum Cluſij.*
The fifth mountaine Moly.

9 This growes to the like height as the former, with a greene ſtalke, hauing few leaues thereupon, and naked at the top, where it carieth a round head conſiſting of many ſtar-like ſmall floures, of a faire purple colour, faſtned to ſhort ſtalkes, each floure being compoſed of ſixe little leaues, with as many chiues, and a peſtill in the middle. The root is bulbous and white, hauing ſomtimes his off-ſets by his ſides. The ſmell of it is like Garlicke. This groweth alſo about Presburgh in Hungarie, and was there obſerued by *Cluſius* to beare his floure in May and Iune. He calleth this *Allium, ſeu Moly montanum quintum.* ‡

CHAP. 102. *Of White Lillies.*

¶ *The Kindes.*

THere be ſundry ſorts of Lillies, whereof ſome be wilde, or of the field; others tame, or of the garden; ſome white, others red; ſome of our owne countries growing, others from beyond the ſeas: and becauſe of the variable ſorts we will diuide them into chapters, beginning with the two white Lillies, which differ little but in the natiue place of growing.

¶ *The Deſcription.*

1 THe white Lillie hath long, ſmooth, and full bodied leaues, of a graſſie or light greene colour. The ſtalkes be two cubits high, and ſometimes more, ſet or garniſhed with the like leaues, but growing ſmaller and ſmaller toward the top; and vpon them doe grow faire white floures ſtrong of ſmell, narrow toward the foot of the ſtalke whereon they doe grow, wide or open in the mouth like a bell. In the middle part of them doe grow ſmall tender pointals tipped with a duſty yellow colour, ribbed or chamfered on the backe ſide, conſiſting of ſix ſmall leaues thicke and fat. The root is a bulbe made of ſcaly cloues, full of tough and clammie iuyce, wherewith the whole plant doth greatly abound.

2 The white Lilly of Conſtantinople hath very large and fat leaues like the former, but narrower and leſſer. The ſtalke riſeth vp to the height of three cubits, ſet and garniſhed with leaues alſo like the precedent, but much leſſe. Which ſtalke oftentimes doth alter and degenerate from his naturall roundneſſe to a flat forme, as it were a lath of wood furrowed or chanelled alongſt the ſame, as it were ribs or welts. The floures grow at the top like the former, ſauing that the leaues do turne themſelues more backward like the Turkes cap, and beareth many more floures than our Engliſh white Lilly doth.

1 *Lilium album.*
The white Lilly.

2 *Lilium album Bizantinum.*
The white Lilly of Conſtantinople.

¶ *The Place.*

Our Engliſh white Lilly groweth in moſt gardens of England. The other groweth naturally in Conſtantinople and the parts adiacent, from whence wee had plants for our Engliſh gardens, where they flouriſh as in their owne countrey.

¶ *The Time.*

The Lillies floure from May to the end of Iune.

The Names.

The Lillie is called in Greeke λείριον: in Latine, *Lilium*, and alſo *Roſa Iunonis*, or *Iuno's* Roſe, becauſe as it is reported it came vp of her milke that fell vpon the ground. For the Poets feigne, That *Hercules*, who *Iupiter* had by *Alcumena*, was put to *Iuno's* breaſts whileſt ſhee was aſleepe; and after the ſucking there fell away aboundance of milke, and that one part was ſpilt in the heauens, and the other on the earth; and that of this ſprang the Lilly, and of the other the circle in the heauens

called

called *Lacteus Circulus*, or the milky way, or otherwiſe in Engliſh Watling ſtreet. Saint *Baſill* in the explication of the 44. Pſalme ſaith, That no floure ſo liuely ſets forth the frailty of mans life as the Lilly. It is called in high Dutch, **Weiſz Gilgen:** in low Dutch, **witte Lilien:** in Italian, *Giglio:* in Spaniſh, *Lirio blanco:* in French, *Lys blanc:* in Engliſh, the white Lilly.

The other is called *Lilium album Bizantinum*, and alſo *Martagon album Bizantinum:* in Engliſh, the white Lilly of Conſtantinople: of the Turkes themſelues, *Sultan Zambach*, with this addition, (that they might be the better knowne which kinde of Lilly they meant when they ſent roots of them into theſe countries) *Fa fiora grandi Bianchi*, ſo that *Sultan Zambach fa fiora grandi Bianchi*, is as much to ſay as, Sultans great Lilly with white floures.

¶ *The Nature.*

The white Lilly is hot, and partly of a ſubtill ſubſtance. But if you regard the root, it is dry in the firſt degree, and hot in the ſecond.

¶ *The Vertues.*

The root of the garden Lilly ſtamped with honey gleweth together ſinewes that be cut in ſunder. It conſumeth or ſcoureth away the vlcers of the head called Achores, and likewiſe all ſcruineſſe of the beard and face. A

The Root ſtamped with Vineger, the leaues of Henbane, or the meale of Barley, cureth the tumours and apoſtumes of the priuy members. It bringeth the haire againe vpon places which haue beene burned or ſcalded, if it be mingled with oyle or greaſe, and the place anointed therewith. B

The ſame root roſted in the embers, and ſtamped with ſome leauen of Rie bread and Hogges greaſe, breaketh peſtilentiall botches. It ripeneth Apoſtumes in the flankes, comming of venery and ſuch like. C

The floures ſteeped in Oyle Oliue, and ſhifted two or three times during Sommer, and ſet in the Sunne in a ſtrong glaſſe, is good to ſoften the hardneſſe of ſinewes, and the hardneſſe of the matrix. D

Florentinus a writer of husbandry ſaith, That if the root be curiouſly opened, and therein be put ſome red, blew, or yellow colour that hath no cauſticke or burning qualitie, it will cauſe the floure to be of the ſame colour. E

Iulius Alexandrinus the Emperors Phyſitian ſaith, That the water thereof diſtilled and drunke cauſeth eaſie and ſpeedy deliuerance, and expelleth the ſecondine or after-burthen in moſt ſpeedy manner. F

He alſo ſaith, the leaues boyled in red Wine, and applied to old wounds or vlcers, doe much good, and forward the cure, according to the doctrine of *Galen* in his ſeuenth booke *de ſimpl. med. facultat.* G

The root of a white Lilly ſtamped and ſtrained with wine, and giuen to drinke for two or three dayes together, expelleth the poyſon of the peſtilence, and cauſeth it to breake forth in bliſters in the outward part of the skinne, according to the experience of a learned Gentleman M. *William Godorus*, Sergeant Surgeon to the Queenes Maieſtie: who alſo hath cured many of the Dropſey with the iuyce thereof, tempered with Barley meale, and baked in cakes, and ſo eaten ordinarily for ſome moneth or ſix weekes together with meate, but no other bread during that time. H

CHAP. 103. *Of Red Lillies.*

¶ *The Kindes.*

THere be likewiſe ſundry ſorts of Lillies, which we do comprehend vnder one generall name in Engliſh, Red Lillies, whereof ſome are of our owne countries growing, and others of beyond the ſeas, the which ſhall be diſtinguiſhed ſeuerally in this chapter that followeth.

¶ *The Deſcription.*

1 THe gold-red Lilly groweth to the height of two, and ſometimes three cubits, and often higher than thoſe of the common white Lilly. The leaues be blacker and narrower, ſet very thicke about the ſtalke. The floures in the top be many, from ten to thirty floures, according to the age of the plant, and fertilitie of the ſoile, like in forme and greatneſſe to thoſe of the white Lilly, but of a red colour tending to a Saffron, ſprinkled or poudred with many little blacke ſpecks, like to rude vnperfect draughts of certaine letters. The roots be great bulbes, conſiſting of many cloues, as thoſe of the white Lilly.

‡ 2 In ſtead of the Plantaine leaued red Lilly, deſcribed and figured in this ſecond place by our Author out of *Tabernamontanus*, for that I iudge both the figure and deſcription counterfeit, I haue omitted them, and here giue you the many-floured red Lilly in his ſtead. This hath a root like that of the laſt deſcribed, as alſo leaues and ſtalkes; the floure alſo in ſhape is like that of the former, but of a more light red colour, and in number of floures it exceedeth the precedent, for ſometimes it beares ſixty floures vpon one ſtalke. ‡

† 3 This red Lilly is like vnto the former, but not ſo tall; the leaues be fewer in number, broader, and downy towards the top of the ſtalke, where it beares ſome bulbes. The floures in ſhape be like the former, ſauing that the colour hereof is more red, and thicke daſht with blacke ſpecks. The root is ſcaly like the former.

4 There is another red Lilly which hath many leaues ſomewhat ribbed, broader than the laſt mentioned, but ſhorter, and not ſo many in number. The ſtalke groweth to the height of two cubits, and ſometimes higher, whereupon do grow floures like the former: among the foot-ſtalks of which floures come forth certaine bulbes or cloued roots, browne of colour, tending vnto rednesſe; which do fall in the end of Auguſt vpon the ground, taking root and growing in the ſame place, whereby it greatly encreaſeth, for ſeldome or neuer it bringeth forth ſeed for his propagation.

1 *Lilium aureum.*
Gold-red Lilly.

† 2 *Lilium rubrum.*
The red Lilly.

5 There is another ſort of red Lillie hauing a faire ſcaly or cloued root, yellow aboue, and browne toward the bottome; from which riſeth vp a faire ſtiffe ſtalke creſted or furrowed, of an ouer-worne browne colour, ſet from the lower part to the branches, whereon the floures doe grow with many leaues, confuſedly placed without order. Among the branches cloſe by the ſtem grow forth certaine cloues or roots of a reddiſh colour, like vnto the cloues of Garlicke before they are pilled: which being fallen vpon the ground at their time of ripeneſſe, do ſhoot forth certaine tender ſtrings or roots that do take hold of the ground, whereby it greatly encreaſeth. The floures are in ſhape like the other red Lillies, but of a darke Orange colour, reſembling a flame of fire ſpotted with blacke ſpots.

‡ 6 This hath a much ſhorter ſtalke, being but a cubit or leſſe in height, with leaues blackiſh

kiſh, and narrower than thoſe afore going. The floures, as in the reſt, grow out of the top of the ſtalke, and are of a purpliſh Saffron colour, with ſome blackiſh ſpots. The root in ſhape is like the precedent. ‡

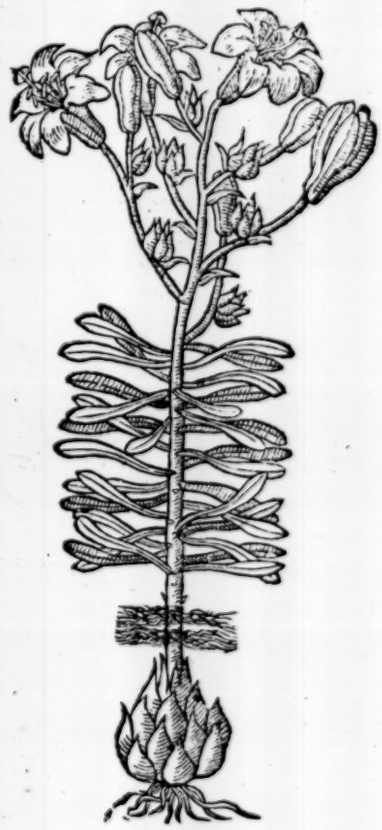
¶ *The Place.*

Theſe Lillies do grow wilde in the plowed fields of Italy and Languedocke, in the mountaines and vallies of Hetruria and thoſe places adiacent. They are common in our Engliſh gardens, as alſo in Germany.

¶ *The Time.*

Theſe red Lillies do floure commonly a little before the white Lillies, and ſometimes together with them.

3 *Lilium cruentum latifolium.*
The fierie red Lilly.



‡ 4 *Lilium cruentum bulbiferum.*
Red bulbe-bearing Lilly.

¶ *The Names.*

‡ 1 The firſt of theſe is thought by ſome to be the *Bulbus cruentus* of *Hippocrates*; as alſo the *Lilium purpureum* of *Dioſcorides*: Yet *Matthiolus* and ſome others would haue it his *Hemerocallis*. *Dodonæus* and *Bapt. Porta* thinke it the *Hyacinthus* and *Cofmoſandalos* of the Poets, of which you ſhall finde more hereafter. It is the *Martagon Chymiſtarum* of *Lobell*, and the *Lilium aureum majus* of *Tabernamontanus*.

2 This is *Martagon Chymiſtarum alterum* of *Lobell*. 3 This is *Cluſius* his *Martagon bulbiferum ſecundum*. 4 *Martagon bulbiferum primum* of *Cluſius*. 5 This *Dodonæus* calls *Lilium purpureum tertium*, and it is *Martagon bulbiferum tertium* of *Cluſius*. 6 This laſt *Lobell* and *Dodonæus* call *Lilium purpureum minus*.

‡ I haue thought good here alſo to giue you that diſcourſe touching the Poets Hyacinth, which being tranſlated out of *Dodonæus*, was formerly vnfitly put into the chapter of Hyacinths; which therefore I there omitted, and haue here reſtored to his due place, as you may ſee by *Dodonæus*, *Pempt. 2. lib. 2. cap. 2.* ‡

† There is a Lilly which *Ouid*, *Metamorph. lib. 10.* calls *Hyacinthus*, of the boy *Hyacinthus*, of whoſe bloud he feigneth that this floure ſprang, when he periſhed as he was playing with *Apollo*,

for

for whoſe ſake, he ſaith, that *Apollo* did print certaine letters and notes of his mourning. Theſe are his words:

Ecce cruor, qui fuſus humo ſignauerat herbas,
Deſinit eſſe cruor, Tyrioque nitentior oſtro
Flos oritur, formamque capit, quam Lilia, ſi non
Purpureus color his argenteus eſſet in illis.
Non ſatis hoc Phœbo eſt, (is enim fuit auctor honoris)
Ipſe ſuos gemitus foliis inſcribit, & ai ai,
Flos habet inſcriptum, funeſtaque littera ducta eſt.

Which lately were elegantly thus rendred in Engliſh by M. *Sands*:

Behold! the bloud which late the graſſe had dy'de
Was now no bloud: from thence a floure full blowne,
Far brighter than the Tyrian ſcarlet ſhone:
Which ſeem'd the ſame, or did reſemble right
A Lilly, changing but the red to white.
Nor ſo contented, (for the Youth receiu'd
That grace from *Phœbus*) in the leaues he weau'd
The ſad impreſſion of his ſighs, Ai, Ai,
They now in funerall characters diſplay, &c.

‡ 5 *Lilium cruentum ſecundum caulem bulbulis donatum.*
Red Lilly with bulbes growing alongſt the ſtalke.

‡ 6 *Lilium purpureum minus.*
The ſmall red Lilly.

Theocritus alſo hath made mention of this Hyacinth, in *Bions* Epitaph, in the 19. *Eidyl.* which *Eidyl* by ſome is attributed to *Moſchus*, and made his third. The words are theſe:

Νῦν ὑακινθε λεγε τὰ σὰ γραμματα ἢ πάλιν ἆ.
Αἴμβατα σοῖς πετάλοισι.

In Engliſh thus:

Now Iacinth ſpeake thy letters, and once more
Imprint thy leaues with Ai, Ai, as before.

Likewiſe

Likewise *Virgill* hath written hereof in the third *Eclog* of his *Bucolicks*.

Et me Phœbus amat, Phœbo sua semper apud me
Munera sunt, lauri & suaue rubens Hyacinthus.
Phœbus loues me, his gifts I alwayes haue,
The e're greene Laurel, and the Iacinth braue.

In like manner also *Nemesianus* in his second *Eclog* of his *Bucolicks*:

Te sine me, misero mihi Lilia nigra videntur,
Pallentesque Rosæ, nec dulce rubens Hyacinthus:
At si tu venias, & candida Lilia fient
Purpureæque Rosæ, & dulce rubens Hyacinthus.
Without thee, Loue, the Lillies blacke do seeme;
The Roses pale, and Hyacinths I deeme
Not louely red. But if thou com'st to me,
Lillies are white, red Rose and Iacinths be.

The Hyacinths are said to be red which *Ouid* calleth purple; for the red colour is somtimes termed purple. Now it is thought this *Hyacinthus* is called *Ferrugineus*, for that it is red of a rusty iron colour: for as the putrifaction of brasse is named *Ærugo*; so the corruption of iron is called *Ferrugo*, which from the reddish colour is stiled also *Rubigo*. And certainly they are not a few that would haue *Color ferrugineus* to be so called from the rust which they thinke *Ferrugo*. Yet this opinion is not allowed of by all men; for some iudge, that *Color ferrugineus* is inclining to a blew, for that when the best iron is heated and wrought, when as it is cold againe it is of a colour neere vnto blew, which from *Ferrum* (or iron) is called *Ferrugineus*. These latter ground themselues vpon *Virgils* authoritie, who in the sixth of his *Æneidos* describeth *Charons* ferrugineous barge or boat, and presently calleth the same blew. His words are these:

Ipse ratem conto subigit velisque ministrat,
Et ferrugineam subuectat corpora Cymba,
He thrusting with a pole, and setting sailes at large,
Bodies transports in ferrugineous barge.

And then a little after he addes;

Cæruleam aduertit puppim, ripæque propinquat.
He then turnes in his blew Barge, and the shore
Approches nigh to.

And *Claudius* also, in his second booke of the carrying away of *Proserpina*, doth not a little confirme their opinions; who writeth, That the Violets are painted, *ferrugine dulci*, with a sweet iron colour.

Sanguineo splendore rosas, vaccinea nigro
Induit, & aulci violas ferrugine pingit.
He trimmes the Rose with bloudy bright,
And Prime-tree berries blacke he makes,
And decks the Violet with a sweet
Darke iron colour which it takes.

But let vs returne to the proper names from which we haue digressed. Most of the later Herbarists do call this Plant *Hyacinthus Poeticus*, or the Poets Hyacinth. *Pausanias* in his second booke of his Corinthiackes hath made mention of *Hyacinthus* called of the Hermonians, *Comosandalos*, setting downe the ceremonies done by them on their festiuall dayes, in honour of the goddesse *Chthonia*. The Priests (saith he) and the Magistrates for that yeare being, doe leade the troupe of the pompe; the women and men follow after; the boyes solemnly leade forth the goddesse with a stately shew: they go in white vestures, with garlands on their heads made of a floure which the Inhabitants call *Comosandalos*, which is the blew or sky-coloured Hyacinth, hauing the marks and letters of mourning as aforesaid.

¶ *The Nature.*

The floure of the red Lilly (as *Galen* saith) is of a mixt temperature, partly of thinne, and partly of an earthly essence. The root and leaues do dry and cleanse, and moderately digest, or waste and consume away.

¶ *The Vertues.*

The leaues of the herbe applied are good against the stinging of Serpents. A

The same boiled and tempered with vineger are good against burnings, and heale green wounds and Vlcers. B

The root rosted in the embers, and pounded with oyle of Roses cureth burnings, and softneth hardnesse of the matrix. C

The

D The ſame ſtamped wtth honey cureth the wounded ſinewes and members out of ioynt. It takes away the morphew, wrinkles, and deformitie of the face.

E Stamped with Vineger, the leaues of Henbane, and wheat meale, it remoueth hot ſwellings of the ſtones, the yard, and matrix.

F The roots boyled in Wine (ſaith *Pliny*) cauſeth the cornes of the feet to fall away within few dayes, with remouing the medicine vntill it haue wrought his effect.

G Being drunke in honied water, they driue out by ſiege vnprofitable bloud.

Chap. 104. *Of Mountaine Lillies.*

¶ *The Deſcription.*

1 THe great mountaine Lilly hath a cloued bulbe or ſcaly root like to thoſe of the Red Lilly, yellow of colour, very ſmall in reſpect of the greatneſſe of the plant: From the which riſeth vp a ſtalke, ſometimes two or three, according to the age of the plant; whereof the middle ſtalke commonly turneth from his roundneſſe into a flat forme, as thoſe of the white Lilly of Conſtantinople. Vpon theſe ſtalkes do grow faire leaues of a blackiſh greene colour, in roundles and ſpaces as the leaues of Woodroofe, not vnlike to the leaues of white Lillie, but ſmaller at the top of the ſtalkes. The floures be in number infinite, or at the leaſt hard to be counted, very thicke ſet or thruſt together, of an ouerworne purple, ſpotted on the inſide with many ſmall ſpecks of the colour of ruſty iron. The whole floure doth turne it ſelfe backeward at ſuch time as the Sunne hath caſt his beames vpon it, like vnto the Tulipa or Turkes Cap, as the Lilly or Martagon of Conſtantinople doth; from the middle whereof doe come forth tender pointalls with ſmall dangling pendants hanging thereat, of the colour the floure is ſpotted with.

1 *Lilium montanum majus.*
The great mountaine Lilly.

2 *Lilium montanum minus.*
Small Mountaine Lilly.

5 The

2 The ſmall mountaine Lilly is very like vnto the former in root, leafe, ſtalke, and floures: differing in theſe points; The whole plant is leſſer, the ſtalke neuer leaueth his round forme, and beareth fewer floures.

‡ There are two or three more varieties of theſe plants mentioned by *Cluſius*; the one of this leſſer kinde, with floures on the outſide of a fleſh colour, and on the inſide white, with blackiſh ſpots; as alſo another wholly white without ſpots. The third varietie is like the firſt, but differs in that the floures blow later, and ſmell ſweet.

Theſe plants grow in the woody mountaines of Styria and Hungarie, and alſo in ſuch like places on the North of Francfort, vpon the Mœne. ‡

The ſmall ſort I haue had many yeares growing in my garden; but the greater I haue not had till of late, giuen me by my louing friend M. *Iames Garret* Apothecarie of London.

¶ *The Time.*

Theſe Lillies of the mountaine floure at ſuch time as the common white Lilly doth, and ſometimes ſooner.

¶ *The Names.*

The great mountaine Lilly is called of *Tabernamontanus*, *Lilium Saracenicum*, receiued by Maſter *Garret* aforeſaid from Liſle in Flanders, by the name of *Martagon Imperiale*: of ſome, *Lilium Saracenicum mas*: It is *Hemerocallis flore rubello*, of *Lobel*.

The ſmall mountaine Lilly is called in Latine, *Lilium montanum*, and *Lilium ſylueſtre*: of *Dodonæus*, *Hemerocallis*: of others, *Martagon*: but neither truly; for that there is of either, other Plants properly called by the ſame names. In high Dutch it is called **Goldwurtz**, from the yellowneſſe of the roots: in low Dutch, **Lilikens van Caluarien**: in Spaniſh, *Lirio Amarillo*: in French, *Lys Sauvage*: in Engliſh, Mountaine Lilly.

¶ *The Nature and Vertues.*

There hath not beene any thing left in writing either of the nature or vertues of theſe plants: notwithſtanding we may deeme, that God which gaue them ſuch ſeemely and beautifull ſhape, hath not left them without their peculiar vertues; the finding out whereof we leaue to the learned and induſtrious Searcher of Nature.

CHAP. 105. *Of the Red Lillie of Conſtantinople.*

1 *Lilium Bizantinum.*
The red Lilly of Conſtantinople.

‡ 2 *Lilium Byzantinum flo. purpuro ſanguineo.*
The Byzantine purpliſh ſanguine-coloured Lilly.

¶ *The Deſcription.*

1 THe red Lilly of Conſtantinople hath a yellow ſcaly or cloued Root like vnto the Mountaine Lilly, but greater: from the which ariſeth vp a faire fat ſtalke a finger thicke, of a darke purpliſh colour toward the top; which ſometimes doth turne from his naturall roundneſſe into a flat forme, like as doth the great mountaine Lilly: vpon which ſtalk grow ſundry faire and moſt beautifull floures, in ſhape like thoſe of the mountaine Lilly, but of greater beauty, ſeeming as it were framed of red wax, tending to a red leade colour. From the middle of the floure commeth forth a tender pointall or peſtell, and likewiſe many ſmall chiues tipped with looſe pendants. The floure is of a reaſonable pleaſant ſauour. The leaues are confuſedly ſet about the ſtalke like thoſe of the white Lilly, but broader and ſhorter.

‡ 2 This hath a large Lilly-like root, from which ariſeth a ſtalke ſome cubit or more in height, ſet confuſedly with leaues like the precedent. The floures alſo reſemble thoſe of the laſt deſcribed, but vſually are more in number, and they are of a purpliſh ſanguine colour.

‡ 3 *Lilium Byzantinum flo. dilute rubente.*
The light red Byzantine Lilly.

‡ 4 *Lilium Byzantinum miniatum polyanthos.*
The Vermilion Byzantine many-floured Lilly.

3 This differs little from the laſt, but in the colour of the floures, which are of a lighter red colour than thoſe of the firſt deſcribed. The leaues and ſtalkes alſo, as *Cluſius* obſerueth, are of a lighter greene.

4 This may alſo more fitly be termed a varietie from the former, than otherwiſe: for according to *Cluſius*, the difference is onely in this, that the floures grow equally from the top of the ſtalke, and the middle floure riſes higher than any of the reſt, and ſometimes conſiſts of twelue leaues as it were a twinne, as you may perceiue by the figure. ‡

¶ *The Time.*

They floure and flouriſh with the other Lillies.

¶ *The*

¶ *The Names.*

The Lilly of Constantinople is called likewise in England, Martagon of Constantinople: of *Lobel, Hemerocallis Chalcedonica,* and likewise *Lilium Bizantinum*: of the Turks it is called *Zusiniare:* of the Venetians, *Marocali.*

¶ *The Nature and Vertues.*

Of the nature or vertues there is not any thing as yet set down, but it is esteemed especially for the beautie and rareneſſe of the floure; referring what may be gathered hereof to a further consideration.

‡ CHAP. 106.

Of the narrow leaued reflex Lillies.

¶ *The Description.*

‡ 1 THe root of this is not much vnlike that of other Lillies; the stalke is some cubit high, or better; the leaues are many and narrow, and of a darker green than those of the ordinarie Lilly; the floures are reflex, like those treated of in the last chap. of a red or Vermilion colour. This floures in the end of May: wherefore *Clusius* calls it *Lilium rubrum præcox,* The early red Lilly.

‡ 1 *Lilium rubrum angustifolium.*
The red narrow leaued Lilly.

‡ 3 *Lilium mont. flore flauo punctato.*
The yellow mountaine Lilly with the spotted floure.

2 This Plant is much more beautifull than the last described; the roots are like those of Lillies, the stalke some cubit and an halfe in height, being thicke set with small grassie leaues. The floures grow out one aboue another, in shape and colour like those of the last described, but oft-

times are more in number, ſo that ſome one ſtalke hath borne ſome 48 floures. The root is much like the former.

‡ 4 *Lilium mont. flore flauo non punctato.* The yellow Mountaine Lilly with the vnſpotted floure.

3 This in roots is like thoſe afore deſcribed; the ſtalke is ſome 2 cubits high, ſet confuſedly with long narrow leaues, with three conſpicuous nerues running alongſt them. The floures are at firſt pale coloured, afterwards yellow, conſiſting of ſix leaues bended backe to their ſtalkes, & marked with blackiſh purple ſpots.

4 There is alſo another differing from the laſt deſcribed onely in that the floure is not ſpotted, as that of the former.

¶ *The Place.*

Theſe Lillies are thought Natiues of the Pyrenean mountaines, and of late yeares are become Denizons in ſome of our Engliſh gardens.

¶ *The Time.*

The firſt (as I haue ſaid) floures in the end of May: the reſt in Iune.

¶ *The Names.*

1 This is called by *Cluſius*, *Lilium rubrum præcox.*

2 *Cluſius* names this, *Lilium rubrum præcox* 3. *anguſtifolium.* *Lobel* ſtiles it, *Hemerocallis Macedonica*, and *Martagon Pomponeum.*

3 This is *Lilium flauo flore maculis diſtinctum* of *Cluſius*, and *Lilium montanum flauo ſo.* of *Lobel.*

4 This being a varietie of the laſt, is called by *Cluſius*, *Lilium flauo flore maculis non diſtinctum.*

¶ *The Temper and Vertues.*

Theſe in all likelihood cannot much differ from the temper and vertues of other Lillies, which in all their parts they ſo much reſemble. ‡

Chap. 107. *Of the Perſian Lilly.*

¶ *The Deſcription.*

The Perſian Lilly hath for his root a great white bulbe, differing in ſhape from the other Lillies, hauing one great bulbe firme or ſolid, full of juyce, which commonly each yeare ſetteth off or encreaſeth one other bulbe, and ſometimes more, which the next yeare after is taken from the mother root, and ſo bringeth forth ſuch floures as the old plant did. From this root riſeth vp a fat thicke and ſtraight ſtemme of two cubits high, whereupon is placed long narrow leaues of a greene colour, declining to blewnes as doth thoſe of the woade. The floures grow alongſt the naked part of the ſtalke like little bels, of an ouer-worne purple colour, hanging down their heads, euery one hauing his owne foot-ſtalke of two inches long, as alſo his peſtell or clapper from the middle part of the floure; which being paſt and withered, there is not found any ſeed at all, as in other plants, but is increaſed onely in his root.

¶ *The Place.*

This Perſian Lilly groweth naturally in Perſia and thoſe places adiacent, whereof it tooke his name, and is now (by the induſtrie of Trauellers into thoſe countries, louers of Plants) made a Denizon in ſome few of our London gardens.

¶ *The*

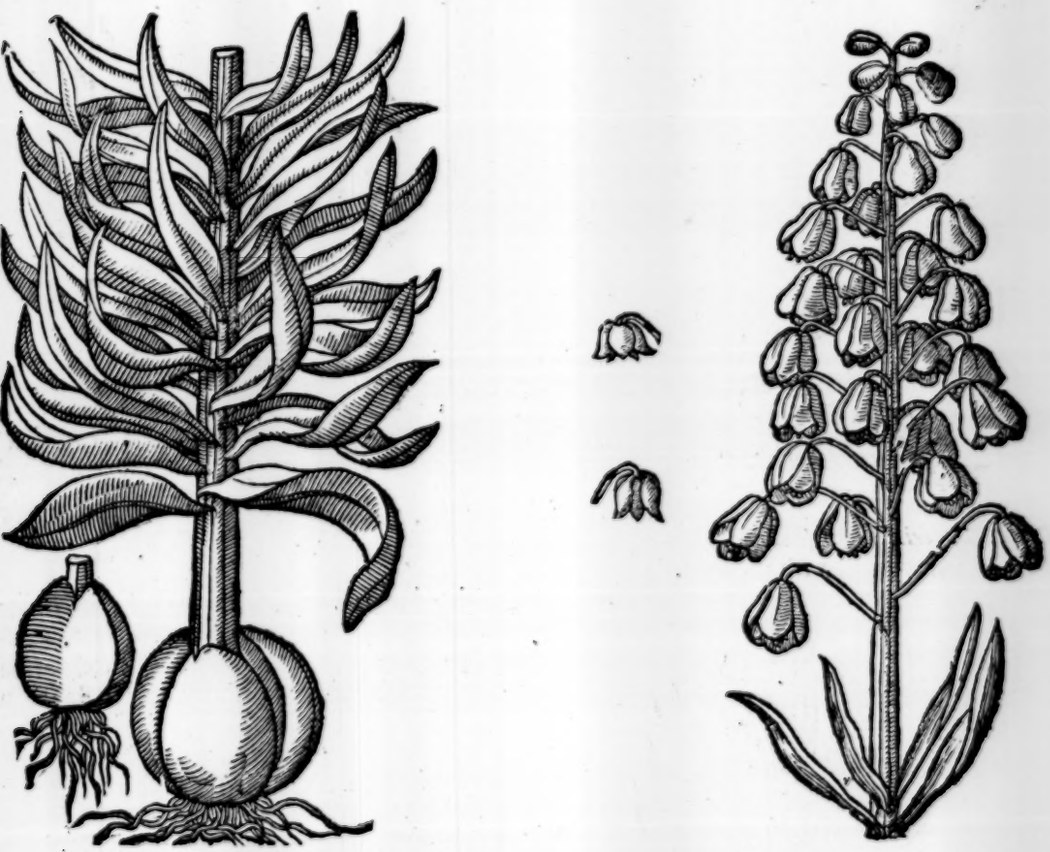
¶ *The Time.*

This plant floureth from the beginning of May, to the end of Iune.

¶ *The Names.*

This Perſian Lilly is called in Latine, *Lilium Perſicum, Lilium Suſianum, Pennaciò Perſiano*, and *Pannaco Perſiano*, either by the Turks themſelues, or by ſuch as out of thoſe parts brought them into England; but which of both is vncertaine. *Alphonſus Pancius*, Phyſition to the Duke of Ferrara, when as he ſent the figure of this Plant vnto *Carolus Cluſius*, added this title, *Pennacio Perſiano è Pianta belliſſima & è ſpecie di Giglio ó Martagon, diuerſo della corona Imperiale*: That is in Engliſh, This moſt elegant plant *Pennacio* of Perſia is a kinde of Lilly or Martagon, differing from the floure called the Crowne Imperiall.

Lilium Perſicum.
The Perſian Lilly.



¶ *The Nature and Vertues.*

There is not any thing knowne of the nature or vertues of this Perſian Lilly, eſteemed as yet for his rareneſſe and comely proportion; although (if I might be ſo bold with a ſtranger that hath vouchſafed to trauell ſo many hundreds of miles for our acquaintance) we haue in our Engliſh fields many ſcores of floures in beauty far excelling it.

CHAP. 108. *Of the Crowne Imperiall.*

¶ *The Deſcription.*

THe Crowne Imperial hath for his root a thicke firme and ſolid bulbe, couered with a yellowiſh filme or skinne, from the which riſeth vp a great thicke fat ſtalke two cubits high, in the bare and naked part of a darke ouerworne dusky purple colour. The leaues grow confuſedly about the ſtalke like thoſe of the white Lilly, but narrower: the floures grow at the top of the ſtalke, incompaſſing it round in forme of an Imperiall crowne, (whereof it tooke his name) hanging their

Corona Imperialis. The Crowne Imperiall.

Corona Imperialis duplici corona.
The double Crowne Imperiall.

Corona Imperialis cum ſemine.
Crowne Imperiall with the ſeed.

heads downward as it were bels: in colour it is yellowiſh; or to giue you the true colour, which by words otherwiſe cannot be expreſſed, if you lay ſap berries in ſteepe in faire water for the ſpace of two houres, and mix a little Saffron with that infuſion, and lay it vpon paper, it ſheweth the perfect colour to limne or illumine the floure withall. The backſide of the ſaid floure is ſtreaked with purpliſh lines, which doth greatly ſet forth the beauty thereof. In the bottome of each of theſe bells there is placed ſix drops of moſt cleere ſhining ſweet water, in taſt like ſugar, reſembling in ſhew faire Orient pearles; the which drops if you take away, there do immediately appeare the like: notwithſtanding if they may be ſuffered to ſtand ſtill in the floure according to his owne nature, they wil neuer fall away, no not if you ſtrike the plant vntill it be broken. Amongſt theſe drops there ſtandeth out a certaine peſtell, as alſo ſundry ſmal chiues tipped with ſmall pendants like thoſe of the Lilly: aboue the whole floures there growes a tuft of green leaues like thoſe vpon the ſtalke, but ſmaller. After the floures be faded, there follow cods or ſeed-veſſels ſix ſquare, wherein

is

is contained flat ſeeds, tough and limmer, of the colour of Mace. The whole plant, as well roots as floures, do ſauour or ſmell very like a Fox. As the plant groweth old, ſo doth it wax rich, bringing forth a Crowne of floures amongſt the vppermoſt greene leaues, which ſome make a ſecond kinde, although in truth they are but one and the ſelfe ſame, which in time is thought to grow to a triple crowne, which hapneth by the age of the root, and fertilitie of the ſoile; whoſe figure or tipe I haue thought good to adioyne with that picture alſo which in the time of his infancie it had.

¶ *The Place.*

This plant likewiſe hath been brought from Conſtantinople amongſt other bulbous roots, and made Denizons in our London gardens, whereof I haue great plenty.

¶ *The Time.*

It floureth in Aprill, and ſometimes in March, when as the weather is warme and pleaſant. The ſeed is ripe in Iune.

¶ *The Names.*

This rare & ſtrange Plant is called in Latine, *Corona Imperialis*, and *Lilium Byzantinum*: the Turks doe call it *Cauale lale*, and *Tuſai*. And as diuers haue ſent into theſe parts of theſe roots at ſundry times, ſo haue they likewiſe ſent them by ſundry names; ſome by the name *Tuſai*; others, *Touſai*, and *Tuyſchiachi*, and likewiſe *Turſani* and *Turſanda*. ‡ *Cluſius*, and that not without good reaſon, iudgeth this to be the *Hemerocallis* of *Dioſcorides*, mentioned *lib.* 3. *cap.* 120.

¶ *The Nature and Vertues.*

The vertue of this admirable plant is not yet knowne, neither his faculties or temperature in working.

† If this be the *Hemerocallis* of *Dioſcorides*, you may finde the vertues thereof ſpecified *pag.* 99. of this Worke; where in my iudgement they are not ſo fitly placed as they might haue beene here: yet we at this day haue no knowledge of the phyſicall operation of either of thoſe plants mentioned in that place, or of this treated of in this chapter.

CHAP. 109. *Of Dogs Tooth.*

¶ *The Deſcription.*

1 THere hath not long ſince beene found out a goodly bulbous rooted plant, and termed Satyrion, which was ſuppoſed to be the true Satyrion of *Dioſcorides*, after that it was cheriſhed, and the vertues thereof found out by the ſtudious ſearchers of nature. Little difference hath bin found betwixt that plant of *Dioſcorides* and this *Dens caninus*, except in the colour, which (as you know) doth commonly vary according to the diuerſitie of places where they grow, as it falleth out in Squilla, Onions, and the other kindes of bulbous plants. It hath moſt commonly two leaues, very ſeldome three; which leafe in ſhape is very like to *Allium Vrſinum*, or Ramſons, though farre leſſe. The leaues turne downe to the groundward; the ſtalke is tender and flexible like to *Cyclamen*, or Sow-bread, about an handfull high, bare and without leaues to the root. The proportion of the floure is like that of Saffron or the Lilly floure, full of ſtreames of a purpliſh white colour. The root is bigge, and like vnto a date, with ſome fibres growing from it: vnto the ſaid root is a ſmall flat halfe round bulbe adioyning, like vnto *Gladiolus*, or Corn-flag.

2 The ſecond kinde is farre greater and larger than the firſt, in bulbe, ſtalke, leaues, floure, and cod. It yeeldeth two leaues for the moſt part, which do cloſe one within another, and at the firſt they doe hide the floure (for ſo long as it brings not out his floure) it ſeemes to haue but one leafe like the Tulipa's, and like the Lillies, though ſhorter, and for the moſt part broader; wherefore I haue placed it and his kindes next vnto the Lillies, before the kinds of *Orchis* or ſtones. The leaues which it beareth are ſpotted with many great ſpots of a darke purple colour, and narrow below, but by little and little toward the top wax broad, and after that grow to be ſharpe pointed, in form ſomewhat neere Ramſons, but thicker and more oleous. When the leaues be wide opened the floure ſheweth it ſelfe vpon his long weake naked ſtalke, bowing toward the earth-ward, which floure conſiſteth of ſix very long leaues of a fine delayed purple colour, which with the heat of the Sunne openeth it ſelfe, and bendeth his leaues backe againe after the manner of the Cyclamen floure, within which there are ſix purple chiues, and a white three forked ſtile or peſtell. This floure is of no pleaſant ſmell, but commendable for the beauty: when the floure is faded, there ſucceedeth a three ſquare huske or head, wherein are the ſeeds, which are very like them of *Leucoium bulboſum præcox*; but longer, ſlenderer, and of a yellow colour. The root is long, thicker below than aboue, ſet with many white fibres, waxing very tender in the vpper part, hauing one or more off-ſets, or young ſhoots, from which the ſtalke ariſeth out of the ground (as hath been ſaid) bringing forth two leaues, and not three, or onely one, ſaue when it will not floure.

3 The

3 The third kinde is in all things like the former, ſaue in the leaues, which are narrower, and in the colour of the floure, which is altogether white, or conſiſting of a colour mixt of purple and white. Wherefore ſith there is no other difference, it ſhall ſuffice to haue ſaid thus much for the deſcription.

¶ *The Place.*

Theſe three plants grow plentifully at the foot of certain hills in the greene and moiſt grounds of Germanie and Italy, in Styria not far from Gratz, as alſo in Modena and Bononia in Italy, and likewiſe in ſome of the choice gardens of this countrey.

¶ *The Time.*

They floure in Aprill, and ſometimes ſooner, as in the middle of March.

1 *Dens caninus.*
Dogs tooth.

2 *Dens caninus flore albo anguſtioribus foliis.*
White Dogs tooth.

¶ *The Names.*

This plant is called in Latine, *Dens caninus*; and ſome haue iudged it *Satyrium Erythronium*. *Matthiolus* calls it *Pſeudohermodactylus*. The men of the countrey where it groweth call it **Schoſt-wurtz**: and the Phyſitians about Styria call it *Dentali*. The ſecond may for diſtinctions ſake be termed *Dens caninus flore albo, anguſtioribus foliis*; that is, Dogs tooth with the white floure and narrow leaues.

¶ *The Nature.*

Theſe are of a very hot temperament, windie, and of an excrementitious nature, as may appeare by the vertues.

¶ *The Vertues.*

A The Women that dwell about the place where theſe grew, and do grow, haue with great profit put the dried meale or pouder of it in their childrens pottage, againſt the wormes of the belly.

B Being drunke with Wine it hath been proued maruellouſly to aſſwage the Collicke paſſion.

C It ſtrengthneth and nouriſheth the body in great meaſure, and being drunke with water it cureth children of the falling ſickneſſe.

Chap.

CHAP. 110. *Of Dogs ſtones.*

¶ *The Kindes.*

STones or Teſticles, as *Dioſcorides* ſaith, are of two ſorts, one named *Cynoſorchis*, or Dogs ſtones, the other *Orchis Serapias*, or Serapias his ſtones. But becauſe there be many and ſundry other ſorts differing one from another, I ſee not how they may be contained vnder theſe two kinds onely: therefore I haue thought good to diuide them as followeth. The firſt kind we haue named *Cynoſorchis*, or Dogs ſtones: the ſecond, *Teſticulus Morionis*, or Fooles ſtones: the third, *Tragorchis*, or Goats ſtones: the fourth, *Orchis Serapias*, or Serapia's ſtones: the fifth, *Teſticulus odoratus*, or ſweet ſmelling ſtones, or after *Cordus*, *Teſticulus Pumilio*, or Dwarfe ſtones.

† 1 *Cynoſorchis maior.*
Great Dogs ſtones.

† 2 *Cynoſorchis major altera.*
White Dogs ſtones.

¶ *The Deſcription.*

1 GReat Dogs ſtones hath foure, and ſometimes fiue, great broad thicke leaues, ſomwhat like thoſe of the garden Lilly, but ſmaller. The ſtalke riſeth vp a foot or more in height; at the top whereof doth grow a thicke tuft of carnation or horſe-fleſh coloured floures, thick and cloſe thruſt together, made of many ſmall floures ſpotted with purple ſpots, in ſhape like to an open hood or helmet. And from the hollow place there hangeth forth a certain ragged chiue or taſſell, in ſhape like to the skinne of a Dog, or ſome ſuch other foure footed beaſt. The roots be round like vnto the ſtones of a Dog, or two oliues, one hanging ſomewhat ſhorter than the other, whereof the higheſt or vppermoſt is the ſmaller, but fuller and harder. The lowermoſt is the greateſt, lighteſt, and moſt wrinkled or ſhriueled, not good for any thing.

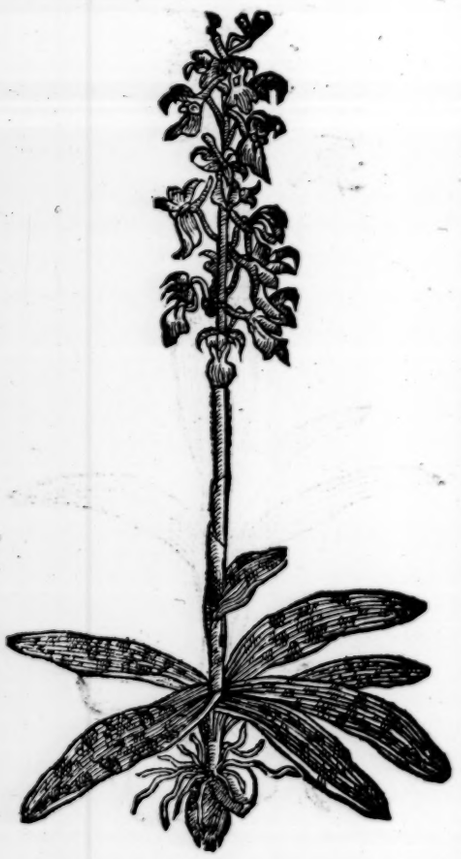
2 Whitiſh Dogs ſtones hath likewiſe ſmooth, long broad leaues, but leſſer and narrower than thoſe of the firſt kinde. The ſtalke is a ſpan long, ſet with fiue or ſix leaues claſping or embracing the ſame round about. His ſpikie floure is ſhort, thicke, buſhy, compact of many ſmall whitiſh purple

purple coloured floures, ſpotted on the inſide with many ſmall purple ſpots and little lines or ſtreakes. The ſmall floures are like an open hood or helmet, hauing hanging out of euery one as it were the body of a little man without a head, with armes ſtretched out, and thighes ſtradling abroad, after the ſame manner almoſt that the little boyes are wont to be pictured hanging out of *Saturnes* mouth. The roots be like the former.

3 Spotted Dogs ſtones bring forth narrow leaues, ribbed in ſome ſort like vnto the leaues of narrow Plaintaine or Rib-wort, daſht with many blacke ſtreakes and ſpots. The ſtalke is a cubit and more high: at the top whereof doth grow a tuft or eare of violet-coloured floures, mixed with a darke purple, but in the hollowneſſe thereof whitiſh, not of the ſame forme or ſhape that the others are of, but leſſer, and as it were reſembling ſomewhat the floures of Larkes-ſpur. The roots be like the former.

4 Mariſh Dogs ſtones haue many thicke blunt leaues next the root, thick ſtreaked with lines or nerues like thoſe of Plantaine. The floure is of a whitiſh red or carnation: the ſtalk and roots be like the former.

† 3 *Cynoſorchis maculata.*
Spotted Dogs ſtones.



4 *Cynoſorchis paluſtris.*
Mariſh Dogs ſtones.

‡ 5 This hath fiue or ſix little leaues; the ſtalke is ſome handfull or better in height, ſet about with ſomewhat leſſe leaues: the tuft of floures at the top of the ſtalke are of a purple colour, ſmall, with a white lip diuided into foure partitions hanging downe, which alſo is lightly ſpotted with purple; it hath a little ſpurre hanging downe on the hinder part of each floure. The ſeed is ſmall, and contained in ſuch twined heads as in other plants of this kinde. The roots are like the former, but much leſſe. ‡

¶ *The Place.*

Theſe kindes of Dogs ſtones do grow in moiſt and fertile medowes. The mariſh Dogs ſtones grow for the moſt part in moiſt and wateriſh woods, and alſo in mariſh grounds. ‡ The 5 growes in many hilly places of Auſtria and Germanie. ‡

¶ *The Time.*

They floure from the beginning of May to the midſt of Auguſt.

¶ *The*

¶ *The Names.*

The firſt and ſecond are of that kinde which *Dioſcorides* calleth *Cynoſorchos*; that is in Engliſh, Dogs ſtones, after the common or vulgar ſpeech; the one the greater, the other the leſſer.

‡ 1 This is *Cynoſorchis prior* of *Dodonæus*; *Cynoſorchis noſtra major* of *Lobel*.

2 *Dodonæus* names this *Cynoſorchis altera*. *Lobel*, *Cynoſorchis majoris ſecunda ſpecies*.

3 This *Lobel* calls *Cynoſorchis Delphinia*, &c. *Tabern. Cynoſorchis maculata*.

4 *Dodonæus* calls this, *Cynoſorchis tertia*: *Lobel*, *Cynoſorchis major altera noſtras*: *Tabernam. Cynoſorchis major quarta*.

5 This is *Cluſius* his *Orchis Pannonica quarta*.

¶ *The Temperature.*

Theſe kindes of Dogs ſtones be of temperature hot and moiſt; but the greater or fuller ſtone ſeemeth to haue much ſuperfluous windineſſe, and therefore being drunke it ſtirreth vp fleſhly luſt.

The ſecond, which is leſſer, is quite contrarie in nature, tending to a hot and dry temperature; therefore his root is ſo far from mouing venerie, that contrariwiſe it ſtaieth and keepeth it backe, as *Galen* teacheth.

He alſo affirmeth, that Serapia's ſtones are of a more dry facultie, and doe not ſo much preuaile to ſtirre vp the luſt of the fleſh.

‡ 5 *Cynoſorchis minor Pannonica.*
The leſſer Auſtrian Dogs ſtones.

¶ *The Vertues.*

Dioſcorides writeth that it is reported, That if men doe eate of the great full or fat roots of theſe kindes of Dogs ſtones, they cauſe them to beget male children; and if women eate of the leſſer dry or barren root which is withered or ſhriueled, they ſhall bring forth females. Theſe are ſome Doctors opinions onely. A

It is further reported, That in Theſſalia the women giue the tender full root to be drunke in Goats milke, to moue bodily luſt, and the dry to reſtraine the ſame. B

¶ *The Choice.*

Our age vſeth all the kindes of ſtones to ſtirre vp venery, and the Apothecaries mix any of them indifferently with compoſitions ſeruing for that purpoſe. But the beſt and moſt effectuall are theſe Dogs ſtones, as moſt haue deemed: yet both the bulbes or ſtones are not to be taken indifferently, but the harder and fuller, and that which containes moſt quantity of iuyce, for that which is wrinkled is leſſe profitable, or not fit at all to be vſed in medicine. And the fuller root is not alwaies the greater, but often the leſſer, eſpecially if the roots be gathered before the plant hath ſhed his floure, or when the ſtalke firſt commeth vp; for that which is fuller of iuyce is not the greateſt before the ſeed be perfectly ripe. For ſeeing that euery other yeare by courſe one ſtone or bulbe waxeth full, the other empty and periſheth, it cannot be that the harder and fuller of iuyce ſhould be alwaies the greater; for at ſuch time as the leaues come forth, the fuller then beginns to encreaſe, and whilſt the ſame by little & little encreaſeth, the other doth decreaſe and wither till the ſeed be ripe: then the whole plant, together with the leaues and ſtalkes doth forthwith fall away and periſh, and that which in the meane time encreaſed, remaineth ſtill freſh and full vnto the next yeare.

† The figures of the firſt and ſecond were tranſpoſed in the former Editiqn: the third was of the *Cynoſorchis moris ma*, following in the next chapter.

CHAP.

Chap. 111. *Of Fooles Stones.*

¶ *The Deſcription.*

1 THe male Foole ſtones hath fiue, ſometimes ſix long broad and ſmooth leaues, not vnlike to thoſe of the Lilly, ſauing that they are daſht and ſpotted in ſundry places with blacke ſpots and ſtreakes. The floures grow at the top, tuft or ſpike faſhion, ſomewhat like the former, but thruſt more thicke together, in ſhape like to a fooles hood, or cocks combe, wide open, or gaping before, and as it were creſted aboue, with certaine eares ſtanding vp by euery ſide, and a ſmall taile or ſpur hanging downe, the backeſide declining to a violet colour, of a pleaſant ſauour or ſmell.

† 1 *Cynoſorchis Morio mas.*
The male Foole ſtones.

2 *Cynoſorchis Morio fœmina.*
The female Foole ſtones.

2 The Female Fooles ſtones haue alſo ſmooth narrow leaues, ribbed with nerues like thoſe of Plantaine. The floures be likewiſe gaping, and like the former, as it were open hoods, with a little horne or heele hanging behinde euerie one of them, and ſmall greene leaues ſorted or mixed among them, reſembling cockes combes, with little eares, not ſtanding ſtraight vp, but lying flat vpon the hooded floure, in ſuch ſort, that they cannot at the ſudden view be perceiued. The roots are a paire of ſmall ſtones like the former. The floures of this ſort doe varie infinitely in colour, according to the ſoile or countrey where they do grow: ſome bring forth their floures of a deepe violet colour, ſome as white as ſnow; ſome of a fleſh colour, and ſome garniſhed with ſpots of diuers colours, which are not poſſible to be diſtinguiſhed.

‡ 3 This hath narrow ſpotted leaues, with a ſtalke ſome foot or more high, at the top whereof groweth a tuft of purple floures in ſhape much like thoſe of the laſt deſcribed, each floure conſiſting of a little hood, two ſmall wings or ſide leaues, and a broad lippe or leafe hanging downe. ‡

¶ *The*

‡ 3 *Cynoſorchis Morio minor.*
The leſſer ſpotted Fooles ſtones.

† The firſt was of *Cynoſorchis maculata*, being the third in the former chapter.

¶ *The Place.*

Theſe kindes of Fooles ſtones do grow naturally to their beſt liking in paſtures and fields that ſeldome or neuer are dunged or manured.

¶ *The Time.*

They floure in May and Iune. Their ſtones are to be gathered for medicine in September, as are thoſe of the Dogs ſtones.

¶ *The Names.*

The firſt is called *Cynoſorchis Morio*: of *Fuchſius*, *Orchis mas anguſtifolia*: of *Apuleius*, *Satyrion*: and alſo it is the *Orchis Delphinia* of *Cornelius Gemma*.

‡ The ſecond is *Cynoſorchis morio fœmina* of *Lobel*: *Orchis anguſtifolia fœmin.* of *Fuchſius*: *Teſticulus Morionis fœmina* of *Dodonæus*.

3 This is *Cynoſorchis minimis & ſecundum caulem, &c. maculoſis foliis*, of *Lobel*. ‡

¶ *The Temperature.*

Fooles ſtones both male and female are hot and moiſt of nature.

¶ *The Vertues.*

Theſe Fooles ſtones are thought to haue the vertues of Dogs ſtones, whereunto they are referred.

CHAP. 112. *Of Goats Stones.*

¶ *The Deſcription.*

1 THe greateſt of the Goats ſtones bringeth forth broad leaues, ribbed in ſome ſort like vnto the broad leaued Plantaine, but larger: the ſtalke groweth to the height of a cubit, ſet with ſuch great leaues euen to the top of the ſtalke by equall diſtances. The tuft or buſh of floures is ſmall and flat open, with many tender ſtrings or laces comming from the middle part of thoſe ſmall floures, crookedly tangling one with another, like to the ſmall tendrels of the Vine, or rather the laces or ſtrings that grow vpon the herbe Sauorie. The whole floure conſiſteth of a purple colour. The roots are like the reſt of the Orchides, but greater.

2 The male Goats ſtones haue leaues like to thoſe of the garden Lilly, with a ſtalke a foot long, wrapped about euen to the tuft of the floure with thoſe his leaues. The floures which grow in this buſh or tuft be very ſmall, in forme like vnto a Lizard, becauſe of the twiſted or writhen tailes, and ſpotted heads. Euery of theſe ſmall floures is at the firſt like a round cloſe huske, of the bigneſſe of a peaſe, which when it openeth there commeth out of it a little long and tender ſpurre or taile, white toward the ſetting of it to the floure; the reſt ſpotted with red daſhes, hauing vpon each ſide a ſmall thing adioyning vnto it, like to a little leg or foot; the reſt of the ſaid taile is twiſted crookedly about, and hangeth downward. The whole plant hath a ranke or ſtinking ſmel or ſauour like the ſmell of a Goat, whereof it tooke his name.

3 The female Goats ſtones haue leaues like the male kinde, ſauing that they be much ſmaller, hauing many floures on the tuft reſembling the flies that feed vpon fleſh, or rather ticks. The ſtones or roots, as alſo the ſmell are like the former.

1 *Tragorchis maximus.*
The greateſt Goat ſtones.

2 *Tragorchis mas.*
The male Goat ſtones.

3 *Tragorchis fœmina.*
The female Goats ſtones.

‡ 4 *Tragorchis minor Bataulca.*
The ſmall Goat ſtones of Holland.

‡ 4 This alſo becauſe of the vnpleaſant ſmell may fitly be referred to this Claſſis. The roots hereof are ſmall, and from them ariſe a ſtalke ſome halfe a foot high, beſet with three or foure narrow leaues: the tuft of floures which groweth on the top of this ſtalke is ſmall, and the colour of them is red without, but ſomewhat paler within; each floure hanging downe a lippe parted in three. ‡

¶ *The Place.*

1. 2. 3. Theſe kindes of Goats ſtones delight to grow in fat clay grounds, and ſeldome in any other ſoile to be found.

‡ 4 This growes vpon the ſea bankes in Holland, and alſo in ſome places neere vnto the Hage. ‡

¶ *The Time.*

They floure in May and Iune with the other kindes of Orchis.

¶ *The Names.*

† 1 Some haue named this kind of Goats ſtones in Greeke, τραγόρχεις: in Latine, *Teſticulus Hircinus*, and alſo *Orchis Saurodes*, or *Scincophora*, by reaſon that the floures reſemble Lizards.

The ſecond may be called *Tragorchis mas*, male Goats ſtones; and *Orchis Saurodes*, or *Scincophora*, as well as the former.

The third, *Tragorchis fœmina*, as alſo *Corioſmites*, and *Coriophora*, for that the floures in ſhape and their vngratefull ſmell reſemble Ticks, called in Greeke κόρις: †

¶ *The Nature and Vertues.*

The temperature and vertues of theſe are referred to the Fooles ſtones, notwithſtanding they are ſeldome or neuer vſed in phyſick, in regard of the ſtinking and loathſome ſmell and ſauor they are poſſeſſed with.

CHAP. 113. *Of Fox Stones.*

1 *Orchis Hermaphroditica.*
Butter-fly Satyrion.

† 2 *Teſticulus pſycodes.*
Gnat Satyrion.

¶ *The Kindes.*

THere be diuers kindes of Fox-ſtones, differing very much in ſhape of their leaues, as alſo in floures: ſome haue floures wherein is to be ſeene the ſhape of ſundry ſorts of liuing creatures; ſome the ſhape and proportion of flies, in other gnats, ſome humble bees, others like vnto honey Bees; ſome like Butter-flies, and others like Waſpes that be dead; ſome yellow of colour, others white; ſome purple mixed with red, others of a browne ouer-worne colour: the which ſeuerally to diſtinguiſh, as well thoſe here ſet downe, as alſo thoſe that offer themſelues dayly to our view and conſideration, would require a particular volume; for there is not any plant which doth offer ſuch varietie vnto vs as theſe kindes of Stones, except the Tulipa's, which go beyond all account: for that the moſt ſingular Simpleſt that euer was in theſe later ages, *Carolus Cluſius* (who for his ſingular induſtrie and knowledge herein is worthy triple honour) hath ſpent at the leaſt fiue and thirty yeares, ſowing the ſeeds of Tulipa's from yeare to yeare, and to this day he could neuer attaine to the end or certaintie of their ſeuerall kindes of colours. The greateſt reaſon whereof that I can yeeld is this; that if you take the ſeeds of a Tulipa that bare white floures, and ſow them in ſome pan or tub with earth, you ſhall receiue from that ſeed plants of infinite colours: contrariwiſe, if you ſow the ſeeds of a plant that beareth floures of variable colours, the moſt of thoſe plants will be nothing like the plant from whence the ſeed was taken. It ſhall be ſufficient therefore to ſet downe moſt of the varieties, and comprehend them in this chapter.

¶ *The Deſcription.*

1 BVtter-fly Orchis, or Satyrion, beareth next the root two very broad leaues like thoſe of the Lilly, ſeldome three: the floures be white of colour, reſembling the ſhape of a Butter-fly: the ſtalke is a foot high; the root is two ſtones like the other kindes of ſtones or Cullions, but ſomewhat ſharper pointed.

‡ 3 *Teſticulus Vulpinus 2. ſphegodes.*
Humble Bee Orchis.

4 *Teſticulus Vulpinus major ſphegodes.*
Waſpe Orchis.

2 Waſpe Satyrion commeth forth of the ground, bearing two, ſomtimes three leaues like the former, but much ſmaller. The ſtalke groweth to the height of an hand, whereon are placed very orderly ſmall floures like in ſhape to Gnats, and of the ſame colour. The root is like the former.

3 The

3 The Humble Bee Orchis hath a few ſmall weake and ſhort leaues, which grow ſcatteringly about the ſtalke: the floures grow at the top among the ſmall leaues, reſembling in ſhape the humble Bee. The root conſiſteth of two ſtones or bulbes, with ſome few threds annexed thereunto.

4 The Waſpe Satyrion groweth out of the ground, hauing ſtalkes ſmall and tender. The leaues are like the former, but ſomewhat greater, declining to a browne or darke colour. The floures be ſmall, of the colour of a dry Oken leafe, in ſhape reſembling the great Bee, called in Engliſh an Hornet or drone Bee. The root is like the other.

5 The leaues of Bee Satyrion are longer than the laſt before mentioned, narrower, turning themſelues againſt the Sun as it were round. The ſtalke is round, tender, and very fragile. At the top grow the floures, reſembling the ſhape of the dead carkaſſe of a Bee. The ſtones or bulbes of the roots be ſmaller and rounder than the laſt deſcribed.

6 The Fly Satyrion is in his leaues like the other, ſauing that they be not of ſo dark a colour: the floures be ſmaller and more plentifully growing about the ſtalke, in ſhape like vnto flies, of a greeniſh colour.

† 5 *Orchis Melittias.*
Bee Orchis.

† 6 *Orchis Myodes.*
Fly Satyrion.

7 Yellow Orchis riſeth out of the ground with browne leaues, ſmaller than the laſt before mentioned: the ſtalk is tender and crooked. The floures grow at the top yellow of colour, in ſhape reſembling the yellow flies bred in the dung of Kine after raine.

8 The ſmall yellow Satyrion hath leaues ſpread vpon the ground, at the firſt comming vp; the ſlender ſtalke riſeth vp in the midſt, of halfe a hand high. The floures grow ſcatteringly toward the top, reſembling the flies laſt before mentioned, darke or ruſty of colour. The ſtones or bulbes are very round.

9 Birds Orchis hath many large ribbed leaues, ſpread vpon the ground like vnto thoſe of Plantaine; among the which riſe vp tender ſtalkes couered euen to the tuft of the floures with the like leaues, but leſſer, in ſuch ſort that the ſtalkes cannot be ſeene for the leaues. The floures grow at the top, not ſo thicke ſet or thruſt together as the others, purple of colour, like in ſhape vnto little Birds, with their wings ſpread abroad ready to fly. The roots be like the former.

10 Spotted Birds Satyrion hath leaues like vnto the former, ſauing that they be daſhed or

ſpotted here and there with darke ſpots or ſtreakes, hauing a ſtalke couered with the like leaues, ſo that the plants differ not in any point, except the blacke ſpots which this kinde is daſht with.

11 White Birds Satyrion hath leaues riſing immediately forth of the ground like vnto the blades or leaues of Leekes, but ſhorter; among the which riſeth vp a ſlender naked ſtalke two handfulls high; on the top whereof be white floures reſembling the ſhape or forme of a ſmall bird ready to fly, or a white Butter-fly with her wings ſpread abroad. The roots are round, and ſmaller than any of the former.

12 Souldiers Satyrion bringeth forth many broad large and ribbed leaues, ſpred vpon the ground like vnto thoſe of the great plantaine: among the which riſeth vp a fat ſtalke full of ſap or iuyce, cloathed or wrapped in the like leaues euen to the tuft of floures, whereupon do grow little floures reſembling a little man hauing a helmet vpon his head, his hands and legges cut off, white vpon the inſide, ſpotted with many purple ſpots, and the backe part of the floure of a deeper colour tending to redneſſe. The roots be greater than any of the other kindes of Satyrions.

† 7 *Orchis Myodes Lutea.*
Yellow Satyrion.

† 9 *Orchis Myodes minor.*
Small yellow Satyrion.

13 Souldiers Cullions hath many leaues ſpread vpon the ground, but leſſer than the ſoldiers Satyrion, as is the whole plant. The backſide of the floures are ſomwhat mixed with whiteneſſe, and ſometimes are aſh coloured: the inſide of the floure is ſpotted with white likewiſe.

14 Spider Satyrion hath many thinne leaues like vnto thoſe of the Lilly, ſcatteringly ſet vpon a weake and feeble ſtalk; whereupon doth grow ſmall floures, reſembling as well in ſhape as colour the body of a dead humble Bee, ‡ or rather of a Spider; and therefore I thinke *Lobel*, who was the Author of this name, would haue ſaid *Arachnitis*, of Ἀράχνης, a Spider. ‡

‡ 15 This by right ſhould haue beene put next the Gnat Satyrion, deſcribed in the ſecond place. It hath ſhort, yet pretty broad leaues, and thoſe commonly three in number, beſides thoſe ſmall ones ſet vpon the ſtemme. The floures are ſmall, and much like thoſe of the ſecond formerly deſcribed.

‡ 16 Our Author gaue you this figure in the fourteenth place, vnder the title of *Orchis Arachnitis*; but it is of the *Orchis* 16. *minor* of *Tabernam.* or *Orchis Anguſtifolia* of *Bauhinus.* This Orchis is of the kinde of the *Myodes*, or Fly Satyrions, but his leaues are farre longer and narrower than

† 9 *Orchis Ornithophora.*
Birds Satyrion.

† 10 *Orchis Ornithophora folio maculoſo.*
Spotted Birds Orchis.

† 11 *Orchis Ornithophora candida.*
White Birds Orchis.

† 12 *Orchis Strateumatica.*
Souldiers Satyrion.

† 13 *Orchis*

than any of the reſt of that kinde, and therein conſiſts the onely and chiefeſt difference. ‡

¶ *The Place.*

Theſe kindes of Orchis grow for the moſt part in moiſt medowes and fertile paſtures, as alſo in moiſt woods.

The Bee, the Fly, and the Butter-fly Satyrions do grow vpon barren chalkie hills and heathie grounds, vpon the hils adioyning to a village in Kent named Green-hithe, vpon long field downes by South-fleet, two miles from the ſame place, and in many other places of Kent: likewiſe in a field adioyning to a ſmall groue of trees, halfe a mile from Saint Albons, at the South end thereof. They grow likewiſe at Hatfield neere S. Albons, by the relation of a learned Preacher there dwelling, M. *Robert Abot*, an excellent and diligent Herbariſt.

† 13 *Orchis Strateumatica minor.*
Souldiers Cullions.

† 14 *Orchis Andrachnitis.*
Spider Satyrion.

That kinde which reſembleth the white Butter-fly groweth vpon the declining of the hill at the North end of Hampſted heath, neere vnto a ſmall cottage there in the way ſide, as yee go from London to Henden a village thereby. It groweth in the fields adioyning to the pound or pinnefold without the gate, at the Village called High-gate, neere London: and likewiſe in the wood belonging to a Worſhipfull Gentleman of Kent named Maſter *Sidley*, of South-fleet; where doe grow likewiſe many other rare and daintie Simples, that are not to be found elſewhere in a great circuit.

¶ *The Time.*

They floure for the moſt part from May to the end of Auguſt, and ſome of them ſooner.

¶ *The Names.*

Theſe kindes of Orchis haue not bin much written of by the Antients, neither by the late writers to any purpoſe, ſo that it may content you for this time to receiue the names ſet down in their

ſeuerall

ſeuerall titles, reſeruing what elſe might be ſaid as touching the Greeke, French, or Dutch names, or any generall definition vntill a further conſideration.

‡ 15 *Orchis trifolia minor.*
Small Gnat Satyrion.

‡ 16 *Orchis anguſtifolia.*
Narrow leaued Satyrion.

¶ *The Nature and Vertues.*

The nature and vertues of theſe kindes of Orchis are referred vnto the others, namely to thoſe of the Fox ſtones; notwithſtanding there is no great vſe of theſe in phyſicke, but they are chiefly regarded for the pleaſant and beautifull floures, wherewith Nature hath ſeemed to play and diſport her ſelfe.

† Theſe Figures in this Chapter were formerly much miſplaced: as thus; The ſecond was of *Orchis Ornith. fol. mascul.* being the tenth. The third was of *Triorchis mas minor* of *Tabern.* being a varietie of *Cynoſorchis mario formina.* The fifth was of *Orchis Ratrachitis.* The ſixth, of *Orchis Melittica.* The ſeuenth and eighth were onely tranſpoſed, or put the one for the other. The ninth was of the ſecond, called formerly *Teſticulus ſphegodes.* The tenth was of the third, called *Teſticulus Vulpinus.* The eleuenth was of *Strateumatica.* The twelfth was of *Strateumatica minor.* The thirteenth was a varietie of the fourth. The fourteenth was of *Orchis Anguſtifolia,* which we here giue you in the ſixteenth place.

CHAP. 114. *Of Sweet Cullions.*

¶ *The Kindes.*

THere be ſundry ſorts of ſweet ſmelling Teſticles or Stones, whereof the firſt is moſt ſweet and pleaſant in ſmell, the others of leſſe ſmell or ſauour, differing in floure and roots. Some haue white floures, others yellow; ſome fleſh coloured; ſome daſht vpon white with a little reddiſh waſh: ſome haue two ſtones, others three, and ſome foure, wherein their difference conſiſteth.

¶ *The Deſcription.*

1 THe firſt kinde of Sweet ſtones is a ſmall baſe and low plant in reſpect of all the reſt: The leaues be ſmall, narrow, and ſhort, growing flat vpon the ground; amongſt the which riſeth vp a ſmall weake and tender ſtalke of a finger long, whereupon doe grow

ſmall

ſmall white floures ſpike faſhion, of a pleaſant ſweet ſmel. The roots are two ſmall ſtones in ſhape like the other.

2 Triple Orchis hath commonly three, yet ſometimes foure bulbes or tuberous roots, ſomewhat long, ſet with many ſmall fibres or ſhort threads; from the which roots riſe immediately many flat and plaine leaues, ribbed with nerues alongſt them like thoſe of Plantaine: among the which come forth naked ſtalkes, ſmall and tender, whereupon are placed certaine ſmall white floures, trace faſhion, not ſo ſweet as the former in ſmell and ſauour. ‡ The top of the ſtalke whereon the floures do grow, is commonly as if it were twiſted or writhen about. ‡

3 Frieſeland Lady traces hath two ſmall round ſtones or bulbes, of the bigneſſe of the peaſe that we call Rouncifalls; from the which riſe vp a few hairy leaues, leſſer than thoſe of the triple ſtones, ribbed as the ſmall leafed Plantaine: among the which commeth forth a ſmall naked ſtalk, ſet round about with little yellow floures, not trace faſhion as the former.

4 Liege Lady traces hath for his roots two greater ſtones, and two ſmaller; from the which come vp two and ſometimes more leaues, furrowed or made hollow in the midſt like to a trough, from the which riſeth vp a ſlender naked ſtalke, ſet with ſuch floures as the laſt deſcribed, ſauing that they be of an ouerworne yellow colour.

1 *Teſticulus odoratus.*
Lady Traces.

2 *Triorchis.*
Triple Lady Traces.

¶ *The Place.*

Theſe kindes of Stones or Cullions do grow in dry paſtures and heaths, and likewiſe vpon chalkie hills, the which I haue found growing plentifully in ſundry places, as in the field by Iſlington, neere London, where there is a bowling place vnder a few old ſhrubby Okes. They grow likewiſe vpon the heath at Barne-elmes, neere vnto the head of a conduit that ſendeth water to the houſe belonging to the late Sir *Francis Walſingham*. They grow in the field next vnto a Village called Thiſtleworth, as you go from Branford to her Maieſties houſe at Richmond; alſo vpon a common Heath by a Village neere London called Stepney, by the relation of a learned merchant of London, named M. *Iames Cole*, exceedingly well experienced in the knowledge of Simples.

The yellow kindes grow in barren paſtures and borders of fields about Ouenden and Clare in Eſſex

Eſſex. Likewiſe neere vnto Muche Dunmow in Eſſex, where they were ſhewed me by a learned Gentleman Maſter *Iames Twaights*, excellently well ſeene in the knowledge of plants.

‡ I receiued ſome roots of the ſecond from my kinde friend M. *Thomas Wallis* of Weſtminſter, the which he gathered at Dartford in Kent, vpon a piece of ground commonly called the Brimth: but I could not long get them to grow in a garden, neither do any of the other Satyrions loue to be pent vp in ſuch ſtraight bounds. ‡

3 *Orchis Friſia lutea.*
Frieſeland Lady-traces.

4 *Orchis Leodienſis.*
Liege Lady-traces.

¶ *The Time.*

Theſe kindes of ſtones do floure from Auguſt to the end of September.

¶ *The Names.*

The firſt is called in Latine *Teſticulus Odoratus:* in Engliſh, Sweet ſmelling Teſticles or ſtones, not of the ſweetneſſe of the roots, but of the floures. It is called alſo *Orchis ſpiralis*, or *Autumnalis*, for that this (as alſo that which is ſet forth in the next place) hath the top of the ſtalke as it were twiſted or twined ſpire faſhion, and for that it commeth to flouring in Autumne: of our Engliſh women they be called Lady-traces; but euery countrey hath a ſeuerall name; for ſome call them Sweet Ballocks, ſweet Cods, ſweet Cullions, and Stander-graſſe. In Dutch, **Knabenkraut**, and **Stondelcraut**: In French, *Satyrion.*

The ſecond ſort is called *Triorchis*, and alſo *Tetrorchis:* in Engliſh, Triple Lady-traces, or white Orchis.

The third is called *Orchis Friſia:* in Engliſh Frieſeland Orchis.

The laſt of theſe kindes of Teſticles or Stones is called of ſome in Latine, *Orchis Leodienſis*, and *Orchis Lutea*, as alſo *Baſilica minor Serapias*, and *Triorchis Æginetæ:* In Engliſh, Yellow Lady-traces.

¶ *The Temperature.*

Theſe kindes of ſweet Cullions are of nature and temperature like the Dogs ſtones, although not vſed in Phyſicke in times paſt; notwithſtanding later Writers haue attributed ſome vertues vnto them as followeth.

¶ *The Vertues.*

The full and ſappy roots of Lady-traces eaten or boyled in milke, and drunke, prouoke venery, A nouriſh and ſtrengthen the body, and be good for ſuch as be fallen into a Conſumption or Feuer Hectique.

Chap.

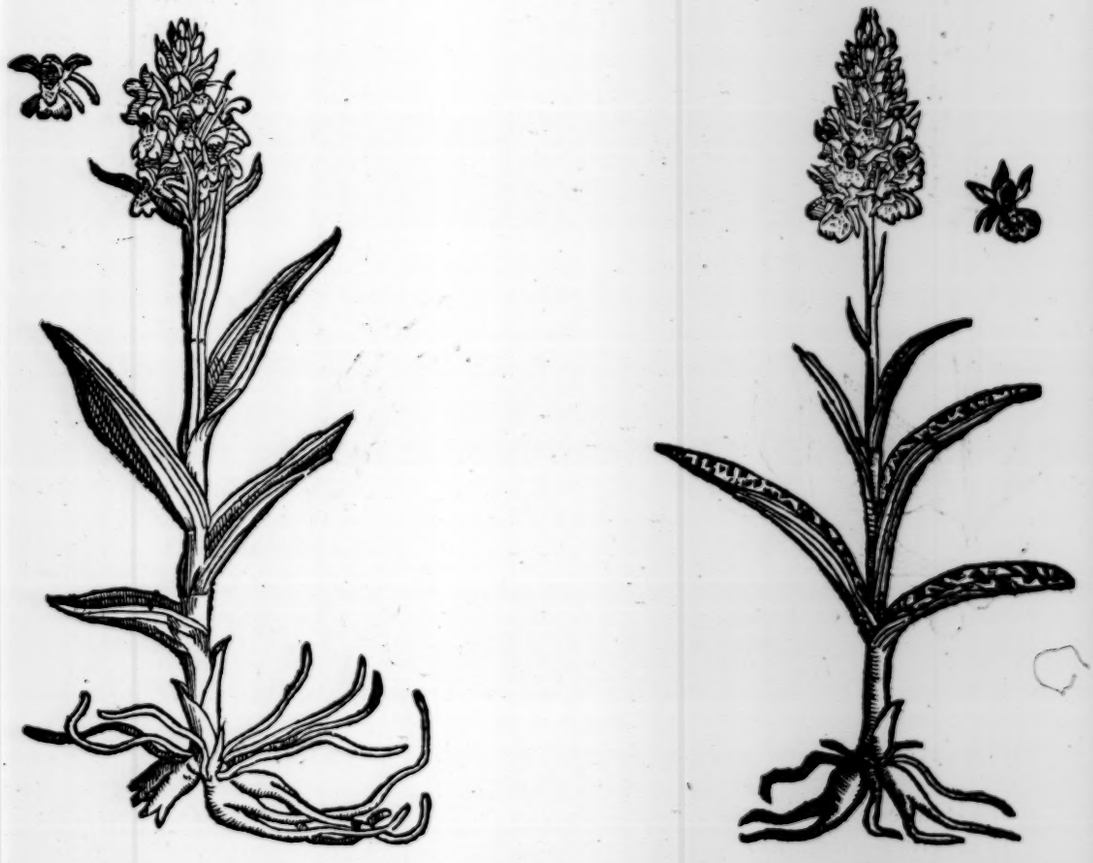
Chap. 115. *Of Satyrion Royall.*

¶ *The Deſcription.*

1 THe male Satyrion royal hath large roots, knobbed, not bulbed as the others, but branched or cut into ſundry ſections like an hand, from the which come vp thick and fat ſtalkes ſet with large leaues like thoſe of Lillies, but leſſe; at the top whereof groweth a tuft of floures, ſpotted with a deepe purple colour.

1 *Palma Chriſti mas.*
The male Satyrion Royall.

2 *Palma Chriſti fœmina.*
The female Satyrion Royall.



2 The female Satyrion hath clouen or forked roots, with ſome fibres ioyned thereto. The leaues be like the former, but ſmaller and narrower, and confuſedly daſhed or ſported with black ſpots: from the which ſpringeth vp a tender ſtalke, at the top whereof doth grow a tuft of purple floures, in faſhion like vnto a Friers hood, changing or varying according to the ſoile and clymat, ſometimes red, ſometimes white, and ſometimes light carnation or fleſh colour.

‡ 3 This in roots and leaues is like the former, but that the leaues want the black ſpots, the ſtalke is but low, and the top thereof hath floures of a whitiſh colour, not ſpotted: they on the foreſide reſemble gaping hoods, with eares on each ſide, and a broad lip hanging down; the backe part ends in a broad obtuſe ſpur. Theſe floures ſmell like Elder bloſſomes. ‡

¶ *The Place.*

The royall Satyrions grow for the moſt part in moiſt and fenny grounds, medowes, and Woods that are very moiſt and ſhadowie. I haue found them in many places, eſpecially in the midſt of a wood in Kent called Swaineſcombe wood neere to Graueſend, by the village Swaineſcombe, and likewiſe in Hampſted wood foure miles from London.

¶ *The Time.*

They foure in May and Iune, but ſeldome later.

¶ *The*

‡ 3 *Orchis Palmata Pannonica* 8. *Cluſ.*
The Auſtrian handed Satyrion.

¶ *The Names.*

† Royal Satyrion, or finger Orchis is called in Latine, *Palma Chriſti*; notwithſtanding there is another herbe or plant called by the ſame name, which otherwiſe is called *Ricinus*. This plant is called likewiſe of ſome, *Satyrium Baſilicum*, or *Satyrium regium*. Some would haue it to be *Buzeiden*, or *Buzidan Arabum*, but *Auicen* ſaith *Buzeiden* is a woody Indian medicine: and *Serapio* ſaith, *Buzeiden* be hard white roots like thoſe of *Behen album*, and that it is an Indian drug: but contrariwiſe the roots of *Palma Chriſti* are nothing leſſe than woody, ſo that it cannot be the ſame. *Matthiolus* would haue Satyrion royall to be the *Digiti Citrini* of *Auicen*; finding fault with the Monkes which ſet forth Commentaries vpon *Meſues* Compoſitions, for doubting and leauing it to the iudgement of the diſcreet Reader. Yet do we better allow of the Monkes doubt, than of *Matthiolus* his aſſertion. For *Auicens* words be theſe; What is *Aſabaſafra*, or *Digiti Citrini*? and anſwering the doubt himſelfe, he ſaith, It is in figure or ſhape like the palme of a mans hand, of a mixt colour betweene yellow and white, and it is hard, in which there is a little ſweetneſſe, and there is a Citrine ſort duſty and without ſweetneſſe. *Rhaſis* alſo in the laſt booke of his Continent calls theſe, *Digiti Crocei*, or Saffron fingers; and he ſaith it is a gumme or veine for Dyars. Now theſe roots are nothing leſſe than of a Saffron colour, and wholly vnfit for Dying. Wherefore without doubt theſe words of *Auicen* and *Rhaſis*, in the eares of men of iudgment do confirme, That Satyrion Royall, or *Palma Chriſti*, are not thoſe *Digiti Citrini*. The Germans call it **Creutſblum**: the low Dutch, **Handekens crupt**: the French, *Satyrion royal*.

¶ *The Temperature and Vertues.*

The Roots of Satyrion royall are like to *Cynoſorchis* or Dogs ſtones, both in ſauour and taſte, and therefore are thought by ſome to be of like faculties. Yet *Nicolaus Nicolus*, in the chapter of the cure of a Quartaine Ague, ſaith, That the roots of *Palma Chriſti* are of force to purge vpward and downward; and that a piece of the root as long as ones thumbe ſtamped and giuen with wine before the fit commeth, is a good remedie againſt old Quartaines after purgation: and reporteth, That one *Baliolus*, after he had endured 44 fits, was cured therewith.

† This facultie of purging and vomiting, which our Author out of *Dodonæus*, and he out of *Nicolus*, giue to the root of *Palma Chriſti*, I doubt is miſtaken and put in the wrong place: for I iudge it to belong to the *Ricinus*, which alſo is called *Palma Chriſti*; for that *Nicolus* ſaith, a piece of root muſt be taken as long as ones thumbe; now the whole root of this plant is not ſo long. And beſides, *Ricinus* is knowne to haue a vomitorie or purging facultie.

CHAP. 116. *Of Serapia's Stones.*

¶ *The Kindes.*

THere be ſundry ſorts of Serapias ſtones, whereof ſome be male, others female; ſome great, and ſome of a ſmaller kinde; varying likewiſe in colour of the floures, whereof ſome be white, others purple; altering according to the ſoile or clymate, as the greateſt part of bulbous roots do. Moreouer, ſome grow in marſhie and fenny grounds, and ſome in fertile paſtures, lying open to the Sun, varying likewiſe in the ſhape of their floures; retaining the forme of flies, Butter-flies, and Gnats, like thoſe of the Fox ſtones.

1 *Serapias Candido flore.*
White handed Orchis.

2 *Serapias minor, nitente flore.*
Red handed Orchis.

3 *Serapias paluſtris latifolia.*
Mariſh Satyrion.

4 *Serapias paluſtris leptophylla.*
Fenny Satyrion.

† 5 *Serapias Montana.*
Mountaine Satyrion.

7 Serapias Caſtrata.
Gelded Satyrion.

† 6 *Serapias Gariophyllat a cum rad. & ſem.*
Sweet-ſmelling Satyrion, with the root and ſeed expreſt at large.

¶ *The Deſcription.*

1 THe white handed Orchis or Satyrion hath long and large leaues, ſpotted and daſhed with blacke ſpots, from the which doth riſe vp a ſmall fragile or brittle ſtalke of two hands high, hauing at the top a buſh or ſpoky tuft of white floures, like in ſhape to thoſe of *Palma Chriſti*, whereof this is a kinde. The root is thicke, fat, and full of iuyce, faſhioned like the hand and fingers of a man, with ſome tough and fat ſtrings faſtned to the vpper part thereof.

2 Red handed Satyrion is a ſmall low and baſe herbe, hauing a ſmall tender ſtalke ſet with two or three ſmall leaues, like vnto thoſe of the Leeke, but ſhorter. The floure groweth at the top tuft faſhion, of a gliſtering red colour, with a root faſhioned like an hand, but leſſer than the former.

3 Serapia's ſtones, or mariſh Satyrion hath a thicke knobby root, diuided into fingers like thoſe of *Palma Chriſti*, whereof it is a kinde: from which riſe thicke fat and ſpongeous ſtalkes, ſet with broad leaues like thoſe of Plantaine, but much longer, euen to the top of the tuft of floures; but the higher they riſe toward the top the ſmaller they are. The floure conſiſteth of many ſmall hooded floures ſomewhat whitiſh, ſpotted within with deepe purple ſpots; the backſide of theſe little floures are Violet mixed with purple.

† 8 *Serapias Batrachites.*
Frog Satyrion.

‡ 9 *Serapias Batrachites altera.*
The other Frog Satyrion.

4 Fenny Satyrion (or Serapia's ſtones) differeth little from the former, ſauing that the leaues are ſmaller, and ſomewhat ſpotted, and the tuft of floures hath not ſo many greene leaues, nor ſo long, mixed with the floures, neither are they altogether of ſo darke or purpliſh a colour as the former. The roots are like thoſe of the laſt deſcribed.

5 Mountaine Orchis or Satyrion hath thicke fat and knobby roots, the one of them for the moſt part being handed, and the other long. It growes like the former in ſtalkes, leaues, and floures, but is ſomewhat bigger, with the leaues ſmoother, and more ſhining.

6 Cloue Satyrion, or ſweet ſmelling Orchis, hath flat and thicke roots diuided into fingers like

like thoſe of *Palma Chriſti*, ſauing that the fingers are longer, ſmaller, and more in number; from the which riſe vp long and narrow leaues like thoſe of Narciſſus or Daffodill: among which commeth forth a ſmall tender ſtalke, at the top whereof groweth a purple tuft compact of many ſmall floures reſembling Flies, but in ſauour and ſmell like the Cloue, or Cloue Gillo-floure; but farre ſweeter and pleaſanter, as my ſelfe with many others can witneſſe now liuing, that haue both ſeene and ſmelt them in my garden. ‡ After the floure is paſt, come many ſeed veſſels filled with a ſmall ſeed, and growing after the manner as you ſee them here at large expreſſed in a figure, together with the root alſo ſet forth at full. ‡

7 Gelded Satyrion hath leaues with nerues and ſinewes like to thoſe of Daffodill, ſet vpon a weake and tender ſtalke, with floures at the top white of colour, ſpotted within the floure, and in ſhape they are like Gnats and little Flies. The ſtalke is gelded as it were, or the ſtones and hands cut off, leauing for the root two long legges or fingers, with many ſtrings faſtned vnto the top.

8 Frog Satyrion hath ſmall flat leaues ſet vpon a ſlender weake ſtem; at the top whereof growes a tuft of floures compact of ſundry ſmall floures, which in ſhape do reſemble little frogges, whereof it tooke his name. The root is likewiſe gelded, onely reſerued two ſmall miſhapen lumps with certaine fibres annexed thereto.

‡ 9 This alſo may fitly be added to the laſt deſcribed, the root ſhewing it to be of a kinde betweene the Serapia's and Orchis. It groweth to the height of the former, with ſhort leaues engirting the ſtalke at their ſetting on. The floures on the top reſemble a Frogge, with their long leaues; and if you looke vpon them in another poſture, they will ſomewhat reſemble little Flies: wherefore *Lobel* calls it as well *Myoides*, as *Batrachites*. ‡

¶ *The Time.*

Theſe Plants flouriſh in the moneth of May and Iune, but ſeldome after, except ſome degenerate kinde, or that it hath had ſome impediment in the time when it ſhould haue floured, as often hapneth.

¶ *The Names.*

We haue called theſe kindes, Serapia's ſtones, or Serapiades, eſpecially for that ſundry of them do bring forth floures reſembling Flies and ſuch like fruitfull and laſciuious inſects, as taking their name from *Serapis* the god of the citiſens of Alexandria in Ægypt, who had a moſt famous Temple at Canopus, where he was worſhipped with all kinde of laſciuious wantonneſſe, ſongs, and dances, as we may reade in *Strabo*, in his ſeuenteenth Booke. *Apuleius* confounds the Orchides and Serapiades, vnder the name of both the Satyrions; and withall ſaith it is called *Entaticos*, *Panion*, and of the Latines, *Teſticulus Leporinus*. In Engliſh we may call them Satyrions, and finger Orchis, and Hares ſtones.

¶ *The Nature and Vertues.*

Serapia's ſtones are thought to be in nature, temperature, and Vertues, like vnto the Satyrion Royall; and although not ſo much vſed in phyſicke, yet doubtleſſe they worke the effect of the other Stones.

† The fifth was the figure of *Satyrium trifolium* of Tabern. and is a kinde of *Teſticulus pſicodes*. 6 In this place formerly was the figure of the laſt before, to wit *Serapias montana*. 8 Here was the figure of *Orchis Myodes*, which ſhould haue beene in the ſixth place in the 101 Chapter of the former Edition, being the 113 of this.

CHAP. 117.

Of Fenny Stones.

¶ *The Deſcription.*

† 1 THis hath cleft or diuided roots like fingers, much like vnto the Roots of other *Palma Chriſti's*; whereof this is a kinde: from the which riſeth vp a ſtalke of a foot high, ſet here and there with very faire Lilly-like leaues, of colour red, the which do clip or embrace the ſtalkes almoſt round about, like the leaues of Thorow-wax. At the

top of the ſtalke groweth a faire buſh of very red floures, among the which floures do grow many ſmall ſharpe pointed leaues. The ſeed I could neuer obſerue, being a thing like duſt that flieth in the winde.

2 The other Mariſh handed Satyrion differeth little from the precedent, but in the leaues and floures, for that the leaues are ſmaller and narrower, and the floures are faire white, gaping wide open; in the hollowneſſe whereof appeare certaine things obſcurely hidden, reſembling little helmets, which ſetteth forth the difference.

† 1 *Serapias Dracontias paluſtris.*
Mariſh Dragon Satyrion.

† 2 *Serapias paluſtris leptophylla altera.*
The other Mariſh handed Satyrion.

3 This third handed Satyrion hath roots faſhioned like an hand, with ſome ſtrings faſtned to the vpper part of them; from which riſeth vp a faire ſtiffe ſtalke armed with large leaues, very notably daſht with blackiſh ſpots, clipping or embracing the ſtalke round about: at the top of the ſtalke ſtandeth a faire tuft of purple floures, with many greene leaues mingled amongſt the ſame, which maketh the buſh or tuft much greater. The ſeed is nothing elſe but as it were duſt like the other of his kinde: ‡ and it is contained in ſuch twined veſſels as you ſee expreſt apart by the ſide of the figure; which veſſels are not peculiar to this, but common to moſt part of the other Satyrions. ‡

4 The creeping rooted Orchis or Satyrion without teſticles, hath many long roots diſperſing themſelues, or creeping far abroad in the ground, contrarie to all the reſt of the Orchides: which Roots are of the bigneſſe of ſtrawes, in ſubſtance like thoſe of Sopewort; from the which immediately doth riſe foure or fiue broad ſmooth leaues like vnto the ſmall Plantaine, from the which ſhooteth vp a ſmall and tender ſtalke, at the top whereof groweth a pleaſant ſpikie eare of a whitiſh colour, ſpotted on the inſide with little ſpeckes of a bloudie colour. The ſeed alſo is very ſmall.

‡ 5 This from handed roots like others of this kinde ſends vp a large ſtalke, ſometimes attaining to the height of two cubits; the leaues are much like to thoſe of the mariſh Satyrions; the floures are of an elegant purple, with little hoods like the top of an helmet (whence *Gemma* termed

3 *Palma Chriſti paluſtris.*
The third handed mariſh Satyrion.

4 *Palma Chriſti, radice repente.*
Creeping Satyrion.

‡ 5 *Palma Chriſti maxima.*
The greateſt handed Satyrion.

termed the plant, *Cynoſorch. conopſea*; and from the height he called it *Macrocaulos.*) Theſe floures ſmel ſweet, and are ſucceeded by ſeeds like thoſe of the reſt of this kindred.

It delights to grow in grounds of an indifferent temper, not too moiſt nor too dry. It floures from mid-May to mid-Iune. ‡

The Place.

They grow in mariſh and fenny grounds, and in ſhadowie woods that are very moiſt.

The fourth was found by a learned Preacher called Maſter *Robert Abbot*, of Biſhops Hatfield, in a boggy groue where a Conduit head doth ſtand, that ſendeth water to the Queenes houſe in the ſame towne.

‡ It growes alſo plentifully in Hampſhire, within a mile of a market Towne called Peters-field, in a moiſt medow named Wood-mead, neere the path leading from Peters-field, towards Beryton. ‡

¶ *The Time.*

They floure and flouriſh about May and Iune.

‡ ¶ *The Names.*

‡ 1 This is *Cynoſorchis Dracuntias* of *Lobell* and *Gemma.*

2 This

2 This is *Cynoſorchis paluſtris altera Leptaphylla*, of *Lobell*; *Teſticulus Galericulatus*, of *Tabernamontanus*.
3 *Lobell* and *Gemma* terme this, *Cynoſorchis paluſtris altera Lophodes, vel nephelodes*.
4 This is *Orchis minor radice repente*, of *Camerarius*.
5 This by *Lobell* and *Gemma* is called *Cynoſorchis macrocaulos, ſiue Conopſea*.

¶ *The Temperature and Vertues.*

There is little vſe of theſe in phyſicke; onely they are referred vnto the handed Satyrions, whereof they are kindes: notwitſtanding *Daleſcampius* hath written in his great Volume, that the Mariſh Orchis is of greater force than any of the Dogs ſtones in procuring of luſt.

Camerarius of Noremberg, who was the firſt that deſcribed this kinde of creeping Orchis, hath ſet it forth with a bare deſcription onely; and I am likewiſe conſtrained to do the like, becauſe as yet I haue had no triall thereof.

† The firſt of theſe was the third in the former Chapter; in lieu whereof I giue you the *Dracontius* of *Lobel*, whoſe figure was here in the ſecond place.

Chap. 118. *Of Birds neſt.*

1 *Satyrium abortinum, ſiue Nidus auis.* Birds neſt.

¶ *The Deſcription.*

1 Birds Neſt hath many tangling roots platted or croſſed one ouer another very intricately, which reſembleth a Crowes neſt made of ſtickes; from which riſeth vp a thicke ſoft groſſe ſtalk of a browne colour, ſet with ſmall ſhort leaues of the colour of a dry Oken leafe that hath lien vnder the tree all the winter long. On the top of the ſtalke groweth a ſpikie eare or tuft of floures, in ſhape like vnto Maimed Satyrion, whereof doubtleſſe it is a kinde. The whole plant, as well ſticks, leaues, and floures, are of a parched browne colour.

‡ I receiued out of Hampſhire from my often remembred friend Maſter *Goodyer* this following deſcription of a *Nidus auis* found by him the twenty ninth of Iune, 1621.

¶ *Nidus auis flore & caule violaceo purpureo colore; an Pſeudoleimodoron Cluſ. Hiſt. Rar. plant. pag.* 270.

This riſeth vp with a ſtalke about nine inches high, with a few ſmal narrow ſharpe pointed ſhort skinny leaues, ſet without order, very little or nothing at all wrapping or incloſing the ſtalke; hauing a ſpike of floures like thoſe of *Orobanche*, without tailes or leaues growing amongſt them: which fallen, there ſucceed ſmall ſeed-veſſels. The lower part of the ſtalke within the ground is not round like *Orobanche*, but ſlender or long, and of a yellowiſh white colour, with many ſmall brittle roots growing vnderneath confuſedly, wrapt or folded together like thoſe of the common *Nidus auis*. The whole plant as it appeareth aboue ground, both ſtalkes, leaues, and floures, is of a violet or deepe purple colour. This I found wilde in the border of a field called Marborne, neere Habridge in Haliborne, a mile from a towne called Alton in Hampſhire, being the land of one *William Balden*. In this place alſo groweth wilde the thiſtle called *Corona fratrum*. *Ioh. Goodyer.*

¶ *The Place.*

This baſtard or vnkindely Satyrion is very ſeldome ſeene in theſe Southerly parts of England.

It

It is reported, That it groweth in the North parts of England, neere vnto a village called Knaesborough. I found it growing in the middle of a Wood in Kent two miles from Graueſend, neere vnto a worſhipfull Gentlemans houſe called Maſter *William Swan*, of Howcke Greene. The wood belongeth to one Maſter *Iohn Sidley*: which plant I did neuer ſee elſewhere; and becauſe it is very rare, I am the more willing to giue you all the markes in the wood for the better finding it, becauſe it doth grow but in one piece of the Wood: that is to ſay, The ground is couered all ouer in the ſame place neere about it with the herbe Sanycle, and alſo with the kinde of Orchis called *Hermaphroditica*, or Butter-fly Satyrion.

¶ *The Time.*

It floureth and flouriſheth in Iune and Auguſt. The duſty or mealy ſeed (if it may be called ſeed) falleth in the end of Auguſt; but in my iudgement it is an vnprofitable or barren duſt, and not any ſeed at all.

¶ *The Names.*

It is called *Satyrium abortirum*: of ſome, *Nidus auis*: in French *Nid d' oiſeau*: in Engliſh, Birds neſt, or Gooſe-neſt: in Low-Dutch, **Vogels neſt:** in High-Dutch, **Wargen Dzehen.**

¶ *The Temperature and Vertues.*

It is not vſed in Phyſicke that I can finde in any authoritie either of the antient or later Writers, but is eſteemed as a degenerate kinde of Orchis, and therefore not vſed.

THE SECOND BOOKE OF THE HISTORIE OF PLANTS:

Containing the deſcription, place, time, names, nature, and vertues of all ſorts of Herbes for meate, medicine, or ſweet ſmelling vſe, &c.

WE haue in our firſt booke ſufficiently deſcribed the Graſſes, Ruſhes, Flags, Corne, and bulbous rooted Plants, which for the moſt part are ſuch as with their braue and gallant floures decke and beautifie Gardens, and feed rather the eyes than the belly. Now there remaine certaine other bulbes, whereof the moſt (though not all) ſerue for food: of which we will alſo diſcourſe in the firſt place in this booke, diuiding them in ſuch ſort, that thoſe of one kinde ſhall be ſeparated from another. ‡ In handling theſe and ſuch as next ſucceed them, we ſhall treat of diuers, yea the moſt part of thoſe Herbes that the Greekes call by a generall name λάχανα: and the Latines, *Olera*: and we in Engliſh, Sallet-herbes. When we haue paſt ouer theſe, we ſhall ſpeake of other plants, as they ſhall haue reſemblance each to other in their externall forme. ‡

CHAP. 1. *Of Turneps.*

¶ *The Kindes.*

THere be ſundry ſorts of Turneps; ſome wilde; ſome of the garden; ſome with round roots globe faſhion; other ouall or peare faſhion; and another ſort longiſh or ſomwhat like a Radiſh: and of all theſe there are ſundry varieties, ſome being great, and ſome of a ſmaller ſort.

¶ *The Deſcription.*

1 THe Turnep hath long rough and greene leaues, cut or ſnipt about the edges with deepe gaſhes. The ſtalke diuideth it ſelfe into ſundry branches or armes, bearing at the top ſmall floures of a yellow colour, and ſometimes of a light purple: which being paſt, there do ſucceed long cods full of ſmall blackiſh ſeed like rape ſeed. The root is round like a bowle, and ſometimes a little ſtretched out in length, growing very ſhallow in the ground, and often ſhewing it ſelfe aboue the face of the earth.

‡ 2 This is like the precedent in each reſpect, but that the root is not made ſo globous or bowle-faſhioned as the former, but ſlenderer, and much longer, as you may perceiue by the figure wee here giue you. ‡

3 The ſmall Turnep is like vnto the firſt deſcribed, ſauing that it is leſſer. The root is much ſweeter in taſte, as my ſelfe hath often proued.

4 There is another ſort of ſmall Turnep ſaid to haue red roots; ‡ and there are other-ſome whoſe roots are yellow both within and without; ſome alſo are greene on the outſide, and other-ſome blackiſh. ‡

¶ *The Place.*

The Turnep proſpereth wel in a light, looſe, and fat earth; and ſo looſe, as *Petrus Crescentius* ſaith, that

that it may be turned almoſt into duſt. It groweth in fields and diuers vineyards or Hop gardens in moſt places of England.

The ſmall Turnep groweth by Hackney, in a ſandy ground; and thoſe that are brought to Cheape-ſide market from that Village are the beſt that euer I taſted.

¶ *The Time.*

Turneps are ſowne in the ſpring, as alſo in the end of Auguſt. They floure and ſeed the ſecond yeare after they are ſowen: for thoſe which floure the ſame yeare that they are ſowen are a degenerate kinde, called in Cheſhire about the Namptwitch, Mad neeps, of their euill qualitie in cauſing frenſie and giddineſſe of the braine for a ſeaſon.

1 *Rapum majus.*
Great Turnep.

‡ 2 *Rapum radice oblonga.*
Longiſh rooted Turnep.

¶ *The Names.*

The Turnep is called in Latine, *Rapum*: in Greeke, ῥάφυς: the name commonly vſed in ſhops and euery where is *Rapa*. The Lacedemonians call it βάσις: the Boetians, ζευγίτης, as *Athenæus* reporteth: in high Dutch, **Ruben**: in low Dutch, **Rapen**: in French, *Naueau rond*: in Spaniſh, *Nabo*: in Engliſh, Turnep, and Rape.

¶ *The Temperature and Vertues.*

A The bulbous or knobbed root, which is properly called *Rapum* or Turnep, and hath giuen the name to the plant, is many times eaten raw, eſpecially of the poore people in Wales, but moſt commonly boiled. The raw root is windy, and engendreth groſſe and cold bloud; the boyled doth coole leſſe, and ſo little, that it cannot be perceiued to coole at all, yet it is moiſt and windy.

B It auaileth not a little after what manner it is prepared; for being boyled in water, or in a certaine broth, it is more moiſt, and ſooner deſcendeth, and maketh the body more ſoluble; but being roſted or baked it drieth, and ingendreth leſſe winde, and yet it is not altogether without winde. But howſoeuer they be dreſſed, they yeeld more plenty of nouriſhment than thoſe that are eaten raw: they do increaſe milke in womens breſts, and naturall ſeed, and prouoke vrine.

C The decoction of Turneps is good againſt the cough and hoarſeneſſe of the voice, being drunke in the euening with a little ſugar, or a quantitie of clarified honey.

D *Dioſcorides* writeth, That the Turnep it ſelfe being ſtamped, is with good ſucceſſe applied vpon mouldie

mouldie or kibed heeles, and that alſo oile of roſes boiled in a hollow turnep vnder the hot embers doth cure the ſame.

The young and tender ſhootes or ſprings of Turneps at their firſt comming forth of the ground, boiled and eaten as a ſallade, prouoke vrine. E

The ſeed is mixed with counterpoiſons and treacles: and being drunke it is a remedie againſt poiſons. F

They of the lowe countries doe giue the oile which is preſſed out of the ſeed, againſt the after throwes of women newly brought to bed, and alſo miniſter it to young children againſt the wormes, which it both killeth and driueth forth. G

The oile waſhed with water doth allaie the feruent heat and ruggedneſſe of the skin. H

CHAP. 2. *Of wilde Turneps.*

¶ *The Kindes.*

THere be three ſorts of wilde Turneps; one our common Rape which beareth the ſeed whereof is made rape oile, and feedeth ſinging birds: the other the common enemy to corne, which call Charlock; whereof there be two kindes, one with a yellow, or els purple floure, the other with a white floure: there is alſo another of the water and mariſh grounds.

1 *Rapum ſylueſtre.*
Wilde Turneps.

2 *Rapiſtrum aruorum.*
Charlocke or Chadlocke.

¶ *The Deſcription.*

1 WIlde Turneps or Rapes, haue long, broad, and rough leaues like thoſe of Turneps, but not ſo deeply gaſhed in the edges. The ſtalkes are ſlender and brittle, ſomewhat hairie, of two cubits high, diuiding themſelues at the top into many armes or branches, whereon doe grow little yellowiſh flowers: which being paſt, there doe ſucceed ſmall long cods which containe the ſeed like that of the Turnep, but ſmaller, ſomewhat reddiſh, and of a firie hot

and biting taſte as is the muſtard, but bitterer. The root is ſmall, and periſheth when the ſeed is ripe.

2 Charlocke, or the wilde rape, hath leaues like vnto the former, but leſſer, the ſtalke and leaues being alſo rough. The ſtalkes bee of a cubite high, ſlender, and branched; the floures are ſometimes purpliſh, but more often yellow. The rootes are ſlender, with certaine threds or ſtrings hanging on them.

‡ There is alſo another varietie hereof with the leaues leſſe diuided, and much ſmoother than the two laſt deſcribed, hauing yellow floures and cods not ſo deeply joynted as the laſt deſcribed: this is that, which is ſet forth by *Matthiolus* vnder the name of *Lampſana*.

3 Water Chadlock groweth vp to the height of three foot or ſomewhat more, with branches ſlender and ſmooth in reſpect of any of the reſt of his kinde, ſet with rough ribbed leaues, deeply indented about the lower part of the leafe. The floures grow at the top of the branches, vmble or tuft faſhion, ſometimes of one colour, and ſometimes of another. ‡ The root is long, tough, and full of ſtrings, creeping and putting forth many ſtalkes: the ſeed veſſells are ſhort and ſmall. *Bauhine* hath this vnder the title of *Raphanus aquaticus alter*. ‡

2 *Rapiſtrum aruenſe alterum.*
Another wilde Charlocke.

3 *Rapiſtrum aquaticum.*
Water Chadlocke.

¶ *The Place.*

Wilde Turneps or Rapes, doe grow of themſelues in fallow fields, and likewiſe by high wayes neere vnto old walls, vpon ditch-bankes, and neere vnto townes and villages, and in other vntoiled and rough places.

The Chadlocke groweth for the moſt part among corne in barraine grounds, and often by the borders of fields and ſuch like places.

Water Chadlocke groweth in moiſt medowes and mariſh grounds, as alſo in water ditches, and ſuch like places.

¶ *The Time.*

Theſe doe floure from March, till Summer be farre ſpent, and in the meane ſeaſon the ſeed is ripe.

¶ *The*

¶ *The Names.*

Wilde Turnep is called in Latine *Rapiſtrum*, *Rapum ſylueſtre*, and of ſome, *Sinapi ſyluestre*, or wild muſtard: in high Dutch, **Hedertich:** in low Dutch, **Herick:** in French, *Velar*: in Engliſh, Rape, and Rape ſeed. *Rapiſtrum aruorum* is called Charlock, and Carlock.

¶ *The Temperature.*

The ſeed of theſe wild kindes of Turneps as alſo the water Chadlock, are hot and drie as muſtard ſeed is. Some haue thought that Carlock hath a drying and clenſing qualitie, and ſomewhat digeſting.

¶ *The Vertues.*

Diuers vſe the ſeed of Rape in ſteed of muſtard ſeed, who either make hereof a ſauce bearing A
the name of muſtard, or elſe mixe it with muſtard ſeed: but this kinde of ſauce is not ſo pleaſant to the taſte, becauſe it is bitter.

Galen writeth that theſe being eaten engender euill blood: yet *Dioſcorides* ſaith, they warme the B
ſtomacke and nouriſh ſomewhat.

CHAP. 3. *Of Nauewes.*

¶ *The Kindes.*

THere be ſundrie kindes of Nape or Nauewes degenerating from the kindes of Turneps, of which ſome are of the garden, and other wilde, or of the field.

¶ *The Deſcription.*

1 NAuew gentle is like vnto Turneps in ſtalkes, floures, and ſeed, as alſo in the ſhape of the leaues, but thoſe of the Nauew are much ſmoother; it alſo differeth in the root: the Turnep is round like a globe, the Nauew root is ſomewhat ſtretched forth in length.

† 1 *Bunias.*
Nauew Gentle.

† 2 *Bunias ſylueſtris L'Obelij.*
Wilde Nauew.

2 The ſmall or wilde Nauew is like vnto the former, ſauing that it is altogether leſſer. The root is ſmall, ſomewhat long, with threads long and tough at the end thereof.

¶ *The Place.*

Nauew-gentle requireth a looſe and yellow mould euen as doth the Turnep, and proſpereth in a fruitfull ſoile: he is ſowen in France, Bauaria, and other places in the fields for the ſeeds ſake, as is likewiſe that wild Colewort called of the old writers *Crambe*: for the plentifull increaſe of the ſeeds bringeth no ſmall gaine to the husbandmen of that countrey, becauſe that being preſſed they yeeld an oile which is vſed not onely in lampes, but alſo in the making of ſope; for of this oile and a lie made of certaine aſhes, is boiled a ſope which is vſed in the Lowe-countries euery where to ſcoure and waſh linnen clothes. I haue heard it reported that it is at this day ſowen in England for the ſame purpoſe.

The wilde Nauew groweth vpon ditch bankes neere vnto villages and good townes, as alſo vpon freſh marſhie bankes in moſt places.

¶ *The Time.*

The Nauew is ſowen, floureth and ſeedeth at the ſame time that the Turnep doth.

¶ *The Names.*

The Nauew is called in Latine *Napus*, and alſo *Bunias*: in Greeke Βουνιας: the Germaines call it **Steckruben**: the Brabanders, **Steckropen**: in Spaniſh, *Naps*: in Italian, *Nauo*: the Frenchmen, *Naueau*: in Engliſh, Nauew-gentle, or French Naueau. The other is called *Napus ſylueſtris*, or wild Nauew.

¶ *The Temperature and Vertues.*

The Nauew and the Turnep are all one in temperature and vertues, yet ſome ſuppoſe that the Nauew is a little drier, and not ſo ſoone concocted, nor paſſeth downe ſo eaſily, and doth withall ingender leſſe winde. In the reſt it is anſwerable to the Turnep.

A ‡ The ſeeds of theſe taken in drinke or broth are good againſt poyſon, and are vſually put into Antidotes for the ſame purpoſe. ‡.

† The figure that was in the firſt place is a kinde of the long Turnep deſcribed by me in the ſecond place of the firſt chapter of this ſecond booke. And that in the ſecond place was a leſſer kinde of the ſame.

Chap. 4. *Of Lyons Turnep, or Lyons leafe.*

Leontopetalon.
Lyons leafe.

¶ *The Deſcription.*

Lyons Turnep or Lyons leafe, hath broad leaues like vnto Coleworts, or rather like the pionyes cut and diuided into ſundry great gaſhes: the ſtalke is two foot long, thicke, and full of iuyce, diuiding it ſelfe into diuers branches or wings; in the tops whereof ſtand red floures: afterward there appeareth long cods in which lie the ſeeds like vnto tares, or wilde chichs. The root is great, bumped like a Turnep, and blacke without.

¶ *The Place.*

It groweth among corne in diuers places of Italy, in Candie alſo, and in other Prouinces towards the South and Eaſt. The right honorable Lord *Zouch* brought a plant hereof from Italy at his returne into England, the which was planted in his garden. But as farre as I doe know, it periſhed.

¶ *The Time.*

It floureth in winter, as witneſſeth *Petrus Bellonius*.

¶ *The Names.*

The Grecians call it Λεοντοπεταλον, that is, *Leonis folium*, or Lyons leafe: *Plinie* doth call it alſo *Leontopetalon*: *Apuleius*, *Leontopodion*: yet there is another plant called by the ſame name. There bee many baſtard Names giuen vnto it, as

Rapeium,

Rapeium, Papauerculum, Semen Leoninum, Pes Leoninus, and *Brumaria:* in Engliſh Lyons leafe, and Lyons Turnep.

¶ *The Temperature.*

Lyons Turnep is of force to digeſt; it is hot and drie in the third degree, as *Galen* teacheth.

¶ *The Vertues.*

The root (ſaith *Dioſcorides*) taken in wine doth helpe them that are bitten of Serpents, and it doth moſt ſpeedily alay the paine. It is put into gliſters which are made for them that bee tormented with the Sciatica. A

CHAP. 5. *Of Radiſh.*

¶ *The Kindes.*

THere be ſundrie ſorts of Radiſh, whereof ſome be long and white; others long and blacke; ſome round and white; others round, or of the forme of a peare, and blacke of colour; ſome wilde, or of the field; and ſome tame, or of the garden, whereof we will intreat in this preſent chapter.

† 1 *Raphanus ſatiuus.* Garden Radiſh.

† 2 *Radicula ſatiua minor.* Small garden Radiſh.

¶ *The Deſcription.*

1 THe garden Radiſh ſendeth forth great and large leaues, greene, rough, cut on both ſides with deepe gaſhes, not vnlike to the garden Turnep, but greater. The ſtalkes bee round and parted into many branches, out of which ſpring ſmall floures of a light purple colour, made of foure little leaues: and when they be paſt, there doe come in place ſharpe pointed cods huſt or blowne vp toward the ſtalke, full of ſpungious ſubſtance, wherein is contained the ſeed, of a light browne colour, ſomewhat greater than the ſeeds of Turneps or Coleworts. The root is groſſe, long, and white both without and within, and of a ſharpe taſte.

2 The ſmall garden Radiſh hath leaues like the former, but ſmaller, and more brittle in handling. The ſtalke of two cubits high, whereon be the floures like the former. The ſeed is ſmaller, and not ſo ſharpe in taſte. The root is ſmall, long, white both within and without, except a little that ſheweth it ſelfe aboue the ground of a reddiſh colour.

3 Radiſh with a round root hath leaues like the garden Turnep: among which leaues ſpringeth vp a round and ſmooth ſtalke, diuiding it ſelfe toward the top into two or three branches, whereon doe grow ſmall purpliſh floures made of foure leaues apeece: which being paſt, there doe come in place ſmall long cods puft vp or bunched in two, and ſometimes three places, full of pith as the common Radiſh; wherein is contained the ſeed, ſomewhat ſmaller than the Colewort ſeed, but of a hotter taſte. The root is round and firme, nothing wateriſh like the common Radiſh, more pleaſant in taſte, wholſomer, not cauſing ſuch ſtinking belchings as the garden Radiſh doth.

4 The Radiſh with a root faſhioned like a peare, groweth to the height of three or foure cubits, of a bright reddiſh colour. The leaues are deeply cut or iagged like thoſe of the Turnep, ſomewhat rough. The floures are made of foure leaues, of a light carnation or fleſhie colour. The ſeed is contained in ſmall bunched cods like the former. The root is faſhioned like a peare or long Turnep, blacke without and white within, of a firme and ſolide ſubſtance. The taſte is quicke and ſharpe, biting the tongue as the other kindes of Radiſh, but more ſtrongly.

3 *Rhaphanus orbiculatus.*
Round Radiſh.

4 *Raphanus pyriformis, ſiue radice nigra.*
The blacke, or Peare-faſhion Radiſh.

¶ *The Place.*

All the kindes of Radiſh require a looſe ground which hath beene long manured and is ſomewhat fat. They proſper well in ſandie ground, where they are not ſo ſubiect to wormes, as in other grounds.

¶ *The Time.*

Theſe kindes of Radiſh are moſt fitly ſowen after the Summer Solſtice in Iune or Iulie: for being ſowen betimes in the ſpring they yeeld not their roots ſo kindly nor profitably, for then they doe for the moſt part quickly run vp to ſtalke and ſeed, where otherwiſe they doe not floure and ſeed till the next ſpring following. They may be ſowen ten moneths in the yeere, but as I ſaid before, the beſt time is in Iune and Iulie.

¶ *The*

¶ *The Names.*

Radiſh is called in Greeke of *Theophraſtus*, *Dioſcorides*, *Galen*, and other old writers, in ſhops *Raphanus*, and *Satiua Radicula*: in high Dutch, **Rettich**: in low Dutch, **Radus**: in French, *Raifort*: in Italian, *Raphano*: in Spaniſh, *Rauano*: in Engliſh, Radiſh, and Rabone: in the Bohemian tongue, **Rzedkew**. *Cælius* affirmeth that the ſeed of Radiſh is called of *Marcellus Empericus*, *Bacanon*; and ſo likewiſe of *Aëtius* in the ſecond chapter of the ſecond booke of his Tetrabible: yet *Cornarius* doth not reade *Bacanon*, but *Cacanon*: The name of *Bacanum* is alſo found in *N. Myrepſius*, in the 255. Compoſition of his firſt booke.

¶ *The Temperature.*

Radiſh doth manifeſtly heat and drie, open and make thin by reaſon of the biting quality that ruleth in it. *Galen* maketh them hot in the third degree, and drie in the ſecond, and ſheweth that it is rather a ſauce than a nouriſhment.

¶ *The Vertues.*

Radiſh are eaten raw with bread in ſtead of other food; but being eaten after that manner, they A
yeeld very little nouriſhment, and that faultie and ill. But for the moſt part, they are vſed as ſauce
with meates to procure appetite, and in that ſort they ingender blood leſſe faulty, than eaten alone
or with bread onely: but ſeeing they be of a harder digeſtion than meates, they are alſo many
times troubleſome to the ſtomacke; neuertheleſſe, they ſerue to diſtribute and diſperſe the nou-
riſhment, eſpecially being taken after meat; and taken before meat, they cauſe belchings, and
ouerthrow the ſtomacke.

Before meate they cauſe vomiting, and eſpecially the rinde: the which as it is more biting than B
the inner ſubſtance, ſo doth it with more force cauſe that effect if it be giuen with Oximel, which
is a ſyrupe made with vineger and hony.

Moreouer, Radiſh prouoketh vrine, and diſſolueth cluttered ſand, and driueth it forth, if a good C
draught of the decoction thereof be drunke in the morning. *Pliny* writeth, and *Dioſcorides* likwiſe,
that it is good againſt an old cough; and to make thin, thicke and groſſe flegme which ſticketh
in the cheſt.

In ſtead hereof the Phiſitions of our age doe vſe water diſtilled thereof: which likewiſe pro- D
cureth vrine mightily, and driueth forth ſtones in the kidnies.

The root ſliced and laid ouer night in white or Rheniſh wine, and drunke in the morning, dri- E
ueth out vrine and grauell mightily, but in taſte and ſmell it is very lothſome.

The root ſtamped with hony and the powder of a ſheepes heart dried, cauſeth haire to grow in F
ſhort ſpace.

The ſeed cauſeth vomite, prouoketh vrine: and being drunke with honied vineger, it killeth and G
driueth forth wormes.

The root ſtamped with the meale of Darnell and a little white wine vineger, taketh away all H
blew and blacke ſpots, and bruſed blemiſhes of the face.

The root boiled in broth, and the decoction drunke, is good againſt an old cough: it moueth I
womens ſickneſſe, and cauſeth much milke.

† Thoſe figures that were in the firſt and ſecond place, were varietyes of the long Turnep deſcribed in the ſecond place, in the firſt Chapter of this ſecond booke.

Chap. 6. *Of wilde Radiſh.*

¶ *The Deſcription.*

1 Wilde Radiſh hath a ſhorter narrower leafe than the common Radiſh, and more deeply cut or iagged, almoſt like the leaues of Rocket, but much greater. The ſtalke is ſlender and rough, of two cubits high, diuided toward the top into many branches. The floures are ſmall and white: the cod is long, ſlender, and ioynted, wherein is the ſeed. The root is of the bigneſſe of the finger, white within and without, of a ſharpe and biting taſte.

2 The water Radiſh hath long and broad leaues, deeply indented or cut euen to the middle rib. The ſtalke is long, weake, and leaneth this way and that way, being not able to ſtand vpright without a prop, in ſo much that yee ſhall neuer find it, no not when it is very young, but leaning down vpon the mud or mire where it groweth. The floures grow at the top made of foure ſmall yellow leaues. The root is long, ſet in ſundrie ſpaces with ſmall fibres or threds like the rowell of a ſpur, hot and burning in taſte more than any of the garden Radiſhes.

¶ *The Place.*

The firſt growes vpon the borders of bankes and ditches caſt vp, and in the borders of fields.

The

The ſecond growes in ditches, ſtanding waters, and riuers; as on the ſtone wall that bordereth vpon the riuer Thames by the Sauoy in London.

1 *Raphanus ſylueſtris.*
Wilde Radiſh.

2 *Raphanus aquaticus.*
Water Radiſh.

¶ *The Time.*

They floure in Iune, and the ſeed is ripe in Auguſt.

¶ *The Names.*

† The firſt of theſe is *Rapiſtrum flore albo Erucæ foliis*, of *Lobell*: *Armoratia*, or *Rapiſtrum album* of *Tabernamontanus*: and *Raphanus ſylueſtris*, of our Author: in Engliſh, wilde Radiſh.

The ſecond is *Radicula ſylueſtris* of *Dodonæus*: and *Rhaphanus aquaticus*, or *paluſtris* of others: in Engliſh, water Radiſh.

¶ *The Temperature.*

The wilde Radiſhes are of like temperature with the garden Radiſh, but hotter and drier.

¶ *The Vertues.*

A *Dioſcorides* writeth, that the leaues are receiued among the pot herbes, and likewiſe the boiled root, which as he ſaith, doth heate, and prouoke vrine.

Chap. 7. *Of Horſe Radiſh.*

¶ *The Deſcription.*

1 Horſe Radiſh bringeth forth great leaues, long, broad, ſharpe pointed and ſnipped about the edges, of a deepe greene colour like thoſe of the great garden Docke, called, of ſome Monkes Rubarbe, of others Patience, but longer and rougher. The ſtalke is ſlender and brittle, bearing at the top ſmall white floures: which being paſt, there follow ſmall cods, wherein is the ſeed. The root is long and thicke, white of colour, in taſte ſharpe, and very much biting the tongue like muſtard.

2 Dittander or pepperwort, hath broad leaues, long, and ſharpe pointed, of a blewiſh greene colour like woad, ſomewhat ſnipt or cut about the edges like a ſawe. The ſtalke is round and tough:

tough: vpon the branches whereof grow little white floures. The root is long and hard, creeping farre abroad in the ground, in ſuch ſort that when it is once taken in a ground, it is not poſſible to root it out, for it will vnder the ground creepe and ſhoot vp and bud forth in many places farre abroad. The root alſo is ſharp and biteth the tongue like pepper, whereof it tooke the name pepperwort.

‡ 3 This which we giue you in the third place hath a ſmall fibrous root, the ſtalke growes vp to the height of two cubits, and it is diuided into many branches furniſhed with white floures, after which follow ſeeds like in ſhape and taſte to Thlaſpi, or Treacle muſtard. The leaues are ſomewhat like thoſe of Woad. This is nouriſhed in ſome Gardens of the Low Countryes, and *Lobell* was the firſt that gaue the figure hereof, and that vnder the ſame title as wee here giue you it. ‡.

1 *Raphanus ruſticanus.*
Horſe Radiſh.

2 *Raphanus ſylueſtris Offic. Lepidium Æginetæ Lob.*
Dittander, and Pepperwort.

¶ *The Place.*

Horſe Radiſh for the moſt part groweth and is planted in gardens, yet haue I found it wilde in ſundrie places, as at Namptwich in Cheſhire, in a place called the Milne eye, and alſo at a ſmall village neere London called Hogſdon, in the field next vnto a farme houſe leading to Kings-land, where my very good friend maſter *Bredwell* practitioner in Phiſick, a learned and diligent ſearcher of Simples, and maſter *William Martin* one of the fellowſhip of Barbers and Chirurgians, my deere aud louing friend, in company with him found it, and gaue me knowledge of the place, where it flouriſheth to this day.

Dittander is planted in gardens, and is to be found wild alſo in England in ſundry places, as at Clare by Ouenden in Eſſex, at the Hall of Brinne in Lancaſhire, and neere vnto Exceſter in the Weſt parts of England. It delighteth to grow in ſandie and ſhadowie places ſomewhat moiſt.

¶ *The Time.*

Horſe Radiſh for the moſt part floureth in April or May, and the ſeed is ripe in Auguſt, and that ſo rare or ſeldome ſeene, as that *Petrus Placentius* hath written, that it bringeth forth no ſeed at all. Dittander floures in Iune and Iuly.

¶ *The Names.*

Horſe Radiſh is commonly called *Raphanus ruſticanus*, or *Magnus*, and of diuers ſimply *Raphanus ſylueſtris*:

ſylue, Iris: of the high Dutch men, **Merrettich krain oz kren:** in French, *Grand raifort:* of the low Germaines, **Merradus:** in Engliſh, mountaine radiſh, Great Raifort, and Horſe Radiſh. It is called in the North part of England, Redcole.

Diuers thinke that this Horſe Radiſh is an enemy to Vines, and that the hatred betweene them is ſo great, that if the roots hereof be planted neere to the Vine it bendeth backward from it, as not willing to haue fellowſhip with it.

It is alſo reported that the root hereof ſtamped, and caſt into good and pleaſant wine, doth forthwith turne it into vineger: but the old writers doe aſcribe this enmity to the vine and Braſſica, our coleworts, which the moſt ancients haue named [illegible].

Dittander is deſcribed of *Pliny* by the name of *Lepidium* in his 19. booke, 9. Chapter: likewiſe *Ægineta* maketh mention of this plant, by the name *Lepidium:* in ſhops, *Raphanus ſylueſtris*, and *Piperitis:* the Germans call it, **Pfefferkraut:** the lowe Dutch men, **Pepper cruyt:** the Engliſh men, Dittander, Dittany, and Pepperwort.

3 *Lepidium Annum.*
Annuall Dittander.

¶ *The Temperature.*

Theſe kindes of wilde Radiſhes, are hot and drie in the third degree: they haue a drying and clenſing quality, and ſomewhat digeſting.

¶ *The Vertues.*

Horſe Radiſh ſtamped with a little vineger put thereto, is commonly vſed among the Germanes for ſauce to eate fiſh with, and ſuch like meates, as we doe muſtard; but this kinde of ſauce doth heate the ſtomacke better, and cauſeth better digeſtion than muſtard.

Oximel or ſyrupe made with vineger and honie, in which the rindes of Horſe radiſh haue beene infuſed three dayes, cauſeth vomit, and is commended againſt the quartaine ague.

The leaues boiled in wine, and a little oile oliue added thereto and laid vpon the grieued parts in manner of a Pultis, doe mollifie and take away the hard ſwellings of the liuer and milte; and being applied to the bottome of the belly is a remedie for the ſtrangurie.

It profiteth much in the expulſion of the ſecondine or after-birth.

It mittigateth and aſſwageth the paine of the hip or haunch, commonly called Sciatica.

It profiteth much againſt the collicke, ſtrangurie, and difficultie of making water, vſed inſtead of muſtard as aforeſaid.

The root ſtamped and giuen to drinke, killeth the wormes in children: the iuyce giuen doth the ſame: an ointment made thereof, doth the like, being annointed vpon the belly of the child.

H The leaues of Pepperwort but eſpecially the rootes, be extreame hot, for they haue a burning and bitter taſte. It is of the number of ſcorching and bliſtring ſimples, ſaith *Pliny* in his 20. booke, the 17. chap. and therefore by his hot qualitie, it mendeth the skin in the face, and taketh away ſcabs, ſcarres, and mangineſſe, if any thing remaine after the healing of vlcers and ſuch like.

Chap. 8. *Of Winter Creſſes.*

¶ *The Deſcription.*

THe Winter Creſſes hath many greene, broad, ſmoothe and flat leaues like vnto the common turneps, whoſe ſtalkes be round, and full of branches, bringing forth at the top ſmall yellow floures: after them doe follow ſmall cods, wherein is conteined ſmall reddiſh ſeed.

¶ The

1 *Barbarea.*
Winter Creſſes.

¶ *The Place.*

It groweth in gardens among pot herbes, and very common in the fields, neere to pathes and high wayes, almoſt euery where.

¶ *The Time.*

This herbe is green all winter long, it floureth in May, and ſeedeth in Iune.

¶ *The Names.*

Winter Creſſe is called of the Latines, *Cardamum*, or *Naſturtium Hibernum*, of ſome, *Barbarea*, and *Pſeudobunium*: the Germanes call it **S. Barberen Kraut:** in lowe Dutch, **winter Kerſſe.**

It ſeemeth to be *Dioſcorides* his ψευδοβούνιον, that is to ſay, falſe or baſtard *Bunium*: in Engliſh, winter Creſſes, or herbe Saint Barbara.

¶ *The Nature.*

This herbe is hot and drie in the ſecond degree.

¶ *The Vertues.*

The ſeed of winter Creſſe cauſeth one to make water, and driueth forth grauell, and helpeth the ſtrangurie. A

The iuyce thereof mundifieth corrupt and filthy vlcers, being made in forme of an vnguent with waxe, oyle, and turpentine. B

In winter when ſalad herbes bee ſcarce, this herbe is thought to be equall with Creſſes of the garden, or Rocket. C

This herbe helpeth the ſcruie, being boiled among ſcruie graſſe, called in Latine *Cochlearia*, cauſing it to worke the more effectually. D

CHAP. 9. *Of Muſtard.*

¶ *The Deſcription.*

1 THe tame or garden Muſtard, hath great rough leaues like to thoſe of the Turnep, but rougher and leſſer. The ſtalke is round, rough, and hairie, of three cubits high, diuided into many branches, whereon doe grow ſmall yellow floures, and after them long cods, ſlender and rough, wherein is contained round ſeed bigger then Rape ſeed, of colour yellow, of taſte ſharpe, and biting the tongue as doth our common field muſtard.

‡ 2 Our ordinary Muſtard hath leaues like Turneps, but not ſo rough, the ſtalkes are ſmooth, and grow ſometimes to three, foure, or fiue cubits high, they haue many branches, and the leaues vpon theſe branches, eſpecially the vppermoſt, are long and narrow, and hang downeward on ſmall ſtalkes; the cods are ſhort, and lie flat and cloſe to the branches, and are ſomewhat ſquare; the ſeed is reddiſh or yellow. ‡

3 The other tame Muſtard is like to the former in leaues, and branched ſtalkes, but leſſer, and they are more whitiſh and rough. The floures are likewiſe yellow, and the ſeed browne like the Rape ſeed, which is alſo not a little ſharpe or byting.

‡ 4 This which I giue you here being the *Sinapi ſatiuum alterum*, of *Lobel*; and the *Sinapi album* of the ſhops, growes but low, and it hath rough crooked cods, and whitiſh ſeeds; the ſtalks, floures, and leaues, are much like the firſt deſcribed. ‡.

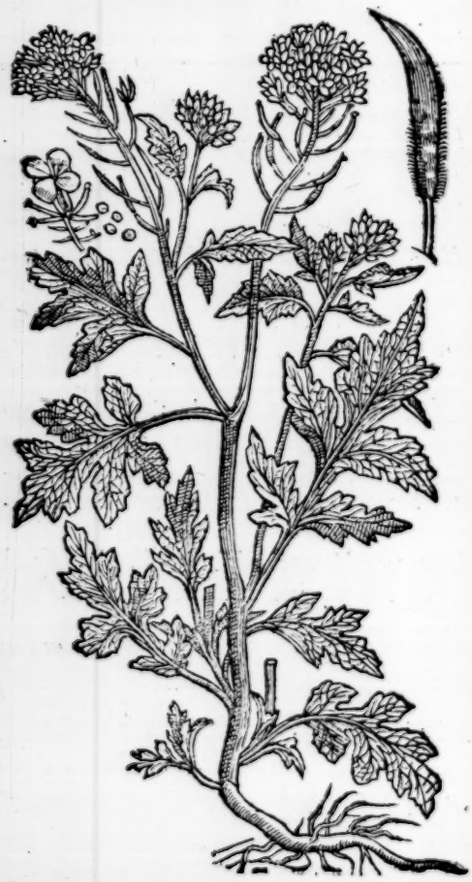
5 The wilde Muſtard hath leaues like thoſe of ſhepheards purſe, but larger, and more deeply indented, with a ſtalke growing to the height of two foot, bearing at the top ſmall yellow floures made of foure leaues: the cods be ſmall and ſlender, wherein is contained reddiſh ſeed, much ſmaller than any of the others, but not ſo ſharpe or biting.

† 1 *Sinapi*

† 1 *Sinapi ſatiuum.*
Garden Muſtard.

† 3 *Sinapi ſatiuum alterum, Dod.*
Field Muſtard.

‡ 4 *Sinapi album.*
White Muſtard.



† 5 *Sinapi ſylueſtre minus.*
Small wilde Muſtard.

¶ The

¶ *The Place.*

‡ Our ordinarie Muſtard (whoſe deſcription I haue added) as alſo the wilde and ſmall grow wilde in many places of this kingdome, and may all three be found on the bankes about the back of Old-ſtreet, and in the way to Iſlington. ‡

¶ *The Time.*

Muſtard may be ſowen in the beginning of the Spring: the ſeed is ripe in Iuly or Auguſt: It commeth to perfection the ſame yeare that it is ſowen.

¶ *The Names.*

The Greekes call Muſtard, σίναπι: the Athenians called it νᾶπυ: the Latines, *Sinapi*: the rude and barbarous, *Sinapium*: the Germanes, **Senff**: the French, *Seneue* and *Mouſtarde*: the low-Dutchmen, **Moſtaert ſaet**: the Spaniards, *Moſtaza*, and *Moſtalla*: the Bohemians, *Horcice*: *Pliny* calls it *Thlaſpi*, whereof doubtleſſe it is a kinde: and ſome haue called it *Saurion*.

‡ Theſe kindes of Muſtard haue beene ſo briefely treated of by all Writers, that it is hard to giue the right diſtinctions of them, and a matter of more difficultie than is expected in a thing ſo vulgarly knowne and vſed: I will therefore endeauour in a few words to diſtinguiſh thoſe kindes of muſtard which are vulgarly written of.

1 The firſt is *Sinapi primum* of *Matthiolus* and *Dodonæus*; and *Sinapi ſatiuum Erucæ aut Rapifolio* of *Lobel*.

2 The ſecond I cannot iuſtly referre to any of thoſe which are written of by Authours; for it hath not a cod like Rape, as *Pena* and *Lobel* deſcribe it; nor a ſeed bigger than it, as *Dodonæus* affirmeth; yet I ſuſpect, and almoſt dare affirme that it is the ſame with the former mentioned by them, though much differing from their figures and deſcription.

3 The third (which alſo I ſuſpect is the ſame with the fourth) is *Sinapi alterum* of *Matthiolus*, and *Sinapi agreſte Apij, aut potius Laueris folio*, of *Lobel*: and *Sinapi ſatiuum alterum* of *Dodonæus*.

4 The fourth is by *Lobel* called *Sinapi alterum ſatiuum*; and this is *Sinapi album Officinarum*, as *Pena* and *Lobel* affirme, *Aduerſ. pag.* 68.

5 The fifth is *Sinapi ſylueſtre* of *Dodonæus*: and *Sinapi ſylueſtre minus Burſæ paſtoris folio*, of *Lobel*. It is much like Rocket, and therefore *Bauhine* fitly calls it *Sinapi Erucæ folio*: in Engliſh it may be called Small wilde Muſtard. ‡

¶ *The Temperature.*

The ſeed of Muſtard, eſpecially that which we chiefely vſe, doth heat and make thinne, and alſo draweth forth. It is hot and dry in the fourth degree, according to *Galen*.

¶ *The Vertues.*

The ſeed of Muſtard pound with vineger, is an excellent ſauce, good to be eaten with any groſſe meates either fiſh or fleſh, becauſe it doth helpe digeſtion, warmeth the ſtomacke, and prouoketh appetite. A

It is giuen with good ſucceſſe in like manner to ſuch as be ſhort winded, and are ſtopped in the breaſt with tough flegme from the head and braine. B

It appeaſeth the tooth-ache being chewed in the mouth. C

They vſe to make a gargariſme with honey, vineger, and muſtard ſeed, againſt the tumours and ſwellings of the Vuula, and the almonds about the throat and root of the tongue. D

Muſtard drunke with water and honey prouoketh the termes and vrine. E

The ſeed of muſtard beaten and put into the noſthrils, cauſeth ſneeſing, and raiſeth women ſicke of the mother out of their fits. F

It is good againſt the falling ſickeneſſe, and ſuch as haue the Lithargie, if it be laid plaiſter-wiſe vpon the head (after ſhauing) being tempered with figs. G

It helpeth the Sciatica, or ache in the hip or huckle bone: it alſo cureth all manner of paines proceeding of a cold cauſe. H

It is mixed with good ſucceſſe with drawing plaiſters, and with ſuch as waſte and conſume nodes and hard ſwellings. I

It helpeth thoſe that haue their haire pulled off; it taketh away the blew and blacke marks that come of bruiſings. K

‡ The ſeed of the white Muſtard is vſed in ſome Antidotes, as *Electuarium de ouo, &c.* L

† The three figures in the former edition were all falſe: The firſt was of *Barbara*, deſcribed in the precedent chapter: The ſecond, of *Eruca aquatica maior* of Tabern. The third, of *Eruca aquat. minor*, Tab.

Chap. 10. *Of Rocket.*

¶ *The Kindes.*

THere be ſundry kindes of Rocket; ſome tame, or of the garden; ſome wilde, or of the field; ſome of the water, and of the ſea.

† 1 *Eruca ſatiua.*
Garden Rocket.

2 *Eruca ſylueſtris.*
Wilde Rocket.

¶ *The Deſcription.*

1 GArden Rocket, or Rocket gentle, hath leaues like thoſe of Turneps, but not neere ſo great nor rough. The ſtalks riſe vp of a cubit, & ſomtimes two cubits high, weak and brittle; at the top whereof grow the floures of a whitiſh colour, and ſometimes yelowiſh; which being paſt, there do ſucceed long cods, which containe the ſeed, not vnlike to rape ſeed, but ſmaller.

2 The common Rocket, which ſome keepe in Gardens, and which is vſually called the wilde Rocket, is leſſer than the Romane Rocket, or Rocket-gentle, the leaues and ſtalkes narrower, and more iagged. The floures be yellow, the cods alſo ſlenderer, the ſeed thereof is reddiſh, and biteth the tongue.

3 This kinde of Rocket hath long narrow leaues almoſt ſuch as thoſe of Tarragon, but thicker and fatter, reſembling rather the leaues of Myagrum, altogether vnlike any of the reſt of the Rockets, ſauing that the branch, floure, and ſeed are like the garden Rocket.

4 There is another kinde of Rocket, thought by that reuerend and excellent Herbariſt *Carolus Cluſius* to be a kinde of Creſſes; if not Creſſes it ſelfe, yet couſine germane at the leaſt. Vnto whoſe cenſure *Lobelius* is indifferent, whether to call it Rocket with thinne and narrow leaues, or to call it Couſine to the kindes of Creſſes, hauing the taſte of the one, and the ſhape of the other. The leaues are much diuided, and the floures yellow.

5 There is is a wild kind of Sea-Rocket which hath long weake and tender branches trailing vpon

vpon the ground, with long leaues like vnto common Rocket, or rather Groundſwell, hauing ſmall and whitiſh blew floures; in whoſe place commeth ſmall cods, wherein is contained ſeed like that of Barley.

‡ 6 Beſides theſe there is another plant, whoſe figure which here I giue was by our Author formerly ſet forth in the precedent chapter, vnder the title of *Sinapi ſylueſtre*; together with a large kinde thereof, vnder the name of *Sinapi ſatiuum alterum*. Now I will onely deſcribe the later, which I haue ſometimes found in wet places: The root is woody: the ſtalke ſome foot long, creſted, and hauing many branches, lying on the ground: the leafe is much diuided, and that after the manner of the wilde Rocket: the floures are of a bright yellow, and are ſucceeded by ſhort crooked cods, wherein is contained a yellowiſh ſeed. ‡

† 3 *Eruca ſylueſtris anguſtifolia.*
Narrow leaued wilde Rocket.

‡ 4 *Eruca naſturtio cognata tenuifolia.*
Creſſy-Rocket.

¶ *The Place.*

Romane Rocket is cheriſhed in Gardens.

Common or wilde Rocket groweth in moſt gardens of it ſelfe: you may ſee moſt bricke and ſtone walls about London and elſewhere couered with it.

The narrow leaued Rocket groweth neere vnto water ſides, in the chinkes and creuiſes of ſtone walls among the morter. I found it as ye go from Lambeth bridge to the village of Lambeth, vnder a ſmall bridge that you muſt paſſe ouer hard by the Thames ſide.

I found Sea Rocket growing vpon the ſands neere vnto the ſea in the Iſle of Thanet, hard by a houſe wherein Sir *Henry Criſpe* did ſometimes dwell, called Queakes houſe.

¶ *The Time.*

Theſe Kindes of Rocket floure in the moneths of Iune and Iuly, and the ſeed is ripe in September.

The Romane Rocket dieth euery yeare, and recouereth it ſelfe againe by the falling of his owne ſeed.

¶ *The Names.*

Rocket is called in Greeke, ἴυζομον: in Latine, *Eruca*: in high Dutch, **Rauckenkraut**: in French, *Roquette*: in Low-Dutch, **Rakette**: in Italian, *Ruchetta*: in Spaniſh, *Oruga*; in Engliſh, Rocket, and Racket. The Poets do oft times name it *Herba ſalax*: *Eruca* doth ſignifie likewiſe a certaine canker worme, which is an enemie to pot-herbes, but eſpecially to Coleworts.

‡ The firſt is called *Eruca ſatiua*, or *Hortenſis major*: Great Garden Rocket.

2 The ſecond, *Eruca ſylueſtris*: Wilde Rocket.

3 This third is by *Lobel* called *Eruca ſylueſtris anguſtifolia*: Narrow leaued wilde Rocket.

4 *Cluſius* fitly calls this, *Naſturtium ſylueſtre*: and he reprehendeth *Lobel* for altering the name into *Eruca Naſturtio cognata tenuifolia*: Creſſy-Rocket.

5 The fifth is *Eruca marina*, (thought by *Lobel* and others to be *Cakile Serapionis*,) Sea Rocket.

6 *Eruca aquatica*: Water Rocket.

‡ 5 *Eruca marina.*
Sea Rocket.

† 6 *Eruca aquatica.*
Water Rocket.

¶ *The Temperature.*

Rocket is hot and dry in the third degree, therefore ſaith *Galen* it is not fit nor accuſtomed to be eaten alone.

¶ *The Vertues.*

A Rocket is a good ſallet herbe, if it be eaten with Lettuce, Purſlane, and ſuch cold herbes; for being ſo eaten it is good and wholeſome for the ſtomacke, and cauſeth that ſuch cold herbes do not ouer-coole the ſame: otherwiſe, to be eaten alone, it cauſeth head-ache, and heateth too much.

B The vſe of Rocket ſtirreth vp bodily luſt, eſpecially the ſeed.

C It prouoketh vrine, and cauſeth good digeſtion.

D *Pliny* reporteth, That whoſoeuer taketh the ſeed of Rocket before he be whipt, ſhall be ſo hardened, that he ſhall eaſily endure the paines.

E The root and ſeed ſtamped, and mixed with Vineger and the gall of an Oxe, taketh away freckles, lentiles, blacke and blew ſpots, and all ſuch deformities of the face.

† The figure that was in the third place, vnder the title of *Eruca ſyl. anguſtifolia*, is of the ſame plant that in the Chapter of *Turritis* is called *Camelina*, where you ſhall finde it treated of at large. And that in the firſt place is *Eryſimum ſecundum* of *Tabern.* and I queſtion whither it be not of *Sinapi ſylueſtre minus.*

CHAP. II. *Of Tarragon.*

Draco herba.
Tarragon.

¶ *The deſcription.*

TArragon the ſallade herbe hath long and narrow leaues of a deepe greene colour, greater and longer than thoſe of common Hyſſope, with ſlender brittle round ſtalkes two cubites high: about the branches whereof hang little round flowers, neuer perfectly opened, of a yellow colour mixed with blacke, like thoſe of common VVormewood. The root is long and fibrous, creeping farre abroad vnder the earth, as doe the rootes of Couch-graſſe, by which ſprouting forth it increaſeth, yeelding no ſeede at all, but as it were a certaine chaffie or duſtie matter that flieth away with the winde.

¶ *The place.*

Tarragon is cheriſhed in gardens, and is encreaſed by the young ſhootes: *Ruellius* and ſuch others haue reported many ſtrange tales hereof ſcarſe worth the noting, ſaying, that the ſeed of flaxe put into a radiſh roote or ſea Onion, and ſo ſet, doth bring forth this herbe Tarragon.

¶ *The time.*

It is greene all Summer long, and a great part of Autumne, and floureth in Iuly.

The names.

It is called in Latine, *Draco*, *Dracunculus hortenſis*, and *Tragum vulgare* by *Cluſius*; Of the Italians, *Dragoncellum*; in French, *Dragon*, in Engliſh, Tarragon.

It is thought to be that *Tarchon* which *Auicen* mentioneth in his 686. chapter: but he writeth ſo little thereof, as that nothing can certainly be affirmed of it. *Simeon Sethi* the Greeke alſo maketh mention of *Tarchon*.

¶ *The temperature and vertues.*

Tarragon is hot and drie in the third degree, and not to be eaten alone in ſallades, but ioyned with other herbes, as Lettuce, Purſlain, and ſuch like, that it may alſo temper the coldnes of them, like as Rocket doth, neither doe we know what other vſe this herbe hath.

CHAP. III. *Of garden Creſſes.*

¶ *The deſcription.*

1 GArden Creſſes or Towne Creſſes hath ſmall narrow iagged leaues, ſharpe and burning in taſte. The ſtalks be round, a cubite high, which bring forth many ſmall white flowers, and after little flat huskes or ſeede veſſels, like to thoſe of the pheards purſe, wherein are contained ſeeds of a browne reddiſh colour. The roote dieth when the ſeede is ripe.

2 There is another kinde in taſte like the former, but in leaues farre different, which I recouered of ſeedes, ſent me from *Robinus* dwelling in Paris. The ſtalkes riſe vp to the height of a foot, garniſhed with many broad leaues deepely cut or indented about the edges: the middle of the leafe is deckt and garniſhed with many little ſmall leaues or rather ſhreds of leaues, which make the ſame like a curlde fanne of feathers. The ſeede is like the former in ſhape.

3 Spaniſh Creſſes riſeth forth of the ground like vnto Baſill, afterwards the leaues grow larger and broader, like thoſe of Marigolds; among the which riſeth vp a crooked lymmer ſtalke,

whereupon do grow ſmall tufts or ſpokie rundles of white flowers. The ſeede followeth, browne of colour, and bitter in taſte. The whole plant is of a loathſome ſmell and ſauour.

4 Stone-Creſſe groweth flat vpon the ground, with leaues iagged and cut about the edges like the oake leafe, reſembling well the leaues of ſhepheardes purſe. I haue not ſeene the flowers, and therefore they be not expreſt in the figure; notwithſtanding it is reported vnto me, that they bee ſmall and white of colour, as are thoſe of the garden Creſſes. The ſeed is contained in ſmall pouches or ſeede veſſels, like thoſe of Treacle muſtard or Thlaſpi.

¶ *The Place.*

Creſſes are ſowne in gardens, it skils not what ſoile it be; for that they like any ground, eſpecially if it be well watered. ‡ M. *Bowles* found the fourth growing in Shropſhire in the fields about Birch in the pariſh of Eleſmere, in the grounds belonging to M. *Richard Herbert*, and that in great plenty. ‡

¶ *The Time.*

It may be ſowne at any time of the yeere, vnleſſe it be in Winter; it groweth vp quickly, and bringeth forth betimes both ſtalke and ſeede: it dieth euery yeere, and recouereth it ſelfe of the fallen or ſhaken ſeed.

1 *Naſturtium hortenſe.*
Garden Creſſes.

¶ *The Names.*

Creſſes is called in Greeke κάρδαμον: in Latine *Naſturtium*; in Engliſh Creſſes: the Germaines call it **Kreſſe**: and in French, *Creſſon*: the Italians, *Naſturtio*, and *Agretto*: of ſome, towne Creſſes, and garden Karſſe. It is called *Naſturtium*, as *Varro* and *Plinie* thinke *à narribus torquendis*, that is to ſay, of writhing the noſthrils, which alſo by the loathſome ſmell and ſharpneſſe of the ſeede doth cauſe ſneeſing. ‡ The firſt is called *Naſturtium hortenſe*, Garden Creſſes. 2 *Naſturtium hortenſe criſpum*, Garden Creſſes with criſpe, or curled leaues. 3 *Naſturtium Hiſpanicum*, or *Latifolium*; Spaniſh Creſſes, or Broad-leaued Creſſes. 4 This is *Naſturtium petræum* of *Tabernamontanus* (and not of *Lobell*, as our Author termed it.) Stone Creſſes. ‡

¶ *The Temperature.*

The herbe of garden Creſſes is ſharpe and biting the tongue; and therefore it is very hot and drie, but leſſe hot whileſt it is yong and tender, by reaſon of the waterie moiſture mixed therewith, by which the ſharpeneſſe is ſomewhat allaied.

The ſeede is much more biting then the herbe, and is hot and drie almoſt in the fourth degree.

¶ *The Vertues.*

A *Galen* ſaith that the Creſſes may be eaten with bread *Velutiobſonium*, and ſo the Antient Spartanes vſually did; and the low-Countrie men many times doe, who commonly vſe to feed of Creſſes with bread and butter. It is eaten with other ſallade hearbes, as Tarragon and Rocket: and for this cauſe it is chiefely ſowen.

B It is good againſt the diſeaſe which the Germaines call **Scorbuch** and **Scorbuye**: in Latine, *Scorbutus*: which we in England call the Scruuie, and Scurby, and vpon the ſeas the Skyrby: it is as good and as effectuall as the Scruuie graſſe, or water Creſſes.

C *Dioſcorides* ſaith, if the ſeed be ſtamped and mixed with hony, it cureth the hardneſſe of the milt: with Vineger and Barley meale parched it is a remedie againſt the Sciatica, and taketh away hard ſwellings and inflammations. It ſcoureth away tetters, mixed with brine: it ripeneth felons, called in Greeke, ἀδήνες: it forcibly cutteth and raiſeth vp thicke and tough humors of the cheſt, if it be mixed with things proper againſt the ſtuffing of the lungs.

Dioſcorides ſaith it is hurtfull to the ſtomacke, and troubleth the belly.

It

3 *Naſturtium Hiſpanicum.*
Spaniſh Creſſes.

4 *Naſturtium Petreum.*
Stone Creſſes.

It driueth forth wormes, bringeth downe the floures, killeth the child in the mothers womb, and prouoketh bodily luſt. D

Being inwardly taken, it is good for ſuch as haue fallen from high places: it diſſolueth clutte- red bloud, and preuenteth the ſame that it do not congeale and thicken in any part of the body: it procureth ſweat, as the later Phyſitions haue found and tried by experience. E

CHAP. 13. *Of Indian Creſſes.*

¶ *The Deſcription.*

CReſſes of India haue many weake and feeble branches, riſing immediately from the ground, diſperſing themſelues far abroade; by meanes whereof one plant doth occupie a great circuit of ground, as doth the great Bindeweede. The tender ſtalkes diuide themſelues into ſundry branches, trailing likewiſe vpon the ground, ſomewhat bunched or ſwollen vp at euery ioint or knee, which are in colour of a light red, but the ſpaces betweene the ioints are greene. The leaues are round like wall peniwort, called Cotyledon, the footeſtalke of the leafe commeth forth on the backeſide almoſt in the middeſt of the leafe, as thoſe of Frogbit, in taſte and ſmell like the garden Creſſes. The flowers are diſperſed throughout the whole plant, of colour yellow, with a croſſed ſtarre ouerthwart the inſide, of a deepe orange colour; vnto the backe part of the ſame doth hang a taile or ſpurre, ſuch as hath the Larkes heele, called in Latine *Conſolida Regalis*, but greater, and the ſpurre or heele longer; which being paſt there ſucceed bunched and knobbed cods or ſeede veſſels, wherein is contained the ſeede, rough, browne of colour, and like vnto the ſeedes of the beete, but ſmaller.

¶ *The Place.*

The ſeedes of this rare and faire plant came firſt from the Indies into Spaine, and thence into France and Flanders, from whence I receiued ſeede that bore with me both flowers and ſeede; eſpecially thoſe I receiued from my louing friend *Iohn Robin* of Paris.

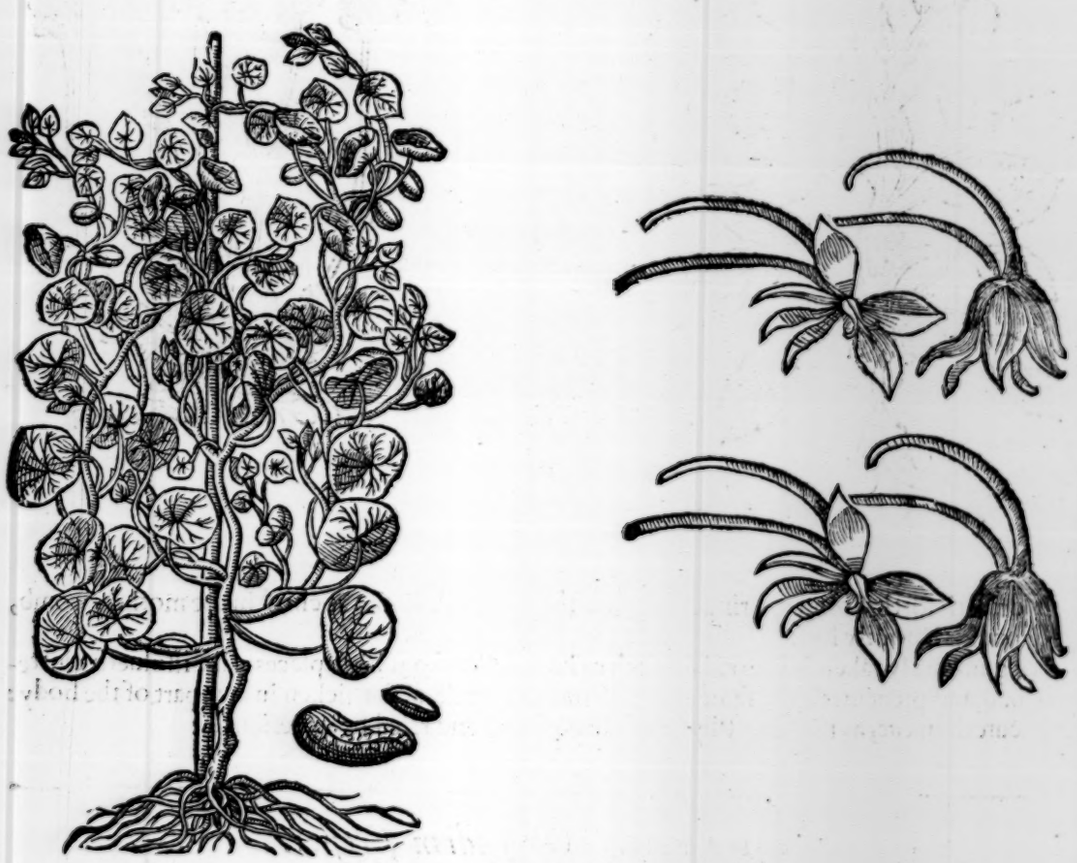
¶ *The Time.*

The ſeedes muſt be ſowen in the beginning of Aprill, vpon a bed of hot horſe dung, and ſome fine

fine ſifted earth caſt thereon of an handfull thicke. The bed muſt be couered in fundry places with hoopes or poles, to ſuſtaine the mat or ſuch like thing that it muſt be couered with in the night, and layd open to the Sunne in the day time. The which being ſprung vp, and hauing gotten three leaues, you muſt replant them abroad in the hotteſt place of the garden, and moſt fine and fertile mold. Thus may you do with Muske-Melons, Cucumbers, and all cold fruits that require haſte; for that otherwiſe the froſt will ouertake them before they come to fruit-bearing.

‡ They may alſo be ſowen in good mold like as other ſeeds, and vſually are. ‡

Naſturtium Indicum cum flore & ſemine.
Indian Creſſes with floure and ſeed.



¶ *The Names.*

This beautifull plant is called in Latine, *Naſturtium Indicum*: in Engliſh, Indian Creſſes. Although ſome haue deemed it a kinde of *Conuolvulus*, or Binde-weed; yet I am well contented that it retaine the former name, for that the ſmell and taſte ſhew it to be a kinde of Creſſes.

¶ *The Nature and Vertues.*

We haue no certain knowledge of his nature or vertues, but are content to refer it to the kindes of Creſſes, or to a further conſideration.

Chap. 14. *Of Sciatica Creſſes.*

¶ *The Deſcription.*

1 Sciatica Creſſes hath many ſlender branches growing from a ſtalke of a cubit high, with ſmall long and narrow leaues like thoſe of Garden Creſſes. The floures be very ſmall, and yellow of colour, the ſeed-veſſels be little flat chaffie huskes, wherein is the ſeed of a reddiſh gold colour, ſharpe and very bitter in taſte. The root is ſmall, tough, white within and without, and of a biting taſte.

‡ The plant whoſe figure I here giue you in ſtead of that with the narrower leaues of our Author, hath leaues ſomewhat like Rocket, but not ſo deepe cut in, being only ſnipt about the edges: the

the vpper leaues are not ſnipt, nor diuided at all, and are narrower. The floures decking the tops of the branches are ſmall and white, the ſeed veſſels are leſſe then thoſe of Creſſes, and the ſeed it ſelfe exceeding ſmall, and of a blackiſh colour; the root is woody, ſometimes ſingle, otherwhiles diuided into two branches. ‡

¶ *The Place.*

It groweth vpon old wals and rough places by high waies ſides, and ſuch like: I haue found it in corne fields about Southfleete neere to Grauesend in Kent.

Iberis Cardamantica.
Sciatica Creſſes.

¶ *The Time.*

It floureth according to the late or earely ſowing of it in the fields, in Iune and Iuly.

¶ *The Names.*

Sciatica Creſſes is called in Greeke ἴβηρις, and καρδαμαντικὴ: in Latine *Iberis*: of *Plinie*, *Heberis*, and *Naſturtium ſylueſtre*, and in like manner alſo *Lepidium*. There is another *Lepidium* of *Plinie*: in Engliſh, Sciatica Creſſe. ‡ The firſt deſcribed may be called *Iberis Cardamantica tenuifolia*, Small leaued Sciatica Creſſes. The ſecond, *Iberis latiore folio*, broad leaued Sciatica Creſſes. ‡

¶ *The Nature.*

Sciatica Creſſe is hot in the fourth degree, and like to garden Creſſes both in ſmell and in taſte.

¶ *The Vertues.*

The rootes gathered in Autumne, ſaith *Dioſcorides*, doe heate and burne, and are with good ſucceſſe with ſwines greaſe made vp in manner of a plaiſter, and put vpon ſuch as are tormented with the Sciatica: it is to lie on the grieued place but foure hours at the moſt, and then taken away, and the patient bathed with warme water, and the place afterwards anointed with oile, and wooll laid on it; which things *Galen* in his ninth booke of medicines, according to the place greeued, citeth out of *Democrates*, in certaine verſes tending to that effect. A

CHAP. 15. *Of Banke Creſſes.*

¶ *The Deſcription.*

1 BAnke Creſſes hath long leaues, deepely cut or jagged vpon both ſides, not vnlike to thoſe of Rocket, or wilde muſtard. The ſtalkes be ſmal, limber or pliant, yet very tough, and wil twiſt and writhe as doth the Ozier or water willow, wherupon do grow ſmall yellow flowers, which being paſt there do ſucceed little ſlender cods, full of ſmall ſeedes, in taſte ſharpe and biting the tongue as thoſe of Creſſes.

2 The ſecond kinde of banke Creſſes hath leaues like vnto thoſe of Dandelion, ſomewhat reſembling Spinach. The branches be long, tough, and pliant like the other. The flowers be yellowiſh, which are ſucceeded by ſmal long cods, hauing leaues growing amongſt them: in theſe cods is contained ſmall biting ſeed like the other of this kinde. The ſmell of this plant is very vngratefull.

¶ *The Place.*

Banke Creſſes is found in ſtonie places among rubbiſh, by path waies, vpon earth or mudde walls, and in other vntoiled places.

The

The ſecond kinde of banke Creſſes groweth in ſuch places as the former doth: I found it growing at a place by Chelmes forde in Eſſex called little Baddowe, and in ſundrie other places.

‡ If our Author meant this which I haue deſcribed and giuen you the figure of, (as it is probable he did) I doubt he ſcarce found it wilde: I haue ſeene it in the garden of Maſter *Parkinſon*, and it groweth wilde in many places of Italy. ‡

¶ *The Time.*

They flower in Iune and Iuly, and the ſeed is ripe in Auguſt and September.

¶ *The Names.*

Banke Creſſes is called in Latine *Irio* and *Eryſimum*: in Greeke ἴριον, and of ſome, χαμαιλίνη, according to *Dioſcorides*: *Theophraſtus* hath an other *Eryſimum*.‡ The firſt is called *Irio*, or *Eryſimum* by *Matthiolus Dodonæus*, and others. *Turner*, *Fuchſius* and *Tragus* call it *Verbena fœmina*, or *recta*. The ſecond is *Irio alter* of *Matthiolus*, and *Saxifraga Romanorum*, *Lugd.* It may be called Italian Banke Creſſes: or Roman Saxifrage. ‡

1 *Eryſimum Dioſcoridis, Lobelij.*
Bancke Creſſes.

† 2 *Eryſimum alterum Italicum.*
Italian bancke Creſſes.

¶ *The Nature.*

The ſeed of bancke Creſſes is like in taſte to garden Creſſes, and is as *Galen* ſaith of a fierie temperature, and doth extreamely attenuate or make thinne.

¶ *The Vertues.*

A The ſeed of bancke Creſſes is good againſt the rheume that falleth into the cheſt, by rotting the ſame.

B It remedieth the cough, the yellow jaundiſe, and the Sciatica or ache of the hucklebones, if it be taken with hony in manner of a lohoc and often licked.

C It is alſo drunke againſt deadly poiſons, as *Dioſcorides* addeth: and being made vp in a plaiſter with water and hony and applied, it is a remedie againſt hidden cankrous apoſtumes behind the eares, hard ſwellings and inflammations of the pappes and ſtones.

D ‡ The ſeeds of the Italian Banke Creſſes, or Roman Saxifrage taken in the weight of a dram, in

in a decoction of Graſſe roots, effectually cleanſe the reines, and expell the ſtone, as the Authour of the *hiſt. Lugd.* affirmes. ‡

† The figure that was here in the ſecond place was of the *Sonchus ſylueſtris*, or *Libanotis Theophraſti ſterilis* of *Tabernamontanus*. You ſhall finde mention of it amongſt the *Sonchi*, or *Sow-thiſtles*.

CHAP. 16. *Of Docke Creſſes.*

† *Lampſana.*
Docke Creſſes.

¶ *The Deſcription.*

† DOcke-Creſſes is a wilde Wort or pot-herbe hauing roughiſh hairy leaues of an ouerworne greene colour, deepely cut or indented vpon both ſides like the leaues of ſmall Turneps. The ſtalkes grow to the height of two or three cubits, and ſometimes higher, diuiding themſelues toward the top into ſundry little branches, whereon do grow many ſmall yellow floures like thoſe of *Hieracium*, or Hawke-weed; which decaying, are ſucceeded by little creſted heads containing a longiſh ſmall ſeed ſomewhat like Lettice ſeed, but of a yellowiſh colour: the plant is alſo milkie, the ſtalke woody, and the root ſmall, fibrous, and white.

¶ *The Place.*

Dock-Creſſes grow euery where by Highwaies, vpon walls made of mud or earth, and in ſtony places.

¶ *The Time.*

It floureth from May to the end of Auguſt: the ſeed is ripe in September.

¶ *The Names.*

Docke-Creſſes are called in Greecke, [illegible]: in Latine, *Lampſana*, and *Napium*, by *Dodonæus*: *Tabernamontanus* calleth this, *Sonchus ſylueſtris*: *Camerarius* affirmes, That in Pruſſia they call it *Papillaris*.

¶ *The Nature.*

Docke-Creſſes are of nature hot, and ſomewhat abſterſiue or cleanſing.

¶ *The Vertues.*

Taken in meate, as *Galen* and *Dioſcorides* affirme, it ingendreth euill iuyce and naughtie nouriſhment. A

‡ *Camerarius* affirmeth, That it is vſed with good ſucceſſe in Pruſſia againſt vlcerated or ſore breaſts. ‡ B

† The figure that was here, was of the *Lapiſtium ſtultorum*, deſcribed in the ſecond chapter of this booke; and the true figure of this plant here deſcribed was pag. 332. vnder the name of *Sonchus ſylueſtris*.

CHAP. 17.

Of Water-Parſenep, and Water-Creſſes.

¶ GReat Water-Parſenep groweth vpright, and is deſcribed to haue leaues of a pleaſant ſauour, fat and full of iuyce as thoſe of Alexanders, but ſomewhat leſſer, reſembling the Garden Parſenep: the ſtalke is round, ſmooth, and hollow, like to Kexe or Caſhes: the root conſiſteth of many ſmall ſtrings or threds faſtned vnto the ſtalke within the water

or

1 *Sium majus latifolium.*
Great Water Parſenep.

† *Sium majus anguſtifolium.*
The leſſer water Parſenep.

‡ 4 *Sium alterum Oluſatri facie.*
Long leaued water-Creſſes.

or miry ground: at the top go grow many white floures, in ſpoky roundles like fennell; which being bruiſed do yeeld a very ſtrong ſauour, ſmelling like *Petroleum*, as doth the reſt of the plant.

‡ 2 This plant much reſembles the laſt deſcribed, and growes vp ſome cubit and a halfe high, with many leaues finely ſnipt about the edges, growing vpon one rib, and commonly they ſtand bolt vpright. The vmbell conſiſts of little white floures: the root is ſmal, and conſiſteth of many ſtrings.

‡ 3 There is another very like this, but they thus differ: the ſtalkes and leaues of this later are leſſe than thoſe of the precedent, and not ſo many vpon one rib; the other growes vpright, to ſome yard or more high: this neuer growes vp, but alwaies creepes, and almoſt at euerie ioynt puts forth an vmbel of floures.

4 To theſe may be added another, whoſe root conſiſts of aboundance of writhen and ſmall blacke fibres; the ſtalkes are like Hemlock, ſome three cubits high, the leaues are long, narrow, and ſnipped about

about the edges, growing commonly two or three together: the vmbel of floures is commonly of a yellowiſh greene: the ſeed is like parſley ſeed, but in taſte ſomewhat reſembles *Cumine*, *Daucus Creticus*, and the rinde of a Citron, yet ſeemes ſomewhat hotter. ‡

5 Water-Creſſe hath many fat and weake hollow branches trailing vpon the grauell and earth where it groweth, taking hold in ſundry places as it creepeth; by meanes whereof the plant ſpreadeth ouer a great compaſſe of ground. The leaues are likewiſe compact and winged with many ſmall leaues ſet vpon a middle rib one againſt another, except the point leafe, which ſtands by it ſelfe, as doth that of the aſh, if it grow in his naturall place, which is in a grauelly ſpring. The vpper face of the whole plant is of a browne colour, and greene vnder the leaues, which is a perfect marke to know the phyſicall kinde from the others. The white floures grow alongſt the ſtalkes, and are ſucceeded by cods wherein the ſeed is contained. The root is nothing elſe but as it were a thrumme or bundle of threds.

† 5 *Naſturtium aquaticum, ſiue Crateua Sium.*
Common Water-Creſſes.

‡ 6 *Sium Matthioli & Italorum.*
Italian Water-Creſſe.

6 There is alſo another kinde hereof, hauing leaues growing many on one ſtalke, ſnipt about the edges, being in ſhape betweene the garden Creſſes and Cuckow-floures: the ſtalke is creſted, and diuided into many branches; the floures white, and are ſucceeded by cods like thoſe of our ordinarie Water-Creſſe laſt deſcribed.

¶ *The Place.*

‡ 1 The firſt of theſe I haue not found growing, nor as yet heard of within this kingdome.

2 The ſecond I firſt found in the company of M. *Robert Larkin*, going betweene Redriffe and Deptford, in a rotten boggy place on the right hand of the way.

3 The third growes almoſt in euery watery place about London.

4 This is more rare, and was found by M^r. *Goodyer* in the ponds about Moore Parke; and by M. *George Bowles* in the ditches about Elleſmere, and in diuers ponds in Flint-ſhire.

5 The fifth is as frequent as the third, and commonly they grow neere together.

6 This *Lobel* ſaith he found in Piemont, in riuelets amongſt the hills: I haue not yet heard that it growes with vs. ‡

¶ *The Time.*

They ſpring and wax greene in Aprill, and floure in Iuly.

The water Creſſe to be eaten in ſallads ſheweth it ſelfe in March, when it is beſt, and floureth in Summer with the reſt.

¶ *The Names.*

‡ 1 The firſt of theſe is *Sium maius latifolium* of *Tabernamontanus*.

2 This is *Sion odoratum Tragi*: *Sium*, of *Matthiolus*, *Dodonæus*, and others: it is taken to be *Sium*, or *Lauer*, of *Dioſcorides*. *Lobel* calls it alſo *Paſtinaca aquatica*, or water Parſenep.

3 This may be called *Sium vmbellatum repens*, Creeping water Parſenep. Of this there is a reaſonable good figure in the *Hiſtoria Lugdunenſis*, *pag.* 1092. vnder the title of *Sium verum Matthioli*; but the deſcription is of that we here giue you in the ſixth place.

4 This is *Sium alterum* of *Dodonæus*: and *Sium alterum Oluſatri facie* of *Lobel*.

5 Many iudge this to be the *Siſymbrium alterum*, or *Cardamine* of *Dioſcorides*: as alſo the *Sion* of *Crateuas*: and therefore *Lobel* termes it *Sion Crateuæ erucæ folium*. It is called by *Dodonæus*, and vulgarly in ſhops knowne by the name of *Naſturtium aquaticum*, or water Creſſes.

6 This is called *Sium vulgare* by *Matthiolus*: *Lobel* alſo termes it *Sium Matthioli & Italorum*. This was thought by our Countrey-man Doctor *Turner* to be no other than the ſecond here deſcribed: of which opinion I muſt confeſſe I alſo was; but vpon better conſideration of that which *Lobel* and *Bauhine* haue written, I haue changed my minde. ‡

¶ *The Temperature.*

Water-Creſſe is euidently hot and dry.

¶ *The Vertues.*

A Water-Creſſe being boyled in Wine or Milke, and drunke for certaine dayes together, is very good againſt the Scuruy or Scorbute.

B Being chopped or boyled in the broth of fleſh, and eaten for thirty dayes together, at morning, noone, and night, it prouoketh vrine, waſts the ſtone, and driueth it forth. Taken in the ſame maner, it doth cure yong maidens of the green ſickneſſe, bringeth downe the termes, and ſendeth into the face their accuſtomed liuely colour, loſt by the ſtopping of their *Menſtrua*.

Chap. 18. *Of wilde Water-Creſſes, or Cuckow Floures.*

¶ *The Deſcription.*

1 THe firſt of the Cuckow floures hath leaues at his ſpringing vp ſomwhat round, and thoſe that ſpring afterward grow iagged like the leaues of Greeke Valerian: among which riſeth vp a ſtalke a foot long, ſet with the like leaues, but ſmaller, and more iagged, reſembling thoſe of Rocket. The floures grow at the top in ſmall bundles, white of colour, hollow in the middle, reſembling the white ſweet-Iohn: after which do come ſmall chaffie husks or ſeed veſſels, wherein the ſeed is contained. The root is ſmall and threddy.

2 The ſecond ſort of Cuckow floures hath ſmall iagged leaues like thoſe of ſmall water Valerian, agreeing with the former in ſtalkes and roots: the floures be white, ouerdaſht or declining toward a light carnation.

‡ 3 The leaues and ſtalks of this are like thoſe of the laſt deſcribed; neither are the floures which firſt ſhew themſelues much vnlike them; but when as they begin to faile, in their middle riſe vp heads of pretty double floures made of many leaues, like in colour to theſe of the ſingle. ‡

4 The fourth ſort of Cuckow Floures groweth creeping vpon the ground, with ſmall threddy ſtalkes, whereon do grow leaues like thoſe of the field Clauer, or three leaued Graſſe: amongſt which do come vp ſmall and tender ſtalkes two handfulls high, hauing floures at the top in greater quantitie than any of the reſt, of colour white; and after them follow cods containing a ſmall ſeed. The root is nothing elſe but as it were a bundle of thrums or threds.

5 Milke white Lady-ſmocke hath ſtalkes riſing immediately from the root, diuiding themſelues into ſundry ſmall twiggy and hard branches, ſet with leaues like thoſe of *Serpillum*. The floures grow at the top, made of foure leaues of a yellowiſh colour: the root is tough and woody, with ſome fibres annexed thereto. ‡ This is no other than the firſt deſcribed, differing onely therefrom in that the floures are milke white, as our Author truly in the title of his figure made them; yet forgetting himſelfe in his deſcription, he makes them yellowiſh, contrarie to himſelfe and the truth. ‡

6 Mountaine

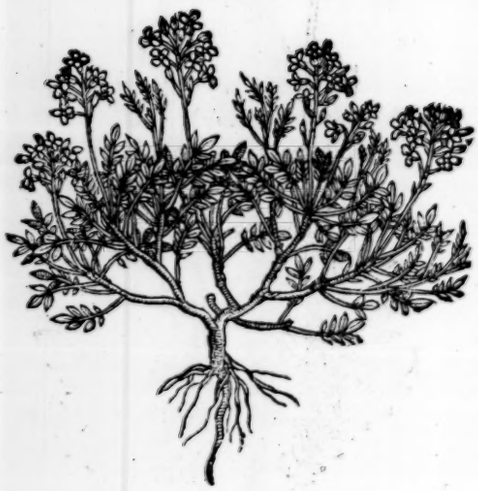
1 *Cardamine.* Cuckow floures.

2 *Cardamine altera.* Ladies-ſmocks.

‡ 3 *Cardamine altera flore pleno.*
Double floured Lady-ſmocke.

4 *Cardamine Trifolia.*
Three leaued Lady-ſmocke.

6 *Cardamine Alpina.*
Mountaine Lady-Smocke.



‡ 7 *Sium minus impatiens.*
The impatient Lady-ſmocke.

8 *Cardamine pumila Bellidis folio Alpina.*
The Dwarfe Daſie-leaued Lady-ſmocke of the Alpes.

6 Mountaine Lady-ſmocke hath many roots, nothing elſe but as it were a bundle of threddy ſtrings, from the which do come forth three or foure ſmall weak or tender leaues made of ſundry ſmall leaues, in ſhew like to thoſe of ſmall water Valerian. The ſtalkes be ſmall and brittle, whereupon doe grow ſmall floures like the firſt kinde.

‡ 7 I ſhould be blame-worthy if in this place I omitted that pretty conditioned *Sium* which is kept in diuers of our London gardens, and was firſt brought hither by that great Treaſurer of Natures rarieties, M. *Iohn Tradeſcant*. This plant hath leaues ſet many vpon a rib, like as the other *Sium* deſcribed in the ſecond place hath; but they are cut in with two or three prety deep gaſhes: the ſtalk is ſome cubit high, & diuided into many branches, which haue many ſmall white floures growing vpon them: after theſe floures are paſt there follow ſmall long cods containing a ſmall white ſeed. Now the nature of this plant is ſuch, that if you touch but the cods when as the ſeed is ripe, though you do it neuer ſo gently, yet will the ſeed fly all abroad with violence, as diſdaining to be touched: whence they vſually call it *Noli me tangere*; as they for the like qualitie name the *Perſicaria ſiliquoſa*. The nature of this plant is ſomewhat admirable, for if the ſeeds (as I ſaid) be fully ripe,

ripe,though you put but your hand neere them,as profering to touch them,though you doe it not, yet will they fly out vpon you,and if you expect no ſuch thing,perhaps make you affraid by reaſon of the ſuddenneſſe thereof. This herbe is written of onely by *Proſper Alpinus*, vnder the title of *Sium Minimum*: and it may be called in Engliſh,Impatient Lady-ſmocke, or Cuckow floure. It is an annuall, and yeerely ſowes it ſelfe by the falling ſeeds. ‡

‡ 8 The leaues of this ſomewhat reſemble thoſe of Daſyes,but leſſe,and lie ſpread vpon the ground,amongſt which riſes vp a weake and ſlender ſtalke ſet with 3 or 4 leaues at certaine diſtances,it being ſome handful high,the top is adorned with ſmal white floures conſiſting of foure leaues apeece,after which follow large and long cods, conſidering the ſmallnes of the plant; within theſe in a double order is conteined a ſmall reddiſh ſeed,of ſomewhat a biting taſte. The root creepes vpon the top of the ground,putting vp new buds in diuers places. *Cluſius* found this growing vpon the rockes on the Etſcherian mountaine in Auſtria,and hath giuen vs the hiſtory and figure thereof vnder the name of *Plantula Cardamines emula*, and *Sinapi pumulum Alpinum*.

¶ *The Time and Place.*

That of the Alpiſh mountaines is a ſtranger in theſe cold Countries: the reſt are to be found euery where, as aforeſaid, eſpecially in the caſtle ditch at Clare in Eſſex. ‡ The ſeuenth growes naturally in ſome places of Italy.

Theſe flower for the moſt part in Aprill and May, when the Cuckowe doth begin to ſing her pleaſant notes with out ſtammering.

¶ *The Names.*

They are commonly called in Latine, *Flos Cuculi*, by *Brunfelſius* and *Dodonæus*, for the reaſon aforeſaid; and alſo ſome call them *Naſturtium aquaticum minus*, or leſſer water Creſſe: of ſome, *Cardamine*, and *Siſymbrium alterum* of *Dioſcorides*: it is called in the Germane tongue, **wilder creſz**: in French, *Paſſerage ſauuage*: in Engliſh, Cuckowe flowers: in Northfolke, Canterbury bells: at the Namptwich in Cheſhire, where I had my beginning, Ladie ſmockes, which hath giuen me cauſe to Chriſten it after my Country faſhion.

¶ *The Nature and Vertues.*

Theſe herbes be hot and drie in the ſecond degree: we haue no certaine proofe or authority of their vertues, but ſurely from the kindes of water Creſſe they cannot much differ, and therefore to them they may be referred in their vertues.

† The figure that was in the fourth place; being of the ſame plant that is deſcribed in the firſt place; the counterfeit ſtalkes and heades being taken away, as *Bauhine* rightly hath obſerued; as alſo the deſcription thereof, which (as many other) our Author frames by looking vpon the figure, and the ſtrength of his owne fancie: I haue omitted as impertinent.

Chap. 19. *Of Treacle Muſtard.*

¶ *The Deſcription.*

1 Treacle muſtard hath long broad leaues, eſpecially thoſe next the ground, the others leſſer, ſlightly indented about the edges like thoſe of Dandelion. The ſtalkes be long and brittle, diuided into many branches euen from the ground to the top, where grow many ſmall idle flowers tuft faſhion, after which ſucceed large, flat, thin, chaffie huskes or ſeed veſſels heart faſhion, wherein are conteined browne flat ſeeds, ſharpe in taſte, burning the tongue as doth muſtard ſeed, leauing a taſte or ſauour of Garlicke behinde for a farewell.

2 Mithridate Muſtard hath long narrow leaues like thoſe of Woad, or rather Cow Baſil. The ſtalkes be incloſed with ſmall ſnipt leaues euen to the branches, Pyramidis faſhion, that is to ſay, ſmaller and ſmaller toward the top, where it is diuided into ſundrie branches, whereon doe grow ſmall flowers: which being paſt, the cods, or rather thinne chaffie huskes do appeare full of ſharpe ſeed, like the former. The roote is long and ſlender.

3 The third kinde of Treacle Muſtard, named Knaues Muſtard, (for that it is too bad for honeſt men) hath long, fat, and broad leaues, like thoſe of Dwale or deadly Nightſhade: in taſte like thoſe of Vuluaria or ſtinching Orach, ſet vpon a round ſtalke two cubits high, diuided at the top into ſmall armes or branches, whereon do grow ſmall fooliſh white ſpokie flowers. The ſeed is conteined in flat pouches like thoſe of Shepheards purſe, brown, ſharpe in taſte, and of an ill ſauor.

4 Bowyers Muſtard hath the lower leaues reſembling the ordinary Thlaſpi, but the vpper are very ſmall like tode flaxe but ſmaller. The ſtalkes be ſmall, ſlender, and many. The flowers be ſmall, and white, each conſiſting of foure leaues. The ſeeds be placed vpon the branches from the loweſt part of them to the top, exceeding ſharpe and hot in taſte, and of a yellowiſh colour. The roote is ſmall and woody.

5 Grecian muſtard hath many leaues ſpred vpon the ground, like thoſe of the common Daiſie, of a darke greeniſh colour: from the midſt whereof ſpring vp ſtalkes two foote long, diuided

1 *Thlaſpi Dioſcoridis.*
Treacle Muſtard.

2 *Thlaſpi Vulgatiſſimum.*
Mithridate Muſtard.

3 *Thlaſpi maius.*
Knaues Muſtard.

4 *Thlaſpi minus.*
Bowyers Muſtard.

5 *Thlaſpi*

5 *Thlaſpi Græcum.*
Grecian Muſtard.

6 *Thlaſpi amarum.*
Clownes Muſtard.

7 *Thlaſpi Clypeatum Lobelij.*
Buckler Muſtard.

8 *Thlaſpi minus Clypeatum.*
Small Buckler Muſtard.

into many ſmall branches, whereupon grow ſmall white flowers compoſed of foure leaues, after which ſucceed round flat huskes or ſeed veſſels, ſet vpon the ſtalke by couples, as it were ſundry paires of ſpectacles, wherein the ſeed is contained, ſharpe and biting as the other. This is ſometimes ſeen with yellow flowers.

† 6 Clownes muſtard hath a ſhort white fibrous root, from whence ariſeth vp a ſtalke of the height of a foot, which a little aboue the root diuides it ſelfe into ſome foure or fiue branches, and theſe againe are ſubdiuided into other, ſmaller ſo that it reſembles a little ſhrub: longiſh narrow leaues notched after the manee of Sciatica Creſſes by turees garniſh theſe branches, and theſe leaues are as bitter as the ſmaller Centaury. The flowers ſtand thicke together at the tops of theſe branches in manner of little vmbels, and are commonly of a light blew and white mixed together (being ſeldome onely white, or yellow.) After the flowers ſucceed ſeed veſſels after the manner of the other plants of this kinde, and in them is conteined a ſmall hot ſeed †

7 Buckler muſtard hath many large leaues, ſpread vpon the ground like *Hieracium* or Hawkeweede, ſomewhat more toothed or ſnipt about the edges: among which comes vp ſtalkes ſmall and brittle, a cubit high, garniſhed with many ſmall pale yellowiſh flowers: in whoſe place ſucceed many round flat cods or pouches, buckler faſhion, conteining a ſeed like vnto the others.

8 Small Buckler Muſtard, is a very ſmall, baſe, or low plant, hauing whitiſh leaues like thoſe of wild Time, ſet vpon ſmall, weake and tender branches. The flowers grow at the top like the other buckler Muſtard. The ſeed veſſels are like, but not ſo round, ſomewhat ſharpe pointed, ſharp in taſte, & burning the tongue. The whole plant lieth flat vpon the ground, like wild Tyme.

¶ *The Place.*

Treacle or rather Mithridate Muſtard growes wild in ſundry places in corn-fields, ditch banks, and in ſandy, drie, and barren ground. I haue found it in corne fields betweene Croydon & Godſtone in Surrey, at South-fleete in Kent, by the path that leadeth from Harnſey (a ſmall village by London) vnto Waltham croſſe, and in many other places.

The other do grow vnder hedges, oftentimes in fields and in ſtonie and vntoiled places; they grow plentifully in Bohemia and Germany: they are ſeene likewiſe on the ſtonie bankes of the riuer Rhene. They are likewiſe to be found in England in ſundrie places wilde, the which I haue gathered into my garden. ‡ I haue found none but the firſt and ſecond growing wilde in any part of England as yet; but I deny not, but that ſome of the other may be found, though not all. ‡

¶ *The Time.*

Theſe treacle Muſtards are found with their flowers from May to Iuly, and the ſeed is ripe in the end of Auguſt.

¶ *The Names.*

The Grecians call theſe kindes of herbes θλάσπι, θλασπίδιον, or σίναπι ἄγριον, of the huske or ſeed veſſell, which is like a little ſhield. They haue alſo other names which be found among the baſtard words: as *Scandulaceum, Capſella, Pes gallinaceus*. Neither be the later writers without their names, as *Naſturtium tectorum*, and *Sinapi ruſticum*: it is called in Dutch, **Wilde Kerſe**: in French, *Seneue ſauuage*: in Engliſh, Treacle Muſtard, diſh Muſtard, Bowyers Muſtard: of ſome, *Thlaſpi*, after the Greeke name, Churles muſtard, and wilde Creſſes.

‡ 1 This is *Thlaſpi Dioſcoridis Drabæ, aut Chamelinæ folio* of *Lobell*: *Thlaſpi Latius* of *Dodonæus*: and the ſecond *Thlaſpi* of *Matthiolus*.

2 This, *Thlaſpi Vulgatiſſimum Vaccariæ folio* of *Lobell*: the firſt *Thlaſpi* of *Matthiolus*, and ſecond of *Dodonæus*; and this is that *Thlaſpi* whoſe ſeed is vſed in ſhops.

3 This is *Thlaſpi majus* of *Tabernamontanus*.

4 This is *Thlaſpi minus* of *Dodonæus*: *Thlaſpi: anguſtifolium* of *Fuchſius*: *Thlaſpi minus hortenſe Oſyridis folio, &c.* of *Lobell*: and *Naſturtium ſylveſtre* of *Thalius*.

5 This is *Alyſſon* of *Matthiolus*: *Thlaſpi Græcum Polygonati folio*, of *Lobell* and *Tabern*.

6 This the Author of the *Hiſt. Lug.* calls *Naſturtium ſylveſtre*; *Tabern.* calls it *Thlaſpi amarum*.

7 *Lobell* termes this *Thlaſpi parvum Hieracifolium*, and *Lunaria Lutea Monſpelienſium*.

8 This is *Thlaſpi minus clypeatum Serpillifolio* of *Lobell*. ‡

† The figures of theſe two laſt mentioned were tranſpoſed in the former Edition.

¶ *The Temperature.*

The ſeed of theſe kindes of Treacle Muſtards be hot and drie in the end of the third degree.

¶ *The Vertues.*

The ſeed of Thlaſpi or treacle Muſtard eaten, purgeth colour both vpward and downeward, prouoketh flowers, and breaketh inward apoſthumes.

The ſame vſed in clyſters, helpeth the ſciatica, and is good vnto thoſe purpoſes for which Muſtard ſeed ſerueth.

¶ *The Danger.*

The ſeed of theſe herbes be ſo extreame hot and vehement in working, that being taken in too great

great a quantitie, purgeth and ſcoureth euen vnto bloud, and is hurtfull to women with child, and therefore great care is to be had in giuing them inwardly in any great quantitie.

Chap. 20. *Of Candie Muſtard.*

¶ *The Deſcription.*

Candie muſtard excelleth all the reſt, as well for the comely floures that it bringeth forth for the decking vp of gardens and houſes, as alſo for that it goeth beyond the reſt in his phyſicall vertues. It riſeth vp with a very brittle ſtalke of a cubit high, which diuideth it ſelfe into ſundry bowes or branches, ſet with leaues like thoſe of ſtocke gilliflowres, of a gray or ouerworne greene colour. The floures grow at the top of thes ſtalke roundt, hicke cluſtering together, like thoſe of Scabious or diuels bit, ſometimes blew, often purple, carnation or horſe fleſh, but ſeldome white for any thing that I haue ſeen; varying according to the ſoile or Clymate. The ſeed is reddiſh, ſharpe, and biting the tongue, wrapped in little huskes faſhioned like an heart. ‡ There is a leſſer variety of this with white well ſmelling flowers, in other reſpects little differing from the ordinary. ‡

Thlaſpi Candiæ.
Candie Muſtard.

‡ *Thlaſpi Candiæ parvum flo albo.*
Small Candy muſtard with a white floure.

¶ *The Place.*

This growes naturally in ſome places of Auſtria, as alſo in Candy, Spaine, & Italy, from whence I receiued ſeeds by the liberality of the right Honorable the Lord *Edward Zouch*, at his returne into England from thoſe parts. ‡ *Cluſius* found the later as he trauelled through Switzerland into Germany. ‡

¶ *The Time.*

It floureth from the beginning of May vnto the end of September, at which time you ſhall haue floures and ſeeds vpon one branch, ſome ripe, ond ſome that will not ripen at all.

¶ *The Name.*

† This plant is called by *Dodonæus* (but not rightly) *Arabis* and *Draba*: as alſo *Thlaſpi Candiæ*: which laſt name is reteined by moſt writers: in Engliſh, Candy Thlaſpi, or Candy Muſtard. †

¶ *The Temperature.*

The ſeed of Candie Muſtard is hot and drie at the end of the third degree, as is that called *Scorodothlaſpi*, or treacle muſtard.

Chap.

Chap. 21. *Of Treacle Muſtard.*

¶ *The Deſcription.*

1 Round leaued Muſtard hath many large leaues laid flat vpon the ground like the leaues of the wilde Cabbage, and of the ſame colour; among which riſe vp many ſlender ſtalkes of ſome two handfulls high or thereabouts, which are ſet with leaues far vnlike to thoſe next the ground, encloſing or embracing the ſtalkes as do the leaues of *Perfoliatum*, or Thorow-wax. The floures grow at the top of the branches, white of colour; which being paſt, there do ſucceed flat huskes or pouches like vnto thoſe of Shepheards purſe, with hot ſeed biting the tongue.

1 *Thlaſpi rotundifolium.*
Round leaued Muſtard.

2 *Thlaſpi Pannonicum Cluſij.*
Hungary Muſtard.

2 Hungary Muſtard bringeth forth ſlender ſtalkes of one cubit high: the leaues which firſt appeare are flat, ſomewhat round like thoſe of the wilde Beet; but thoſe leaues which after doe garniſh the ſtalkes are long and broad like thoſe of the garden Colewort, but leſſer and ſofter, greene on the vpper ſide, and vnder declining to whiteneſſe, ſmelling like Garlicke. The floures be ſmall and white, conſiſting of foure ſmall leaues, which in a great tuft or vmbel do grow thick thruſt together: which being paſt, there followeth in euery ſmall huske one duskiſh ſeed and no more, bitter and ſharpe in taſte. The root is white and ſmall, creeping vnder the ground far abroad like the roots of Couch-graſſe; preparing new ſhoots and branches for the yeare following, contrarie to all the reſt of his kinde, which are encreaſed by ſeed, and not otherwiſe.

3 Churles Muſtard hath many ſmall twiggy ſtalkes, ſlender, tough, and pliant, ſet with ſmall leaues like thoſe of Cudweed, or Lauander, with ſmall white floures: the huskes and ſeeds are ſmall, few, ſharpe, bitter, and vnſauorie: the whole plant is of a whitiſh colour.

4 Peaſants Muſtard hath many pretty large branches, with thin and iagged leaues like thoſe of Creſſes, but ſmaller, in ſauor and taſte like to the ordinarie *Thlaſpi*: the floures be whitiſh, and grow in a ſmall ſpoky tuft. The ſeed in taſte and ſauor is equall with the other of his kinde and countrey, or rather exceeds them in ſharpneſſe.

5 Yellow

3 *Thlaſpi Narbonenſe Lobelij.*
Churles Muſtard.

4 *Thlaſpi vmbellatum Narbonenſe.*
Peaſants Muſtard of Narbone.

‡ 5 *Thlaſpi ſupinum luteum.*
Yellow Muſtard.

5 Yellow Muſtard hath an exceeding number of whitiſh leaues ſpred vpon the ground in manner of a turfe or haſſocke; from the midſt whereof riſeth vp an vpright ſtalke of three foot high, putting forth many ſmall branches or armes: at the top whereof grow many ſmall yellow floures like thoſe of the wall-floure, but much leſſer: which being paſt, the husks appeare flat, pouch-faſhion, wherein is the ſeed like Treacle Muſtard, ſharp alſo and biting.

6 White Treacle Muſtard hath leaues ſpred vpon the ground like the other, but ſmaller: the ſtalkes riſe vp from the middeſt thereof, branched, ſet with leaues ſmaller than thoſe that lie vpon the ground euen to the top, where doth grow a tuft of white floures in faſhion like to thoſe of the other Thlaſpies: the ſeed is like the other: ‡ The cods of this are ſometimes flat, and otherwhiles round: the floures alſo grow ſometimes ſpike-faſhion, otherwhiles in an vmbell. I haue giuen you two figures expreſſing both theſe varieties. ‡

The

6 *Thlaſpi album ſupinum, & eius*
White Treacle Muſtard.

7 *Thlaſpi minus Cluſij.*
Cluſius his ſmall Muſtard.

8 *Thlaſpi petræum minus.*
Small Rocke Muſtard.

7 This ſmall kinde of Muſtard hath a few ſmall leaues ſpread vpon the ground like thoſe of the leſſer Daſie, but of a blewiſher greene colour; from which riſe vp ſmall tender ſtalks ſet with three, and ſometimes foure ſmall ſharpe pointed leaues: the floures grow at the top, ſmall and white; the cods are flat, pouch-faſhion, like thoſe of Shepheards purſe, and in each of them there is contained two or three yellowiſh ſeeds.

‡ 8 To theſe we may fitly adde another ſmall mountaine Thlaſpi, firſt deſcribed by that diligent and learned Apothecarie *Iohn Pona* of Verona, in his deſcription of Mount Baldus. This from a threddy root brings forth many ſmall whitiſh leaues lying ſpred vpon the ground, and a little nicked about their edges: among theſe riſeth vp a ſtalke ſome two or three handfulls high, diuaricated toward the top into diuers ſmall branches, vpon which grow white little floures conſiſting of foure leaues apiece: which fading, there follow round ſeed-veſſels, like to thoſe of *Myagrum*: whence *Pona*, the firſt deſcriber thereof, calls it *Thlaſpi petræum myagrodes*. The ſeed is as ſharpe and biting as any of the other Thlaſpies. This growes naturally in the chinkes of the rocks in that part of Baldus that is termed *Vallis frigida*, or, The cold Valley. ‡

¶ *The Place.*

Theſe kindes of Treacle Muſtard grow vpon hills and mountaines in corne fields, in ſtony barren and grauelly grounds.

¶ *The Time.*

Theſe floure in May, Iune, and Iuly: the ſeed is ripe in September.

¶ *The Names.*

‡ 1 This is *Thlaſpi oleraceum* of *Tabernamontanus*: *Thlaſpi primum*, of *Daleſchampius*: *Thlaſpi mitius rotundifolium* of *Columna*. Our Author confounded it with that whoſe figure is the firſt in the enſuing Chapter, and called it *Thlaſpi incanum*.

2 *Thlaſpi montanum peltatum* of *Cluſius*: and *Thlaſpi Pannonicum* of *Lobel* and *Taber*.

3 *Thlaſpi Narbonenſe centunculi anguſtifolio*, of *Lobel*: and *Thlaſpi maritimum* of *Daleſchampius*.

4 *Thlaſpi vmbellatum Naſturtij hortenſis folio Narbonenſe*, of *Lobel*. The figures of this and the precedent were tranſpoſed in the former edition.

5 *Thlaſpi ſupinum luteum* of *Lobel*. Our Authors figure was a varietie of the next following.

6 *Thlaſpi album ſupinum* of *Lobel*: *Thlaſpi montanum ſecundum* of *Cluſius*.

7 *Thlaſpi pumilum* of *Cluſius*: *Thlaſpi minimum* of *Tabernamontanus*.

8 *Thlaſpi petræum myagrodes* of *Pona*: *Thlaſpi tertium ſaxatile* of *Camerarius*, in his *Epit.* of *Matthiolus*. ‡

¶ *The Temperature and Vertues.*

The ſeeds of theſe churliſh kindes of Treacle Muſtard haue a ſharpe or biting qnalitie, breake A
inward apoſtumes, bring downe the floures, kill the birth, and helpeth the Sciatica or pain in the hip. They purge choler vpward and downeward, if you take two ounces and a halfe of them, as *Dioſcorides* writeth. They are mixed in counterpoyſons, as Treacle, Mythridate, and ſuch like Compoſitions.

CHAP. 22.

Of Wooddy Muſtard.

¶ *The Deſcription.*

1 WOoddy Muſtard hath long narrow leaues declining to whiteneſſe, like thoſe of the ſtocke Gilloflower, but ſmaller, very like the leaues of Roſemary, but ſomewhat broader, with rough ſtalks very tough and pliant, being of the ſubſtance of wood: the floures grow at the top, white of colour: the ſeeds do follow, in taſte ſharpe and biting. The huskes or ſeed-veſſels are round and ſomewhat longiſh.

2 Small wooddy Muſtard groweth to the height of two cubits, with many ſtalkes ſet with ſmall narrow leaues like thoſe of Hyſſop, but rougher; and at the top grow floures like thoſe of Treacle Muſtard, or Thlaſpi. The whole plant groweth as a ſhrub or hedge-buſh.

3 Thorny Muſtard groweth vp to the height of foure cubits, of a wooddy ſubſtance, like vnto a hedge-buſh, or wilde ſhrub, with ſtalkes beſet with leaues, floures, and ſeeds like the laſt before mentioned; agreeing in all points, ſauing in the cruell pricking ſharpe thornes wherewith this plant is armed; the other not. The root is tough, wooddy, and ſome ſtrings or fibres annexed thereto.

1 *Thlaſpi fruticoſum incanum.*
Hoary wooddy Muſtard.

2 *Thlaſpi fruticoſum minus.*
Small wooddy Muſtard.

3 *Thlaſpi ſpinoſum.*
Thorny Muſtard.

‡ 4 *Thlaſpi fruticoſum folio Leucoÿ marini.*
Buſhy Muſtard.

‡ 5 *Thlaſpi*

‡ 5 *Thlaſpi hederacium.*
Iuy Muſtard.

4 There is another ſort of wooddy Muſtard growing in ſhadowie and obſcure mountaines, and rough ſtony places reſembling the laſt deſcribed; ſauing that this plant hath no pricks at all, but many ſmall branches ſet thick with leaues, reſembling thoſe of the leſſer ſea *Leucoion*: the floures are many and white; the ſeed like the other Thlaſpies: the root is wooddy and fibrous.

‡ 5 There is (ſaith *Lobel*) in Portland and about Plimouth, and vpon other rockes on the ſea coaſt of England, a creeping little herbe hauing ſmall red creſted ſtalkes about a ſpanne high: the leaues are thicke and faſhioned like Iuy; the white floures and ſmall ſeeds do in taſte and ſhape reſemble the Thlaſpies. ‡

¶ *The Place.*

‡ 1 The firſt of theſe groweth about Mechline.

2. 3. 4. Theſe plants grow vpon the Alpiſh and Pyrene mountaines: in Piemont and in Italy, in ſtony and rockie grounds.

¶ *The Time.*

They floure when the other kindes of Thlaſpies do; that is, from May to the end of Auguſt.

¶ *The Names.*

‡ 1 This *Cluſius* and *Lobel* call *Thlaſpi incanum Mechlinienſe*: *Bauhine* thinks it to be the *Iberis prima* of *Tabernamontanus*, whoſe figure retained this place in the former edition.

2 This is *Thlaſpi fruticoſum alterum* of *Lobel*: *Thlaſpi* 5. *Hiſpanicum* of *Cluſius*.

3 *Lobel* calls this, *Thlaſpi fruticoſum ſpinoſum*.

4 *Camerarius* calls this, *Thlaſpi ſemper virens biflorum folio Leucoïj, &c. Lobel*, *Thlaſpi fruticoſum folio Leucoïj, &c.*

5 This *Lobel* calls *Thlaſpi hederaceum*. ‡

¶ *The Nature and Vertues.*

I finde nothing extant of their nature or vertues, but they may be referred to the kinds of Thlaſpies, whereof no doubt they are of kindred and affinitie, as well in facultie as forme.

CHAP. 23. *Of Towers Muſtard.*

¶ *The Deſcription.*

‡ 1 TOwers Muſtard hath beene taken of ſome for a kinde of Creſſes, and referred by them to it: of ſome, for one of the Muſtards, and ſo placed among the Thlaſpies as a kinde thereof; and therefore my ſelfe muſt needs beſtow it ſomewhere with others. Therefore I haue with *Cluſius* and *Lobel* placed it among the Thlaſpies, as a kinde thereof. It commeth out of the ground with many long and large rough leaues, like thoſe of Hounds-tongue, eſpecially thoſe next the ground: amongſt which riſeth vp a long ſtalke of a cubit or more high, ſet about with ſharpe pointed leaues like thoſe of Woad. The floures grow at the top, if I may terme them floures, but they are as it were a little duſty chaffe driuen vpon the leaues and branches with the winde: after which come very ſmall cods, wherein is ſmall reddiſh ſeed like that of Cameline or Engliſh Worm-ſeed, with a root made of a tuft full of innumerable threds or ſtrings.

‡ 2 This ſecond kinde hath a thicker and harder root than the precedent, hauing alſo fewer fibers; the leaues are bigger than thoſe of the laſt deſcribed, ſomewhat curled or ſinuated, yet leſſe, rough, and of a lighter greene; in the middeſt of theſe there riſe vp one or two ſtalkes or more, vſually ſome two cubits high, diuided into ſome branches, which are adorned with leaues almoſt ingirting them round at there ſetting on. The floures are like thoſe of the former, but ſomewhat larger, and the colour is either white, or a pale yellow: after theſe ſucceed many long cods filled with a ſeed ſomewhat larger than the laſt deſcribed. ‡

3 Gold of pleaſure is an herbe with many branches ſet vpon a ſtraight ſtalke, round, and diuided into ſundry wings, in height two cubits. The leaues be long, broad, and ſharpe pointed, ſomewhat ſnipt or indented about the edges like thoſe of Sow-thiſtles. The flowers along the ſtalkes are white; the ſeed contained in round little veſſels is fat and oily.

1 *Turritis.*
Towers Muſtard.

‡ 2 *Turritis major.*
Great Tower Muſtard,

4 Treacle Wormeſeed riſeth vp with tough and pliant branches, whereupou do grow many ſmall yellow flowers; after which come long ſlender cods like Flixe-weed, or Sophia, wherein is conteined ſmall yellowiſh ſeed, bitter as Wormeſeed or Coliquintida. The leaues are ſmall and darke of colour, in ſhape like thoſe of the wilde ſtocke Gilloſloures, but not ſo thicke, nor fat. The root is ſmall and ſingle.

¶ *The Place.*

Towers Treacle groweth in the Weſt part of England, vpon dunghils and ſuch like places. I haue likewiſe ſeen it in ſundrie other places, as at Pyms by a village called Edmonton neere London, by the Citie wals of Weſt-cheſter in corne fields, and where flaxe did grow about Cambridge. ‡ The ſecond is a ſtranger with vs; yet I am deceiued if I haue not ſeene it growing in M. *Parkinſons* garden. ‡

The other grow in the territorie of Leiden in Zeeland, and many places of the Low-countries; and likewiſe wilde in ſundrie places of England.

¶ *The Time.*

Theſe herbes doe floure in May and Iune, and their ſeed is ripe in September.

¶ *The Names.*

‡ 1 This is *Turritis* of *Lobell*: *Turrita Vulgatior* of *Cluſius*.

2 This is *Turrita maior*, of *Cluſius*, who thinkes it to be *Braſſica Virgata* of *Cordus*.

3 Mat-

3 *Matthiolus* calls this, *Pſeudomyagrum: Tragus* calls it, *Seſamum: Dodonæus, Lobel*, and others call it *Myagrum*.

4 This *Lobel* calls *Myagrum thlaſpi effigie. Tabernamontanus* hath it twice; firſt vnder the name of *Eryſimum tertium*: ſecondly, of *Myagrum ſecundum*. And ſo alſo our Authour (as I formerly noted) had it before vnder the name of *Eruca ſylueſtris anguſtifolia*; and here vnder the name of *Camelina*. ‡

3 *Myagrum.*
Gold of pleaſure.

4 *Camelina.*
Treacle Worm-ſeed.

¶ *The Temperature.*

Theſe Plants be hot and dry in the third degree.

¶ *The Vertues.*

It is thought, ſaith *Dioſcorides*, That the roughneſſe of the skinne is poliſhed and made ſmooth with the oylie fatneſſe of the ſeed of *Myagrum*. A

Ruellius teacheth, That the iuyce of the herbe healeth vlcers of the mouth; and that the poore peaſant doth vſe the oile in banquets, and the rich in their lampes. B

The ſeed of *Camelina* ſtamped, and giuen children to drinke, killeth the wormes, and driueth them forth both by ſiege and vomit. C

‡ † The two Drabaes here omitted are treated of at large in the following Chapter.

‡ Chap. 24. *Of Turky Creſſes.*

‡ OVr Author did briefely in the precedent Chapter make mention of the two plants wee firſt mention in this Chapter; but that ſo briefely, that I thought it conuenient to diſcourſe more largely of them, as alſo to adde to them other two, being by moſt Writers adiudged to be of the ſame Tribe or kindred. The vertues of the firſt were by our Author out of *Dodonæus* formerly put to the *Thlaſpi Candiæ*, Chapter 20. from whence I haue brought them to their proper place, in the end of this preſent Chapter.

¶ *The Deſcription.*

† 1 The firſt hath creſted ſlender, yet firme ſtalkes of ſome foot long, which are ſet with leaues of ſome inch in length, broad at the ſetting on, ſinuated about the edges, and ſharpe pointed; their colour is a whitiſh greene, and taſte acride; the leaues that are at the bottome of the ſtalke are many, and larger. The tops of the ſtalkes are diuided into many branches of an vnequall length, and ſuſtain many floures; each whereof conſiſts of foure litle white leaues, ſo that together they much reſemble the vmbell of the Elder when it is in floure. Little ſwolne ſeed veſſels diuided into two cells follow the fading floures: the ſeed is whitiſh, about the bigneſſe of millet; the root alſo is white, ſlender and creeping.

† 2 This hath creeping roots, from which ariſe many branches lying vpon the ground here and there, taking root alſo; the leaues, which vpon the lower branches are many, are in forme and colour much like thoſe of the laſt deſcribed, but leſſe, and ſomewhat ſnipt about the edges. The ſtalkes are about a handfull high, or ſomewhat more, round, greene, and hairy, hauing ſome leaues growing vpon them. The floures grow ſpoke faſhion at the top of the ſtalkes, white, and conſiſting of foure leaues; which fallen, there follow cods conteining a ſmall red ſeed.

1 *Draba Dioſcoridis.*
Turkie Creſſes.

‡ 2 *Draba prima repens.*
The firſt creeping Creſſe.

3 From a ſmall and creeping root riſe vp many ſhootes, which while they are young haue many thicke juicy and darke greene leaues roſe faſhion adorning their tops, out of the middeſt of which ſpring out many ſlender ſtalkes of ſome foot high, which at certain ſpaces are encompaſſed (as it were) with leaues ſomewhat leſſer then the former, yet broader at the bottome: the floures, cods, and ſeed are like the laſt mentioned.

4 There is a plant alſo by ſome refer'd to this Claſſis; and I for ſome reaſons thinke good to make mention thereof in this place. It hath a ſtrong and very long root of colour whitiſh, and of as ſharpe a taſte as Creſſes; the ſtalkes are many, and oft times exceed the height of a man, yet ſlender, and towards their tops diuided into ſome branches, which make no vmbell, but carry their floures diſperſed; which conſiſt of foure ſmall yellow leaues: after the floure is paſt there follow long ſlender cods conteining a ſmall, yellowiſh, acride ſeed. The leaues which adorne this plant are long, ſharpe pointed, and ſnipt about the edges, ſomewhat like thoſe of Saracens Conſound, but that theſe towards the top are more vnequally cut in.

¶ *The*

‡ 3 *Draba altera repens.*
The other creeping Creſſe.

¶ *The Time.*

The firſt of theſe floures in May and the beginning of Iune. The 2 and 3 in Aprill. The fourth in Iune and Iuly.

¶ *The Place.*

None of theſe (that I know of) are found naturally growing in this kingdome; the laſt excepted, which I thinke may be found in ſome places.

¶ *The Names.*

1 This by a generall conſent of *Matthiolus, Anguillara, Lobell, &c.* is iudged to be the *Arabis*, or *Draba* of the Ancients.

2 *Draba altera* of *Cluſius.*

3 *Draba tertia ſucculento folio*, of *Cluſius*: *Eruca Muralis* of *Daleſchampius.*

4 This by *Camerarius* is ſet forth vnder the name of *Arabis quorundam*, and he affirmes in his *Hor. Med.* that he had it out of England vnder the name of *Solidago*; The which is very likely, for without doubt this is the very plant that our Author miſtooke for *Solidago Sarracenica*; for he bewraies himſelfe in the Chapter of *Epimedium*, whereas he ſaith it hath cods like *Sarraccens Conſound*; when as both he, and all other giue no cods at all to *Sarracens Conſound.* My very good friend Mr. *Iohn Goodyer* was the firſt, I thinke, that obſerued this miſtake in our Author; for which his obſeruation, together with ſome others formerly and hereafter to be remembred, I acknowledge my ſelfe beholden to him.

¶ *The Vertues, attributed to the firſt.*

1 *Dioſcorides* ſaith, that they vſe to eate the dryed ſeed of this herbe with meate, as we do pepper A
eſpecially in Cappadocia.

They vſe likewiſe to boyle the herbe with the decoction of barly, called Ptiſana; which be- B
ing ſo boiled, concocteth and bringeth forth of the cheſt tough and raw flegme which ſticketh therein.

The reſt are hot, and come neere to the vertues of the precedent. ‡ C

Chap. 25. *Of Shepheards-purſe.*

¶ *The Deſcription.*

1 THe leaues of Shepheards purſe grow vp at the firſt long, gaſhed in the edges like thoſe of Rocket, ſpred vpon the ground: from theſe ſpring vp very many little weake ſtalks diuided into ſundry branches, with like leaues growing on them, but leſſer; at the top whereof are orderly placed ſmall white floures: after theſe come vp little ſeed veſſels, flat, and cornered, narrow at the ſtem like to a certaine little pouch or purſe, in which lieth the ſeed. The root is white not without ſtrings. ‡ There in another of this kinde with leaues not ſinuated, or cut in. ‡

2 The ſmall Shepheards purſe commeth forth of the ground like the Cuckow floure, which I haue Engliſhed Ladie-ſmockes, hauing ſmall leaues deepely indented about the edges; among which riſe vp many ſmall tender ſtalkes with floures at the top, as it were chaffe. The huskes and ſeed is like the other before mentioned.

¶ *The Place.*

Theſe herbes do grow of themſelues for the moſt part, neere common high waies, in deſert and vntilled places, among rubbiſh and old walls.

¶ *The*

1 *Burſa Paſtoris.*
Shepheards purſe.

2 *Burſa Paſtoria minima.*
Small Shepheards purſe.

¶ *The Time.*

They floure, flouriſh, and ſeed all the Sommer long.

¶ *The Names.*

Shepheards purſe is called in Latine, *Paſtoris burſa*, or *Pera paſtoris*: in high Dutch, **Seckel**: in low-Dutch, **Bozſekens cruyt**: in French, *Bourſe de paſteur ou Curé*: in Engliſh, Shepheards purſe or ſcrip: of ſome, Shepheards pouch, and poore mans Parmacetie: and in the North part of England, Toy-wort, Pick-purſe, and Caſe-weed.

¶ *The Temperature.*

They are of temperature cold and dry, and very much binding, after the opinion of *Ruellius*, *Mathiolus*, and *Dodonæus*; but *Lobel* and *Pena* hold them to be hot and dry, iudging the ſame by their ſharpe taſte: which hath cauſed me to inſert them here among the kindes of Thlaſpi, conſidering the faſhion of the leaues, cods, ſeed, and taſte thereof: which do ſo wel agree together, that I might very well haue placed them as kindes thereof. But rather willing to content others that haue written before, than to pleaſe my ſelfe, I haue followed their order in marſhalling them in this place, where they may ſtand for couſine germanes.

¶ *The Vertues.*

A Shepheards purſe ſtayeth bleeding in any part of the body, whether the iuyce or the decoction thereof be drunke, or whether it be vſed pulteſſe-wiſe, or in bath, or any other way elſe.

B In a Clyſter it cureth the bloudy flix: it healeth greene and bleeding wounds: it is maruellous good for inflammations new begun, and for all diſeaſes which muſt be checked backe and cooled.

C The decoction doth ſtop the laske, the ſpitting and piſſing of bloud, and all other fluxes of bloud.

Chap. 26. *Of Italian Rocket.*

¶ *The Deſcription.*

1 Italian Rocket hath long leaues cut into many parts or diuiſions like thoſe of the Aſh tree, reſembling *Ruellius* his Bucks-horne: among which riſe vp ſtalks weake and tender, but thicke and groſſe, two foot high, garniſhed with many ſmall yellowiſh floures like the middle part of Tanſie floures, of a naughty ſauor or ſmell. The ſeed is ſmall like ſand or duſt, in taſte like Rocket ſeed, whereof in truth wee ſuſpect it to be a kinde. The root is long and wooddy.

1 *Rheſeda Plinij.*
Italian Rocket.

2 *Rheſeda maxima.*
Crambling Rocket.

2 Crambling Rocket hath many large leaues cut into ſundry ſections, deeply diuided to the middle rib, branched like the hornes of a ſtag or hart: among which there do riſe vp long fat and fleſhy ſtalkes two cubits high, lying flat vpon the ground by reaſon of his weake and feeble branches. The floures grow at the top, cluſtering thicke together, white of colour, with browniſh threds in them. The ſeed is like the former. ‡ *Lobel* affirmes it growes in the Low-country gardens with writhen ſtalkes, ſometimes ten or twelue cubits high, with leaues much diuided. ‡

¶ *The Place.*

Theſe Plants grow in ſandy, ſtony, grauelly, and chalky barren grounds. I haue found them in ſundry places of Kent, as at South-fleet, vpon Long-field downes, which is a chalkie and hilly ground very barren. They grow at Greenhithe vpon the hills, and in other places of Kent. ‡ The firſt growes alſo vpon the Wolds in Yorke-ſhire. The ſecond I haue not ſeene growing except in gardens, and much doubt whether it grow wilde with vs or no. ‡

¶ *The Time.*

Theſe Plants do flouriſh in Iune, Iuly, and Auguſt.

¶ *The*

¶ *The Names.*

The firſt is called of *Plinie*, *Reſeda*, *Eruca peregrina*, & *Eruca Cantabrica*: in Engliſh, Italian Rocket.
The ſecond is called *Reſeda maxima*: of *Anguillara*, *Pignocomon*, whereof I finde nothing extant worthy the memorie, either of temperature or vertues.

Chap. 27. *Of Groundſell.*

¶ *The Deſcription.*

1 THe ſtalke of Groundſell is round, chamfered and diuided into many branches: the leaues be greene, long, and cut in the edges almoſt like thoſe of Succorie, but leſſer, like in a manner to the leaues of Rocket. The floures be yellow, and turne to downe, that is carried away with the winde. The root is full of ſtrings and threds.

1 *Erigerum.*
Groundſell.

2 *Erigerum Tomentoſum.*
Cotton Groundſell.

2 Cotton Groundſel hath a ſtraight ſtalke of a browne purple colour, couered with a fine cotton or downy haire, of the height of two cubits. The leaues are like thoſe of S. Iames Wort, or Rag-wort; and at the top of the ſtalke grow ſmall knops, from which come floures of a pale yellow colour; which are no ſooner opened and ſpred abroad, but they change into downe like that of the Thiſtle, euen the ſame houre of his flouring, and is carried away with the winde: the root is ſmall and tender.

‡ 3 There is another with leaues more iagged, and finelier cut than the laſt mentioned, ſoft alſo and downie: the floures are fewer, leſſe and paler than in the ordinarie, but turne ſpeedily into downe like as the former. ‡

¶ *The Place.*

Theſe herbes are very common throughout England, and do grow almoſt euery where.

¶ *The Time.*

They flouriſh almoſt euery moneth of the yeare.

¶ *The*

‡ 3 *Erigeron tomentoſum alterum.*
The other Cotton Groundſell.

¶ *The Names.*

Groundſel is called in Greek ἐρίγηρον: in Latine, *Senecio*, becauſe it waxeth old quickely: by a baſtard name *Herbutum*: in Germany, **Creuſz-wurtz**: in low-Dutch, **Cruys cruyt**, and **Cruyſ-ken cruyt**: in Spaniſh, *Yerua cana*: in Italian, *Cardoncello, Spelicioſa*: in Engliſh, Groundſel.

Cotton Groundſell ſeemeth to be all one with *Theophraſtus* his *Aphace*; hee maketh mention of *Aphace* in his ſeuenth booke, which is not onely a kinde of pulſe, but an herbe alſo, vnto which this kinde of Groundſell is very like. For as *Theophraſtus* ſaith, The herbe *Aphace* is one of the pot-herbs and kindes of Succorie: adding further, That it floureth in haſte, but yet ſoone is old, and turneth into down; and ſuch a one is this kind of Groundſell. But *Theophraſtus* ſaith further, That it floureth all the winter long, and ſo long as the Spring laſteth, as my ſelfe haue often ſeene this Groundſell do.

¶ *The Temperature.*

Groundſell hath mixt faculties; it cooleth, and withall digeſteth, as *Paulus Ægineta* writeth.

¶ *The Vertues.*

The leaues of Groundſell boyled in wine or wa- A
ter, and drunke, healeth the paine and ache of the ſtomacke that proceedeth of choler.

The leaues and floures ſtamped with a little B
Hogs greaſe ceaſeth the burning heat of the ſtones and fundament. By adding to a little ſaffron or ſalt it helpeth the *Struma* or Kings Euill.

The leaues ſtamped and ſtrained into milke and drunke, helpeth the red gummes and frets in C
children.

Dioſcorides ſaith, That with the fine pouder of Frankinſence it healeth wounds in the ſinewes. D
The like operation hath the downe of the floures mixed with vineger.

Boyled in Ale with a little honey and vineger, it prouoketh vomit, eſpecially if you adde there- E
to a few roots of *Aſſarabacca*.

CHAP. 28. *Of Saint Iames his Wort.*

¶ *The Kindes.*

THe herbe called Saint Iames his wort is not without cauſe thought to be a kinde of Groundſel: of which there be ſundry ſorts; ſome of the paſture, and one of the ſea; ſome ſweet-ſmelling; and ſome of a loathſome ſauor. All which kindes I will ſet downe.

¶ *The Deſcription.*

1 SAint Iames his wort or Rag-wort is very well knowne euery where, and bringeth forth at the firſt broad leaues, gaſhed round about like to the leaues of common Wormewood, but broader, thicker, not whitiſh or ſoft, of a deepe greene colour, with a ſtalke which riſeth vp aboue a cubit high, chamfered, blackiſh, and ſomewhat red withall. The armes or wings are ſet with leſſer leaues like thoſe of Groundſell or of wilde Rocket. The floures at the top be of a yellow colour like Marigolds, as well the middle button as the ſmall floures that ſtand in a pale round about, which turne into downe as doth Groundſell. The root is threddy.

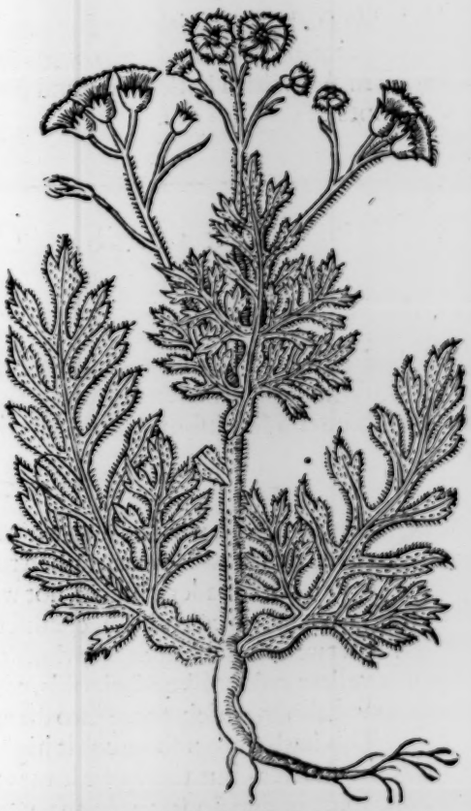
‡ 2 This hath ſtalkes ſome cubit high, creſted, and ſet with long whitiſh leaues; the lower leaues are the ſhorter; but the vpper leaues the longer, yet the narrower: at the top of the ſtalke grow ſome foure or fiue floures as in an vmbell, which are of a darke red colour before they open themſelues,

1 *Iacobæa.* Rag-wort.

‡ 2 *Iacobæa angustifolia.* Narrow leaued Rag-weed.

‡ 3 *Iacobæa latifolia.*
Broad leaued Rag-weed.

4 *Iacobæa marina.*
Sea Rag-weed.



themſelues; but opened, of a bright golden colour, and thoſe are ingirt by fifteene or more little leaues, which are of a flame colour aboue, and red vnderneath. The floures fly away in downe, and the ſeed is blackiſh, and like that of the former. The roots are made of many ſtrings like thoſe of the precedent.

3 This broad leaued Rag-weed hath ſtiffe creſted ſtalkes, which are ſet with broad wrinckled ſharpe pointed leaues, of a greene colour: the bottome leaues are the larger and rounder, the top leaues the leſſe, and more diuided. The floures grow at the top of the ſtalkes, in ſhape and colour like thoſe of the common Rag-weed, but much bigger: They alſo turne into Downe as the former. ‡

4 Sea Rag-wort groweth to the height of two cubits: the ſtalkes be not reddiſh as the other, but contrariwiſe Aſh-coloured, gray and hoary: the leaues be greater and broader than the other: the floures grow at the top, of a pale yellow colour, couered on the cup or huske of the floure, as alſo the leaues, with a certaine ſoft white Downe or freeſe: the floures vaniſh into Downe, and fly away with the winde.

¶ *The Place.*

Land Rag-wort groweth euery where in vntilled paſtures and fields, which are ſomewhat moiſt eſpecially, and neere vnto the borders of fields.

‡ 2 3 Theſe grow vpon the Auſtrian and Heluetian Alpes. ‡

The fourth kinde of Rag-wort groweth neere the ſea ſide in ſundry places: I haue ſeene it in the field by Margate, by Queakes houſe, and by Byrchenton in the Iſle of Tenet: likewiſe it groweth neere the Kings ferry in the Iſle of Shepey, in the way leading to Sherland houſe, where S^r. *Edward Hobby* dwelleth: and likewiſe at Queenborough caſtle in the ſame Iſle; and in other places. ‡ I haue been at the former and later of theſe places to finde out plants, yet could I not ſee this plant. It growes in the garden of M^r. *Ralph Tuggy*; but I feare hardly wilde in this kingdome. ‡

¶ *The Time.*

They floure in Iuly and Auguſt, at which time they are carried away with the Downe.

¶ *The Names.*

The firſt is called in Latine, *Herba S. Iacobi*, or *S. Iacobi flos*, and *Iacobæa*: in high-Dutch, **Sant Jacobs bloumen**: in low-Dutch, **Sant Jacobs crupt**: in French, *Fluer de S. Iacques*: in Engliſh, S. Iames his Wort: the countrey people do call it Stagger-wort, and Staner-wort, and alſo Rag-wort, ‡ and Rag-weed. In Holderneſſe in Yorke-ſhire they call it Seggrum.

The ſecond is *Iacobæa Pannonica* 2. of *Cluſius*.

The third is his *Iacobæa latifolia*. *Geſner* calls it *Coniza montana*. ‡

The fourth is named *Cineraria*, or Aſh-coloured S. *Iames* Wort: ſome call it *Erigeron marinum*, or Sea Groundſell: of ſome, *Artemiſia marina*. ‡ And by *Proſper Alpinus*, *Artemiſia alba*. ‡

¶ *The Temperature.*

S. Iames wort is hot and dry in the ſecond degree, and alſo cleanſing, by reaſon of the bitterneſſe which it hath.

¶ *The Vertues.*

It is commended by the later Phyſitions to be good for greene wounds, and old filthy Vlcers which are not ſcoured, mundified, and made cleane; it alſo healeth them, with the iuyce hereof tempered with honey and May butter, and boyled together to the forme of an Vnguent or ſalue. A

It is much commended, and not without cauſe, to helpe old aches and pains in the armes, hips, and legs, boyled in hogs greaſe to the forme of an ointment. B

Moreouer, the decoction hereof gargariſed is much ſet by as a remedie againſt ſwellings and impoſtumations of the throat, which it waſteth away and throughly healeth. C

The leaues ſtamped very ſmall, and boyled with ſome hogs greaſe vnto the conſumption of the iuyce, adding thereto in the end of the boyling a little Maſticke and Olibanum, and then ſtrained, taketh away the old ache in the huckle-bones called Sciatica. D

‡ The Egyptians (ſaith *Proſper Alpinus*) vſe the Sea Rag-wort, for many things: for they commend the decoction made with the leaues thereof againſt the ſtone in the kidnies and bladder, as alſo to helpe the old obſtructions of the inward parts, but principally thoſe of the wombe; as alſo the coldneſſe, ſtrangulation, barrenneſſe, inflation thereof, and it alſo brings downe the intercepted courſes: wherefore women troubled with the mother are much eaſed by baths made of the leaues and floures hereof. ‡ E

Chap. 29. *Of Garden Succorie.*

¶ *The Kindes.*

There be ſundry ſorts of plants comprehended vnder the title of *Cichoracea*, that is to ſay Cichorie, Endiue, Dandelion, &c. differing not ſo much in operation and working, as in ſhape and forme, which hath cauſed many to deeme them diuers, who haue diſtinguiſhed them vnder the titles aforeſaid: of euery which kinde there be diuers ſorts, the which ſhall be diuided in their ſeuerall chapters, wherein the differences ſhall be expreſt.

¶ *The Deſcription.*

1 Garden Succory is of two ſorts, one with broad leaues, and the other with narrow, deeply cut and gaſhed on both ſides. The firſt hath broad leaues ſomewhat hairie, not much vnlike to Endiue, but narrower; amongſt which doe riſe vp ſtalkes, whereon are placed the like leaues, but ſmaller. The ſtalke diuideth it ſelfe toward the top into many branches, whereon doe grow little blew floures conſiſting of many ſmall leaues, after which followeth white ſeed. The root is tough, long, and white of colour, continuing many yeeres; from the which as from euery part of the plant doth iſſue forth bitter and milkie juice. The whole plant is of a bitter taſte likewiſe.

2 *Cichorium ſatiuum.*
Garden Succorie.

3 *Itybus ſatiua.*
Garden Endiue.

2 The ſecond kinde of Succorie is like vnto the former, but greater in euery point. That which cauſeth the difference is, that this beareth floures white of colour tending to blewneſſe; the others blew, as I haue ſaid.

3 Garden Endiue bringeth forth long leaues, broad, ſmooth, more greene than white, like almoſt to thoſe of lettuce, ſomething nicked in the edges. The ſtalke groweth vp among the leaues, being round and hollow, diuided into branches; out of which being broken or cut there iſſueth a juice like milke, ſomewhat bitter: the floures vpon the branches conſiſt of many leaues, in colour com-

‡ 5 *Cichorium ſpinoſum.*
Thornie Succory.

commonly blew, ſeldome white. The root is long, white, with ſtrings growing thereat, which withereth after the ſeed is ripe.

4 Curled Endiue hath leaues not vnlike to thoſe of the curled or Cabbage lettuce, but much greater; among which riſe vp ſtrong and thicke ſtalkes, ſet with the like leaues, but leſſer, and not ſo notably curled or criſped. The flours grow at the top, blew of colour. The root periſheth, as doth the whole plant, when it hath brought forth his ripe ſeed.

‡ 5 To theſe may fitly be added the thorny or prickly Succory of Candy, being of this kindred, and there vſed in defect of the true Succorie, in ſtead thereof. The root is pretty long, white, with few fibers hanging thereat; the ſtalke is hard, wooddy, and diuaricated into many branches, which commonly end in two or three prickes like hornes: The leaues are bitter, long, narrow, and ſharpe pointed, and lie ſpread vpon the ground, and are a *little* ſinuated, or cut about the edges: The flours, which vſually grow vpon little footſtalkes at the diuiſions of the branches, are much like thoſe of the ordinary Succory, yet much leſſe, conſiſting of fiue blew leaues, with yellow chiues in the middle. The ſeed is like thoſe of the common Succory. It floures in Iuly and Auguſt. ‡

¶ *The Place and Time.*

This Succory, and theſe Endiues are only ſowne in gardens.

Endiue being ſowen in the ſpring quickly commeth vp to floure, which ſeedeth in harueſt, and afterward dieth. But being ſowen in Iuly it remaineth till winter, at which time it is taken vp by the roots, and laid in the ſunne or aire for the ſpace of two houres; then will the leaues be tough, and eaſily endure to be wrapped vpon an heape, and buried in the earth with the roots vpward, where no earth can get within it (which if it did, would cauſe rottenneſſe) the which ſo couered may be taken vp at times conuenient, and vſed in ſallades all the winter, as in London and other places is to be ſeen; and then it is called white Endiue, whereof *Pliny* ſeemeth not to be ignorant, ſpeaking to the ſame purpoſe in his 20. booke and 8. chapter.

¶ *The Names.*

Theſe herbes be called by one name in Greek σέριδες: notwithſtanding for diſtinctions ſake they called the garden Succory, σέρις ἡμερὶς, and the wilde Succory, σέρις ἀγρία; *Pliny* nameth the Succory *Hedypnois*: and the bitterer *Dioſcorides* calleth πικρὶς: in Latine, *Intybum ſylueſtre*, *Intybum agreſte*, *Intybum erraticum*, and *Cichorium*: in ſhops it is called *Cichorea*, which name is not onely allowed of the later Phyſitions, but alſo of the Poet *Horace* in the 31. Ode of his firſt booke,

Me paſcunt oliuæ,
Me Cichorea, leueſque maluæ.

With vs, ſaith *Pliny* in his 20. booke, 8. chapter, they haue called *Intybum erraticum*, or wilde Endiue, *Ambugia* (others reade *Ambubeia*) and ſome there be that name it *Roſtrum porcinum*: and others, as *Guilielmus Placentinus*, and *Petrus Creſcentius*, terme it *Sponſa ſolis*: the Germanes call it **Wegwarten**, which is as much to ſay, as the keeper of the waies: the Italians, *Cichorea*: the Spaniards, *Almerones*: the Engliſh-men, Cicorie and Succory: the Bohemians, *Czakanka*.

Endiue is named in Greeke σέριδιον: in Latine, *Intybum ſatiuum*: of ſome, *Endiuia*: of *Auicen* and *Serapio*, *Taraxacon*: of the Italians, *Scariola*, which name remaineth in moſt ſhops; alſo *Seriola*, as though they ſhould fitly call it *Seris*, but not ſo well *Serriola*, with a double *r*: for *Serriola* is *Lactuca ſylueſtris*, or wilde lettuce: it is called in Spaniſh, *Serraya Enuide*: in Engliſh, Endiue, and Scariole: and when it hath been in the earth buried as aforeſaid, then it is called white Endiue.

‡ 5 This was firſt ſet forth by *Cluſius* vnder this name, *Chondrillæ genus elegans cæruleo flore*: ſince, by *Pona* and *Bauhine*, by the title we giue you, to wit, *Cichorium ſpinoſum*. *Honorius Bellus* writes that in Candy where as it naturally growes, they vulgarly terme it κυμαγαν, that is, *Hydriæ ſpina*, the Pitcher Thorne; becauſe the people fetch all their water in ſtone pots or Pitchers, which they ſtop with this plant, to keepe mice and other ſuch things from creeping into them: and it growes ſo round, that it ſeems by nature to be prouided for that purpoſe. ‡

¶ *The Nature.*

Endiue and Succorie are cold and drie in the ſecond degree, and withall ſomewhat binding: and becauſe they be ſomething bitter, they doe alſo clenſe and open.

Garden Endiue is colder, and not ſo drie or clenſing, and by reaſon of theſe qualities they are thought to be excellent medicines for a hot liuer, as *Galen* hath written in his 8. book of the compoſitions of medicines according to the places affected.

¶ *The Vertues.*

A Theſe herbs when they be greene haue vertue to coole the hot burning of the liuer, to helpe the ſtopping of the gall, yellow jaundice, lacke of ſleepe, ſtopping of vrine, and hot burning feauers.

B A ſyrup made thereof and ſugar is very good for the diſeaſes aforeſaid.

C The diſtilled water is good in potions, cooling and purging drinkes.

D The diſtilled water of Endiue, Plantaine, and roſes, profiteth againſt excoriations in the conduit of the yard to be iniected with a ſyringe, whether the hurt came by vncleaneneſſe or by ſmall ſtones and grauell iſſuing forth with the vrine; as often hath been ſeene.

E Theſe herbes eaten in ſallades or otherwiſe, eſpecially the white Endiue, doth comfort the weake and feeble ſtomacke, and cooleth and refreſheth the ſtomacke ouermuch heated.

F The leaues of Succorie bruſed are good againſt inflammation of the eyes, being outwardly applied to the grieued place.

Chap. 30. *Of wilde Succorie.*

† 1 *Cichorium ſylueſtre.*
Wilde Succorie.

† 2 *Cichorium luteum.*
Yellow Succorie.

¶ *The*

¶ *The Kindes.*

IN like manner as there be ſundrie ſorts of Succories and Endiues, ſo is there wilde kindes of either of them.

¶ *The Deſcription.*

1 WIlde Succorie hath long leaues, ſomewhat ſnipt about the edges like the leaues of Sow-thiſtle, with a ſtalke growing to the height of two cubits, which is diuided towards the top into many branches. The floures grow at the top blew of colour: the root is tough, and wooddie, with many ſtrings faſtned thereto.

2 Yellow Succorie hath long and large leaues, deepely cut about the edges like thoſe of the Hawkeweed. The ſtalke is branched into ſundry arms, wheron do grow yellow floures very double, reſembling the floures of Dandelion, or Piſſe-abed; the which being withered, it flieth away in downe with euery blaſt of winde.

3 *Intybum ſylueſtre.* Wilde Endiue.

3 Wilde Endiue hath long ſmooth leaues ſlightly ſnipt about the edges. The ſtalke is brittle and full of milkie iuice, as is all the reſt of the plant: the floures grow at the top, of a blew or skie colour: the root is tough and threddie.

4 Medow Endiue, or Endiue with broad leaues, hath a thicke, tough, and wooddie root with many ſtrings faſtened thereto, from which riſe vp many broad leaues ſpread vpon the ground like thoſe of garden Endiue, but leſſer, and ſomewhat rougher, among which riſe vp many ſtalkes immediately from the root; euery of them are deuided into ſundrie branches, whereupon doe grow many floures like thoſe of the former, but ſmaller.

¶ *The Place.*

Theſe plants doe grow wilde in ſundrie places in England, vpon wilde and vntilled barren grounds, eſpecially in chalkie and ſtonie places.

¶ *The Time.*

They floure from the middeſt to the end of Auguſt.

¶ *The Names.*

‡ The firſt of theſe is *Scris Picris* of *Lobell*, or *Cichorium ſyluestre*: or *Intybus erratica* of *Tabernamontanus*. ‡

Yellow Succorie is not without cauſe thought to be *Hyoſiris*, or (as ſome copies haue it) *Hyoſciris*, of which *Pliny* in his 20. booke and 8. chapter writeth; *Hyoſiris* (ſaith he) is like to Endiue, but leſſer and rougher: it is called of *Lobelius*, *Hedypnois*: the reſt of the names ſet forth in their ſeueall titles ſhall be ſufficient for this time.

¶ *The Temperature.*

They agree in temperature with the garden Succorie, or Endiue.

¶ *The Vertues.*

The leaues of theſe wilde herbes are boiled in pottage or brothes, for ſicke, and feeble perſons that haue hot, weake, and feeble ſtomackes, to ſtrengthen the ſame. A

They are iudged to haue the ſame vertues with thoſe of the garden, if not of more force in working. B

† The firſt figure was of *Cichoreum album ſatiuum* of *Tabernamontanus*. The ſecond is *Cichoreum luteum*. But the true figures of thoſe our Author meant, were vnder theſe titles. The firſt, of *Hieracium Latifolium*. The ſecond, *Dens Leonis Cichoriaceus*; for that is *Lobelli Hedypnois*.

Chap. 31. *Of Gumme Succorie.*

¶ *The Deſcription.*

1 GVmme Succorie with blew floures hath a thicke and tough root, with ſome ſtrings annexed thereto, full of a milkie iuyce, as is all the reſt of the plant, the floures excepted. The leaues are great and long, in ſhape like to thoſe of garden Succorie, but deeplier cut or iagged, ſomewhat after the manner of wilde Rocket: among which riſe tender ſtalkes very eaſie to be broken, branched toward the top in two or ſometimes three branches, bearing very pleaſant floures of an azure colour or deepe blew; which being paſt, the ſeed flieth away in downe with the winde.

1 *Chondrilla cærulea.*
Blew Gum Succorie.

2 *Chondrilla cærulea latifolia.*
Robinus Gum Succory.

2 Gum Succorie with broad leaues, which I haue named *Robinus* Gum Succorie (for that he was the firſt that made any mention of a ſecond kind, which he ſent me as a great dainty, as indeed I confeſſe it) in roots is like the former: the leaues be greater, not vnlike to thoſe of Endiue, but cut more deeply euen to the middle rib: the ſtalkes grow to the height of two foot: the floures likewiſe are of an azure colour, but ſprinckled ouer as it were with ſiluer ſand; which addeth vnto the floure great grace and beauty.

3 Yellow gum Succorie hath long leaues like in forme and diuiſion of the cut leaues to thoſe of wild Succorie, but leſſer, couered all ouer with a hoarie down. The ſtalke is two foot high, white and downie alſo; diuided into ſundry branches, whereupon doe grow torne floures like thoſe of Succorie, but in colour yellow, which are turned into downe that is caried away with the winde. The root is long, and of a meane thickneſſe, from which, as from all the reſt of the plant, doth iſſue forth a milky iuyce, which being dried is of a yellowiſh red, ſharp, or biting the tongue. There is found vpon the branches hereof a gum, as *Dioſcorides* ſaith, which is vſed at this day in phyſicke in the Iſle Lemnos, as *Bellonius* witneſſeth.

4 Spaniſh

4 Spaniſh Gum Succorie hath many leaues ſpred vpon the ground, in ſhape like thoſe of Groundſell, but much more diuided, and not ſo thicke nor fat: amongſt which riſe vp branched ſtalkes ſet with leaues like thoſe of *Stæbe ſalamantica minor*, or Siluer-weed, whereof this is a kinde. The floures grow at the top, of an ouerworne purple colour, which ſeldome ſhew themſelues abroad blowne: ‡ The ſeed is like that of *Carthamus* in ſhape, but blacke and ſhining. ‡

† 3 *Chondrilla lutea.*
Yellow Gum Succorie.

† 4 *Chondrilla Hiſpanica.*
Spaniſh Gum Succorie.

5 Ruſhy Gum Succorie hath a tough and hard root, with a few ſhort threds faſtned thereto; from the which riſe vp a few iagged leaues like thoſe of Succorie, but much more diuided: The ſtalke groweth vp to the height of two foot, tough and limmer like vnto ruſhes, whereon are ſet many narrow leaues. The floures be yellow, ſingle, and ſmall; which being faded doe fly away with the winde: the whole plant hauing milky iuyce like vnto the other of his kinde.

‡ There is another ſort of this plant to be found in ſome places of this kingdome, and it is mentioned by *Bauhinus* vnder the name of *Chondrilla viſcoſa humilis.*

† 6 Sea Gum Succorie hath many knobby or tuberous roots full of iuyce, of a whitiſh purple colour, with long ſtrings faſtned to them; from which immediately riſe vp a few ſmall thinne leaues faſhioned like thoſe of Succory, narrower below, and ſomewhat larger towards their ends; among which ſpring vp ſmall tender ſtalkes, naked, ſmooth, hollow, round, of ſome foot high, or thereabout: each of theſe ſtalkes haue one floure, in ſhape like that of the Dandelion, but leſſer. The whole plant is whitiſh or hoary, as are many of the ſea plants. †

7 Swines Succorie hath white ſmall and tender roots, from the which riſe many indented leaues like thoſe of Dandelion, but much leſſe, ſpred or laid flat vpon the ground; from the midſt whereof riſe vp ſmall ſoft and tender ſtalkes, bearing at the top double yellow floures like thoſe of Dandelion or Piſſe-abed, but ſmaller: the ſeed with the downy tuft flieth away with the wind.

8 The male Swines Succorie hath a long and ſlender root, with ſome few threds or ſtrings faſtned thereto; from which ſpring vp ſmall tender leaues about the bigneſſe of thoſe of Daſies, ſpred vpon the ground, cut or ſnipt about the edges confuſedly, of an ouerworne colour, full of a milky iuyce: among which riſe vp diuers ſmall tender naked ſtalkes, bearing at the top of euery ſtalke one floure and no more, of a faint yellow colour, and ſomething double: which being ripe,

do

5 *Chondrilla juncea.*
Ruſhy Gum Succorie.

6 *Chondrilla marina Lobely.*
Sea Gum Succorie.

7 *Hypochæris, Porcellia.*
Swines Succorie.

8 *Hyoſeris maſcula.*
Male Swines Succorie.

doe turne into downe that is carried away with the winde: the ſeed likewiſe cleaueth vnto the ſaid downe, and is alſo carried away with the winde. The whole plant periſheth when it hath perfected his ſeed, and recouereth it ſelfe againe by the falling thereof.

‡ 9 *Cichorium verracarium.*
Wart-Succorie.

‡ 9 I thinke it expedient in this place to deliuer vnto you the hiſtorie of the *Cichorium verrucarium*, or *Zacintha* of *Matthiolus*; of which our Author maketh mention in his Names and Vertues, although he neither gaue figure, nor the leaſt deſcription thereof. This Wart-Succory (for ſo I will call it) hath leaues almoſt like Endiue, greene, with pretty deepe gaſhes on their ſides; the ſtalkes are much creſted, and at the top diuided into many branches; betweene which, and at their ſides grow many ſhort ſtalkes with yellow floures like thoſe of Succorie, but that theſe turne not into Downe, but into cornered and hard heads, moſt commonly diuided into eight cels or parts, wherein the ſeed is contained. ‡

¶ *The Place.*

† Theſe plants are found only in gardens in this country; the ſeuenth & eighth excepted, which peraduenture may be found to grow in vntilled places, vpon ditches bankes and the borders of fields, or the like.

¶ *The Time.*

They do floure from May to the end of Auguſt.

¶ *The Names.*

Gum Succorie hath beene called of the Grecians, χονδρίλλη: of the Latines, *Condrilla*, and *Chondrilla*: *Dioſcorides* and *Pliny* call it *Cichorion*, and *Seris*, by reaſon of ſome likeneſſe they haue with Succorie, eſpecially the two firſt, which haue blew floures as thoſe of the Succories. *Lobelius* maketh *Cichorea verrucaria* to be *Zacintha* of *Matthiolus*.

‡ ¶ *Names in particular.*

‡ 1 This is called *Chondrilla cærulea Belgarum*, of *Lobel*: *Apate*, of *Daleſchampius*.

2 *Condrilla* 2. of *Matthiolus*: *Chondrilla latifolia cærulea*, of *Tabernamontanus*.

3 *Chondrilla prior Dioſcoridis*, of *Cluſius* and *Lobel*.

4 *Chondrilla rara purpurea, &c.* of *Lobel*: *Chondrilla Hiſpanica Narbonenſis*, of *Tabern. Seneciocarduus Apulus*, of *Columna*.

5 *Chondrilla prima Dioſcoridis*, of *Columna* and *Bauhinus*: *Viminea, viſcoſa*, of *Lobel* and *Cluſius*.

6 *Chondrilla altera Dioſcoridis*, of *Columna*: ſome thinke it to be χόνδρυλλα of *Theophraſtus*: *Lobell* calls it, *Chondrilla puſilla marina lutea bulboſa*.

7 *Hypocharis, porcellia*, of *Tabernamontanus*.

8 *Hieracium minimum* 9. of *Cluſius*: *Hyoſeris latifolia*, of *Tabern.* The two laſt ſhould haue bin put among the *Hieracia*.

9 *Cichorium verrucarium*, and *Zacinthus* of *Matthiolus* and *Cluſius*. ‡

¶ *The Nature and Vertues.*

Theſe kinds of gum Succorie are like in temperature to the common Succory, but drier.

The root and leaues tempered with hony, and made into Trochiskes, or little flat cakes, with niter or ſalt-peter added to them, cleanſe away the morphew, ſun-burnings, and all ſpots of the face. A

The gum which is gathered from the branches, whereof it tooke his name, layeth downe the ſtairing haires of the eye-browes and ſuch like places: and in ſome places it is vſed for Maſtick, as *Bellonius* obſerues. B

The gum poudered with myrrh, and put into a linnen cloath, and a peſſarie made thereof like a finger, and put vp, bringeth downe the termes in yong Wenches and ſuch like. C

The

D The ſeedes of *Zazintha* beate to powder, and giuen in the decreaſing of the Moone to the quantitie of a ſpoonefull, taketh away warts, and ſuch like excreſcence, in what part of the body ſoeuer they be; the which medicine a certaine Chirurgion of Padua did much vſe, whereby he gained great ſums of mony, as reporteth that ancient Phyſition *Ioachimus Camerarius* of Noremberg a famous citie in Germanie. And *Matthiolus* affirmes that he hath knowne ſome helped of warts, by once eating the leaues hereof in a Sallade.

† The figure of the third was of the ſame plant as the firſt, and was *Chondrilla alba* of *Taber.* The fourth was of *Hieracium montanum maius Lanifolium* of Tabern. which you ſhall finde in the tenth place in the foure and thirtieth Chapter.

Chap. 32. *Of Dandelion.*

¶ *The Deſcription.*

ϗ THe herbe which is commonly called Dandelion doth ſend forth from the root long leaues deepely cut and gaſhed in the edges like thoſe of wilde Succorie, but ſmoother: vpon euery ſtalke ſtandeth a floure greater than that of Succorie, but double, and thicke ſet together, of colour yellow, and ſweet in ſmell, which is turned into a round downie blowball, that is carried away with the winde. The root is long, ſlender, and full of milkie juice when any part of it is broken, as is the Endiue or Succorie, but bitterer in taſte than Succorie.

‡ There are diuers varieties of this plant, conſiſting in the largeneſſe, ſmallneſſe, deepeneſſe, or ſhalloweneſſe of the diuiſions of the leafe, as alſo in the ſmoothneſſe and roughneſſe thereof. ‡

1 *Dens Leonis.*
Dandelion.

‡ 3 *Dens Leonis bulboſus.*
Knottie rooted Dandelion.

2 There is alſo another kinde of Succorie which may be referred heereunto, whoſe leaues are long, cut like thoſe of broad leafed Succorie: the ſtalkes are not vnlike, being diuided into branches as thoſe of Dandelion, but leſſer, which alſo vaniſheth into downe when the ſeed is ripe, hauing a long and white root.

‡ 3 There is another *Dens Leonis*, or Dandelion, which hath many knotty, and tuberous roots like

like thoſe of the Aſphodil; the leaues are not ſo deeply cut in as thoſe of the common Dandelion, but larger, and ſomewhat more hairy: the floures are alſo larger, and of a paler yellow, which flie away in ſuch downe as the ordinary. ‡

¶ *The Place.*

They are found often in medowes neere vnto water ditches, as alſo in gardens and high waies much troden.

¶ *The Time.*

They floure moſt times in the yeere, eſpecially if the winter be not extreame cold.

¶ *The Names.*

Theſe plants belong to the Succory which *Theophraſtus*, & *Pliny* call *Aphaca*, or *Aphace Leonardus*: *Fuchſius* thinketh that Dandelion is *Hedypnois Plinij*, of which he writeth in his 20. booke, and eighth chapter, affirming it to be a wilde kinde of broad leafed Succorie, and that Dandelion is *Taraxacon*: but *Taraxacon*, as *Auicen* teacheth in his 692. chapter, is garden Endiue, as *Serapio* mentioneth in his 143. chapter; who citing *Paulus* for a witneſſe concerning the faculties, ſetteth down theſe words which *Paulus* writeth of Endiue and Succorie. Diuers of the later Phyſitions do alſo call it *Dens Leonis*, or Dandelion: it is called in high Dutch, **Kolkraut**: in low-Dutch, **Papencruit**: in French, *Piſſenlit ou couronne de preſtre*, or *Dent de lyon*: in Engliſh, Dandelion: and of diuers, Piſſeabed. The firſt is alſo called of ſome, and in ſhops *Taraxacon*, *Caput monachi*, *Roſtrum porcinum*, and *Vrinaria*. The other is *Dens Leonis Monſpelienſium* of *Lobell*, and *Cichoreum Conſtantinopolitanum*, of *Matthiolus*.

¶ *The Temperature and Vertues.*

Dandelion is like in temperature to Succorie, that is to ſay, to wilde Endiue. It is cold, but it drieth more, and doth withall clenſe, and open by reaſon of the bitterneſſe which it hath ioyned with it: and therefore it is good for thoſe things for which Succory is. ‡ Boiled, it ſtrengthens the weake ſtomacke, and eaten raw it ſtops the bellie, and helpes the Dyſentery, eſpecially being boyled with Lentiles; The iuice drunke is good againſt the vnuoluntary effuſion of ſeed; boyled in vineger, it is good againſt the paine that troubles ſome in making of water; A decoction made of the whole plant helpes the yellow jaundice. ‡ A

† The figure which was in the 2 place was of the *Cich. Luteum*, where you may find it, but to what plant the deſcription may be referred, I cannot yet determine.

CHAP. 20. *Of Sow-thiſtle.*

† 1 *Sonchus aſper.* Prickly Sow-thiſtle.

‡ 2 *Sonchus aſperior.* The more prickly Sow-thiſtle.

¶ *The*

¶ *The Kindes.*

THere be two chiefe kindes of Sow-thiſtles; one tenderer and ſofter; the other more pricking and wilder: but of theſe there be ſundry ſorts more found by the diligence of the later Writers; all which ſhall be comprehended in this chapter, and euery one be diſtinguiſhed with a ſeuerall deſcription.

¶ *The Deſcription.*

1 THe prickly Sow-thiſtle hath long broad leaues cut very little in, but full of ſmal prickles round about the edges ſomething hard and ſharpe, with a rough and hollow ſtalke: the floures ſtand on the tops of the branches, conſiſting of many ſmall leaues, ſingle, and yellow of colour; and when the ſeed is ripe it turneth into downe, and is carried away with the winde. The whole plant is full of a white milky iuyce.

‡ 2 There is another kinde of this, whoſe leaues are ſometimes prettily deepe cut in like as thoſe of the ordinarie Sow-thiſtle; but the ſtalkes are commonly higher than thoſe of the laſt deſcribed, and the leaues more rough and prickly; but in other reſpects not differing from the reſt of this kinde. It is alſo ſometimes to be found with the leaues leſſe diuided. ‡

† 3 *Sonchus Lævis.*
Hares Lettuce.

4 *Sonchus lævis latifolius.*
Broad leaued Sow-thiſtle.

3 The ſtalke of Hares Lettuce, or ſmooth-Thiſtle is oftentimes a cubit high, edged and hollow, of a pale colour, and ſometimes reddiſh: the leaues be greene, broad, ſet round about with deepe cuts or gaſhes, ſmooth, and without prickles. The floures ſtand at the top of the branches, yellow of colour, which are caried away with the winde when the ſeed is ripe. ‡ This is ſometimes found with whitiſh, and with ſnow-white floures, but yet ſeldome: whence our Authour made two kindes more, which were the fourth and fifth; calling the one, The white floured Sow-thiſtle; and the other, The ſnow-white Sow-thiſtle. Both theſe I haue omitted as impertinent, and giue you others in their ſtead. ‡

4 Broad leaued Sow-thiſtle hath a long thicke and milky root, as is all the reſt of the Plant, with many ſtrings or fibres; from the which commeth forth a hollow ſtalke branched or diuided into ſundry ſections. The leaues be great, ſmooth, ſharpe pointed, and greene of colour: the floures be

be white, in ſhape like the former. ‡ The floures of this are for the moſt part yellow like as the former. ‡

‡ 5 Wall Sow-thiſtle hath a fibrous wooddy root, from which riſes vp a round ſtalke not creſted: the leaues are much like to thoſe of the other Sow-thiſtles, broad at the ſetting on, then narrower, and after much broader, and ſharpe pointed, ſo that the end of the leafe much reſembles the ſhape of an iuy leafe; theſe leaues are very tender, and of ſomewhat a whitiſh colour on the vnder ſide: the top of the ſtalke is diuided into many ſmall branches, which beare little yellow floures that fly away in downe.

6 This hath longiſh narrow leaues ſoft and whitiſh, vnequally diuided about the edges. The ſtalkes grow ſome foot high, hauing few branches, and thoſe ſet with few leaues, broad at their ſetting on, and ending in a ſharpe point: the floures are pretty large like to the great Hawk-weed, and fly away in downe: the root is long, white, and laſting. It floures moſt part of Summer; and in Tuſcany, where it plentifully growes, it is much eaten in ſallets, with oile and vineger, it hauing a ſweetiſh and ſomewhat aſtringent taſte. ‡

‡ 5 *Sonchus lævis muralis.*
Wall (or Iuy-leaued) Sow-thiſtle.

‡ 6 *Sonchus lævis anguſtifolius.*
Narrow leaued Sow-thiſtle.

† 7 This blew floured Sow-thiſtle is the greateſt of all the reſt of the kindes, ſomewhat reſembling the laſt deſcribed in leaues; but thoſe of this are ſomewhat rough or hairy on the vnder ſide: the floures are in ſhape like thoſe of the ordinarie Sow-thiſtle, but of a faire blew colour; which fading, flie away in Downe that carries with it a ſmall aſh-coloured ſeed. The whole plant yeeldeth milke as all the reſt do. †

8 Tree Sow-thiſtle hath a very great thicke and hard root ſet with a few hairy threds; from which ariſeth a ſtrong and great ſtalke of a wooddy ſubſtance, ſet with long leaues not vnlike to Languedebeefe, but more deepely cut in about the edges, and not ſo rough: vpon which do grow faire double yellow floures, which turne into Downe, and are caried away with the winde. The whole plant is poſſeſt with ſuch a milky iuyce as are the tender and hearby Sow-thiſtles; which certainly ſheweth it to be a kinde thereof: otherwiſe it might be referred to the Hawke-weeds, whereunto in face and ſhew it is like. ‡ This hath a running root, and the heads and tops of the ſtalkes are very rough and hairy. ‡

7 *Sonchus flore cæruleo.*
Blew-floured Sow-thiſtle.

8 *Sonchus Arboreſcens.*
Tree Sow-thiſtle.

‡ 9 *Sonchus arboreſcens alter.*
The other Tree Sow-thiſtle.

† 10 *Sonchus ſylvaticus.*
Wood Sow-thiſtle.

‡ 9 This other Tree Sow-thiſtle growes to a mans height or more, hauing a firme creſted ſtalke, ſmooth, without any prickles, and ſet with many leaues incompaſſing the ſtalke at their ſetting on, and afterwards cut in with foure, or ſometimes with two gaſhes only: the vpper leaues are not diuided at all: the colour of theſe leaues is green on the vpper ſide, and grayiſh vnderneath: the top of the ſtalke is hairy, and diuided into many branches, which beare the floures in an equall height, as it were in an vmbell: the floures are not great, conſidering the largeneſſe of the plant, but vſually as big as thoſe of the common Sow-thiſtle, and yellow, hauing a hairy head or cap: the ſeed is creſted, longiſh, and aſh-coloured, and flies away with the downe: the root is thicke, whitiſh, hauing many fibres, putting out new ſhoots, and ſpreading euery yeare. *Bauhine* maketh this all one with the other, according to *Cluſius* his deſcription: but in my opinion there is ſome difference betweene them, which chiefely conſiſts, in that the former hath larger and fewer floures; the plant alſo not growing to ſo great a height. ‡

‡ 10 This plant (whoſe figure our Author formerly gaue, *pag.* 148. vnder the title of *Eryſimum ſylueſtre*) hath long knotty creeping roots, from whence ariſeth a round ſlender ſtalke ſome two foot high, ſet at firſt with little leaues, which grow bigger and bigger as they come neerer the middle of the ſtalke, being pretty broad at their ſetting on, then ſomewhat narrower, and ſo broader againe, and ſharpe pointed, being of the colour of the Wall (or Iuy-leaued) Sow-Thiſtle. The top is diuided into many ſmall branches, which end in ſmall ſcaly heads like thoſe of the wilde Lettuce, containing floures conſiſting of foure blewiſh purple leaues, turned backe and ſnipped at their ends; there are alſo ſome threds in the midle of the floure, which turning into Downe, carry away with them the ſeed, which is ſmall, and of an Aſh-colour. *Bauhine* makes a bigger and a leſſer of theſe, diſtinguiſhing betweene that of *Cluſius* (whoſe figure I here giue you) and that of *Columna*; yet *Fabius Columna* himſelfe could finde no difference, but that *Cluſius* his plant had fiue leaues in the floure, and his but foure: which indeed *Cluſius* in his deſcription affirmes; yet his figure (as you may ſee) expreſſes but foure: adding, That the root is not well expreſſed; which notwithſtanding *Cluſius* deſcribes according to *Columna's* expreſſion. ‡

¶ *The Place.*

The firſt foure grow wilde in paſtures, medowes, woods, and mariſhes neere the ſea, and among pot-herbes.

The fifth groweth vpon walls, and in wooddy mountainous places.

The Tree Sow-thiſtle growes amongſt corne in waterie places.

The ſixth, ſeuenth and tenth are ſtrangers in England.

¶ *The Time.*

They floure in Iune, Iuly, Auguſt, and ſometimes later.

¶ *The Names.*

Sow-thiſtle is called in Greeke, σόγχος: in Latine, *Sonchus*: of diuers, *Cicerbita*, *lactucella*, and *Lacterones*: *Apuleius* calleth it *Lactuca Leporina*, or Hares-thiſtle: of ſome, *Braſſica Leporina*, or Hares Colewort. The Engliſh names are ſufficiently touched in their ſeuerall titles: In Dutch it is called **Haſen Latouwe**: the French, *Palays de lieure*.

‡ ¶ *Names in particular.*

1 This is *Sonchus aſper major* of *Cordus*: *Sonchus tenerior aculeis aſperior* of *Lobel*: *Sonchus* 3. *aſperior* of *Dodonæus*.

2 This is *Sonchus aſper*, of *Matthiolus*, *Fuchſius*, and others.

3 This, *Matthiolus*, *Dodonæus*, *Lobel*, and others call *Sonchus læuis*: *Tragus* calls it *Intybus erratica tertia*.

4 This *Tabernamontanus* onely giues, vnder the title as you haue it here.

5 *Matthiolus* ſtiles this, *Sonchus læuis alter*: *Cæſalpinus* calls it *Lactuca murorum*: and *Tabern. Sonchus ſylvaticus quartus*: *Lobel*, *Sonchus alter folio ſinuato hederaceo*.

6 *Lobel* calls this, *Sonchus læuis Matthioli*: it is *Terracrepulus* of *Cæſalpinus*: and *Crepis* of *Daleſchampius*.

7 *Cluſius* and *Camerarius* giue vs this vnder the title of *Sonchus cæruleus*.

8 Onely *Tabern.* hath this figure, vnder the title our Author giues it: *Bauhine* puts it amongſt the *Hieracia*, calling it *Hieracium arboreſcens paluſtre*.

9 This *Bauhine* alſo makes an *Hieracium*, and would perſuade vs that *Cluſius* his deſcription belongs to the laſt mentioned, and the figure to this: to which opinion I cannot conſent. *Cluſius* giueth it vnder the name of *Sonchus* 3 *lævis alt ſimus*.

10 This *Cluſius* giues vnder the name of *Sonchus lævior Pannonicus* 4. *flore purp. Tabern.* calls it *Libanotis Theophraſti ſterilis*: *Columna* hath it by the name of *Sonchus montanus purpureus*: *Cordus*, *Geſner*, *Thalius*, and *Bauhine* refer it to the *Lactucæ ſylueſtres*: the laſt of them terming it, *Lactuca montana purpuro-cærulea*. ‡

¶ *The Temperature.*

The Sow-thiſtles, as *Galen* writeth, are of a mixt temperature; for they conſiſt of a watery and earthy ſubſtance, cold, and likewiſe binding.

¶ *The Vertues.*

A Whileſt they are yet yong and tender they are eaten as other pot-herbes are; but whether they be eaten, or outwardly applied in manner of a pulteſſe, they do euidently coole: therefore they be good for all inflammations or hot ſwellings, if they be laid thereon.

B Sow-thiſtle giuen in broth taketh away the gnawings of the ſtomacke proceeding of an hot cauſe; and increaſe milke in the breaſts of Nurſes, cauſing the children whom they nurſe to haue a good colour: and of the ſame vertue is the broth if it be drunken.

C The iuyce of theſe herbes doth coole and temper the heate of the fundament and priuy parts.

Chap. 34. *Of Hawke-weed.*

¶ *The Kindes.*

HAwke-weed is alſo a kinde of Succorie; of which *Dioſcorides* maketh two ſorts, and the later Writers more: the which ſhall be deſcribed in this chapter following, where they ſhall be diſtinguiſhed as well with ſeuerall titles as ſundry deſcriptions.

† 1 *Hieracium majus Dioſcoridis.*
Great Hawke-weed.

2 *Hieracium minus, ſiue Leporinum.*
Small Hares Hawk-weed, or Yellow Diuels-bit.

¶ *The Deſcription.*

1 THe great Hawke-weed hath large and long leaues ſpred vpon the ground, in ſhape like thoſe of the Sow-thiſtle: the ſtalk groweth to the height of two cubits, branched into ſundry armes or diuiſions, hollow within as the yong Kexe, reddiſh of colour; whereupon do grow yellow floures thicke and double, which turne into Downe that flieth away with the winde when the ſeed is ripe. The root is thicke, tough and threddy.

2 The

2 The ſmall Hawke-weed, which of moſt writers hath been taken for yellow Diuels-bit, hath long leaues deepely cut about the edges, with ſome ſharpe roughneſſe thereon like vnto Sow-thiſtle. The ſtalkes and floures are like the former: the root is compact of many ſmall ſtrings, with a ſmall knob, or as it were the ſtumpe of an old root in the middle of thoſe ſtrings, cut or bitten off; whereupon it tooke his name Diuels bit.

3 Blacke Hawke-weed hath very many long iagged leaues, not much vnlike to thoſe of Bucks horne, ſpred flat and farre abroad vpon the ground, which the picture cannot expreſſe as is requiſite, in ſo little roome: among which riſe vp many ſtalkes ſlender and weake, the floures growing at the top yellow and very double: it hath alſo a threddy root.

‡ Our Author formerly gaue three figures, and ſo many deſcriptions of this ſmall *Hieracium*, which I haue contracted into two; for the onely difference that I can finde is, that the one hath the root as it were bitten off, with the leaues leſſe cut in; the other hath a root ſomewhat longer, and fibrous as the former; the leaues alſo in this are much more finely and deepe cut in: in other reſpects there is no difference. ‡

3 *Hieracium nigrum.*
Blacke Hawke-weed.

4 *Hieracium Aphacoides.*
Succory Hawke-weed.

4 Succory Hawke-weed hath many long and large leaues ſpred vpon the ground, deepely cut on both ſides almoſt to the middle rib; from which riſe vp ſmall ſtalkes and floures like thoſe of the leſſe Dandelion, but leſſer. The root conſiſteth of many ſmall threddy ſtrings.

5 Endiue Hawke-weed hath many broad leaues, indented about the edges very like vnto Garden Endiue, but narrower; among which riſe vp ſtalkes a foot or more high, ſlender, hairy, and brittle: the floures are yellow, and grow at the top double, and thick ſet in a ſcaly huske like the Knapweed or Iacea, hauing great thicke and threddy roots. ‡ This hath a ſtalke ſometimes more, and otherwhiles leſſe rough, with the leaues ſomtimes more cut in, more long and narrow, and againe otherwhiles more ſhort and broad. ‡

6 Long rooted Hawk-weed hath many broad leaues ſpread vpon the ground, ſleightly & confuſedly indented about the edges, with ſomewhat a bluntiſh point; among which leaues ſpring vp ſtrong and tough ſtalks a foot and halfe high, ſet on the top with faire double yellow floures much like vnto a Piſſe-abed. The root is very long, white and tough.

7 Sharpe Hawk-weed hath leaues like thoſe of Languebeefe or Ox-tongue, but much narrower, ſharpe about the edges, and rough in the middle: the ſtalks be long and ſlender, ſet with the like leaues, but leſſer: the floures grow at the top, double and yellow: the root is tough & threddy.

5 *Hieracium intybaceum.*
Endiues Hawke-weed.

6 *Hieracium longius radicatum.*
Long rooted Hawke-weed.

7 *Hieracium aſperum.*
Sharpe Hawke-weed.

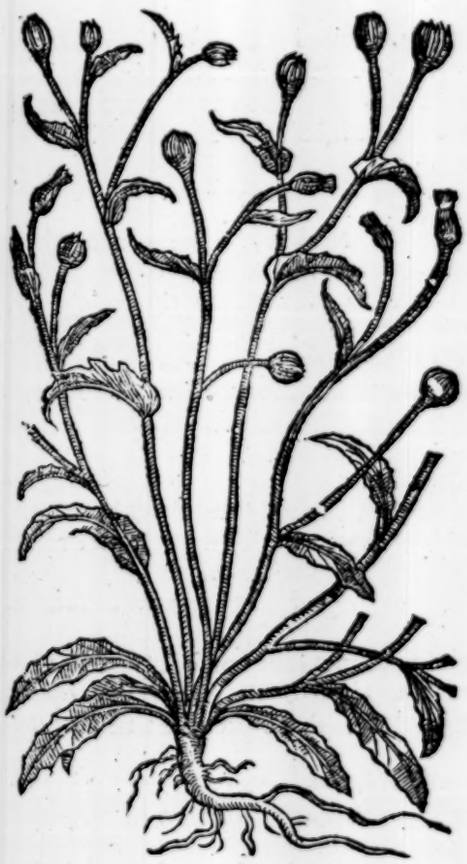
8 *Hieracium falcatum Lobelij.*
Crooked Hawke-weed.

‡ 9 *Hieracium.*

† 8 Crooked or falked Hawkeweed hath leaues like vnto the garden Succory, yet much ſmaller, and leſſe diuided, ſlightly indented on both ſides, with tender, weake, and crooked ſtalkes; whereupon doe grow floures like thoſe of *Lampſana*, of a blacke, or pale yellow colour, and the roote ſmall and threddy. The ſeedes are long, and falcated, or crooked, ſo that they ſomewhat reſemble the foot or clawes of a bird, and from theſe ſeeds the plant hath this Epithite, *Falcatum*, or crooked in maner of a Sicle or Sithe.

‡ 9 This in leaues is not much vnlike the laſt deſcribed, but that they are ſomewhat broader, and leſſe cut in, hauing little or no bitterneſſe nor milkineſſe, the ſtalkes are ſome foot high commonly bending, or falling vpon the ground; the floures are ſmall and yellow, and ſeeme to grow out of the middeſt of the ſeed, whenas indeed they grow at the top of them, the reſt being but an empty huske which is falcated like that of the laſt deſcribed. This figure we giue you was taken before the floures were blowne, ſo that by that meanes the falcated or crooked ſeed veſſels are not expreſt in this, but you may ſee there manner of growing by the former. ‡

‡ 9 *Hieracium falcatum alterum.*
The other crooked Hawkeweed.



† 10 *Hieracium Latifolium montanum.*
Broad leaued mountaine Hawkeweed.

10 The broad leaued mountaine Hawkeweed hath broad, long, ſmooth leaues, deepely indented toward the ſtalke, reſembling the leaues of the greateſt Sowthiſtle. The ſtalke is hollow, and ſpungious, full of a milkie iuice, as is the reſt of the plant, as alſo all the other of his kinde: the floures grow at the top of the ſtalkes, double and yellow.

11 The narrow leaued mountaine Hawkeweed hath leaues like thoſe of the laſt deſcribed, but narrower. The ſtalkes be fat, hollow, and full of milke: the floures grow at the top double, and yellow of colour. The root is ſmall and threddy.

There is a ſmall mountaine Hawkeweed hauing leaues like vnto the former, but more deepely cut about the edges, and ſharper pointed; the ſtalkes are tender and weake; the floures be double and yellow like thoſe of Piloſella, or great Mouſe-eare; the root is ſmall and threddy.

¶ *The Place.*

Theſe kindes of herbes doe grow in vntoiled places neere vnto the borders of corne fields, in medowes, high-waies, woode, mountaines, and hillie places, and neere to the brinks of ditches. ‡ The two falcated Hawkeweeds grow onely in ſome few gardens. ‡

¶ *The*

11 *Hieracium montanum Latifolium minus.*
The leſſer broad leaued mountaine Hawke-weed.

¶ *The Time.*

They floure for the moſt part all the ſummer long, ſome ſooner, and others later.

¶ *The Names in generall.*

Theſe plants are all conteined vnder the name of *Hieracium*: which is called in Greeke alſo ἱέραξ: diuers name it in Latine, *Accipitrina*, which is termed in French, *Cichoree iaulne*: in Engliſh, Hawkeweed. Theſe herbes tooke there name from a Hawke, which is called in Latine *Accipiter*, and in Greeke, ἱέραξ, for they are reported to cleere their ſight by conueying the juice heereof into their eyes. *Gaza* calleth it *Porcellia* for it is numbred among the Succories, they are called alſo *Lampuca*.

Yellow Hawkeweed is called of ſome *Morſus diaboli*, or yellow Diuels bit, for that the root doth very well reſemble the bitten or cropt root of the common Diuels bit, being like Scabious.

‡ ¶ *The Names in particular.*

1 *Matthiolus*, *Fuchſius*, *Dodonæus*, and others call this *Hieracium maius*.

2 3 Theſe are varieties of the ſame plant, the firſt of them being called by *Fuchſius*, *Dodonæus*, and *Matthiolus*, *Hieracium minus*, *Lobell* calls it, *Hieracium minus præmorſa radice*. That ſort of this with more cut leaues is by *Tabernamontanus* called, *Hieracium nigrum*.

4 *Lobell* calls this *Hieracium foliis & facie Chondrillæ*; *Bauhinus* makes this to differ from that which our Author gaue in this 4. place out of *Tabern.* for he termes this *Hieracium Chondrillæ folio hirſutum*, and the other, *Hieracium Chondrillæ folio Glabrum*; the one ſmooth leaued, the other rough; yet that which growes frequently with vs, and is very well repreſented by this figure, hath ſmooth leaues, as he alſo obſerued it to haue in Italy and about Mountpelier in France.

5 This is *Hieracium alterum grandius*, and *Hieracium montanum anguſtifolium primum* of *Tabernamontanus*.

6 *Lobell* calls this from the length of the root (though ſometimes it be not ſo long) *Hieracium Longius radicatum*; as alſo *Taber. Hieracium macrorhizon*, it is thought to be the *Apargia* of *Theophraſtus*, by *Daleſchampius* in the *Hiſt. Lugd. pag.* 562. but the figure there that beares the title is of *Hieracium minus*.

7 *Tabernamontanus* firſt gaue this vnder the name of *Hieracium intybaceum aſperum*: *Bauhine* refers it to the wilde yellow Succories, and calls it *Cichoreum montanum anguſtifolium hirſutie aſperum*.

8 This *Lobell* calls *Hieracium Narbonenſe falcata ſiliqua*.

9 He calls this *Hieracium facie Hedypnois*: and *Cæſalpinus* termes this *Rhagadiolus*; and the laſt mentioned, *Rhagadiolus alter*.

10 This by *Tabernamontanus* is called *Hieracium montanum majus Latifolium*; The figure of this was giuen by our Author, *chap.* 30. vnder the title of *Chondrilla Hiſpanica*.

11 *Tabernamontanus* alſo ſtiles this *Hieracium montanum Latifolium minus*. ‡

¶ *The Nature.*

The kindes of Hawkeweed are cold and drie, and ſomewhat binding.

¶ *The Vertues.*

A They are in vertue and operation like to *Sonchus* or Sowthiſtle, and being vſed after the ſame manner, be as good to all purpoſes that it doth ſerue vnto.

B They be good for the eie-ſight, if the juice of them be dropped into the eyes, eſpecially that which is called Diuels bit, which is thought to be the beſt, and of greateſt force.

Therefore

Therefore as *Dioſcorides* writeth, it is good for an hot ſtomacke, and for inflammations if it be laid vpon them. C

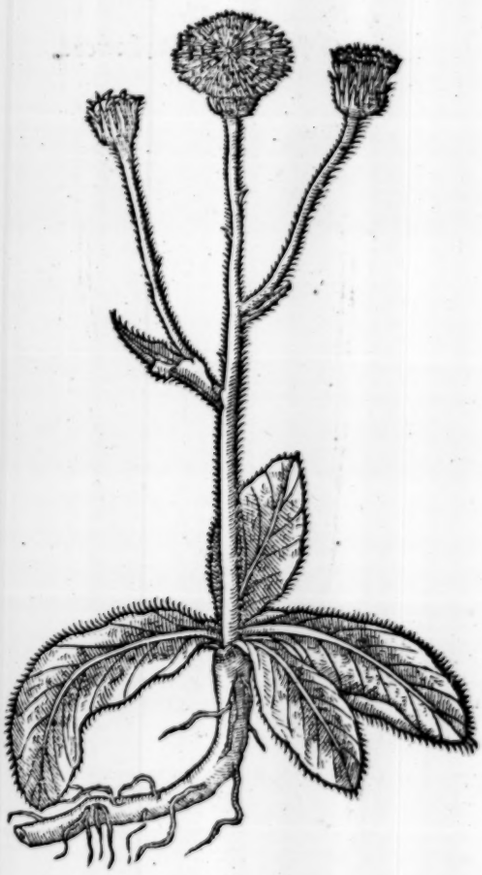
The herbe and root being ſtamped and applied, is a remedie for thoſe that be ſtung of the ſcorpion; which effect not onely the greater Hawkeweeds, but the leſſer ones alſo doe performe. D

Chap. 35. *Of Cluſius Hawkeweed.*

¶ *The Kindes.*

There be likewiſe other ſorts of Hawkeweeds, which *Carolus Cluſius* hath ſet forth in his Pannonicke obſeruations, the which likewiſe require a particular chapter, for that they do differ in forme very notably.

1 *Hieracium primum latifolium Cluſij.*
The firſt Hawkeweed of *Cluſius*.



2 *Hieracium* 5. *Cluſij.*
Cluſius his 5. kinde of Hawkeweed,

¶ *The Deſcription.*

1 The firſt of *Cluſius* his Hawkeweeds haue great broad leaues ſpred vpon the ground, ſomewhat hairie about the edges, oftentimes a little iagged, alſo ſoft as is the leafe of Mullen, or Higtaper, and ſometimes daſht here and there with ſome blacke ſpots, in ſhape like the garden Endiue, full of a milkie iuice: among which riſeth vp a thicke hollow ſtalke of a cubit high, diuiding it ſelfe at the top into two or three branches, whereupon do grow ſweete ſmelling floures not vnlike to thoſe of yellow Succorie, ſet or placed in a blacke hoarie and woollie cup or huske, of a pale bleake yellow colour, which turneth into a downie blowball that is caried away with the winde: the root entereth deepely into the ground, of the bigneſſe of a finger, full of milke, and couered with a thicke blacke barke.

2 The ſecond ſort of great Hawkeweed according to my computation, and the 5. of *Cluſius*, hath leaues like the former, that is to ſay ſoft, and hoarie, and as it were couered with a kinde of white

white woollineſſe or hairineſſe, bitter in taſte, of an inche broad. The ſtalke is a foot high, at the top whereof doth grow one yellow floure like that of the great Hawkeweed, which is caried away with the winde when the ſeed is ripe. The root is blacke and full of milkie juice, and hath certaine white ſtrings annexed thereto.

3 This kinde of Hawkeweed hath blacke roots a finger thicke, full of milkie juice, deepely thruſt into the ground, with ſome ſmall fibers belonging thereto: from which come vp many long leaues halfe an inch or more broad, couered with a ſoft downe or hairineſſe, of an ouerworne ruſſet colour: and amongſt the leaues come vp naked and hard ſtalkes, whereupon doe grow yellow floures ſet in a woollie cup or chalice, which is turned into downe, and caried away with his ſeed by the winde.

4 The fourth Hawkeweed hath a thicke root aboue a finger long, blackiſh, creeping vpon the top of the ground, and putting out ſome fibres, and it is diuided into ſome heads, each whereof at the top of the earth putteth out ſome ſix or ſeuen longiſh leaues ſome halfe an inche broad, and ſomewhat hoarie, hairie, and ſoft as are the others precedent, and theſe leaues are ſnipt about the edges, but the deepeſt gaſhes are neereſt the ſtalkes, where they are cut in euen to the middle rib, which is ſtrong and large. The ſtalke is ſmooth, naked, and ſomewhat high: the floures be yellow and double as the other.

3 *Hieracium 6. Cluſij.*
Cluſius his 6. Hawkeweed.

4 *Hieracium 7. Cluſij.*
Cluſius his 7. Hawkeweed.

‡ 5 The ſame Author hath alſo ſet forth another *Hieracium*, vnder the name of *Hieracium parvum Creticum*, which he thus deſcribes; this is an elegant little plant ſpreading ſome ſix, or more leaues vpon the top of the ground, being narrower at that part whereas they adhere to the root, and broader at the other end, and cut about the edges, hauing the middle rib of a purple colour; amongſt theſe riſe vp two or three little ſtalkes about a foot high, without knot vntill you come almoſt to the top, whereas they are diuided into two little branches, at which place growes forth leaues much diuided; the floures grow at the top of a ſufficient bigneſſe, conſidering the magnitude of the plant, and they conſiſt of many little leaues lying one vpon another, on the vpper ſide wholly white, and on the vnder ſide of a fleſh colour. The root is ſingle, longiſh, growing ſmall towards

towards the end, and putting forth ſtringy fibres on the ſides. Thus much *Cluſius*, who receiued this figure and deſcription from his friend *Iaques Plateau* of Tournay. I conieƈture this to be the ſame plant that *Bauhine* hath ſomewhat more accurately figured and deſcribed in his *Prod. pag.* 68. vnder the title of *Chondrilla purpuraſcens fœtida*: which plant being an annuall, I haue ſeen growing ſome yeares ſince with M^r. *Tuggy* at Weſtminſter; and the laſt Summer with an honeſt and skilfull Apothecarie one M^r. *Nicholas Swayton* of Feuerſham in Kent: but I muſt confeſſe I did not compare it with *Cluſius*; yet now I am of opinion, that both theſe figures and deſcriptions are of one and the ſame plant. It floures in Iuly and Auguſt, at the later end of which moneth the ſeeds alſo come to ripeneſſe.

6 This other (not deſcribed by *Cluſius*, but by *Lobel*) hath long rough leaues cut in and toothed like to Dandelion, with naked hairy ſtalkes, bearing at their tops faire large and very double yellow floures, which fading fly away in downe. It growes in ſome medowes.

‡ 5 *Hieracium parvum Creticum.*
Small Candy Hawk-weed.

‡ 6 *Hieracium Dentis leonis folio hirſutum.*
Dandelion Hawk-weed.

¶ *The Place.*

Theſe kinds of Hawke-weeds, according to the report of *Cluſius*, do grow in Hungarie and Auſtria, and in the graſſy dry hills, and herby and barren Alpiſh mountaines, and ſuch like places: notwithſtanding if my memorie faile me not I haue ſeene them growing in ſundry places in England; which I meane, God willing, better to obſerue hereafter, as opportunitie ſhall ſerue me.

¶ *The Time.*

He ſaith they floure from May to Auguſt, at what time the ſeed is ripe.

¶ *The Names.*

The Author himſelfe hath not ſaid more than here is ſet downe as touching the names, ſo that it ſhall ſuffice what hath now been ſaid, referring the handling thereof to a further conſideration.

¶ *The Nature and Vertues.*

I finde not any thing at all ſet downe either of their nature or vertues, and therefore I forbeare to ſay any thing elſe of them, as a thing not neceſſarie to write of their faculties vpon my owne conceit and imagination.

Chap.

Chap. 36.

‡ *Of French or Golden Lung-wort.*

‡ 1 *Pulmonaria Gallica ſiue aurea latifolia.* Broad-leaued French or golden Lung-wort.

‡ 2 *Pulmonaria Gallica ſiue aurea anguſtifolia.* Narrow leaued French or golden Lung-wort.

¶ *The Deſcription.*

‡ 1 THis which I here giue you in the firſt place, as alſo the other two, are of the kinds of Hawke-weed, or *Hieracium*; wherefore I thought it moſt fit to treat of them in this place, and not to handle them with the *Pulmonaria maculoſa*, or Sage of Ieruſalem: whereas our Author gaue the name *Pulmonaria Gallorum*, and pointed at the deſcription; but his figure being falſe, and the deſcription imperfect, I iudged it the beſt to handle it here next to thoſe plants which both in ſhape and qualities it much reſembles. This firſt hath a pretty large yet fibrous and ſtringy root; from the which ariſe many longiſh leaues, hairy, ſoft, and vnequally diuided, and commonly cut in the deepeſt neereſt the ſtalke; they are of a darke green colour, and they are ſometimes broader and ſhorter, and otherwhiles narrower and longer (whence *Tabernamontanus* makes three ſorts of this, yet are they nothing but varieties of this ſame plant.) Amongſt theſe leaues grow vp one or two naked ſtalks, commonly hauing no more than one leafe apiece, and that about the middle of the ſtalke; theſe ſtalks are alſo hairy, and about a cubit high, diuided at their tops into ſundry branches, which beare double yellow floures of an indifferent bigneſſe, which fading and turning into downe, are together with the ſeed carried away with the winde. This whole plant is milky like as the other Hawk-weeds.

2 This Plant (though confounded by ſome with the former) is much different from the laſt deſcribed; for the root is ſmall and fibrous; the leaues alſo are ſmall, of the bigneſſe, and ſomewhat of the ſhape (though otherwiſe indented) of Daſie leaues, whitiſh and hoarie; the ſtalke is not aboue an handfull high, creſted, hoary, and ſet with many longiſh narrow leaues; and at the top on ſhort foot-ſtalkes it beares foure or fiue floures of a bright yellow colour, and pretty large, conſidering

‡ 3 *Hieracium hortenſe latifolium, ſiue Piloſella major.*
Golden Mouſe-eare, or Grimme the Colliar.

conſidering the ſmallneſſe of the plant. The floures, like as others of this kinde, fly away in downe, and carry the ſeeds with them.

3 This plant (which ſome alſo haue confounded with the firſt deſcribed) hath a root at the top, of a reddiſh or browniſh colour, but whitiſh within the earth, & on the lower ſide ſending forth whitiſh fibres: it bringeth forth in good and fruitfull grounds leaues about a foot long, and two or three inches broad, of a darke greene colour, and hairy, little or nothing at all cut in about the edges; amongſt theſe leaues riſeth vp a ſtalke ſome cubit high, round, hollow, and naked, but that it ſometimes hath a leafe or two toward the bottome, and towards the top it puts forth a branch or two. The floures grow at the top as it were in an vmbell, and are of the bignes of the ordinarie Mouſe-eare, and of an orange colour. The ſeeds are round, & blackiſh, and are caried away with the downe by the wind. The ſtalkes and cups of the floures are all ſet thicke with a blackiſh downe or hairineſſe as it were the duſt of coles; whence the women, who keep in it gardens for noueltie ſake, haue named it Grim the Colliar.

¶ *The Time.*

All theſe floure in Iune, Iuly, and Auguſt, about the later part of which moneth they ripen their ſeed.

¶ *The Place.*

1 I receiued ſome plants of this from M^r. *Iohn Goodyer*, who firſt found it May 27, 1631. in floure; and the 3 of the following May, not yet flouring, in a copſe in Godlemen in Surrey, adioyning to the orchard of the Inne whoſe ſigne is the Antilope.

2 This I had from my kinde friend M^r. *William Coote*, who wrot to mee, That he found them growing on a hill in the Lady *Bridget Kingſmills* ground, in an old Romane campe, cloſe by the *Decumane* port, on the quarter that regards the Weſt-South-Weſt, vpon the skirts of the hill.

3 This is a ſtranger, and onely to be found in ſome few gardens.

¶ *The Names.*

1 This was firſt ſet forth by *Tragus*, vnder the name of *Auricula muris major*: and by *Tabern.* (who gaue three figures expreſſing the ſeuerall varieties thereof) by the name of *Pulmonaria Gallica ſiue aurea*: *Daleſchampius* hath it vnder the name of *Corchorus*.

2 This was by *Lobel* (who firſt ſet it forth) confounded with the former, as you may ſee by the title ouer the figure in his Obſeruations, *pag.* 317. yet his figure doth much differ from that of *Tragus*, who neither in his figure nor deſcription allowes ſo much as one leafe vpon the ſtalke; and *Tabernamontanus* allowes but one, which it ſeldome wants. Now this by *Lobels* figure hath many narrow leaues; and by the Deſcription, *Aduerſ. pag.* 253. it is no more than an handfull, or handfull and halfe high: which very well agrees with the plant wee heere giue you, and by no meanes with the former, whoſe naked ſtalkes are at leaſt a cubit high. So it is manifeſt that this plant I haue deſcribed is different from the former, and is that which *Pena* and *Lobel* gaue vs vnder the title of *Pulmonaria Gallorum flore Hieracij*. *Bauhine* alſo confounds this with the former.

3 *Baſil Beſler* in his *Hortus Eyſtettenſis* hath well expreſt this plant vnder the title of *Hieracium latifolium peregrinum Phlomoides*: *Bauhinus* calls it *Hieracium hortenſe floribus atropurpuraſcentibus*; and ſaith that ſome call it *Piloſella major*: and I iudge it to be the *Hieracium Germanicum* of *Fabius Columna*. This alſo ſeemes rather to be the herbe *Coſta* of *Camerarius*, than the firſt deſcribed; and I dare almoſt be bold to affirme it the ſame: for he ſaith that it hath fat leaues lying flat vpon the ground, and as much as he could diſcerne by the figure, agreed with the *Hieracium latifolium* of *Cluſius*: towhich indeed in the leaues it is very like, as you may ſee by the figure which is in the firſt place in the foregoing chapter, which very well reſembles this plant, if it had more and ſmaller floures.

¶ *The Temper and Vertues.*

I iudge theſe to be temperate in qualitie, and endued with a light aſtriction.

A 1 The decoction or the diſtilled water of this herbe taken inwardly, or outwardly applied, conduce much to the mundifying and healing of greene wounds; for ſome boyle the herb in wine, and ſo giue it to the wounded Patient; and alſo apply it outwardly.

B It alſo is good againſt the internall inflammations and hot diſtempers of the heart, ſtomacke, and liuer.

C The iuyce of this herbe is with good ſucceſſe dropped into the eares when they are troubled with any pricking or ſhooting paine or noyſe.

D Laſtly, The water hath the ſame qualitie as that of Succorie. *Tragus.*

E 2 *Pena* and *Lobel* affirme this to be commended againſt whitlowes, and in the diſeaſes of the lungs.

F 3 This (if it be the *Coſta* of *Camerarius*) is of ſingular vſe in the Pthiſis, that is, the vlceration or conſumption of the lungs: whereupon in Miſnia they giue the conſerue, ſyrrup, and pouder thereof for the ſame purpoſe: and they alſo vſe it in broths and otherwiſe. *Cam.* ‡

Chap. 37. *Of Lettuce.*

1 *Lactuca ſatiua.*
Garden Lettuce.

2 *Lactuca criſpa.*
Curled Lettuce.

¶ *The Kindes.*

THere be according to the opinion of the Antients, of Lettuce two ſorts; the one wilde, or of the field; the other tame, or of the Garden: but time, with the induſtrie of later Writers haue found out others both wilde and tame, as alſo artificiall, which I purpoſe to lay downe.

¶ *The*

¶ *The Deſcription.*

1 GArden Lettuce hath a long broad leafe, ſmooth, and of a light green colour: the ſtalke is round, thicke ſet with leaues full of milky iuyce, buſhed or branched at the top: whereupon do grow yellowiſh floures, which turne into downe that is carried away with the winde. The ſeed ſticketh faſt vnto the cottony downe, and flieth away likewiſe, white of colour, and ſomewhat long: the root hath hanging on it many long tough ſtrings, which being cut or broken, do yeeld forth in like manner as doth the ſtalke and leaues, a iuyce like to milke. And this is the true deſcription of the naturall Lettuce, and not of the artificiall; for by manuring, tranſplanting, and hauing a regard to the Moone and other circumſtances, the leaues of the artificiall Lettuce are oftentimes transformed into another ſhape: for either they are curled, or elſe ſo drawne together, as they ſeeme to be like a Cabbage or headed Colewort, and the leaues which be within and in the middeſt are ſomething white, tending to a very light yellow.

5 *Lactuca capitata.*
Cabbage Lettuce.

6 Lactuca intybacea.
Lumbard Lettuce.

2 The curled Lettuce hath great and large leaues deeply cut or gaſhed on both the ſides, not plaine or ſmooth as the former, but intricately curled and cut into many ſections. The floures are ſmall, of a bleake colour, the which do turne into downe, and is carried away with the winde. The ſeed is like the former, ſauing that it changeth ſometime into blackneſſe, with a root like vnto the former.

3 This ſmall ſort of curled Lettuce hath many leaues hackt and torne in pieces very confuſedly, and withall curled in ſuch an admirable ſort, that euery great leafe ſeemeth to be made of many ſmall leaues ſet vpon one middle rib, reſembling a fan of curled feathers vſed among Gentlewomen: the floures, roots, and ſeeds agree with the former.

4 The Sauoy Lettuce hath very large leaues ſpred vpon the ground, at the firſt comming vp broad, cut or gaſht about the edges, criſping or curling lightly this or that way, not vnlike to the leaues of Garden Endiue, with ſtalkes, floures, and ſeeds like the former, as well in ſhape, as yeelding that milky iuyce wherewith they do all abound.

5 Cabbage Lettuce hath many plaine and ſmooth leaues at his firſt growing vp, which for the moſt part lie flat ſtill vpon the ground: the next that do appeare are thoſe leaues in the midſt, which turn themſelues together, embracing each other ſo cloſely, that it is formed into that globe

or round head, whereof the ſimpleſt is not ignorant. The ſeed hereof is blacke, contrary to all the reſt; which may be as it were a rule whereby ye may know the ſeed of Cabbage Lettuce from the other ſorts.

6 The Lumbard Lettuce hath many great leaues ſpred vpon the ground like vnto thoſe of the garden Endiue, but leſſer. The ſtalkes riſe vp to the height of three foot: the floures be yellowiſh, which turne into downe and flie away with the winde: the ſeed is white as ſnow.

¶ *The Place.*

Lettuce delighteth to grow, as *Palladius* ſaith, in a mannured, fat, moiſt, and dunged ground: it muſt be ſowen in faire weather in places where there is plenty of water, as *Columella* ſaith, and proſpereth beſt if it be ſowen very thin.

¶ *The Time.*

It is certaine, ſaith *Palladius*, that Lettuce may well be ſowen at any time of the yeare, but eſpecially at euery firſt ſpring, and ſo ſoone as winter is done, till ſummer be well nigh ſpent.

¶ *The Names.*

Garden Lettuce is called in Latine, *Lactuca ſatiua*: *Galen* names it θριδακίνην: the Pythagorians ἰνδάμην: ſome iudge it to be *Lactuca, à Lacteo ſucco*, called of the milkie iuice which iſſueth forth of the wounded ſtalkes and rootes: the Germanes name it **Lattich**: the low Duch, **Latouwe**: the Spaniards, *Lechuga*, and *Alface*: the Engliſh, Lettuce: and the French, *Laictue*. When the leaues of this kinde are curled or crompled, it is named of *Pliny*, *Lactuca criſpa*: and of *Columella*, *Lactuca Ceciliana*: in Engliſh, curl'd or crompled Lettuce.

The Cabbage Lettuce is commonly called *Lactuca capitata*, and *Lactuca ſeſſilis*: *Pliny* nameth it *Lactuca Laconica*: *Columella*, *Lactuca Batica*: *Petrus Creſcentius*, *Lactuca Romana*: in Engliſh, Cabbage Lettuce, and Loued Lettuce.

There is another ſort with reddiſh leaues, called of *Columella*, *Lactuca Cypria*: in Engliſh, red Lettuce.

¶ *The Temperature.*

Lettuce is a cold and moiſt pot-herbe, yet not in the extreame degree of cold or moiſture, but altogether moderately; for otherwiſe it were not to be eaten.

¶ *The Vertues.*

A Lettuce cooleth the heate of the ſtomacke, called the heart-burning; and helpeth it when it is troubled with choller: it quencheth thirſt, cauſeth ſleepe, maketh plenty of milke in nurſes, who through heate and drineſſe grow barren and drie of milke: for it breedeth milke by tempering the drieneſſe and heate. But in bodies that be naturally cold, it doth not ingender milke at all, but is rather an hinderance thereunto.

B Lettuce maketh a pleaſant ſallad, being eaten raw with vineger, oyle, and a little ſalt: but if it be boyled it is ſooner digeſted, and nouriſheth more.

C It is ſerued in theſe dayes, and in theſe countries in the beginning of ſupper, and eaten firſt before any other meate: which alſo *Martiall* teſtifieth to be done in his time, maruelling why ſome did vſe it for a ſeruice at the end of ſupper, in theſe verſes.

Claudere quæ cœnas Lactuca ſolebat anorum,
Dic mihi, cur noſtras incohat illa dapes?
Tell me why Lettuce, which our Grandſires laſt did eate,
Is now of late become, to be the firſt of meate?

D Notwithſtanding it may now and then be eaten at both thoſe times to the health of the body: for being taken before meat it doth many times ſtir vp appetite: and eaten after ſupper it keepeth away drunkenneſſe which commeth by the wine; and that is by reaſon that it ſtayeth the vapors from riſing vp into the head.

E The iuice which is made in the veines by Lettuce is moiſt and cold, yet not ill, nor much in quantitie: *Galen* affirmeth that it doth neither binde the belly nor looſe it, for it hath in it no harſhnes nor ſtiptike qualitie by which the belly is ſtayed, neither is there in it any ſharpe or biting faculty, which ſcoureth and prouoketh to the ſtoole.

F But howſoeuer *Galen* writeth this, and howſoeuer the ſame wanteth theſe qualities, yet it is found by experience, that it maketh the body ſoluble, eſpecially if it be boyled; for by moiſtning of the belly it maketh it the more ſlippery: which *Martial* very well knew, writing in his 11. booke of Epigrams in this manner: *Prima tibi dabitur, ventri Lactuca mouendo Vtilis.*

G Lettuce being outwardly applied mitigateth all inflammations; it is good for burnings and ſcaldings, if it be laid thereon with ſalt before the bliſters doe appeare, as *Plinie* writeth.

H The iuice of Lettuce cooleth and quencheth the naturall ſeed if it be too much vſed, but procureth ſleepe.

‡ Chap.

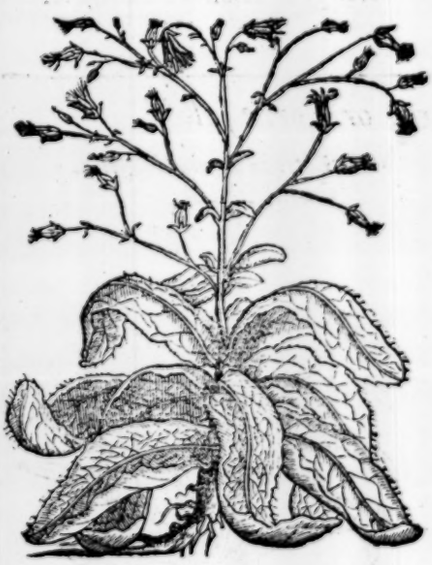
‡CHAP. 38. *Of Wilde Lettuce.*

¶ *The Deſcription.*

‡ THere are three ſorts of wilde Lettuce growing wilde here with vs in England, yet I know not any that haue mentioned more than two; yet I thinke all three of them haue beene written of, though two of them be confounded together and made but one (a thing often happening in the hiſtory of Plants) and vnleſſe I had ſeene three diſtinct ones, I ſhould my ſelfe haue beene of the ſame opinion.

1 The firſt and rareſt of theſe hath long and broad leaues, not cut in, but only ſnipt about the edges, and thoſe leaues are they that are on the lower part of the ſtalke almoſt to the midle thereof: then come leaues from thence to the top, which are deepely diuided with large gaſhes: the ſtalke if it grow in good grounds exceeds the height of a man, (for I haue ſeene it grow in a garden to the height of eight or nine foot) it is large, round, and ſmooth, and towards the top diuided into many branches which beare yellow floures ſomewhat like to the garden Lettuce, after which alſo ſucceed blackiſh ſeeds like to other plants of this kinde. The whole plant is full of a clammy milky iuice, which hath a very ſtrong and grieuous ſmell of *Opium*.

‡ 1 *Lactuca ſyl. maior odore Opij.*
The greater wilde Lettuce ſmelling of *Opium*.



‡ 3 *Lactuca ſylueſtris foliis diſſectis.*
The wilde Lettuce with the diuided Leafe.

2 This hath broad leaues only cut about the edges, but not altogether ſo large as thoſe of the laſt deſcribed: the ſtalke, which commonly is two cubits or better high, is alſo ſmooth, and diuided into many branches, bearing ſuch floures and ſeeds as the laſt deſcribed; and this alſo hath a milky iuice of the ſame ſmell as the laſt deſcribed, from which it differs only in the magnitude, and that this hath all the leaues whole, and not ſome whole and ſome diuided, as the former.

3 This in ſtalkes, floures and ſeedes is like to the laſt deſcribed, but the leaues are much different, for they are all deeply gaſhed or cut in like as the leaues of Succory, or Dandelion. This alſo is full of a milky iuice, but hath not altogether ſo ſtrong a ſent of *Opium* as the two former, though it partake much thereof. The ſtalke of this is ſometimes a little prickly, and ſo alſo is the middle rib vpon the backeſide of the leafe. All theſe three haue wooddy roots which die euery yeare, and ſo they come vp againe of the ſcattered ſeed.

¶ *The Place.*

The firſt of theſe was found in Hampſhire by M^r. *Goodyer* and the ſeeds hereof ſent to M^r. *Parkinſon*

in whoſe garden I ſaw it growing ſome two yeares agoe. The other grow plentifully betweene London and Pancridge Church, about the ditches and highway ſide.

¶ *The Time.*

They come vp in the Spring, and ſometimes ſooner, and ripen their ſeed in Iuly and Auguſt.

¶ *The Names.*

1 I take the firſt of theſe to be the *Lactuca Sylveſtris* of *Dioſcorides* and the Ancients, and that which the Authours of the *Adverſaria* gaue vs vnder the title of *Lactuca agreſtis ſcariolæ hortenſis folio, Lactucæ flore, Opij odore vehementi, ſoporifero & viroſo.*

2 This is the *Endiuia* of *Tragus*, *pag.* 268. and the *Theſion* of *Daliſchampius*, *pag.* 564. *Bauhine* confounds this with the former.

3 This is the *Lactuca Sylveſtris prior*, of *Tragus*: the *Lactuca Sylveſtris* of *Matthiolus*, *Fuchſius*, *Dodonæus*, and others: it is the *Seris Domeſtica* of *Lobell.*

The Temper.

Theſe certainly, eſpecially the two firſt, are cold, and that in the later end of the third or beginning of the fourth degree (if *Opium* be cold in the fourth.)

The Vertues.

A Some (ſaith *Dioſcorides*) mix the milkie iuice hereof with *Opium*; (for his *Meconium* is our *Opium.*) in the making thereof.

B He alſo ſaith, that the iuice hereof drunke in Oxycrate in the quantity of 2 *obuli*, (which make ſome one ſcruple) purgeth watriſh humors by ſtoole; it alſo clenſeth the little vlcer in the eye called *Argemon* in Greeke, as alſo the myſtines or darkeneſſe of ſight.

C Alſo beaten and applied with womans milke it is good againſt burnes and ſcaldes.

D Laſtly, it procures ſleepe, aſſwages paine, moues the courſes in women, and is drunke againſt the ſtingings of ſcorpions, and bitings of ſpiders.

E The ſeed taken in drinke, like as the Garden Lettuce, hindreth generation of ſeed and venereous imaginations. ‡

Chap. 39. *Of Lambs Lettuce, or Corne ſallad.*

1 *Lactuca Agnina.*
Lambes Lettuce.

2 *Lactuca Agnina latifolia.*
Corne ſallade.

¶ The

¶ *The Description.*

1 THe plant which is commonly called *Olus album*, or the white pot-herbe (which of some hath been set out for a kinde of Valerian, but vnproperly, for that it doth very notably resemble the Lettuce, as well in forme, as in meate to be eaten, which propertie is not to be found in Valerian, and therefore by reason and authoritie I place it as a kinde of Lettuce) hath many slender weake stalkes trailing vpon the ground, with certaine edges a foot high when it growes in most fertile ground; otherwise a hand or two high, with sundry ioynts or knees: out of euery one whereof grow a couple of leaues narrow and long, not vnlike to Lettuce at the first comming vp, as well in tenderneſse as taste in eating; and on the top of the stalkes stand vpon a broad tuft as it were certaine white floures that be maruellous little, which can scarsely be known to be floures, sauing that they grow many together like a tuft or vmbel: it hath in stead of roots a few slender threads like vnto haires.

2 The other kind of Lettuce, which *Dodonæus* in his last edition setteth forth vnder the name of *Album olus*: the Low-countrey men call it **Witmoes**, and vse it for their meate called Wermose; with vs, Loblollie. This plant hath small long leaues a finger broad, of a pale green colour; among which shooteth vp a small cornered and slender stem halfe a foot high, ioynted with two or three ioynts or knees, out of which proceed two leaues longer than the first, bearing at the top of the branches tufts of very smal white floures closely compact together, with a root like the former.

‡ Both these are of one plant, differing in the bigneſse and broadneſse of the leafe and the whole plant besides. ‡

¶ *The Place.*

These herbes grow wilde in the corne fields; and since it hath growne in vse among the French and Dutch strangers in England, it hath beene sowen in gardens as a sallad herbe.

¶ *The Time.*

They are found greene almost all Winter and Sommer.

¶ *The Names.*

The Dutch-men do call it **Witmoes**; that is to say, *Album olus*: of some it is called **Uelterop**: the French terme it *Sallade de Chanoine*: it may be called in Greeke, Λευκὸλαχανον: in English, The White Pot-herbe; but commonly, Corne sallad.

¶ *The Temperature and Vertues.*

This herbe is cold and something moist, and not vnlike in facultie and temperature to the garden Lettuce; in stead whereof, in Winter and in the first moneths of the Spring it serues for a sallad herbe, and is with pleasure eaten with vineger, salt and oile, as other sallads be, among which it is none of the worst.

CHAP. 40. *Of Coleworts.*

¶ *The Kindes.*

Dioscorides maketh two kindes of Coleworts; the tame and the wilde: but *Theophrastus* makes more kindes hereof; the russed or curled Cole, the smooth Cole, and the wilde Cole. *Cato* imitating *Theophrastus*, setteth downe also three Coleworts: the first hee describeth to be smooth, great, broad leaued, with a big stalke; the second ruffed; the third with little stalks, tender, and very much biting. The same distinction also *Pliny* maketh, in his twentieth booke, and ninth chapter; where he saith, That the most ancient Romanes haue diuided it into three kindes; the first roughed, the second smooth, and the third which is properly called ῥάφανος, or Colewort. And in his nineteenth booke he hath also added to these, other moe kindes; that is to say, *Tritianum*, *Cumanum*, *Pompeianum*, *Brutianum*, *Sabellium*, and *Lacuturrium*.

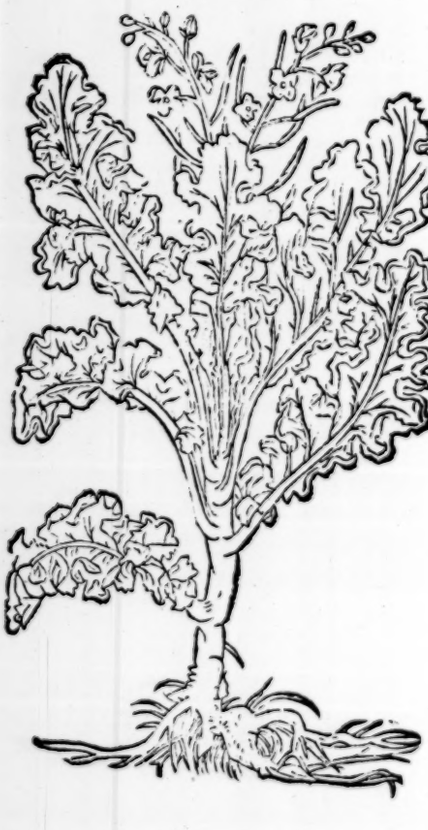
The Herbarists of our time haue likewise obserued many sorts, differing either in colour or else in forme; other headed with the leaues drawne together; most of them white, some of a deepe greene, some smooth leaued, and others curled or ruffed; differing likewise in their stalkes, as shall be expressed in their seuerall descriptions.

¶ *The*

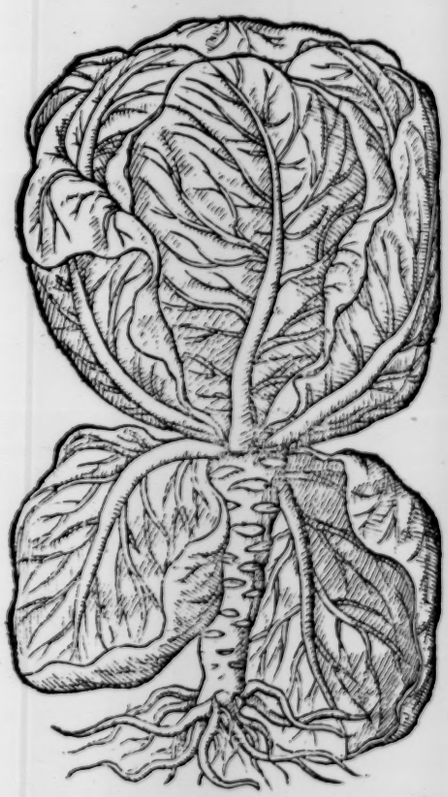
1 *Braſſica vulgaris ſatiua.*
Garden Colewort.

2 *Braſſica ſatiua criſpa.*
Curled Garden Cole.

3 *Braſſica rubra.*
Red Colewort.



4 *Braſſica capitata alba.*
White Cabbage Cole.



5 *Braſſica*

¶ *The Deſcription.*

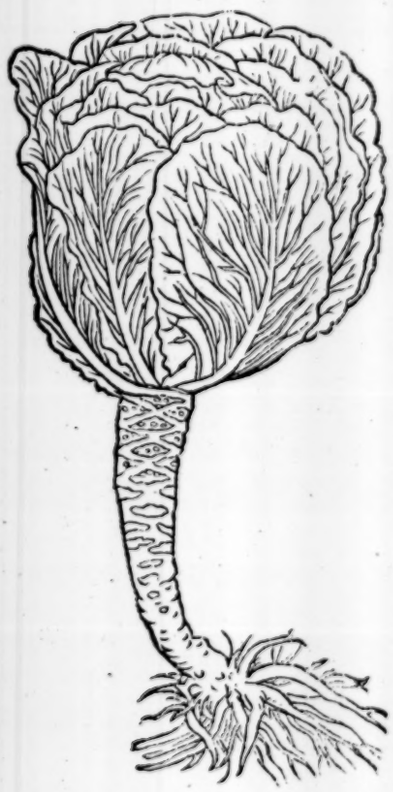
1 THe Garden Colewort hath many great broad leaues of a deepe blacke greene colour, mixed with ribs and lines of reddiſh and white colours: the ſtalke groweth out of the middeſt from among the leaues, branched with ſundry armes bearing at the top little yellow floures: and after they be paſt, there do ſucceed long cods full of round ſeed like thoſe of the Turnep, but ſmaller, with a wooddy root hauing many ſtrings or threds faſtned thereto.

2 There is another leſſer ſort than the former, with many deepe cuts on both ſides euen to the middeſt of the rib, and very much curled and roughed in the edges; in other things it differeth not.

3 The red kinde of Colewort is likewiſe a Colewort of the garden, and differeth from the common in the colour of his leaues, which tend vnto redneſſe; otherwiſe very like.

4 There is alſo found a certaine kinde hereof with the leaues wrapped together into a round head or globe, whoſe head is white of colour, eſpecially toward Winter when it is ripe. The root is hard, and the ſtalkes of a wooddy ſubſtance. ‡ This is the great ordinarie Cabbage knowne euery where, and as commonly eaten all ouer this kingdome. ‡

5 *Braſſica capitata rubra.*
Red Cabbage Cole.



6 *Braſſica patula*
Open Cabbage Cole.

5 There is another ſort of Cabbage or loued Colewort which hath his leaues wrapped together into a round head or globe, yet leſſer than that of the white Cabbage, and the colour of the leaues of a lighter red than thoſe of the former.

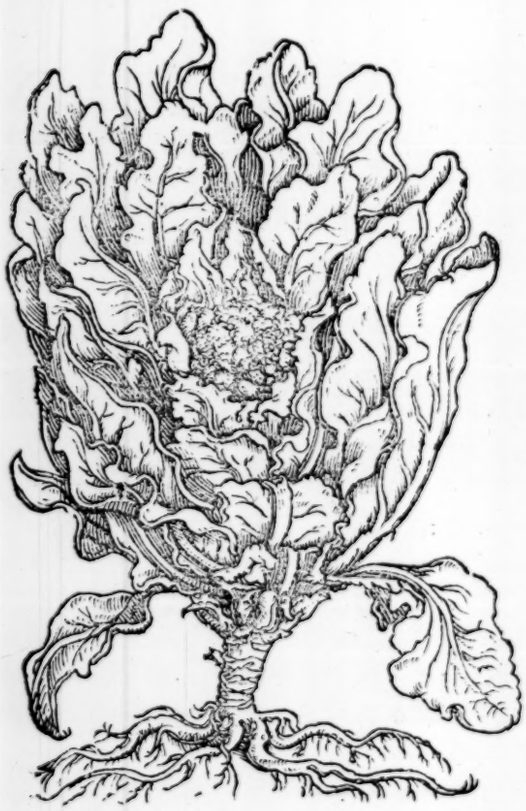
6 The open loued Colewort hath a very great hard or wooddy ſtalke, whereupon do grow very large leaues of a white greene colour, and ſet with thicke white ribs, and gathereth the reſt of the leaues cloſely together, which be leſſer than thoſe next the ground; yet when it commeth to the ſhutting vp or cloſing together, it rather dilateth it ſelfe abroad, than cloſeth all together.

7 Double Colewort hath many great and large leaues, whereupon doe grow here and there other ſmall iagged leaues, as it were made of ragged ſhreds and iagges ſet vpon the ſmooth leafe, which giueth ſhew of a plume or fan of feathers. In ſtalke, root, and euery other part beſides it doth agree with the Garden Colewort.

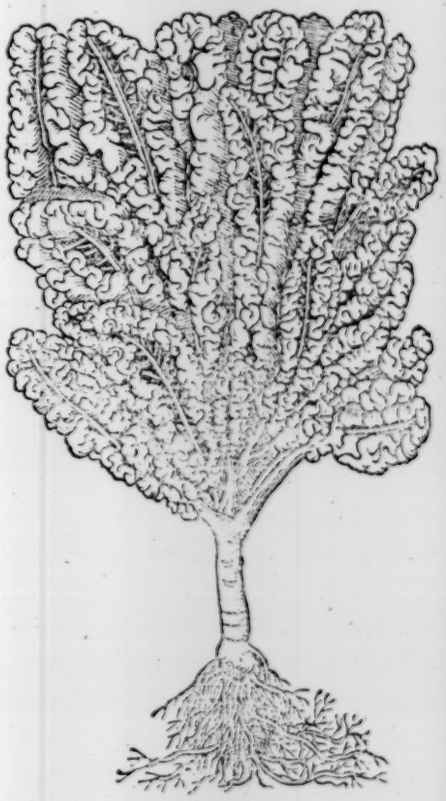
8 The

8 The double criſpe or curled Colewoort agreeth with the laſt before deſcribed in euery reſpect, onely it differeth in the leaues, which are ſo intricately curled, and ſo thick ſet ouer with other ſmall cut leaues, that it is hard to ſee any part of the leafe it ſelfe, except ye take and put aſide ſome of thoſe iagges and ragged leaues with your hand.

9 *Braſsica florida.*
Cole-Florie.



10 *Braſsica Tophoſa.*
Swollen Colewoort.



9 Cole flore, or after ſome Colieflore, hath many large leaues ſleightly indented about the edges, of a whitiſh greene colour, narrower and ſharper pointed than Cabbage: in the middeſt of which leaues riſeth vp a great white head of hard floures cloſely thruſt together, with a root full of ſtrings; in other parts like vnto the Coleworts.

10 The ſwollen Colewort of all other is the ſtrangeſt, which I receiued from a worſhipfull merchant of London maſter *Nicholas Lete*, who brought the ſeed thereof out of France; who is greatly in loue with rare and faire floures & plants, for which he doth carefully ſend into Syria, hauing a ſeruant there at Aleppo, and in many other countries, for the which my ſelfe and likewiſe the whole land are much bound vnto him. This goodly Colewort hath many leaues of a blewiſh green, or of the colour of Woade, bunched or ſwollen vp about the edges as it were a peece of leather wet and broiled on a gridiron, in ſuch ſtrange ſort that I cannot with words deſcribe it to the full. The floures grow at the top of the ſtalkes, of a bleake yellow colour. The root is thicke and ſtrong like to the other kindes of Coleworts.

11 Sauoy Cole is alſo numbred among the headed Colewoorts or Cabbages. The leaues are great and large very like to thoſe of the great Cabbage, which turne themſelues vpwards as though they would embrace one another to make a loued Cabbage, but when they come to the ſhutting vp they ſtand at a ſtay, and rather ſhew themſelues wider open, than ſhut any neerer together; in other reſpects it is like vnto the Cabbage.

12 The curled Sauoy Cole in euery reſpect is like the precedent, ſauing that the leaues hereof doe ſomewhat curle or criſpe about the midle of the plant: which plant if it be opened in the ſpring time, as ſometimes it is, it ſendeth forth branched ſtalks, with many ſmall white floures at the top, which being paſt their follow long cods and ſeeds like the common or firſt kinde deſcribed.

13 This kinde of Colewoort hath very large leaues deepely iagged euen to the middle rib, in face reſembling great and ranke parſley. It hath a great and thicke ſtalke of three cubits high, whereupon doe grow floures, cods, and ſeed like the other Colewoorts.

14 The

11 *Braſsica Sabauda.*
Sauoy Cole.

12 *Braſsica Sabauda criſpa.*
Curled Sauoy Cole.

13 *Braſsica Selinoides.*
Parſeley Colewoort.

† 15 *Braſsica marina Anglica.*
Engliſh ſea Colewoorts.

14 The

14 The ſmall cut Colewoort hath very large leaues, wonderfully cut, hackt and hewen euen to the middle rib, reſembling a kinde of curled parſley, that ſhall be deſcribed in his place, (which is not common nor hath not beene knowne nor deſcribed vntill this time) very well agreeing with the laſt before mentioned, but differeth in the curious cutting and iagging of the leaues: in ſtalke floures and ſeed not vnlike.

† 16 *Braſſica ſylueſtris.*
Wilde Colewoorts.

15 Sea Colewoort hath large and broad leaues very thicke and curled, and ſo brittle that they cannot be handled without breaking, of an ouerworne greene colour, tending to grayneſſe: among which riſe vp ſtalkes two cubits high, bearing ſmall pale floures at the top; which being paſt their follow round knobs wherein is contained one round ſeed and no more, blacke of colour, of the bigneſſe of a tare and a fetch: ‡ And therefore *Pena* and *Lobell* called it *Braſſica marina monoſpermos*. ‡

16 The wilde Colewoort hath long broad leaues not vnlike to the tame Colewoort, but leſſer, as is all the reſt of the plant, and is of his owne nature wilde, and therefore not ſought after as a meate, but is ſowen and husbanded vpon ditch bankes and ſuch like places for the ſeeds ſake, by which oftentimes great gaine is gotten.

¶ *The Place.*

The greateſt ſort of Colewoorts doe grow in gardens, and doe loue a ſoile which is fat and throughly dunged and well manured: they doe beſt proſper when they be remooued, and every of them grow in our Engliſh gardens, except the wilde, which groweth in fields and new digged ditch banks.

The ſea Colewoort groweth naturally vpon the bayche and brims of the ſea, where there is no earth to bee ſeene, but ſand and rowling pibble ſtones, which thoſe that dwell neere the ſea doe call Bayche: I found it growing betweene Whytſtable and the Ile of Thanet neere the brinke of the ſea, and in many places neere to Colcheſter and elſewhere by the ſea ſide.

¶ *The Time.*

Petrus Creſcentius ſaith that the Colewoort may bee ſowen and remooued at any time of the yeere; whoſe opinion I altogether miſlike. It is ſowen in the ſpring, as March, Aprill, and oftentimes in May, and ſometimes in Auguſt, but the ſpeciall time is about the beginning of September.

The Colewoort, ſaith *Columella*, muſt be remoued when it attaineth to ſix leaues, after it is come vp from ſeed; the which muſt be done, in Aprill or May, eſpecially thoſe that were ſowne in Autumne; which afterwards flouriſh in the winter moneths, at what time, they are fitteſt for meate.

But the Sauoy-Cole, and the Cole florey, muſt be ſowne in Aprill, in a bed of hot horſedung, and couered with ſtraw or ſuch like, to keepe it from the cold, and froſty mornings; and when it hath gotten ſix leaues after this ſort, then ſhall you remoue him as aforeſaid, otherwiſe if you tarry for temperate weather before you ſow, the yeare will be ſpent, before it come to ripeneſſe.

¶ *The Names.*

Euery of the Colewoorts, is called in Greeke by *Dioſcorides* and *Galen* κράμβη: it is alſo called ἀμέθυστος: ſo named, not only becauſe it driueth away drunkenneſſe, but alſo for that it is like in colour to the precious ſtone called the Amethyſt: which is meant by the firſt and garden Colewoort. The Apothecaries and the common Herbariſts doe call it *Caulis*, of the goodneſſe of the ſtalke: in the Germane tongue it is called **Koole kraut**: in French, *des Choux*: in Engliſh, Colewoorts.

Cole-florey is called in Latine *Braſſica Cypria*, and *Cauliflora*: in Italian, *Caulifiore*: it ſeemeth to agree with *Braſſica pompeiana* of *Pliny*, whereof he writeth in his 19. booke, and 8. chapter.

¶ *The*

¶ *The Temperature.*

All the Colewoorts haue a drying and binding facultie, with a certaine nitrous or ſalt quality, whereby they mightily cleanſe, either in the iuice, or in the broth. The whole ſubſtance or body of the Colewoort is of a binding and drying faculty, becauſe it leaueth in the decoction this ſalt quality; which lieth in the iuyce and watry part thereof: the water wherein it is firſt boyled, draweth to it ſelfe all the quality; for which cauſe the decoction thereof looſeth the belly, as doth alſo the iuyce of it, if it be drunke: but if the firſt broth in which it was boyled be caſt away, then doth the Colewoort dry and binde the belly. But it yeeldeth to the body ſmall nourithment, and doth not ingender good, but a groſſe and Melancholicke bloud. The white Cabbage is beſt next vnto the Cole-florey; yet *Cato* doth chiefly commend the ruſſet Cole: but he knew neither the white ones, nor the Cole-florey; for if he had, his cenſure had beene otherwiſe.

¶ *The Vertues.*

Dioſcorides teacheth, that the Colewoort being eaten is good for them that haue dim eyes, A
and that are troubled with the ſhaking palſie.

The ſame author affirmeth, that if it be boiled and eaten with vineger, it is a remedie for thoſe B
that be troubled with the ſpleene.

It is reported, that the raw Colewoort being eaten before meate, doth preſerue a man from C
drunkenneſſe: the reaſon is yeelded, for that there is a naturall enmity betweene it and the vine, which is ſuch, as if it grow neere vnto it, forthwith the vine periſheth and withereth away: yea, if wine be poured vnto it while it is in boyling, it will not be any more boiled, and the colour thereof quite altered, as *Caſtius* and *Dionyſius Vticenſis* doe write in their bookes of tillage: yet doth not *Athenæus* aſcribe that vertue of driuing away drunkenneſſe to the leaues, but to the ſeeds of Colewoort.

Moreouer, the leaues of Colewoorts are good againſt all inflammations, and hot ſwellings, D
being ſtamped with barley and meale, and laid vpon them with ſalt: and alſo to breake carbuncles.

The iuyce of Colewoorts, as *Dioſcorides* writeth, being taken with floure-deluce and niter, doth E
make the belly ſoluble: aud being drunke with wine, it is a remedie againſt the bitings of venomous beaſts.

The ſame being applyed with the powder of Fennugreeke, taketh away the paine of the gout, F
and alſo cureth old and foule vlcers.

Being conueied into the noſthrils, it purgeth the head: being put vp with barley meale it brin- G
geth downe the floures.

Pliny writeth, that the iuyce mixed with wine, and dropped into the eares, is a remedie againſt H
deafeneſſe.

The ſeed, as *Galen* ſaith, driueth forth wormes, taketh away freckles of the face, ſun-burning, I
and what thing ſoeuer that need to be gently ſcoured or clenſed away.

They ſay that the broth wherein the herbe hath beene ſodden is maruellous good for the ſi- K
newes and ioynts, and likewiſe for Cankers in the eies, claled in Greeke *Carcinomata*, which cannot be healed by any other meanes, if they be waſhed therewith.

† The fifteenth and ſixteenth figures were formerly tranſpoſed.

Chap. 41. *Of Rape-Cole.*

¶ *The Deſcription.*

1 THe firſt kinde of Rape Cole hath one ſingle long root, garniſhed with many threddy ſtrings: from which riſeth vp a great thicke ſtalke, bigger than a great Cucumber or great Turnep: at the top whereof ſhooteth forth great broad leaues, like vnto thoſe of Cabbage Cole. The floures grow at the top on ſlender ſtalkes, compact of foure ſmall yellow floures: which being paſt the ſeed followeth incloſed in litle long cods, like the ſeed of Muſtard.

2 The ſecond hath a long fibrous root like vnto the precedent; the tuberous ſtalke is very great and long, thruſting forth in ſome few places here and there, ſmall footſtalkes, whereupon doe grow ſmooth leaues, ſleightly indented about the edges: on the top of the long Turnep ſtalke grow leane ſtalkes and floures like the former. ‡ This ſecond differs from the former onely in the length of the ſwolne ſtalke, whence they call it *Caulorapum longum*, or Long Rape Cole. ‡

¶ *The Place.*

They grow in Italy, Spaine, and ſome places of Germanie, from whence I haue receiued ſeedes for my garden, as alſo from an honeſt and curious friend of mine called maſter *Goodman*, at the Minories neere London.

1 *Caulorapum rotundum.*
Round rape Cole.

¶ *The Time.*

They floure and flouriſh when the other Colewoorts doe, whereof no doubt they are kinds, and muſt be carefully ſet and ſowne, as muske Melons and Cucumbers are.

¶ *The Names.*

They are called in Latine, *Caulorapum*, and *Rapocaulis*, bearing for their ſtalkes, as it were Rapes and Turneps, participating of two plants, the Colewort and Turnep; whereof they tooke their names.

¶ *The Temperature and Vertues.*

There is nothing ſet downe of the faculties of theſe plants, but are accounted for daintie meate, contending with the Cabbage Cole in goodneſſe and pleaſant taſte.

Chap. 42. *Of Beets.*

¶ *The Deſcription.*

1 THe common white Beet hath great broad leaues, ſmooth, and plain: from which riſe thicke creſted or chamfered ſtalks: the floures grow along the ſtalks cluſtering together, in ſhape like little ſtarres; which being paſt, there ſucceed round and vneuen prikly ſeed. The root is thicke, hard, and great.

1 *Beta alba.* White Beets.

2 *Beta rubra.* Red Beets.

2 There

‡ 3 *Beta rubra Romana.*
Red Roman Beet.

2 There is another ſort like in ſhape and proportion to the former, ſauing that the leaues of this be ſtreaked with red here and there confuſedly, which ſetteth forth the difference.

3 There is likewiſe another ſort hereof, that was brought vnto me from beyond the ſeas, by that courteous merchant maſter *Lete*, before remembred, the which hath leaues very great, and red of colour, as is all the reſt of the plant, as well roote, as ſtalke, and floures, full of a perfect purple iuyce tending to redneſſe: the middle rib of which leaues are for the moſt part very broad and thicke, like the middle part of the Cabbage leafe, which is equall in goodneſſe with the leaues of Cabbage being boyled. It grew with me 1596. to the height of viij. cubits, and did bring forth his rough and vneuen ſeed very plentifully: with which plant nature doth ſeeme to play and ſport herſelfe: for the ſeeds taken from that plant, which was altogether of one colour and ſowen, doth bring forth plants of many and variable colours, as the worſhipfull gentleman maſter *Iohn Norden* can very well teſtifie, vnto whom I gaue ſome of the ſeeds aforeſaid, which in his garden bruoght forth many other of beautifull colours.

¶ *The Place.*

The Beete is ſowen in gardens: it loueth to grow in a moiſt and fertile ground. ‡ The ordinary white Beet growes wilde vpon the ſea-coaſt of Tenet and diuers other places by the Sea, for this is not a different kind as ſome would haue it. ‡

¶ *The Time.*

The fitteſt time to ſow it is in the ſpring: it flouriſheth and is greene all ſommer long, and likewiſe in winter, and bringeth forth his ſeed the next yeare following.

¶ *The Names.*

The Grecians haue named it τεῦτλον, σεῦτλον: the Latines, *Beta:* the Germanes, **Maugolt:** the Spaniards, *Aſelgas:* the French, *de la Porée, des Iotes,* and *Beets: Theophraſtus* ſaith, that the white Beete is ſurnamed σικελὸν, that is to ſay, *Sicula,* or of Sicilia: hereof commeth the name *Sicla,* by which the Barbarians, and ſome Apothecaries did call the Beet; the which word we in England doe vſe, taken for the ſame.

¶ *The Nature.*

The white Beets are in moiſture and heate temperate, but the other kinds are drie, and all of them abſterſiue: ſo that the white Beete is a cold and moiſt pot-herbe, which hath ioyned with it a certaine ſalt and nitrous quality, by reaſon whereof it cleanſeth and draweth flegme out of the noſthrils.

¶ *The Vertues.*

Being eaten when it is boyled, it quickly deſcendeth, looſeth the belly, and prouoketh to the ſtoole, eſpecially being taken with the broth wherein it is ſodden: it nouriſheth little or nothing, and is not ſo wholeſome as Lettuce. A

The iuyce conueied vp into the noſthrils doth gently draw forth flegme, and purgeth the head. B

The great and beautifull Beet laſt deſcribed may be vſed in winter for a ſallad herbe, with vineger, oyle, and ſalt, and is not onely pleaſant to the taſte, but alſo delightfull to the eye. C

The greater red Beet or Roman Beet, boyled and eaten with oyle, vineger and pepper, is a moſt excellent and delicate ſallad: but what might be made of the red and beautifull roote (which is to be preferred before the leaues, as well in beauty as in goodneſſe) I refer vnto the curious and cunning cooke, who no doubt when he hath had the view thereof, and is aſſured that it is both good and wholeſome, will make thereof many and diuers diſhes, both faire and good. D

Chap. 43. *Of Blites.*

¶ *The Deſcription.*

1 THe great white Blite groweth three or foure foot high, with grayiſh or white round ſtalkes: the leaues are plaine and ſmooth, almoſt like to thoſe of the white Orach, but not ſo ſoft nor mealy: the floures grow thruſt together like thoſe of Orach: after that commeth the ſeed incloſed in little round flat husky skinnes.

2 There is likewiſe another ſort of Blites very ſmooth and flexible like the former, ſauing that the leaues are reddiſh, mixed with a darke greene colour, as is the ſtalke and alſo the reſt of the plant.

3 There is likewiſe found a third ſort very like vnto the other, ſauing that the ſtalkes, branches, leaues, and the plant is altogether of a greene colour. But this growes vpright, and creepes not at all.

4 There is likewiſe another in our gardens very like the former, ſauing that the whole Plant traileth vpon the ground: the ſtalks, branches, and leaues are reddiſh: the ſeed is ſmall, and cluſtering together, greene of colour, and like vnto thoſe of *Ruellius* his *Coronopus*, or Bucks-horne.

‡ 1 *Blitum majus album.*
The great white Blite.

2 *Blitum majus rubrum.*
The great red Blite.

¶ *The Place.*

The Blites grow in Gardens for the moſt part, although there be found of them wilde many times.

¶ *The Time.*

They flouriſh all the Summer long, and grow very greene in Winter likewiſe.

¶ *The Names.*

It is called in Greeke, βλίτον: in Latine, *Blitum*: in Engliſh, Blite, and Blites: in French, *Blites*, or *Blitres*.

¶ *The*

‡ 3 *Blitum minus album.*
The ſmall white Blite.

‡ 4 *Blitum minus rubrum.*
The ſmall red Blite.

¶ *The Nature.*

The Blite (ſaith *Galen* in his ſixth booke of the faculties of ſimple medicines) is a pot-hearbe which ſerueth for meate, being of a cold moiſt temperature, and that chiefely in the ſecond degree. It yeeldeth to the body ſmall nouriſhment, as in his ſecond booke of the faculties of nouriſhments he plainly ſhewes; for it is one of the pot-herbes that be vnſauoury or without taſte, whoſe ſubſtance is wateriſh.

¶ *The Vertues.*

The Blite doth nouriſh little, and yet is fit to make the belly ſoluble, though not vehemently, A
ſeeing it hath no nitrous or ſharpe qualitie whereby the belly ſhould be prouoked. I haue heard many old wiues ſay to their ſeruants, Gather no Blites to put into my pottage, for they are not good for the eye-ſight: whence they had thoſe words I know not, it may be of ſome Doctor that neuer went to ſchoole, for that I can finde no ſuch thing vpon record, either among the old or later Writers.

CHAP. 44. *Of Floure-Gentle.*

¶ *The Kindes.*

THere be diuers ſorts of floure-Gentle, differing in many points very notably; as in greatneſſe and ſmallneſſe; ſome purple, and others of a skarlet colour; and one aboue the reſt wherewith Nature hath ſeemed to delight her ſelfe, eſpecially in the leaues, which in variable colours do ſtriue with the Parats feathers for beautie.

1 *Amaranthus purpureus.*
Purple Floure-Gentle.

2 *Amaranthus coccineus.*
Scarlet Floure-Gentle.

3 *Amaranthus tricolor.*
Floramor and Paſſeuelours.

4 *Amaranthus Pannicula ſparſa.*
Branched Floure-Gentle.

5 *Amaranthus*

¶ *The Deſcription.*

1 PVrple floure Gentle riſeth vp with a ſtalke a cubit high, and ſometime higher, ſtreaked or chamfered alongſt the ſame, often reddiſh toward the root, and very ſmooth: which diuideth it ſelfe toward the top into ſmall branches, about which ſtand long leaues, broad, ſharpe pointed, ſoft, ſlippery, of a greene colour, and ſometimes tending to a reddiſh: in ſtead of floures, come vp eares or ſpokie tufts, very braue to looke vpon, but without ſmell; of a ſhining light purple, with a gloſſe like veluet, but far paſſing it: which when they are bruiſed, doe yeeld a iuyce almoſt of the ſame colour, and being gathered, doe keepe their beauty a long time after; inſomuch that being ſet in water, it will reuiue againe as at the time of his gathering, and it remaineth ſo, many yeares, whereupon likewiſe it hath taken its name. The ſeed ſtandeth in the ripe eares, of colour blacke, and much glittering: the root is ſhort, and full of ſtrings.

‡ 5 *Amaranthus pannicula incurua holoſerica.*
Veluet Floures Gentle.

2 The ſecond ſort of floure Gentle hath leaues like vnto the former: the ſtalke is vpright with a few ſmall ſlender leaues ſet vpon it: among which doe grow ſmall cluſters of ſcaly floures, of an ouerworne ſcarlet colour. The ſeed is like the former.

3 It far exceedeth my skill to deſcribe the beauty and excellency of this rare plant called *Floramor*; and I thinke the penſill of the moſt curious painter wil be at a ſtay, when he ſhall come to ſet him downe in his liuely colours: but to colour it after my beſt manner this I ſay: *Floramor* hath a thicke knobby root, whereupon doe grow many threddy ſtrings: from which riſeth a thicke ſtalke, but tender and ſoft, which beginneth to deuide himſelfe into ſundry branches at the ground and ſo vpward, whereupon doe grow many leaues, wherein doth conſiſt his beauty: for in few words, euery leafe doth reſemble in colours the moſt faire and beautifull feather of a Parrat, eſpecially thoſe feathers that are mixed with moſt ſundry colours, as a ſtripe of red, and a line of yellow, a daſh of white, and a rib of green colour, which I canot with words ſet forth, ſuch are the ſundry mixtures of colours that nature hath beſtowed in her greateſt iollitie vpon this floure. the floures doe grow betweene the foot-ſtalkes of thoſe leaues and the body of the ſtalke or trunke, baſe, and of no moment in reſpect of the leaues, being as it were little chaffie husks of an ouerworne tawnie colour: the ſeed is blacke, and ſhining like burniſhed horne. ‡ I haue not ſeene this thus variegated as our Author mentions, but the leaues are commonly of three colours; the lower part, or that next to the ſtalke is greene; the middle red, and the end yellow; or elſe the end red, the middle yellow, and the bottome greene. ‡

4 This plant hath a great many of threds and ſtrings, of which his roots doe conſiſt. From which doe riſe vp very thicke fat ſtalkes, creſted and ſtreaked, exceeding ſmooth, and of a ſhining red colour, which begin at the ground to diuide themſelues into branches; whereupon doe grow many great and large leaues of a darke greene colour tending to redneſſe, in ſhew like thoſe of the red Beet, ſtreaked and daſht here and there with red, mixed with greene. The floures grow alongſt the ſtalkes, from the middeſt thereof euen to the top, in ſhape like *Panicum*, that is, a great number of chaffie confuſed eares thruſt hard together, of a deepe purple colour. I can compare the ſhape thereof to nothing ſo fitly as to the veluet head of a Stag, compact of ſuch ſoft matter as is the ſame: wherein is the ſeed, in colour white, round, and bored through the middle.

‡ 5 This in ſtalkes and leaues is much like the purple floure Gentle, but the heads are larger, bended round, and laced, or as it were wouen one with another looking very beautifully like to Crimſon veluet: this is ſeldome to be found with vs; but for the beauties ſake is kept in the Gardens of Italy, whereas the women eſteemed it not only for the comelineſſe and beautious aſpect, but

1 *Atriplex ſatiua alba.*
White Orach.

† 2 *Atriplex ſatiua purpurea.*
Purple Orach.

3 *Atriplex ſylueſtris, ſiue Polyſpermon.*
Wilde Orach, or All-ſeed.

† 4 *Atriplex marina.*
Sea Orach.

but alſo for the efficacy thereof againſt the bloudy iſſues, and ſanious vlcers of the wombe and kidneyes, as the Authors of the *Aduerſaria* affirme. ‡

¶ *The Place and Time.*

These pleaſant floures are ſowen in gardens, eſpecially for their great beauty.

They floure in Auguſt, and continue flouriſhing till the froſt ouertake them, at what time they periſh. But the Floramor would be ſowne in a bed of hot horſe-dung, with ſome earth ſtrewed thereon in the end of March, and ordered as we doe muske Melons, and the like.

¶ *The Names.*

This plant is called in Greeke Ἀμάραντος, becauſe it doth not wither and wax old: in Latin, *Amaranthus purpureus*: in Duch, **Samatbluomen**: in Italian, *Fior velluto*: in French, *Paſſe velours*: in Engliſh, floure Gentle, purple Veluet floure, Floramor, and of ſome floure Velure.

¶ *The Temperature, and Vertues.*

Moſt attribute to floure Gentle a binding faculty, with a cold and dry temperature.

It is reported they ſtop all kinds of bleeding, which is not manifeſt by any apparant quality in them, except peraduenture by the colour only that the red eares haue: for ſome are of opinion, that all red things ſtanch bleeding in any part of the body: becauſe ſome things, as *Bole armoniacke, ſanguis Draconis, terra Sigillata,* and ſuch like of red colour doe ſtop bloud: But *Galen, lib. 2. & 4. de ſimp. facult.* plainly ſheweth, that there can be no certainty gathered from the colours, touching the vertues of ſimple and compound medicines: wherefore they are ill perſuaded, that thinke the floure Gentle to ſtanch bleeding, to ſtop the laske or bloody flix, becauſe of the colour only, if they had no other reaſon to induce them thereto. A

Chap. 45. *Of Orach.*

¶ *The Deſcription.*

1 THe Garden white Orach hath an high and vpright ſtalke, with broad ſharpe pointed leaues like thoſe of Blite, yet ſmoother and ſofter. The floures are ſmall and yellow, growing in cluſters: the ſeed round, and like a leafe couered with a thin skin, or filme, and groweth in cluſters. The root is wooddy and fibrous: the leaues and ſtalkes at the firſt are of a glittering gray colour, and ſprinkled as it were with a meale or floure.

2 This differs from the former, only in that it is of an ouerworne purple colour.

‡ 3 This might more fitly haue beene placed amongſt the Blites, yet finding the figure here (though a contrary diſcription) I haue let it inioy the place. It hath a white and ſlender root, and it is ſomewhat like, yet leſſe then the Blite, with narrow leaues ſomewhat reſembling Baſill: it hath aboundance of ſmall floures, which are ſucceeded by a numerous ſort of ſeeds, which are blacke and ſhining. ‡

4 There is a wilde kinde growing neere the ſea, which hath pretty broad leaues, cut deepely about the edges, ſharpe pointed, and couered ouer with a certaine mealineſſe, ſo that the whole plant as well leaues, as ſtalkes and floures, looke of an hoary or gray colour. The ſtalks lye ſpred, on the ſhore or Beach, whereas it vſually growes.

‡ 5 The common wilde Orach hath leaues vnequally ſinuated, or cut in ſomewhat after the manner of an oaken leafe, and commonly of an ouerworne grayiſh colour: the floures and ſeeds are much like thoſe of the garden, but much leſſe.

6 This is like the laſt deſcribed, but the leaues are leſſer and not ſo much diuided, the ſeeds grow alſo in the ſame manner as thoſe of the precedent.

7 This alſo in the face and manner of growing is like thoſe already deſcribed, but the leaues are long and narrow, ſometimes a little notched: and from the ſhape of the leafe *Lobell* called it *Atriplex Sylueſtris polygoni, aut Helxines folio.*

8 This elegant Orach hath a ſingle and ſmall root, putting forth a few fibers, the ſtalkes are ſome foot high, diuided into many branches, and lying along vpon the ground; and vpon theſe grow leaues at certaine ſpaces whitiſh and vnequally diuided, ſomewhat after the manner of the wilde Orach; about the ſtalke or ſetting on of the leaues grow as it were little berries, ſomewhat like a little mulberry, and when theſe come to ripeneſſe, they are of an elegant red colour, and make a fine ſhew. The ſeed is ſmall round and aſh coloured. ‡

¶ *The Place.*

The Garden Oraches grow in moſt gardens. The wilde Oraches grow neere paths-wayes and ditch ſides; but moſt commonly about dung-hils and ſuch fat places. Sea Orach I haue found at Queeneborough, as alſo at Margate in the Ile of Thanet: and moſt places about the ſea ſide. ‡ The eighth groweth only in ſome choice gardens, I haue ſeen it diuers times with Mr. *Parkinſon.* ‡

¶ *The*

‡ 5 *Atriplex ſylueſtrus vulgaris.*
Common wilde Orach.

‡ 6 *Atriplex ſylueſtris altera.*
The other wilde Orach.

‡ 7 *Atriplex ſylueſtris anguſtifolia.*
Narrow leaued wilde Orach.

‡ 8 *Atriplex baccifera.*
Berry-bearing Orach.

¶ *The Time.*

They floure and ſeed from Iune to the end of Auguſt.

¶ *The Names.*

Garden Orach is called in Greeke, ἀτράφαξυς: in Latine, *Atriplex*, and *Aureum Olus*: in Dutch, **Weld**: in French, *Arrouches ou bonnes dames*: in Engliſh, Orach, and Orage: in the Bohemian tongue, *Leboda*: *Pliny* hath made ſome difference betweene *Atriplex* and *Chryſolachanum*, as though they differed one from another; for of *Atriplex* he writeth in his twentieth booke; and of *Chryſolachanum* in his twenty eighth booke, and eighth chapter: where hee writeth thus, *Chryſolachanum*, ſaith he, groweth in Pinetum like Lettuce: it healeth cut ſinewes if it be forthwith applied.

3 This wilde Orach hath beene called of *Lobel*, *Polyſpermon Caſſani Baſti*, or All ſeed.

¶ *The Temperature.*

Orach, ſaith *Galen*, is of temperature moiſt in the ſecond degree, and cold in the firſt.

¶ *The Vertues.*

Dioſcorides writeth, That the garden Orach is both moiſt and cold, and that it is eaten boyled as other ſallad herbes are, and that it ſoftneth and looſeth the belly. A

It conſumeth away the ſwellings of the throat, whether it be laid on raw or ſodden. B

The ſeed being drunke with meade or honied water, is a remedie againſt the yellow jaundice. C

Galen thinketh, that for that cauſe it hath a clenſing qualitie, and may open the ſtoppings of the liuer. D

† The figure which was in the ſecond place was of *Pes Anſerinus* 2. of *Tabr.* The figure in the fourth place was of the wild Orach, that I haue deſcribed in the fifth place.

CHAP. 46. *Of Stinking Orach.*

Atriplex olida.
Stinking Orach.

¶ *The Deſcription.*

STinking Orach growes flat vpon the ground and is a baſe and low plant with many weak and feeble branches, whereupon doe grow ſmall leaues of a grayiſh colour, ſprinkled ouer with a certaine kinde of duſty mealineſſe, in ſhape like the leaues of Baſill: amongſt which leaues here and there confuſedly be the ſeeds diſperſed, as it were nothing but duſt or aſhes. The whole plant is of a moſt loathſome ſauour or ſmel; vpon which plant if any ſhould chance to reſt and ſleepe, he might very well report to his friends, that he had repoſed himſelfe among the chiefe of *Scoggins* heires.

¶ *The Place.*

It groweth vpon dunghills, and in the moſt filthy places that may be found, as alſo about the common piſſing places of great princes and Noblemens houſes. Sometime it is found in places neere bricke-kilns and old walls, which doth ſomewhat alter his ſmell, which is like toſted cheeſe: but that which groweth in his naturall place ſmells like ſtinking ſalt-fiſh, whereof it tooke his name *Garoſmus*.

¶ *The Time.*

It is an herbe for a yeare, which ſpringeth vp, and when the ſeed is ripe it periſheth, and recouereth it ſelfe againe of his owne ſeed; ſo that if it be gotten into a ground, it cannot be deſtroyed.

¶ *The Names.*

Stinking Orach is called of *Cordus*, *Garoſmus*, becauſe it ſmelleth like ſtinking fiſh: it is likewiſe called

called *Tragium Germanicum*, and *Atriplex fœtidagarum olens*, by *Pena* and *Lobel*: for it ſmelleth more ſtinking than the rammiſh male Goat: whereupon ſome by a figure haue called it *Vulvaria*: and it may be called in Engliſh, ſtinking Mother-wort.

¶ *The Nature and Vertues.*

A There hath been little or nothing ſet down by the Antients, either of his nature or vertues, notwithſtanding it hath beene thought profitable, by reaſon of his ſtinking ſmell, for ſuch as are troubled with the mother: for as *Hyppocrates* ſaith, when the mother doth ſtiffe or ſtrangle, ſuch things are to be applied vnto the noſe as haue a ranke and ſtinking ſmell.

Chap. 47. *Of Gooſe-foot.*

¶ *The Deſcription.*

1 Gooſe-foot is a common herbe, and thought to be a kinde of Orach: it riſeth vp with a ſtalke a cubit high or higher, ſomewhat chamfered and branched: the leaues be broad, ſmooth, ſharpe pointed, ſhining, hauing certaine deepe cuts about the edges, and reſembling the foot of a gooſe: the floures be ſmall, ſomething red: the ſeed ſtandeth in cluſters vpon the top of the branches, being very like the ſeed of wilde Orach, and the root is diuided into ſundry ſtrings.

‡ 2 This differs from the laſt deſcribed, in that the leaues are ſharper cut, and more diuided, the ſeed ſomewhat ſmaller, and the colour of the whole plant is a deeper or darker greene.

‡ 1 *Atriplex ſylueſtris latifolia, ſiue Pes Anſerinus.* Gooſe-foot.

‡ 2 *Atriplex ſylueſtris latifolia altera.* The other Gooſe-foot.

¶ *The Place.*

It growes plentifully in obſcure places neere old walls and high-waies, and in deſart places.

¶ *The Time.*

It flouriſheth when the Orach doth, whereof this is a wilde kinde.

¶ *The Names.*

The later Herbariſts haue called it *Pes anſerinus*, and *Chenopodium*, of the likeneſſe the leaues haue with the foot of a Gooſe: in Engliſh, Gooſe-foot, and wilde Orach.

¶ *The*

¶ *The Temperature.*

This herbe is cold and moiſt, and that no leſſer than Orach, but as it appeareth more cold.

¶ *The Vertues.*

It is reported that it killeth ſwine if they do eate thereof: it is not vſed in Phyſicke: and much leſſe as a ſallade herbe.

Chap. 48. *Of Engliſh Mercurie.*

Bonus Henricus.
Engliſh Mercurie, or good Henrie.

¶ *The Deſcription.*

Good Henrie called *Tota bona*, ſo named of the later Herbariſts, is accounted of them to be one of the Dockes, but not properly. This bringeth forth very many thicke ſtalkes, ſet with leaues two foot high; on the branches wherof towards the top ſtand greene floures in cluſters, thicke thruſt together. The ſeed is flat like that of the Orach, whereof this is a kinde. The leaues be faſtened to long foote-ſtalkes, broad behinde, and ſharpe pointed, faſhioned like the leaues of Aron, or Wake-robin, white, or grayiſh of colour, and as it were couered ouer with a fine meale: in handling it is fat and olious, with a very thicke root, and parted into many diuiſions, of a yellow colour within, like the ſharpe pointed Docke.

¶ *The Place.*

It is commonly found in vntilled places, and among rubbiſh neere common waies, old walls, and by hedges in fields.

¶ *The Time.*

It floureth in Iune and Iuly eſpecially.

¶ *The Names.*

It is called of ſome *Pes Anſerinus*, and *Tota bona*: in Engliſh, All-Good, and Good Henrie: in Cambridgſhire it is called Good king Harry: the Germanes call it **Guter Heinrick**, of a certaine good qualitie it hath, as they alſo name a certaine pernicious herbe, *Malus Henricus*, or bad Henry. It is taken for a kinde of Mercurie, but vnproperly, for that it hath no participation with Mercurie, either in forme or quality, except yee will call euery herbe Mercurie which hath power to looſe the belly.

¶ *The Temperature.*

Bonus Henricus, or Good Henrie is moderately hot and dry, clenſing and ſcouring withall.

¶ *The Vertues.*

The leaues boiled with other pot-herbes and eaten, maketh the body ſoluble. A
The ſame bruſed and laid vpon greene wounds, or foule and old vlcers, doth ſcoure, mundifie and heale them. B

Chap. 49. *Of Spinach.*

Spinacia.
Spinach.

¶ *The Deſcription.*

1 Spinach is a kinde of Blite, after ſome, notwithſtanding I rather take it for a kinde of Orach. It bringeth forth ſoft and tender leaues of a darke greene colour, full of juice, ſharpe pointed, and in the largeſt part of neather end ſquare; parted oftentimes with a deepe gaſh on either ſide next to the ſtemme or foot-ſtalke: the ſtalke is round, a foot high, hollow within: on the tops of the branches ſtand little floures in cluſters, in whoſe places doth grow a prickly ſeed. The root conſiſteth of many ſmall threds.

2 There is another ſort found in our gardens like vnto the former in goodneſſe, as alſo in ſhape, ſauing that the leaues are not ſo great, nor ſo deepely gaſht or indented: and the ſeed hath no prickles at all, for which cauſe it is called round Spinach.

¶ *The Place.*

It is ſowne in gardens without any great labor or induſtrie, and forſaketh not any ground being but indifferent fertill.

¶ *The Time.*

It may be ſowne almoſt at any time of the yeere, but being ſowne in the ſpring it quickly groweth vp, and commeth to perfection within two moneths: but that which is ſowne in the fall of the leafe groweth not ſo ſoone to perfection, yet continueth all the winter and ſeedeth preſently vpon the firſt ſpring.

¶ *The Names.*

It is called in theſe daies *Spinachia*: of ſome, *Spinacheum olus*: of others, *Hiſpanicum olus*: *Fuchſius* nameth it σπανάκια: the Arabians and *Serapio* call it *Hiſpane*: the Germanes, **Spinet**: in Engliſh, Spinage and Spinach: in French, *Eſpinas*.

¶ *The Nature.*

Spinach is euidently cold and moiſt almoſt in the ſecond degree, but rather moiſt. It is one of the pot-herbes whoſe ſubſtance is wateric, and almoſt without taſte, and therefore quickly deſcendeth and looſeth the bellie.

¶ *The Vertues.*

A It is eaten boiled, but it yeeldeth little or no nouriſhment at all: it is ſomething windie, and eaſily cauſeth a deſire to vomit: it is vſed in ſallades when it is young and tender.

B This herbe of all other pot-herbes and ſallade herbes maketh the greateſt diuerſitie of meates and ſallades.

Chap. 50. *Of Pellitorie of the wall.*

¶ *The Deſcription.*

Pellitorie of the wall hath round tender ſtalkes ſomewhat browne or reddiſh of colour and ſomewhat ſhining: the leaues be rough like to the leaues of Mercurie, nothing ſnipt about the edges. The floures be ſmall, growing cloſe to the ſtemmes: the ſeed is blacke and very ſmall, couered with a rough huske which hangeth faſt vpon garments: the root is ſomewhat reddiſh.

¶ *The*

Parietaria.
Pellitorie of the wall.

¶ *The Place.*

It groweth neere to old walls in the moiſt corners of Churches and ſtone buildings, among rubbiſh and ſuch like places.

¶ *The Time.*

It commeth vp in May: it ſeedeth in July and Auguſt: the root onely continueth and is to be found in Winter.

¶ *The Names.*

It is commonly called *Parietaria*, or by a corrupt word *Paritaria*, becauſe it groweth neere to walls: and for the ſame cauſe it is named of diuers *Muralis*: alſo *Muralium* of *Pliny* and *Cellas* of the Grecians *ibidem*. There is alſo another *Helxine* ſyrnamed *Ciſſampelos*: ſome call it *Perdicium*, of Partridges which ſometimes feed hereon: ſome, *Vitrealaris*, and *Vitraria*, becauſe it ſerueth to ſcoure glaſſes, pipkins, and ſuch like: it is called in high-Dutch, **Tag vnd nacht**: in Spaniſh, *Yerua del muro*: in Engliſh, Pellitorie of the wall: in French, *Parietaire*.

¶ *The Temperature.*

Pellitorie of the wall (as *Galen* ſaith) hath force to ſcoure, and is ſomething cold and moiſt.

¶ *The Vertues.*

Pellitory of the wall boyled, and the decoction of it drunken, helpeth ſuch as are vexed with an old cough, the grauell and ſtone, and is good againſt the difficultie of making water, and ſtopping of the ſame, not onely inwardly, but alſo outwardly applied vpon the region of the bladder, in manner of a fomentation or warme bathing, with ſpunges or double clouts, or ſuch like. A

Dioſcorides ſaith, That the iuyce tempered with Ceruſe or white leade maketh a good ointment againſt Saint Anthonies fire and the Shingles: and mixed with the Cerot of Alcanna, or with the male Goats tallow, it helpeth the gout in the feet: which *Pliny* alſo affirmeth, *Lib.* 27. *cap.* 17. B

It is applied (ſaith he) to paines of the feet with Goats ſuet and wax of Cyprus; where in ſtead of wax of Cyprus there muſt be put the Cerot of Alcanna. C

Dioſcorides addeth, That the iuyce hereof is a remedy for old coughs, and taketh away hot ſwellings of the almonds in the throat, if it be vſed in a gargariſme, or otherwiſe applied: it mitigateth alſo the paines of the eares, being poured in with oile of Roſes mixed therewith. D

It is affirmed, That if three ounces of the iuyce be drunke it prouoketh vrine out of hand.

The leaues tempered with oyle of ſweet almonds in manner of a pulteſſe, and laid to the pained parts, is a remedie for them that be troubled with the ſtone, and that can hardly make water.

CHAP. 51. *Of French Mercurie.*

¶ *The Kindes.*

THere be two kindes of Mercury reckoned for good, and yet both ſometimes wilde; beſides two wilde neuer found in gardens, vnleſſe they be brought thither.

¶ *The Deſcription.*

1 THe male garden Mercurie hath tender ſtalks full of ioints and branches, whereupon do grow greene leaues like Pellitorie of the wall, but ſnipt about the edges: amongſt which come forth two hairy bullets round, and ioyned together like thoſe of Gooſegraſſe or Cleuers, each containing in it ſelfe one ſmall round ſeed: the root is tender, and full of white hairy ſtrings.

2 The female is like vnto the former in leaues, ſtalks, and manner of growing, differing but in

the floures and ſeed: for this kinde hath a greater quantitie of floures and ſeed growing together like little cluſters of grapes, of a yellowiſh colour. The ſeed for the moſt part is loſt before it can be gathered.

1 *Mercurialis mas.*
Male Mercurie.

2 *Mercurialis fœmina.*
Female Mercurie.

¶ *The Place.*

French Mercurie is ſowen in Kitchen gardens among pot-herbes; in Vineyards, and in moiſt ſhadowie places: I found it vnder the dropping of the Biſhops houſe at Rocheſter; from whence I brought a plant or two into my garden, ſince which time I cannot rid my garden from it.

¶ *The Time.*

They floure and flouriſh all the Sommer long.

¶ *The Names.*

It is called in Greeke, κυνόσορος, and ἱππὶ κρήνιον, or Mercurie his herbe; whereupon the Latines call it *Mercurialis*: it is called in Italian, *Mercorella*: in Engliſh, French Mercurie: in French, *Mercuriale, Vignoble*, and *Foirelle, quia Fluidam laxamue alvum reddit, Gallobelgæ enim foize & foizeus, ventris Fluorem vocant.*

¶ *The Temperature.*

Mercury is hot and dry, yet not aboue the ſecond degree: it hath a cleanſing facultie, and (as *Galen* writeth) a digeſting qualitie alſo.

¶ *The Vertues.*

A It is vſed in our age in cliſters, and thought very good to clenſe and ſcoure away the excrements and other filth contained in the guts. It ſerueth to purge the belly, being eaten or otherwiſe taken, voiding out of the belly not only the excrements, but alſo phlegme and choler. *Dioſcorides* reporteth, that the decoction hereof purgeth wateriſh humors.

B The leaues ſtamped with butter, and applied to the fundament, prouoketh to the ſtoole; and the herbe bruiſed and made vp in manner of a peſſary, cleanſeth the mother, and helpeth conception.

C *Coſtæus* in his booke of the nature of plants ſaith, that the iuyce of Mercurie, Hollihocks, & purſlane mixed together, and the hands bathed therein, defendeth them from burning, if they be thruſt into boyling leade.

Chap.

Chap. 52. *Of Wilde Mercurie.*

‡ 1 *Cynocrambe.*
Dogs Mercury.

3 *Phyllon Thelygonon, ſiue Fœminificum,*
Childrens Mercurie, the female.

† 2 *Phyllon arrhenogonon, ſiue marificum,*
Male childrens Mercury.

¶ *The Deſcription.*

1 DOgs Mercurie is ſomewhat like vnto the garden Mercury, ſauing the leaues hereof are greater, and the ſtalke not ſo tender, and yet very brittle, growing to the height of a cubit, without any branches at all, with ſmal yellow floures. The ſeed is like the female Mercurie. ‡ It is alſo found like the male Mercurie, as you ſee them both expreſt in the figure; and ſo there is both male & female of this Mercury alſo. ‡

2 Male childrens Mercury hath three or foure ſtalkes, or moe: the leaues be ſomwhat long, not much vnlike the leaues of the oliue tree, couered ouer with a ſoft downe or wooll gray of colour; and the ſeed alſo like thoſe of Spurge, growing two together, being firſt of an aſh-colour, but after turne to a blew.

‡ 3 This is much in ſhape like to the laſt deſcribed, but the ſtalkes are weaker, and haue more leaues vpon them; the floures alſo are ſmall and moſſy, and they grow vpon long ſtalks, whereas the ſeeds of the other are faſtned to very ſhort ones: the ſeed is contained in round little heads, being ſometimes two, otherwhiles three or more in a cluſter. ‡

¶ *The Place.*

They grow in woods and copſes, in the borders of fields, and among buſhes and hedges. ‡ But the two laſt deſcribed are not in England, for any thing that I know. ‡

The Dogs Mercurie I haue found in many places about Green-hithe, Swaineſ-combe village, Graueſend, and South-fleet in Kent; in Hampſted wood, and all the villages thereabout, foure miles from London.

¶ *The Time.*

Theſe flouriſh all the Sommer long, vntill the extreame froſt do pull them downe.

¶ *The Names.*

Dogs Mercurie is called in Greeke, κυνοκράμβη: in Latine, *Canina*, and *Braſsica Canina*, and *Mercurialis ſylueſtris*: in Engliſh, Dogs Cole, and Dogs Mercury.

Childrens Mercury is called *Phyllon thelygonon*, and *Phyllon Arrhenogonon*.

¶ *The Temperature and Vertues.*

Theſe wilde kindes of Mercurie are not vſed in phyſicke; notwithſtanding it is thought they agree as well in nature as qualitie with the other kindes of Mercury.

A ‡ It is reported by the Antients, that the male *Phyllon* conduces to the generation of boyes, and the female to girles.

B At Salamantica they giue and much commend the decoction of either of theſe againſt the bitings of a mad dog.

C The Moores at Granado vſe them frequently in womens diſeaſes. ‡

† The figure of the *Cynocrambe* was omitted, and in ſtead thereof was put the figure of *Phyllon mariſcum*.

Chap. 53. *Of Torne-ſole.*

1 *Heliotropium maius.*
Great Torne-ſole.

† 2 *Heliotropium minus.*
Small Torne-ſole.

¶ *The Kindes.*

THere be foure ſorts of Torne-ſole, differing one from another in many notable points, as in greatneſſe and ſmallneſſe, in colour of floures, in forme and ſhape.

¶ *The*

The deſcription.

1 THe great Torneſole hath great ſtraight ſtalks couered with a white hairy cotton, eſpecially about the top; the leaues are ſoft and hairy in handling, in ſhape like the leaues of Baſill: the floures grow at the top of the branches, in colour white, thicke together in rowes vpon one ſide of the ſtalke, which ſtalke doth bend or turne backward like the taile of a ſcorpion: the root is ſmall and hard.

2 The ſmall Torneſole hath many little and weake branches trailing vpon the ground, whereupon doe grow ſmall leaues, like thoſe of the leſſer Baſill. The floures doe grow without any certaine order, amongſt the leaues and tender branches, gray of colour, with a little ſpot of yellow in the middeſt, the which turne into crooked tailes like thoſe of the precedent, but not altogether ſo much.

† 3 *Heliotropium ſupinum Cluſij & Lobelij.* Hairie Torneſole.

4 *Heliotropium Tricoccum.*
Widowwaile Tornſole.

3 Hairy Torneſole hath many feeble and weake branches trailing vpon the ground, ſet with ſmall leaues, leſſer than the great Tornſole, of which it is a kinde, hauing the ſeed in ſmall chaffie huſks, which do turne back like the taile of a ſcorpion, iuſt after the manner of the firſt deſcribed.

4 This kinde of Torneſole hath leaues very like to thoſe of the great Tornſole, but of a blacker greene colour: the floures be yellow, and vnprofitable; for they are not ſucceeded by the fruit, but after them commeth out the fruit hanging vpon ſmall foot-ſtalks three ſquare, and in euery corner there is a ſmall ſeed like to thoſe of the Tythimales; the root is ſmall and threddy.

¶ *The Place.*

Tornſole, as *Dioſcorides* ſaith, doth grow in fennie grounds and neere vnto pooles and lakes. They are ſtrangers in England as yet: It doth grow about Montpelier in Languedock, where it is had in great vſe to ſtaine and die clouts withall, wherewith through Europe meat is coloured.

¶ *The Time.*

They flouriſhe ſpecially in the Sommer ſolſtice, or about the time when the ſun entreth into Cancer.

¶ *The Names.*

The Græcians call it *Heliotropium*: the Latines keepe theſe names, *Heliotropium magnum*,

and

and *Scorpiurum*: of *Ruellius*, *Herba Cancri*: it is named *Heliotropium*, not becauſe is is turned about at the daily motion of the ſun, but by reaſon it flowreth in the ſommer ſolſtice, at which time the ſun being fartheſt gone from the Æquinoctiall circle, returneth to the ſame: and *Scorpiurum* of the twiggie tops, that bow backeward like a ſcorpions taile: of the Italians, *Torneſole bobo*; in French, *Tournſol*: ſome thinke it to be *Herba Clytiæ*, into which the Poets feigne *Clytia* to be metamorphoſed; whence one hath theſe verſes:

Herba velut Clytiæ ſemper petit obuia ſolem,
Sic pia mens Chriſtum, quo prece ſpectet, habet.

¶ *The Nature.*

Tornſole, as *Paulus Ægineta* writeth, is hot and dry, and of a binding faculty.

¶ *The Vertues.*

A A good handfull of great Tornſole boyled in wine, and drunke, doth gently purge the body of hot cholericke humours and tough clammie or ſlimie flegme.

B The ſame boyled in wine and drunke is good againſt the ſtingings of Scorpions, or other venomous beaſts, and is very good to be applyed outwardly vpon the griefe or wound.

C The ſeed ſtamped and layd vpon warts and ſuch like excreſcences, or ſuperfluous out-growings, cauſeth them to fall away.

D The ſmall Torneſole and his ſeed boyled with Hyſſope, Creſſes, and ſalt-peter and drunke, drieueth forth flat and round wormes.

E With the ſmall Tornſole they in France doe die linnen rags and clouts into a perfect purple colour, wherewith cookes and confectioners doe colour iellies, wines, meates, and ſundry confectures: which clouts in ſhops be called Tornſole, after the name of the herbe.

† The ſecond and third figures were formerly tranſpoſed: the fourth was the figure of the hairy Scorpion-graſſe deſcribed in the fourth place, in the following Chapter.

Chap. 54. *Of Scorpion Graſſe.*

¶ *The Deſcription.*

1 Scorpion graſſe hath many ſmooth, plaine, euen leaues, of a darke greene colour; ſtalks ſmall, feeble and weake, trailing vpon the ground, and occupying a great circuit in reſpect of the plant. The floures grow vpon long and ſlender foot-ſtalks, of colour yellow, in ſhape like to the floures of broome; after which ſucceed long, crooked, rough cods, in ſhape and colour like vnto a Caterpiller; wherein is contained yellowiſh ſeed like vnto a kidney in forme. The roote is ſmall and tender: the whole plant periſheth when the ſeed is ripe.

2 There is another Scorpion graſſe, found among (or rather reſembling) peaſe and tares, and thereupon called *Scorpioides Leguminoſa*, which hath ſmall and tender roots like ſmall threds: branches many, weake and tender, trailing vpon the ground, if there be nothing to take hold vpon with his claſping and crooked ſeed veſſels; otherwiſe it rampeth vpon whatſoeuer is neere vnto it. The leaues be fewe and ſmall: the floures very little and yellow of colour: the ſeed followeth, little and blackiſh, conteined in little cods, like vnto the taile of a Scorpion.

3 There is another ſort almoſt in euery ſhallow grauelly running ſtreame, hauing leaues like to *Becabunga* or Brooklime. The floures grow at the top of tender fat greene ſtalkes, blew of colour, and ſometimes with a ſpot of yellow among the blew; the whole branch of floures doe turne themſelues likewiſe round like the ſcorpions taile.

There is alſo another growing in watrie places, with leaues like innto *Anagallis aquatica*, or water Chickweed, hauing like ſlender ſtalkes and branches as the former, and the floures not vnlike, ſauing that the floures of this are of a light blew or watched colour, ſomewhat bigger, and layd more open, whereby the yellow ſpot is better ſeene.

4 There is likewiſe another ſort growing vpon moſt dry grauelly and barren ditch bankes, with leaues like thoſe of or Mouſe-eare: this is called *Myoſotis ſcorpioides*; it hath rough and hairy leaues, of an ouerworne ruſſet colour: the floures doe grow vpon weake, feeble, and rough branches, as is all the reſt of the plant. They likewiſe grow for the moſtpart vpon one ſide of the ſtalke, blew of colour, with a like little ſpot of yellow as the others, turning themſelues backe againe like the taile of a Scorpion.

There

There is another of the land called *Myoſotis Scorpioides repens*, like the former: but the floures are thicker thruſt together, and doe not grow all vpon one ſide as the other, and part of the floures are blew, and part purple, confuſedly mixt together.

¶ *The Place.*

1, 2 Theſe Scorpion graſſes grow not wilde in England, notwithſtanding I haue receiued ſeed of the firſt from beyond the ſeas, and haue diſperſed them through England, which are eſteemed of gentlewomen for the beauty and ſtrangeneſſe of the crooked cods reſembling Caterpillers.

The others doe grow in waters and ſtreames, as alſo on drie and barren bankes.

¶ *The Time.*

The firſt floureth from May to the end of Auguſt: the others I haue found all the ſommer long.

¶ *The Names.*

‡ 1 *Fabius Columna* iudges this to be the *Clymenon* of *Dioſcorides*: others call it *Scorpioides*, and *Scorpioides bupleuri folio*.

2 This is the *Scorpioides* of *Matthiolus*, *Dod. Lobell*, and others; and I iudge it was this plant our Author in this place intended, and not the *Scorpioides Leguminoſa* of the *Aduerſaria*, for that hath not a fewleaues, but many vpon one rib; and beſides, *Dodonæus*, whom in deſcriptions & hiſtory our Author chiefely followes, deſcribes this immediatly after the other: *Guillandinus*, *Cæſalpinus*, and *Bauhine* iudge it to be the *Telephium* of *Dioſcorides*.

3 This and the next want no names, for almoſt euery writer hath giuen them ſeuerall ones: *Brunfelſius* called it *Cynogloſſa minor*: *Tragus*, *Tabernamontanus*, and our Author (*page* 537. of the former edition) haue it vnder the name of *Euphraſia Cærulea*: *Dodonæus* cals it *Scorpioides fœmina*: *Lonicerus*, *Leontopodium*; *Cæſalpinus*, *Heliotropium minus in paluſtribus*: *Cordus* and *Thalius*, *Echium paluſtre*.

4 This is *Auricula muris minor tertia*; *Euphraſia quarta*, and *Piloſella ſylveſtris of Tragus*: *Scorpioides mas* of *Dodonæus*; *Alſine Myoſotis*: and *Myoſotis hirſuta repens* of *Lobell*; *Heliotropium minus alterum* of *Cæſalpinus*; *Echium minimum* of *Columna*; and *Echium paluſtre alterum* of *Thalius*: our Author had it thriſe: firſt in the precedent chapter, by the name of *Heliotropium rectum*, with a figure: ſecondly in this preſent chapter, without a figure: and thirdly *pag.* 514. alſo with a figure vnder the name of *Piloſella flore cæruleo*. ‡

¶ *The Nature and Vertues.*

There is not any thing remembred of the temperature: yet *Dioſcorides* ſaith, that the laeues of Scorpion graſſe applyed to the place, is a preſent remedy againſt the ſtinging of Scorpions: and likewiſe boyled in wine and drunke, preuaileth againſt the ſaid bitings, as alſo of adders, ſnakes, and ſuch venomous beaſts: being made in an vnguent with oile, wax, and a little gum *Elemni*, is profitable againſt ſuch hurts as require a healing medicine. A

Chap. 55. *Of Nightſhade.*

¶ *The Kindes.*

There be diuers Nightſhades, whereof ſome are of the garden; and ſome that loue the fields, and yet euery of them found wilde; whereof ſome cauſe ſleepineſſe euen vnto death: others cauſe ſleepineſſe, and yet Phyſicall: and others very profitable vnto the health of man, as ſhall be declared in their ſeuerall vertues.

¶ *The Deſcription.*

1 Garden Nightſhade hath round ſtalkes a foot high, and full of branches, whereon are ſet leaues of a blackiſh colour, ſoft and full of iuice, in ſhape like to leaues of Baſill, but much greater: among which doe grow ſmall white floures with yellow pointals in the middle; which being paſt, there ſucceed round berries, greene at the firſt, and blacke when they be ripe, like thoſe of Iuy: the root is white, and full of hairy ſtrings.

‡ 2 The root of this is long, pretty thicke and hard, being couered with a browniſh skin; from this root grow vp many ſmal ſtalks of the height of a cubit and better, ſomewhat thick withall: the leaues that grow alongſt the ſtalke are like thoſe of the Quince tree, thicke, white, ſoft and downye. The floures grow about the ſtalke at the ſetting on of the leafe, ſomewhat long and of a pale colour, diuided into foure parts, which are ſucceeded by ſeeds contained in hairy or woolly receptacles: which when they come to ripeneſſe are red, or of a reddiſh ſaffron colour. ‡

¶ *The Place.*

This Nightſhade commeth vp in many places, and not only in gardens, of which not withſtanding

1 *Scorpioides Bupleuri folio, Penæ & L'Obelij.*
Scorpion graſſe, or Caterpillers.

‡ 2 *Scorpioides Matthioli.*
Matthiolus his Scorpion graſſe.

‡ 3 *Myoſotis ſcorpioides paluſtris.*
Water Scorpion graſſe.

‡ 4 *Myoſotis ſcorpioides aruenſis hirſuta.*
Mouſe-eare Scorpion graſſe.

ding it hath taken his ſurname, and in which it is often found growing with other herbes; but alſo neere common high waies, the borders of fields, by old walls and ruinous places.

‡ 2 This growes not with vs, but in hotter Countries *Cluſius* found it growing among rubbiſh at Malago in Spaine.‡

1 *Solanum Hortenſe.*
Garden Nightſhade.

‡ 2 *Solanum Somniferum.*
Sleepie Nightſhade.

¶ *The Time.*

It flowreth in Sommer, and oftentimes till Autumne be well ſpent; and then the fruit commeth to ripeneſſe.

‡ 2 This *Cluſius* found in flower and with the ſeede ripe in Februarie; for it liueth many yeares in hot Countries, but in cold it is but an annuall.‡

¶ *The Names.*

It is called of the Græcians στρύχνος: of the Latines, *Solanum*, and *Solanum Hortenſe*: in ſhops, *Solatrum*: of ſome, *Morella*, *Vua Lupina*, and *Vua Vulpis*: in Spaniſh likewiſe, *Morella*, and *Yerua Mora*: *Marcellus* an old Phiſicke writer, and diuers others of his time called it *Strumum*: *Plinie* in his 27. booke chap. 8. ſheweth that it is called *Cucubalus*: both theſe words are likewiſe extant in *Apuleius* among the confuſed names of Nightſhade; who comprehending all the kindes of Nightſhade together in one chapter; being ſo many, hath ſtrangely & abſurdly confounded their names. In Engliſh it is called Garden Nightſhade, Morel, and Petie Morell: in French, *Morelle*, *Gallobelgis*: *ſeu ardent*: *quia medetur igni ſacro.*

¶ *The Temperature.*

Nightſhade (as *Galen* ſaith in his booke of the faculties of ſimple medicines) is vſed for thoſe infirmities that haue need of cooling and binding; for theſe two qualities it hath in the ſecond degree: which thing alſo hee affirmeth in his booke of the faculties of nouriſhments, where hee ſaith that there is no pot-herbe which wee vſe to eat that hath ſo great aſtriction or binding as Nightſhade hath; and therefore Phyſitions do worthily vſe it, and that ſeldome as a nouriſhment, but alwaies as a medicine.

¶ *The Vertues.*

1 *Dioſcorides* writeth, that Nightſhade is good againſt S. Anthonies fire, the ſhingles, paine of the head, the heart burning or heat of the ſtomacke, and other like accidents proceeding of ſharp and biting humours. Notwithſtanding that it hath theſe vertues, yet it is not alwaies good that it ſhould be applied vnto thoſe infirmities, for that many times there hapneth more dangers by applying

plying of theſe remedies, than of the diſeaſe it ſelfe: for as *Hippocrates* writeth in the 6. booke of his Aphoriſmes, the 25. particular, that it is not good, that S. Anthonies fire ſhould be driuen from the outward parts to the inward. And likewiſe in his Prognoſticks he ſaith, that it is neceſſary that S. Anthonies fire ſhould breake forth, and that it is death to haue it driuen in; which is to be vnderſtood not onely of S. Anthonies fire, but alſo of other like burſtings out procured by nature. For by vſing of theſe kindes of cooling and repelling medicines, the bad, corrupt, and ſharpe humors are driuen backe inwardly to the chiefe and principall parts, which cannot be done without great danger and hazard of life. And therefore we muſt not vnaduiſedly, lightly, or raſhly miniſter ſuch kinde of medicines vpon the comming out of Saint Anthonies fire, the ſhingles, or ſuch hot pimples and blemiſhes of the skinne.

B The iuice of the greene leaues of Garden Nightſhade mixed with Barley meale, is very profitably applied vnto Saint Anthonies fire, and to all hot inflammations.

C The iuice mixed with oile of Roſes, Ceruſe, and Littarge of gold, and applied, is more proper and effectuall to the purpoſes before ſet downe.

D † Neither the iuice heereof, nor any other part is vſually giuen inwardly, yet it may without any danger.

E The leaues ſtamped are profitably put into the ointment of Popler buds, called *Vnguentum populeon*, and it is good in all other ointments made for the ſame purpoſe.

F ‡ 2 The barke of the root of Sleepie Nightſhade, taken in the weight of 3 1. hath a ſomniferous qualitie; yet is it milder then *Opium*, and the fruit thereof vehemently prouokes vrine. But (as *Pliny* ſaith) the remedies hereof are not of ſuch eſteeme that we ſhould long inſiſt vpon them, eſpecially ſeeing wee are furniſhed with ſuch ſtore of medicines leſſe harmefull, yet ſeruing for the ſame purpoſe. ‡

† The Figure in the ſecond place was of the *Solanum Pomiferum*, or *Mala Æthiopica*, treated of at large in the 61. Chap. of this Booke, and therefore it is omitted here: and in ſtead thereof another put in the place.

t

Chap. 56. *Of ſleepy Nightſhade.*

Solanum Lathale.
Dwale, or deadly Nightſhade.

¶ *The Deſcription.*

DWale or ſleeping Nightſhade hath round blackiſh ſtalkes ſix foot high, whereupon do grow great broad leaues of a darke greene colour; among which doe grow ſmall hollow flowers bel faſhion, of an ouerworne purple colour; in the place whereof come forth great round berrigs of the bigneſſe of the blacke cherry, greene at the firſt, but when they be ripe of the color of blacke iette or burniſhed horne, ſoft and full of purple iuice: among which iuice lie the ſeeds like the berries of Iuy: the root is very great, thicke, and long laſting.

The Place.

It groweth in vntoiled places neere vnto high waies and the ſea marſhes, and ſuch like places.

It groweth very plentifully in Holland in Lincolnſhire, and in the Ile of Ely at a place called Walſoken, neere vnto Wisbitch

I found it growing without the gate of Highgate neere vnto a pound or pinfold on the left hand.

The Time.

This flouriſheth all the Sommer and Spring, beareth his ſeed and flower in Iuly and Auguſt.

¶ *The Names.*

It is called of *Dioſcorides*, [illegible]: of *Theophraſtus*, [illegible]: of the Latines, *Solanum ſomniferum*.

ſomniferum, or ſleeping Nightſhade; and *Solanum lethale*, or deadly Nightſhade; and *Solanum manicum*, raging Nightſhade: of ſome, *Apollinaris minor vlticana*, and *Herba Opſago*: in Engliſh, Dwale, or ſleeping Nightſhade: the Venetians and Italians call it *Bella dona*: the Germanes, **Dollwurtz**: the low Dutch, **Dulle beſſen**: in French, *Morelle mortelle*: it commeth very neere vnto *Theophraſtus* his *Mandragoras*, (which differeth from *Dioſcorides* his *Mandragoras*.)

¶ *The Nature.*

It is cold euen in the fourth degree.

¶ *The Vertues.*

This kinde of Nightſhade cauſeth ſleep, troubleth the minde, bringeth madneſſe if a few of the berries be inwardly taken, but if moe be giuen they alſo kill and bring preſent death. *Theophraſtus* in his 6. booke doth likewiſe write of Mandrake in this manner; Mandrake cauſeth ſleepe, and if alſo much of it be taken it bringeth death. A

The greene leaues of deadly Nightſhade may with great aduice be vſed in ſuch caſes at Pettimortell: but if you will follow my counſell, deale not with the ſame in any caſe, and baniſh it from your gardens and the vſe of it alſo, being a plant ſo furious and deadly: for it bringeth ſuch as haue eaten thereof into a dead ſleepe wherein many haue died, as hath been often ſeen and prooued by experience both in England and elſe where. But to giue you an example heereof it ſhall not be amiſſe: It came to paſſe that three boyes of Wisbich in the Ile of Ely did eate of the pleaſant & beautifull fruite hereof, two whereof died in leſſe than eight houres after that they had eaten of them. The third child had a quantitie of hony and water mixed together giuen him to drinke, cauſing him to vomit often: God bleſſed this meanes and the child recouered. Baniſh therefore theſe pernicious plants out of your gardens, and all places neere to your houſes, where children or women with child do reſort, which do oftentimes long and luſt after things moſt vile and filthie; and much more after a berry of a bright ſhining blacke colour, and of ſuch great beautie, as it were able to allure any ſuch to eate thereof. B

The leaues heereof laid vnto the temples cauſe ſleepe, eſpecially if they be imbibed or moiſtened in wine vineger. It eaſeth the intollerable paines of the head-ache proceeding of heate in furious agues, cauſing reſt being applied as aforeſaid. C

Chap. 57. *Of winter Cherries.*

¶ *The Deſcription.*

1 THe red winter Cherrie bringeth forth ſtalkes a cubit long, round, ſlender, ſmooth, and ſomewhat reddiſh, reeling this way and that way by reaſon of his weakeneſſe, not able to ſtand vpright without a ſupporter: whereupon do grow leaues not vnlike to thoſe of common Nightſhade, but greater; among which leaues come forth white floures, conſiſting of fiue ſmall leaues: in the middle of which leaues ſtandeth out a berry, greene at the firſt, and red when it is ripe, in colour of our common Cherry and of the ſame bigneſſe, incloſed in a thinne huske or little bladder, it is of a pale reddiſh colour, in which berrie is conteined many ſmall flat ſeeds of a pale colour. The rootes be long, not vnlike to the rootes of Couch-graſſe, ramping and creeping within the vpper cruſt of the earth farre abroad, whereby it encreaſeth greatly.

2 The blacke winter Cherrie hath weake and ſlender ſtalkes ſomewhat creſted, and like vnto the tendrels of the vine, caſting it ſelfe all about, and taketh hold of ſuch things as are next vnto it: whereupon are ſet jagged leaues deepely indented or cut about the edges almoſt to the middle ribbe. The floures be very ſmall and white ſtanding vpon long foote-ſtalkes or ſtemmes. The skinnie bladders ſucceed the floures, parted into three ſells or chambers, euery of the which conteineth one ſeed and no more, of the bigneſſe of a ſmall peaſe, and blacke of colour, hauing a marke of white colour vpon each berrie, in proportion of an heart. The roote is very ſmall and threddie.

¶ *The Place.*

The red winter Cherrie groweth vpon old broken walls, about the borders of fieldes, and in moiſt ſhadowie places, and in moſt gardens, where ſome cheriſh it for the beautie of the berries, and others for the great and worthy vertues thereof.

2 The blacke winter Cherrie is brought out of Spaine and Italy, or other hot regions, from whence I haue had of thoſe blacke ſeeds marked with the ſhape of a mans hart, white, as aforeſaid: and haue planted them in my garden where they haue borne floures, but haue periſhed before the fruit could grow to maturitie, by reaſon of thoſe vnſeaſonable yeeres, 1594. 95. 96.

¶ *The Time.*

The red winter Cherrie beareth his floures and fruite in Auguſt.
The blacke beareth them at the ſame time, where it doth naturally grow.

¶ *The Names.*

The red winter Cherrie is called in Greeke, Στρύχνος: in Latine, *Veſicaria*, and *Solanum Veſicarium*: in ſhops, *Alkekengi*: *Plinie* in his 21. booke nameth it *Halicacabus*, and *Veſicaria*, of the little bladders: or as the ſame Author writeth, becauſe it is good for the bladder and the ſtone: it is called in Spaniſh, *Vexiga de porro*: in French, *Alquequenges*, *Bagenauldes*, and *Ceriſes d'outre mer*: in Engliſh, red Nightſhade, Winter Cherries, and Alkakengie.

1 *Solanum Halicacabum.*
Red winter Cherries.

2 *Halicacabum Peregrinum.*
Blacke winter Cherries.

The blacke winter Cherrie is called *Halacacabum Peregrinum*, *Veſicaria Peregrina*, or ſtrange winter Cherrie: of *Pena* and *Lobel* it is called, *Cor Indum*, *Cor Indicum*: of others, *Piſum Cordatum*. in Engliſh, the Indian heart, or heart peaſe: ſome haue taken it to be *Doryenion*, but they are greatly deceiued, being in truth not any of the Nightſhades; it rather ſeemeth to agree with the graine named of *Serapio*, *Abrong*, or *Abrugi*, of which he writeth in his 153. chapter in theſe words: It is a little graine ſpotted with blacke and white, round, and like the graine Maiz, with which notes this doth agree.

¶ *The Temperature.*

The red winter Cherrie is thought to be cold and drie, and of ſubtile parts.
The leaues differ not from the temperature of the garden Nightſhade, as *Galen* ſaith.

¶ *The Vertues.*

A The fruite bruſed and put to infuſe or ſteepe in white wine two or three houres, and after boiled two or three bublings, ſtraining it, and putting to the decoction a little ſugar and cinnamon, and drunke, preuaileth very mightily againſt the ſtopping of vrine, the ſtone and grauell, the difficultie and ſharpenes of making water, and ſuch like diſeaſes: if the griefe be old, the greater quantity muſt be taken; if new and not great, the leſſe: it ſcoureth away the yellow jaundiſe alſo, as ſome write.

Chap-

Chap. 58. *Of the Maruell of the World.*

Mirabilia Peruuiana flore luteo.
The maruell of Peru with yellowiſh floures.

‡ *Mirabilia Peruuiana flore albo.*
The maruell of Peru with white floures.

The deſcription.

THis admirable plant called the maruell of Peru, or the maruell of the World, ſpringeth forth of the ground like vnto Baſill in leaues; amongſt which it ſendeth out a ſtalke two cubits and a halfe high, of the thickeneſſe of a finger; full of iuice, very firme, and of a yellowiſh greene colour, knotted or kneed with ioints ſomewhat bunching forth, of purpliſh color, as in the female Balſamina: which ſtalke diuideth it ſelfe into ſundrie branches or boughes, and thoſe alſo knottie like the ſtalke. His branches are decked with leaues growing by couples at the ioints like the leaues of wilde Peaſcods, greene, fleſhie, and full of ioints; which beeing rubbed doe yeeld the like vnpleaſant ſmell as wilde Peaſcods doe, and are in taſte alſo verie vnſauorie, yet in the latter end they leaue a taſte and ſharpe ſmacke of Tabaco. The ſtalkes towards the top are garniſhed with long hollow ſingle flowers, folded, as it were, into fiue parts before they be opened; but being fully blowne doe reſemble the flowers of Tabaco, not ending into ſharpe corners, but blunt and round as the flowers of Bindeweede, and larger than the flowers of Tabaco, glittering oftentimes with a fine purple or Crimſon colour; many times of an horſe-fleſh; ſometime yellow; ſometime pale, and ſometime reſembling an old red or yellow colour; ſometime whitiſh, and moſt commonly two colours occupying halfe the flower, or intercourſing the whole flower with ſtreakes and orderly ſtreames, now yellow, now purple, diuided through the whole; hauing ſometime great, ſometime little ſpots of a purple colour, ſprinkled and ſcattered in a moſt variable order, and braue mixture. The ground or field of the whole flower is either pale, red, yellow, or white, containing in the middle of the hollowneſſe a pricke or pointell ſet round about with ſixe ſmall ſtrings or chiues. The flowers are verie ſweet and pleaſant, reſembling the Narciſſe or white Daffodill, and are very ſuddenly fading; for at night they are flowred wide open, and ſo continue vntill eight of the clocke the next morning: at which time they beginne to cloſe or ſhut vp (after the manner of the Bindeweede) eſpecially if the weather be very hot: but if the aire be more temperate they remaine open the whole day, and are cloſed onely at night, and ſo periſh, one flower laſting

ſting but onely one day, like the true Ephemerum or Hemerocallis. This maruellous varietie doth not without cauſe bring admiration to all that obſerue it. For if the flowers be gathered and reſerued in ſeuerall papers, and compared with thoſe flowers that will ſpring and flouriſh the next day, you ſhall eaſily perceiue that one is not like another in colour, though you ſhould compare one hundreth which flower one day, and another hundred which you gathered the next day; and ſo from day to day during the time of their flowring. The cups and huskes which containe and embrace the flowers are diuided into fiue pointed ſections, which are greene, and, as it were, conſiſting of skinnes, wherein is contained one ſeede and no more, couered with a blackiſh skinne, hauing a blunt point whereon the flower groweth; but on the end next the cup or huske it is adorned with a little fiue cornered crowne. The ſeed is as bigge as a pepper corne, which of it ſelfe faderh with any light motion. Within this ſeede is contained a white kernell, which being bruiſed, reſolueth into a very white pulpe like ſtarch. The root is thicke and like vnto a great radiſh, outwardly blacke, and within white, ſharpe in taſte, wherewith is mingled a ſuperficiall ſweetnes. It bringeth new floures from Iuly vnto October in infinite number, yea euen vntill the froſts doe cauſe the whole plant to periſh: notwithſtanding it may be reſerued in pots, and ſet in chambers and cellars that are warme, and ſo defended from the iniurie of our cold climate; prouided alwaies that there be not any water caſt vpon the pot, or ſet forth to take any moiſture in the aire vntill March following; at which time it muſt bee taken forth of the pot and replanted in the garden. By this meanes I haue preſerued many (though to ſmall purpoſe) becauſe I haue ſowne ſeeds that haue borne floures in as ample manner and in as good time as thoſe reſerued plants.

Of this wonderfull herbe there be other ſorts, but not ſo amiable or ſo full of varietie, and for the moſt part their floures are all of one color. But I haue ſince by practiſe found out another way to keepe the roots for the yeare following with very little difficultie, which neuer faileth. At the firſt froſt I dig vp the rootes and put vp or rather hide the roots in a butter ferkin, or ſuch like veſſell, filled with the ſand of a riuer, the which I ſuffer ſtill to ſtand in ſome corner of a houſe where it neuer receiueth moiſture vntill Aprill or the midſt of March, if the weather be warme; at which time I take it from the ſand and plant it in the garden, where it doth flouriſh exceeding well and increaſeth by roots; which that doth not which was either ſowne of ſeed the ſame yeare, nor thoſe plants that were preſerued after the other manner.

¶ *The Place.*

The ſeed of this ſtrange plant was brought firſt into Spaine, from Peru, whereof it tooke his name *Mirabilia Peruana*, or *Peruuiana*: and ſince diſperſed into all the parts of Europe: the which my ſelfe haue planted many yeares, and haue in ſome temperate yeares receiued both floures and ripe ſeed.

¶ *The Time.*

It is ſowne in the midſt of Aprill, and bringeth forth his variable floures in September, and periſheth with the firſt froſt, except it be kept as aforeſaid.

¶ *The Names.*

It is called in Peru of thoſe Indians there, *Hachal*. Of others after their name *Hachal Indi*: of the high and low Dutch, *Solanum Odoriferum*: of ſome, *Iaſminum mexicanum*: and of *Carolus Cluſius*, *Admirabilia Peruuiana*: in Engliſh rather the Maruell of the World, than of Peru alone.

¶ *The Nature and Vertues.*

We haue not as yet any inſtructions from the people of India concerning the nature or vertues of this plant: the which is eſteemed as yet rather for his rareneſſe, beautie, and ſweetneſſe of his floures, than for any vertues knowne; but it is a pleaſant plant to decke the gardens of the curious. Howbeit *Iacobus Antonius Cortuſus* of Padua hath by experience found out, that two drams of the root thereof taken inwardly doth very notably purge wateriſh humours.

Chap. 59. *Of Madde Apples.*

¶ *The Deſcription.*

RAging Apples hath a round ſtalke of two foot high, diuided into ſundry branches, ſet with broad leaues ſomewhat indented about the edges, not vnlike the leaues of white Henbane, of a darke browne greene colour, ſomewhat rough. Among the which come the floures of

of a white colour, and ſome timeschanging into purple, made of ſix parts, wide open like a ſtarre with certaine yellow chiues or thrums in the middle; which beeing paſt the fruit commeth in place, ſet in a cornered cup or huske after the manner of the great Nightſhade, great and ſomewhat long, of the bigneſſe of a ſwans egge, and ſomtimes much greater, of a white color, ſometimes yellow, and often browne, wherein is contained ſmall flat ſeed of a yellow colour. The root is thicke, with many threds faſtned thereto.

Mala inſana.
Madde or raging Apples.

¶ *The Plate.*

This plant groweth in Egypt almoſt euery where in ſandie fields euen of it ſelfe, bringing forth fruit of the bigneſſe of a great Cucumber, as *Petrus Bellonius* reporteth in the ſecond booke of his ſingular obſeruations.

Wee had the ſame in our London Gardens, where it hath borne floures; but the Winter approching before the time of ripening, it periſhed: notwithſtanding it came to beare fruit of the bigneſſe of a gooſe egge one extraordinarie temperate yeare, as I did ſee in the garden of a worſhipfull Merchant Mr. *Harnie* in Limeſtreet, but neuer to the full ripeneſſe.

¶ *The Time.*

This herbe muſt be ſowne in Aprill in a bed of hot horſe doung, as Muske-Melons are, and floureth in Auguſt.

¶ *The Names.*

Petrus Bellonius hath iudged it to bee *Malinathalla Theophraſti.* In the Dukedome of Millaine it is called *Melongena:* and of ſome, *Melanzana:* in Latine, *Mala inſana:* and in Engliſh, Mad Apples: in the Germaine tongue, **Dollopffel:** In Spaniſh, *Verangenes.*

¶ *The Nature.*

The hearbe is cold almoſt in the fourth degree.

¶ *The vſe and danger.*

The people of Tolledo do eat them with great deuotion being boiled with fat fleſh, putting thereto ſome ſcraped cheeſe, which they do keepe in vineger, honie, or ſalt pickell all Winter to procure luſt. A

Petrus Bellonius, and *Hermolaus Barbarus*, report that in Egypt and Barbary they vſe to eat the fruit of *Mala inſana* boiled or roſted vnder aſhes, with oile, vineger, & pepper, as people vſe to eat Muſhroms. But I rather wiſh Engliſh men to content themſelues with the meat and ſauce of our owne Countrey, than with fruit and ſauce eaten with ſuch perill: for doubtleſſe theſe apples haue a miſchieuous qualitie, the vſe whereof is vtterly to be forſaken. And as wee ſee and know many haue eaten and doe eat Muſhroms more for wantonneſſe than for need: for there are two kindes thereof venemous and deadly, which being in the handling of an vnskilful cooke, may procure vntimely death. Therefore it is better to eſteeme this plant and haue him in the Garden for your pleaſure and the rareneſſe threof, than for any vertue or good qualities yet knowne. B

Chap. 60. *Of Apples of Loue.*

¶ *The Deſcription.*

The Apple of Loue bringeth forth very long round ſtalkes or branches, fat and full of iuice, trailing vpon the ground, not able to ſuſtaine himſelfe vpright by reaſon of the tenderneſſe of the ſtalkes, and alſo the great weight of the leaues and fruit wherewith it is ſurcharged. the leaues are great and deeply cut or iagged about the edges, not vnlike to the leaues of Agrimony, but greater, and of a whiter greene colour: among which come forth yellow floures growing

vpon ſhort ſtems or foot ſtalks,cluſtering together in bunches: which being fallen,there do come in place faire and goodly apples, chamfered,vneuen, and bunched out in many places; of a bright ſhining red colour,and the bigneſſe of a gooſe egge or a large pippin. The pulpe or meat is verie full of moiſture, ſoft, reddiſh, and of the ſubſtance of a wheat plumme. The ſeed is ſmall,flat and rough: the roote ſmall and threddie: the whole Plant is of a ranke and ſtinking ſauour.

There hath happened vnto my hands another ſort, agreeing very notably with the former,as well in leaues and ſtalkes as alſo in floures and roots, onely the fruit hereof was yellow of colour, wherein conſiſted the difference.

Poma Amoris.
Apples of Loue.

¶ *The Place.*

Apples of Loue grow in Spaine, Italie, and ſuch hot Countries, from whence my ſelfe haue receiued ſeeds for my garden,where they do increaſe and proſper.

¶ *The Time.*

It is ſowne in the beginning of Aprill in a bed of hot horſe dung,after the maner of muſk Melons and ſuch like cold fruits.

¶ *The Names.*

The Apple of Loue is called in Latine *Pomum Aureum, Poma Amoris*, and *Lycoperſicum*: of ſome, *Glaucium*: in Engliſh, Apples of Loue, and Golden Apples: in French, *Pommes d'amours*. Howbeit there be other golden Apples whereof the Poets doe fable,growing in the Gardens of the daughters of *Heſperus*, which a Dragon was appointed to keepe,who,as they fable,was killed by *Hercules*.

¶ *The Temperature.*

The Golden Apple, with the whole herbe it ſelfe is cold, yet not fully ſo cold as Mandrake, after the opinion of *Dodonæus*. But in my iudgement it is very cold, yea perhaps in the higheſt degree of coldneſſe: my reaſon is,becauſe I haue in the hotteſt time of Sommer cut away the ſuperfluous branches from the mother root, and caſt them away careleſly in the allies of my garden, the which (notwithſtanding the extreme heat of the Sun, the hardneſſe of the trodden allies, and at that time when no raine at all did fall) haue growne as freſh where I caſt them, as before I did cut them off; which argueth the great coldneſſe contained therein. True it is,that it doth argue alſo a great moiſture wherewith the plant is poſſeſſed, but as I haue ſaid,not without great cold,which I leaue to euery mans cenſure.

¶ *The Vertues.*

A In Spaine and thoſe hot Regions they vſe to eat the Apples prepared and boiled with pepper, ſalt,and oile: but they yeeld very little nouriſhment to the bodie, and the ſame nought and corrupt.

B Likewiſe they doe eat the Apples with oile, vineger and pepper mixed together for ſauce to their meat,euen as we in theſe cold Countries doe Muſtard.

Chap. 61. *Of the Æthiopian Apple.*

¶ *The Deſcription.*

THe Apple of Æthiopia hath large leaues of a whitiſh greene colour, deepely indented about the edges, almoſt to the middle rib; the which middle rib is armed with a few ſharpe prickles. The floures be white,conſiſting of ſix ſmal leaues,with a certain yellow pointel in the midſt.

The

Mala Æthiopica.
Apples of Æthiopia.

The fruit is round, and bunched with vneuen lobes or bankes leſſer than the golden Apple, of colour red, and of a firme and ſollid ſubſtance, wherein are contained ſmall flat ſeeds. The root is ſmall and threddy.

¶ *The Place.*

The ſeeds of this plant haue beene brought vnto vs out of Spaine, and alſo ſent into France and Flanders: but to what perfection it hath come vnto in thoſe parts I am ignorant, but mine periſhed at the firſt approch of Winter. His firſt original was from Æthiopia, whereof it tooke his name.

¶ *The Time.*

This Plant muſt be ſowen as Muske-Melons, and at the ſame time. They floure in Iuly, and the fruit is ripe in September.

¶ *The Names.*

In Engliſh wee haue thought good to call it the Æthiopian Apple, for the reaſon before alledged: in Latine, *Mala Æthiopica*: of ſome it hath been thought to be *Malinathalla*. ‡ This is the *Solanum pomiferum* of *Lobel* and others; by which name our Author alſo formerly had it, in the fiftieth chapter of the former edition. ‡

¶ *The Nature.*

The temperature agreeth with the Apple of Loue.

¶ *The Vertues.*

Theſe Apples are not vſed in phyſicke that I can reade of; onely they are vſed for a ſauce and ſeruice vnto rich mens tables to be eaten, being firſt boyled in the broth of fat fleſh with pepper and ſalt, and haue a leſſe hurtfull iuyce than either mad apples or golden Apples.

CHAP. 62. *Of Thornie-Apples.*

¶ *The Deſcription.*

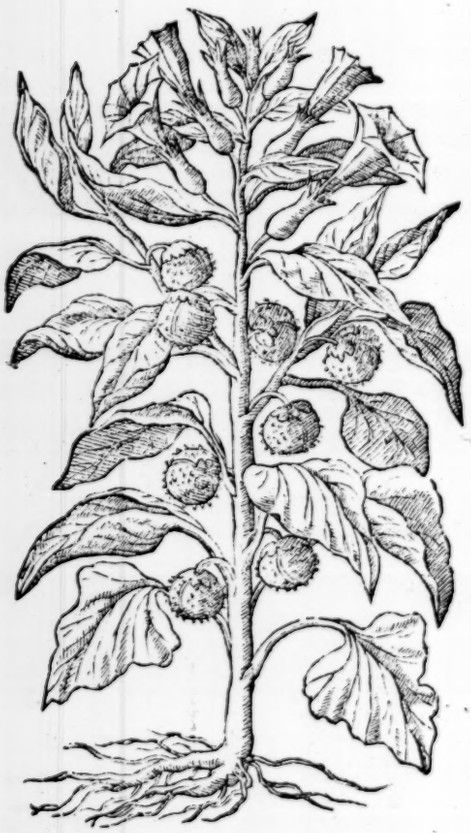
1 THe ſtalkes of Thorny-apples are oftentimes aboue a cubit and a halfe high, ſeldome higher, an inch thicke, vpright and ſtraight, hauing very few branches, ſometimes none at all, but one vpright ſtemme; whereupon doe grow leaues ſmooth and euen, little or nothing indented about the edges, longer and broader than the leaues of Night-ſhade, or of the mad Apples. The floures come forth of long toothed cups, great, white of the forme of a bell, or like the floures of the great Withwinde that rampeth in hedges; but altogether greater and wider at the mouth, ſharpe cornered at the brimmes, with certaine white chiues or threds in the middeſt, of a ſtrong ponticke ſauour, offending the head when it is ſmelled vnto: in the place of the floure commeth vp round fruit full of ſhort and blunt prickles, of the bigneſſe of a greene Wall-nut when it is at the biggeſt, in which are the ſeeds of the bigneſſe of tares or of Mandrakes, and of the ſame forme. The herbe it ſelfe is of a ſtrong ſauor, and doth ſtuffe the head, and cauſeth drowſineſſe. The root is ſmall and threddy.

2 There is another kinde hereof altogether greater than the former, whoſe ſeeds I receiued of the right honorable the Lord *Edward Zouch*; which he brought from Conſtantinople, and of his liberalitie did beſtow them vpon me, as alſo many other rare & ſtrange ſeeds; and it is that Thorn-apple that I haue diſperſed through this land, whereof at this preſent I haue great vſe in Surgery, as well in burnings and ſcaldings, as alſo in virulent and maligne vlcers, apoſtumes, and ſuch like. The which plant hath a very great ſtalke in fertile ground, bigger than a mans arme, ſmooth, and greene of colour, which a little aboue the ground diuideth it ſelfe into ſundry branches or armes, in manner of an hedge tree; whereupon are placed many great leaues cut and indented deepely

about

about the edges, with many vneuen ſharpe corners: among theſe leaues come white round floures made of one piece in manner of a bell, ſhutting it ſelfe vp cloſe toward night, as do the floures of the great Binde-weed, whereunto it is very like, of a ſweet ſmell, but ſo ſtrong, that it offends the ſences. The fruit followeth round, ſometimes of the faſhion of an egge, ſet about on euerie part with moſt ſharpe prickles; wherein is contained very much ſeed of the bigneſſe of tares, and of the ſame faſhion. The root is thicke, made of great and ſmall ſtrings: the whole plant is ſowen, beareth his fruit, and periſheth the ſame yeare. ‡ There are are ſome varieties of this plant, in the colour and doubleneſſe of the floures. ‡

1 *Stramonium Peregrinum.*
The Apple of Peru.



2 *Stramonium ſpinoſum.*
Thorny Apples of Peru.

¶ *The Place.*

1 This plant is rare and ſtrange as yet in England: I receiued ſeeds thereof from *Iohn Robin* of Paris, an excellent Herbariſt; which did grow and bare floures, but periſhed before the fruit came to ripeneſſe.

2 The Thorne-apple was brought in ſeed from Conſtantinople by the right honourable the Lord *Edward Zouch*, and giuen vnto me, and beareth fruit and ripe ſeed.

¶ *The Time.*

The firſt is to be ſowen in a bed of horſe-dung, as we do cucumbers and Muske-melons.
The other may be ſowen in March or Aprill, as other ſeeds are.

¶ *The Names.*

The firſt of theſe Thorne-apples may be called in Latine, *Stramonia*, and *Pomum*, or *Malum ſpinoſum*: of ſome, *Corona regia*, and *Meloſpinum*: The Grecians of our time name it μηλίαικον, or rather καρυοκάκαβον; as though they ſhould ſay, a nut ſtuffing, and cauſing drowſineſſe and diſquiet ſleepe: the Italians, *Paracoculi*: it ſeemeth to *Valerius Cordus* to be *Hyoſcyamus Peruvianus*, or Henbane of Peru: *Cardanus* doubteth whether it ſhould be inſerted among the Night-ſhades as a kinde thereof: of *Matthiolus* and others it is thought to be *Nux methel*: *Serapio, cap.* 375. ſaith, That *Nux methel* is like vnto *Nux vomica*; the ſeed whereof is like that of Mandrake: the huske is rough or full of prickles; the taſte pleaſing and ſtrong: the qualitie thereof is cold in the fourth degree. Which deſcription agreeth herewith, except in the forme or ſhape it ſhould haue with *Nux vomica*: *Anguillara* ſuſpecteth it to be *Hippomanes* which *Theocritus* mentioneth, wherewith in his ſecond *Eclog*

he

he ſheweth that horſes are made mad: for *Crateuas*, whom *Theocritus* his Scholiaſt doth cite, writeth, That the plant of *Hippomanes* hath a fruit full of prickles, as hath the fruit of wilde Cucumbers. In Engliſh it may be called Thorne-apple, or the Apple of Peru.

‡ The words of *Theocritus*, *Eidyll.* 2. are theſe:

Ἱππομανὲς φυτὸν ἐστὶ παρ' Ἀρκάδεσσι, &c.

Which is thus in Engliſh:

Hippomanes 'mongſt the Arcadians ſprings, by which euen all
The Colts and agile Mares in mountaines mad do fall.

Now in the Greeke *Scholia* amongſt the Expoſitions there is this: χαμαικὸν φυτὸν, &c. That is, *Crateuas* ſaith, That the plant hath a fruit like the wilde Cucumber, but blacker; the leaues are like a poppie, but thorny or prickly. Thus I expound theſe words of the Greeke Scholiaſt, being *pag.* 51 of the edition ſet forth by *Dan. Heinſius*, *Ann. Dom.* 1603. *Iulius Scaliger* blames *Theocritus*, becauſe he calls *Hippomanes* φυτὸν, a Plant: but *Heinſius*, as you may ſee in his notes vpon *Theocritus*, *pag.* 120, probably iudges, that φυτὸν in this place ſignifies nothing but χρῆμα, a Thing [*growing.*] Such as are curious may haue recourſe to the places quoted, where they may finde it more largely handled than is fit for me in this place to inſiſt vpon. There is no plant at this day knowne, in mine opinion, whereto *Crateuas* his deſcription may be more fitly referred, than to the *Papauer ſpinoſum*, or *ficus infernalis*, which we ſhall hereafter deſcribe. ‡

¶ *The Nature.*

The whole plant is cold in the fourth degree, and of a drowſie and numming qualitie, not inferior to Mandrake.

¶ *The Vertues.*

The iuyce of Thorne-apples boiled with hogs greaſe to the forme of an vnguent or ſalue, cureth all inflammations whatſoeuer, all manner of burnings or ſcaldings, as well of fire, water, boyling leade, gun-pouder, as that which comes by lightning, and that in very ſhort time, as my ſelf haue found by my dayly practiſe, to my great credit and profit. The firſt experience came from Colcheſter, where Miſtreſſe *Lobel* a Merchants wife there being moſt grieuouſly burned with lightning, and not finding eaſe or cure in any other thing, by this found helpe when all hope was paſt, by the report of M^r. *William Ramme*, publique Notarie of the ſaid towne, was perfectly cured. A

The leaues ſtamped ſmall, and boiled with oyle Oliue vntill the herbes be as it were burnt, then ſtrained and ſet to the fire againe with ſome wax, roſin, and a little Turpentine, and made into a ſalue, doth moſt ſpeedily cure old vlcers, new and freſh wounds, vlcers vpon the glandulous part of the yard, and other ſores of hard curation. B

Chap. 63.

Of Bitter-ſweet, or Wooddy Nightſhade.

¶ *The Deſcription.*

Bitter-ſweet bringeth forth wooddy ſtalkes as doth the Vine, parted into many ſlender creeping branches, by which it climeth and taketh hold of hedges and ſhrubs next vnto it. The barke of the oldeſt ſtalkes are rough and whitiſh, of the colour of aſhes, with the outward rinde of a bright greene colour, but the yonger branches are greene as are the leaues: the wood brittle, hauing in it a ſpongie pith; it is clad with long leaues, ſmooth, ſharpe pointed, leſſer than thoſe of the Binde-weed. At the lower part of the ſame leaues doth grow on either ſide one ſmall or leſſer leafe like vnto two eares. The floures be ſmall, and ſomewhat cluſtered together, conſiſting of fiue little leaues apiece, of a perfect blew colour, with a certaine pricke or yellow pointall in the middle: which being paſt, there do come in place faire berries, more long than round, at the firſt green, but very red when they be ripe; of a ſweet taſte at the firſt, but after very vnpleaſant, of a ſtrong ſauour, growing together in cluſters like burniſhed coral. The root is of a meane bigneſſe, and full of ſtrings.

I haue found another ſort which bringeth forth moſt pleaſant white floures with yellow pointals in the middle, in other reſpects agreeing with the former.

¶ *The Place.*

Bitter-ſweet doth grow in moiſt places about ditches, riuers, and hedges, almoſt euery where.

The

Amara-dulcis.
Bitter-ſweet.

The other ſort with the white floures I found in a ditch ſide againſt the right honorable the Earle of Suſſex his garden wall at his houſe in Bermonſey ſtreet by London, as you go from the court which is full of trees, vnto a farme houſe neere thereunto.

¶ *The Time.*

The leaues come forth in the Spring, the floures in Iuly, the berries are ripe in Auguſt.

¶ *The Names.*

The later Herbariſts haue named this plant *Dulcamara, Amarodulcis*, and *Amaradulcis*; that is in Greeke, γλυκάμαρον: they call it alſo *Solanum lignoſum*, and *Siliquaſtrum*: *Pliny* calleth it *Melortum*: *Theophraſtus*, *Vitis ſylueſtris*: in Engliſh we call it Bitter-ſweet, and Wooddy Night-ſhade. But euery Author muſt for his credit ſay ſomthing, although to ſmall purpoſe; for *Vitis ſylueſtris* is that which we call our Ladies Seale, which is no kinde of Nightſhade: for *Tamus* and *Vitis ſylueſtris* are both one; as likewiſe *Solanum lignoſum* or *Fruticoſum*; and alſo *Solanum rubrum*: whereas indeed it is no ſuch plant, nor any of the Nightſhades, although I haue followed others in placing it here. Therfore thoſe that vſe to mixe the berries thereof in compoſitions of diuers cooling ointments, in ſtead of the berries of Nightſhade haue committed the greater errour; for the fruit of this is not cold at all, but hot, as forthwith ſhall be ſhewed. *Dioſcorides* ſaith it is *Cyclaminus altera*; deſcribing it by the deſcription of thoſe with white floures aforeſaid, whereunto it doth very well agree. ‡ *Dioſcorides* deſcribeth his *Muſcoſo flore* with a moſſy floure, that is, ſuch an one as conſiſts of ſmall chiues or threds, which can by no meanes be agreeable to the floure of this plant. ‡

¶ *The Temperature.*

The leaues and fruit of Bitter-ſweet are in temperature hot and dry, clenſing and waſting away.

¶ *The Vertues.*

A The decoction of the leaues is reported to remoue the ſtoppings of the liuer and gall; and to be drunke with good ſucceſſe againſt the yellow jaundice.

B The iuyce is good for thoſe that haue fallen from high places, and haue beene thereby bruiſed, or dry beaten: for it is thought to diſſolue bloud congealed or cluttered any where in the intrals, and to heale the hurt places.

C *Hieronymus Tragus* teacheth to make a decoction of Wine with the wood finely ſliced and cut into ſmall pieces; which he reporteth to purge gently both by vrine and ſiege thoſe that haue the dropſie or jaundice.

D *Dioſcorides* doth aſcribe vnto *Cyclaminus altera*, or Bitter-ſweet with white floures as I conceiue it, the like faculties.

E The fruit (ſaith he) being drunke in the weight of one dram, with three ounces of white wine, for forty dayes together helpeth the ſpleene.

F It is drunke againſt difficultie of breathing: it throughly cleanſeth women that are newly brought a bed.

Chap. 64. *Of Binde-weed Nightſhade.*

¶ *The Deſcription.*

INchanters Night-ſhade hath leaues like to Peti-morel, ſharpe at the point like vnto Spinage: the ſtalke is ſtraight and vpright, very brittle, two foot high: the floures are white tending to carnation, with certaine ſmall browne chiues in the midſt: the ſeed is contained in ſmall round bullets

Circæa Lutetiana.
Inchanters Night-ſhade.

bullets, rough and very hairy. The roots are tough, and many in number, thruſting themſelues deep into the ground, and diſperſing far abroad; whereby it doth greatly increaſe, inſomuch that when it hath once taken faſt rooting, it can hardly with great labour be rooted out or deſtroyed.

¶ *The Place.*

It groweth in obſcure and darke places, about dung-hills, and in vntoiled grounds, by path-wayes and ſuch like.

¶ *The Time.*

It flouriſheth from Iune to the end of September.

¶ *The Names.*

It is called of *Lobel, Circæa Lutetiana*: in Engliſh, Inchanters Night-ſhade, or Binde-weed Nightſhade.

¶ *The Nature and Vertues.*

There is no vſe of this herbe either in phyſicke or Surgerie that I can reade of; which hath happened by the corruption of time and the errour of ſome who haue taken *Mandragoras* for *Circæa*; in which errour they haue ſtill perſiſted vnto this day, attributing vnto *Circæa* the vertues of *Mandragoras*; by which means there hath not any thing been ſaid of the true *Circæa*, by reaſon, as I haue ſaid, that *Mandragoras* hath been called *Circæa*: but doubtleſſe it hath the vertue of Garden Night-ſhade, and may ſerue in ſtead thereof without error.

Chap. 65. *Of Mandrake.*

¶ *The Deſcription.*

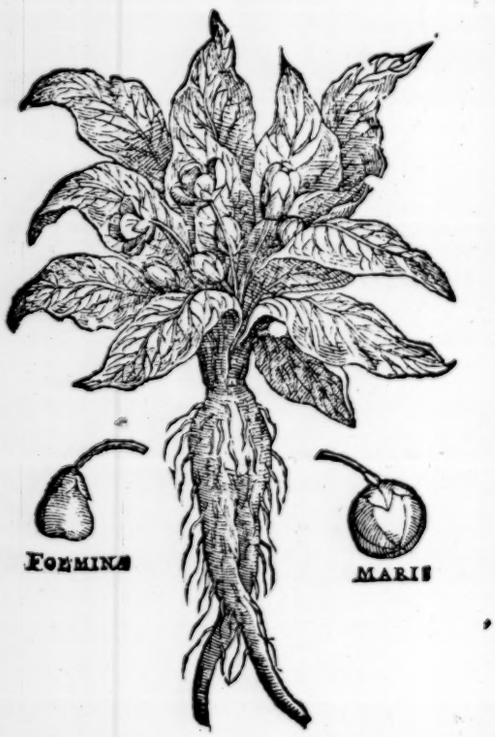
The male Mandrake hath great broad long ſmooth leaues of a darke greene colour, flat ſpred vpon the ground: among which come vp the floures of a pale whitiſh colour, ſtanding euery one vpon a ſingle ſmall and weake foot-ſtalke of a whitiſh greene colour: in their places grow round Apples of a yellowiſh colour, ſmooth, ſoft, and glittering, of a ſtrong ſmell; in which are contained flat and ſmooth ſeeds in faſhion of a little kidney, like thoſe of the Thorne-apple. The root is long, thicke, whitiſh, diuided many times into two or three parts reſembling the legs of a man, with other parts of his body adioyning thereto, as the priuy part, as it hath beene reported; whereas in truth it is no otherwiſe than in the roots of carrots, parſeneps, and ſuch like, forked or diuided into two or more parts, which Nature taketh no account of. There hath been many ridiculous tales brought vp of this plant, whether of old wiues, or ſome runnagate Surgeons or phyſicke-mongers I know not, (a title bad enough for them) but ſure ſome one or moe that ſought to make themſelues famous and skilfull aboue others, were the firſt brochers of that errour I ſpeake of. They adde further, That it is neuer or very ſeldome to be found growing naturally but vnder a gallowes, where the matter that hath fallen from the dead body hath giuen it the ſhape of a man; and the matter of a woman, the ſubſtance of a female plant, with many other ſuch doltiſh dreams. They fable further and affirme, That he who would take vp a plant thereof muſt tie a dog thereunto to pull it vp, which will giue a great ſhreeke at the digging vp; otherwiſe if a man ſhould do it, he ſhould ſurely die in ſhort ſpace after. Beſides many fables of louing matters, too full of ſcurrilitie to ſet forth in print, which I forbeare to ſpeake of. All which dreames and old wiues tales you ſhall from henceforth caſt out of your books and memory; knowing this, that they are all and euerie part of them falſe and moſt vntrue: for I my ſelfe and my ſeruants alſo haue digged vp, planted, and replanted very many, and yet neuer could either perceiue ſhape of man or woman, but ſometimes one ſtraight root, ſometimes two, and often ſix or ſeuen branches comming from the maine

great

great root, euen as Nature liſt to beſtow vpon it, as to other plants. But the idle drones that haue little or nothing to do but eate and drinke, haue beſtowed ſome of their time in caruing the roots of Brionie, forming them to the ſhape of men & women: which falſifying practiſe hath confirmed the errour amongſt the ſimple and vnlearned people, who haue taken them vpon their report to be the true Mandrakes.

The female Mandrake is like vnto the male, ſauing that the leaues hereof be of a more ſwart or darke greene colour; and the fruit is long like a peare, and the other is round like an apple.

Mandragoras mas & fœmina.
The male and female Mandrake.



¶ *The Place.*

Mandrake groweth in hot Regions, in woods and mountaines, as in mount Garganus in Apulia, and ſuch like places; we haue them onely planted in gardens, and are not elſewhere to be found in England.

¶ *The Time.*

They ſpring vp with their leaues in March, and floure in the end of Aprill: the fruit is ripe in Auguſt.

¶ *The Names.*

Mandrake is called of the Grecians Μανδραγόρας: of diuers, Κιρκαία, and *Circæa*, of *Circe* the witch, who by art could procure loue: for it hath beene thought that the Root hereof ſerueth to win loue: of ſome, ἀνθρωπόμορφος, *Anthropomorphos*, and *Morion*: ſome of the Latines haue called it *Terræ malum*, and *Terreſtre malum*, and *Canina malus*: Shops, and alſo other Nations doe receiue the Greeke name. *Dioſcorides* ſaith, That the male is called of diuers *Morion*: and deſcribeth alſo another Mandrake by the name of *Morion*, which, as much as can be gathered by the deſcription, is like the male, but leſſe in all parts: in Engliſh we cal it Mandrake, Mandrage, and Mandragon.

¶ *The Temperature.*

Mandrake hath a predominate cold facultie, as *Galen* ſaith, that is to ſay cold in the third degree: but the root is cold in the fourth degree.

¶ *The Vertues.*

A *Dioſcorides* dath particularly ſet downe many faculties hereof; of which notwithſtanding there be none proper vnto it, ſauing thoſe that depend vpon the drowſie and ſleeping power thereof: which qualitie conſiſteth more in the root than in any other part.

B The Apples are milder, and are reported that they may be eaten, being boyled with pepper and other hot ſpices.

C *Galen* ſaith that the Apples are ſomething cold and moiſt, and that the barke of the root is of greateſt ſtrength, and doth not onely coole, but alſo dry.

D The iuyce of the leaues is very profitably put into the ointment called *Populeon*, and all cooling ointments.

E The iuyce drawne forth of the roots dried, and taken in ſmall quantitie, purgeth the belly exceedingly from flegme and melancholike humors.

F It is good to be put into medicines and colliries that do mitigate the paine of the eyes; and put vnder a peſſarie it draweth forth the dead childe and ſecondine.

G The greene leaues ſtamped with barrowes greaſe and barley meale, coole all hot ſwellings and inflammations; and they haue vertue to conſume apoſtumes and hot vlcers, being bruiſed and applied thereon.

H A ſuppoſitorie made with the ſame iuyce, and put into the fundament cauſeth ſleepe.

I The wine wherein the root hath beene boyled or infuſed prouoketh ſleepe and aſſwageth paine.

K The ſmell of the Apples moueth to ſleepe likewiſe; but the iuyce worketh more effectually if you take it in ſmall quantitie.

Great

Great and ſtrange effects are ſuppoſed to be in the Mandrakes, to cauſe women to be fruitfull L
and beare children, if they ſhall but carry the ſame neere vnto their bodies. Some doe from hence ground it, for that *Rahel* deſired to haue her ſiſters Mandrakes (as the text is tranſlated) but if we looke well into the circumſtances which there we ſhall finde, we may rather deeme otherwiſe. Young *Ruben* brought home amiable and ſweet ſmelling floures (for ſo ſignifieth the Hebrew word, which is vſed *Cantic.* 7. 13. in the ſame ſenſe:) and the lad brought them home, rather for their beauty and ſmell, than for their vertue. Now in the floures of Mandrake there is no ſuch delectable or amiable ſmell as was in theſe amiable floures which *Ruben* brought home. Beſides, wee read not that *Rahel* conceiued hereupon, for *Leah Iacobs* wife had foure children before God granted that bleſſing of fruitfulneſſe vnto *Rahel*. And laſt of all (which is my chiefeſt reaſon) *Iacob* was angry with *Rahel* when ſhe ſaid, Giue me children elſe I die: and demanded of her, whether he were in the ſtead of God or no, who had withheld from her the fruit of her body. And we know that the Prophet *Dauid* ſaith, Children and the fruit of the wombe are the inheritance, that commeth from the Lord, *Pſalm.* 127.

Serapio, *Auicen*, and *Paulus Ægineta* doe write, that the ſeed and fruit of *Mandragoras* taken M
in drinke, doe cleanſe the matrix or mother, and *Dioſcorides* wrote the ſame long before them.

He that would know more hereof, may reade that chapter of doctor *Turner* his booke, concerning this matter, where he hath written largely and learnedly of this Simple.

CHAP. 66. *Of Henbane.*

1 *Hyoſcyamus Niger.*
Blacke Henbane.

2 *Hyoſcyamus Albus.*
White Henbane.

¶ *The Deſcription.*

1 THe common blacke Henbane hath great and ſoft ſtalkes: leaues very broad, ſoft, and woolly, ſomewhat iagged, eſpecially thoſe that grow neere vnto the ground, and thoſe that grow vpon the ſtalke, narrower, ſmaller, and ſharper. The floures are bel faſhion, of a faint yellowiſh white, and browne within towards the bottome; when the floures are

gone, there commeth hard knobby huskes, like ſmall cups or boxes, wherein are ſmall browne ſeeds.

2 The White Henbane is not much vnlike to the blacke, ſauing that his leaues are ſmaller, whiter and more woolly, and the floures alſo whiter. The cods are like the other, but without pricks; it dieth in winter, and muſt likewiſe be ſowne againe the next yeere.

‡ 3 *Hyoſcyamus albus minor.*
The leſſer White Henbane.

‡ 4 *Hyoſcyamus albus Creticus.*
White Henbane of Candy.

‡ 3 This other white Henbane is much like the laſt deſcribed, but that it is leſſer: the leaues ſmaller and rounder, hanging vpon pretty long ſtalkes, the floures and ſeed veſſels are like thoſe of the laſt mentioned.

4 This is ſofter and tenderer than the laſt deſcribed, the leaues alſo hang vpon long foot-ſtalkes, and are couered ouer with a ſoft downines: and they are ſomewhat broader, yet thinner and more ſinuated than thoſe of the white, and ſomewhat reſemble the forme of a vine leafe, being ſnipt about the edges; the ſtalkes are alſo couered with a white downe. The floures are of a gold yellow, with a veluet coloured circle in their middles: the root is ſufficiently thicke and large: *Cluſius* had the figure and deſcription of this from his friend *Iaques Plateau*, who had the plant growing of ſeed receiued from Candy.

5 The ſtalke of this growes ſome cubit high, being pretty ſtiffe, about the thickeneſſe of ones little finger, and couered ouer with a ſoft and white downe: the leaues grow diſperſed vpon the ſtalk, not much vnlike thoſe of the common kinde, but leſſer and more diuided, and white (while they are young) couered with a ſlender and long downineſſe: the top of the ſtalke is diuided into certaine branches that bend or hang downe their heads, which alternately amongſt narrower, leſſer and vndiuided leaues carry cups like as the common one, ending in fiue pretty ſtiffe points, in which are contained floures at firſt ſomewhat like the common kinde, but afterwards, as they grow bigger, they change into an elegant red purpliſh colour, with deepe coloured veines: neither is the ring or middle part purple as in the common kinde, but whitiſh, hauing a purpliſh pointall, and fiue threds in the middle: the ſeeds and ſeed veſſels are like thoſe of the common kind. *Cluſius* receiued the ſeed hereof from *Paludanus* returning from his trauailes into Syria and Egypt, wherefore he calls it *Hyoſcyamus Ægyptius*, Egyptian Henbane. ‡

¶ The

‡ 5 *Hyoſcyamus flore rubello.*
Henbane with a reddiſh floure.

¶ *The Place.*

Blacke Henbane grows almoſt euerie where by high-wayes, in the borders of fields, about dung-hills and vntoiled places; the white Henbane is not found but in the gardens of thoſe that loue phyſicall plants: the which groweth in my garden, and doth ſow it ſelfe from yeare to yeare.

¶ *The Time.*

They ſpring out of the ground in May, bring forth their floures in Auguſt, and the ſeed is ripe in October.

¶ *The Names.*

Henbane is called of the Grecians, ὑοσκύαμος: of the Latines, *Apollinaris*, and *Faba ſuilla*: of the Arabians, as *Pliny* ſaith, *Altercum*: of ſome, *Faba Iouis*, or *Iupiters* beame: of *Pythagoras*, *Zoroaſtes*, and *Apuleius Inſana*, *Alterculum*, *Symphoniaca*, and *Calicularis*: of the Tuſcanes, *Fabulonia*, and *Faba lupina*: of *Matthæus ſyluaticus*, *Dens Caballinus*, *Milimandrum*, *Caßilago*: of *Iacobus à Manlijs*, *Herbapinnula*: in ſhops it is called *Iuſquiamus*, and *Hyoſcyamus*: in Engliſh, Henbane in Italian, *Hyoſquiamo*: in Spaniſh, *Velenno*: in high Dutch, **Bilſen kraut**: in French, *Hannebane*, *Endormie*: the other is called *Hyoſcyamus albus*, or white Henbane.

¶ *The Temperature.*

Theſe kindes of Henbane are cold in the fourth degree.

¶ *The Vertues.*

Henbane cauſeth drowſineſſe, and mitigateth all kinde of paine: it is good againſt hot and ſharpe diſtillations of the eyes and other parts: it ſtayeth bleeding and the diſeaſe in women: it is applied to inflammations of the ſtones and other ſecret parts. A

The leaues ſtamped with the ointment *Populeon*, made of poplar buds, aſſwageth the paine of the gout, and the ſwellings of the ſtones, aud the tumors of womens breſts, and are good to be put into the ſame ointment, but in ſmall quantitie B

To waſh the feet in th e decoction of Henbane cauſeth ſleepe; or giuen in a cliſter it doth the ſame; and alſo the often ſmelling to the floures. C

The leaues, ſeed, and iuyce taken inwardly cauſeth an vnquiet ſleepe like vnto the ſleep of drunkenneſſe, which continueth long, and is deadly to the party. D

The ſeed of white Henbane is good againſt the cough, the falling of waterie humours into the eyes or breſt; againſt the inordinate flux of womens iſſues, and all other iſſues of bloud, taken in the weight of ten graines, with water wherein honey hath beene ſodden. E

The root boyled with vineger, and the ſame holden hot in the mouth, eaſeth the paine of the teeth. The ſeed is vſed by Mountibanke Tooth-drawers which runne about the countrie, for to cauſe wormes come forth of mens teeth, by burning it in a chafing-diſh with coles, the party holding his mouth ouer the fume thereof: but ſome crafty companions to gaine mony conuey ſmall lute ſtring into the water, perſuading the patient that thoſe ſmall creeping beaſts came out of his mouth or other parts which he intended to eaſe. F

Chap. 67. *Of yellow Henbane, or Engliſh Tabaco.*

Hyoſcyamus luteus.
Yellow Henbane.

¶ *The Deſcription.*

YEllow Henbane groweth to the height of two cubits: the ſtalke is thicke, fat, and greene of colour, full of a ſpongeous pith, and is diuided into ſundry branches ſet with ſmooth and euen leaues, thick, and ful of juice. The floures grow at the tops of the branches, orderly placed, of a pale yellow colour, ſomething leſſer than thoſe of the blacke Henbane. The cups wherein the floures do ſtand are like, but leſſer, tenderer, and without ſharpe points, wherein is ſet the husk or cod ſomwhat round, full of very ſmall ſeed like the ſeed of Marjerome. The root is ſmall and threddy.

¶ *The Place.*

Yellow Henbane is ſowen in gardens, where it doth proſper exceedingly, inſomuch that it cannot be deſtroyed where it hath once ſowen it ſelfe, and it is diſperſed into the moſt parts of England.

¶ *The Time.*

It floureth in the Sommer moneths, and oftentimes till Autumne be farre ſpent, in which time the ſeed commeth to perfection.

¶ *The Names.*

Yellow Henbane is called *Hyoſcyamus luteus*: of ſome, *Petum*, and *Petun*: of others, *Nicoſiana*, of *Nicot* a Frenchman that brought the ſeeds from the Indies, as alſo the ſeeds of the true Tabaco, whereof this hath beene taken for a kinde; inſomuch that *Lobel* hath called it *Dubius Hyoſcyamus*, or doubtfull Henbane, as a plant participating of Henbane and Tabaco: and it is vſed of diuers in ſtead of Tabaco, and called by the ſame name, for that it hath beene brought from Trinidada, a place ſo called in the Indies, as alſo from Virginia and Norembega, for Tabaco; which doubtleſſe taken in ſmoke worketh the ſame kinde of drunkenneſſe that the right Tabaco doth. ‡ Some vſe to call this [illegible]cotian, in Engliſh, being a name taken from the Latine. ‡

¶ *The Nature.*

This kinde of Henbane is thought of ſome to be cold and moiſt; but after *Lobel* it rather heateth than cooles at all, becauſe of the biting taſte, as alſo that roſennineſſe or gummines it is poſſeſſed of; which is euidently perceiued both in handling and chewing it in the mouth.

¶ *The Vertues.*

A This herbe auaileth againſt all apoſtumes, tumors, inueterate vlcers, botches, and ſuch like, being made into an vnguent or ſalue as followeth: Take of the greene leaues three pounds and an halfe, ſtampe them very ſmall in a ſtone morter; of Oyle Oliue one quart; ſet them to boyle in a braſſe pan or ſuch like, vpon a gentle fire, continually ſtirring it vntill the herbes ſeem blacke, and will not boyle or bubble any more: then ſhall you haue an excellent greene oyle; which being ſtrained from the feces or droſſe, put the cleare and ſtrained oyle to the fire againe; adding thereto of wax halfe a pound, of roſen foure ounces, and of good Turpentine two ounces: melt them all together, and keepe it in pots for your vſe, to cure inueterate vlcers, apoſtumes, burnings, greene wounds, and all cuts and hurts in the head; wherewith I haue gotten both crownes and credit.

B It is vſed of ſome in ſtead of Tabaco, but to ſmall purpoſe or profit, although it do ſtupifie and dull the ſences, and cauſe that kinde of giddineſſe that Tabaco doth, and likewiſe ſpitting; which any other herbe of hot temperature will do, as Roſemary, Time, winter Sauorie, ſweet Marjerome, and ſuch like: any of the which I like better to be taken in ſmoke than this kinde of doubtfull henbane.

CHAP. 68.

Of Tabaco, or Henbane of Peru.

¶ *The Kindes.*

THere be two ſorts or kindes of Tabaco; one greater, the other leſſer: the greater was brought into Europe out of the prouinces of America, which we call the Weſt Indies; the other from Trinidada, an Iſland neere vnto the continent of the ſame Indies. Some haue added a third ſort: and others make the yellow Henbane a kinde thereof.

† 1 *Hyoſcyamus Peruvianus.*
Tabaco or Henbane of Peru.

† 2 *Sana Sancta Indorum.*
Tabaco of Trinidada.

¶ *The Deſcription.*

1 TAbaco, or Henbane of Peru hath very great ſtalkes of the bigneſſe of a childes arme, growing in fertile and well dunged ground of ſeuen or eight foot high, diuiding it ſelfe into ſundry branches of great length; whereon are placed in moſt comely order very faire long leaues, broad, ſmooth, and ſharpe pointed, ſoft, and of a light greene colour, ſo faſtned about the ſtalke, that they ſeeme to embrace and compaſſe it about. The floures grow at the top of the ſtalkes, in ſhape like a bell-floure, ſomewhat long and cornered, hollow within, of a light carnation colour, tending to whiteneſſe toward the brimmes. The ſeed is contained in long ſharpe pointed cods or ſeed-veſſels like vnto the ſeed of yellow Henbane, but ſomewhat ſmaller and browner of colour. The root is great, thicke, and of a wooddy ſubſtance, with ſome threddie ſtrings anexed thereunto.

2 Trinidada Tabaco hath a thicke tough and fibrous root, from which immediately riſe vp long broad leaues and ſmooth, of a greeniſh colour, leſſer than thoſe of Peru: among which riſeth vp a ſtalke diuiding it ſelfe at the ground into diuers branches, whereon are ſet confuſedly the like leaues, but leſſer: at the top of the ſtalks ſtand vp long necked hollow floures of a pale purple tending to a bluſh colour: after which ſucceed the cods or ſeed-veſſels, including many ſmall ſeeds like vnto the ſeed of Marjerome. The whole plant periſheth at the firſt approch of Winter.

‡ 3 *Tabacum minimum.*
Dwarfe Tabaco.

‡ 3 This third is an herbe ſome ſpanne or better long, not in face vnlike the precedent, neither defectiue in the hot and burning taſte. The floures are much leſſe than thoſe of the yellow Henbane, & of a greeniſh yellow. The leaues are ſmall, and narrower thoſe of Sage of Ieruſalem. The root is ſmall and fibrous. ‡

¶ *The Place.*

Theſe were firſt brought into Europe out of America, which is called the Weſt Indies, in which is the prouince or countrey of Peru: but being now planted in the gardens of Europe it proſpereth very well, and commeth from ſeed in one yeare to beare both floures and ſeed. The which I take to be better for the conſtitution of our bodies than that which is brought from India; and that growing in the Indies better for the people of the ſame Countrey: notwithſtanding it is not ſo thought, nor receiued of our Tabaconiſts; for according to the Engliſh Prouerbe, Far fetcht and deare bought is beſt for Ladies.

¶ *The Time.*

Tabaco muſt be ſowen in the moſt fruitfull ground that may be found, carleſly caſt abroad in the ſowing, without raking it into the ground or any ſuch paine or induſtrie taken as is requiſite in the ſowing of other ſeeds, as my ſelf haue found by proofe, who haue experimented euery way to cauſe it quickly to grow: for I haue committed ſome to the earth in the end of March, ſome in Aprill, and ſome in the beginning of May, becauſe I durſt not hazard all my ſeed at one time, leſt ſome vnkindely blaſt ſhould happen after the ſowing, which might be a great enemie thereunto.

¶ *The Names.*

The people of America call it *Petun*: Some, as *Lobel* and *Pena*, haue giuen it theſe Latine names, *Sacra herba*, *Sancta herba*, and *Sana ſancta Indorum*: and other, as *Dodonæus*, call it *Hyoſcyamus Peruuianus*, or Henbane of Peru: *Nicolaus Monardus* names it *Tabacum*. That it is *Hyoſcyami ſpecies*, or a kind of Henbane, not onely the forme being like to yellow Henbane, but the qualitie alſo doth declare; for it bringeth drowſineſſe, troubleth the ſences, and maketh a man as it were drunke by taking of the fume onely; as *Andrew Theuet* teſtifieth, (and common experience ſheweth:) of ſome it is called *Nicotiana*: the which I refer to the yellow Henbane, for diſtinctions ſake.

¶ *The Temperature.*

It is hot and dry, and that in the ſecond degree, as *Monardis* thinketh, and is withall of power to diſcuſſe or reſolue, and to cleanſe away filthy humors, hauing alſo a ſmall aſtriction, and a ſtupifying or benumming qualitie, and it purgeth by the ſtoole: and *Monardis* writeth that it hath a certaine power to reſiſt poyſon. And to proue it to be of an hot temperature, the biting qualitie of the leaues doth ſhew, which is eaſily perceiued by taſte: alſo the greene leaues laid vpon vlcers in ſinewie parts may ſerue for a proofe of heate in this plant; becauſe they do draw out filth and corrupted matter, which a cold Simple would neuer do. The leaues likewiſe being chewed draw forth flegme and water, as doth alſo the fume taken when the leaues are dried: which things declare that this is not a little hot; for what things ſoeuer, that being chewed or held in the mouth bring forth flegme and water, the ſame be all accounted hot; as the root of Pellitorie of Spaine, of Saxifrage, and other things of like power. Moreouer, the benumming qualitie hereof is not hard to be perceiued, for vpon the taking of the fume at the mouth there followeth an infirmitie like vnto drunkenneſſe, and many times ſleepe; as after the taking of *Opium*: which alſo ſheweth in the taſte a biting qualitie, and therefore is not without heate; which when it is chewed and

and inwardly taken, it doth forthwith ſhew, cauſing a certaine heat in the cheſt, and yet withall troubling the wits, as *Petrus Bellonius* in his third Booke of Singularities doth declare; where alſo hee ſheweth, that the Turkes oftentimes doe vſe *Opium*, and take one dramme and a halfe thereof at one time; without any other hurt following, ſauing that they are thereupon (as it were) taken with a certaine light drunkenneſſe. So alſo this Tabaco being in taſte biting, and in temperature hot, hath notwithſtanding a benumming qualitie. Hereupon it ſeemeth to follow, that not onely this Henbane of Peru, but alſo the iuice of poppie otherwiſe called *Opium*, conſiſteth of diuers parts; ſome biting and hot, and others extreame cold, that is to ſay, ſtupifying or benumming: if ſo bee that this benumming qualitie proceed of extreme cold (as *Galen* and all the old Phyſitions doe hold opinion) Then ſhould this bee cold; but if the benumming faculti doth not depend of an extreme cold qualitie, but proceedeth of the eſſence of the ſubſtance; then Tabaco is not cold and benumming; but hot and benumming, and the latter not ſo much by reaſon of his temperature, as through the propertie of his ſubſtance; no otherwiſe than a purging medicine, which hath his force not from the temperature, but from the eſſence of the whole ſubſtance.

¶ *The Vertues.*

Nicolaus Monardis ſaith, that the leaues hereof are a remedy for the paine in the head called the Megram or Migraime that hath beene of long continuance: and alſo for a cold ſtomacke, eſpecially in children; and that it is good againſt the paines in the kidneies. A

It is a preſent remedie for the fits of the Mother: it mitigateth the paine of the gout if it bee roſted in hot embers and applied to the grieued part. B

It is likewiſe a remedie for the tooth-ache, if the teeth and gums be rubbed with a linnen cloth dipped in the iuice; and afterward a round ball of the leaues laid vnto the place. C

The iuice boiled with Sugar in forme of a ſirrup and inwardly taken, driueth forth wormes of the bellie; if withall a leaſe be laid to the Nauell. D

The ſame doth likewiſe ſcoure and clenſe old and rotten vlcers, and bringeth them to perfect digeſtion as the ſame Author affirmeth. E

In the Low Countreyes it is vſed againſt ſcabbes and filthineſſe of the skinne, and for the cure of wounds: but ſome hold opinion that it is to bee vſed but onely to hot and ſtrong bodies: for they ſay that the vſe is not ſafe in weake and old folkes: and for this cauſe, as it ſeemeth, the women in America (as *Theuet* ſayth) abſtayne from the hearbe *Petun* or Tabaco, and doe in no wiſe vſe it. F

The weight of foure ounces of the iuice heereof drunke purgeth both vpwards and downewards, and procureth after, a long and ſound ſleepe, as wee haue learned of a friend by obſeruation, affirming that a ſtrong Countreyman of a middle age, hauing a dropſie, tooke of it, and being wakened out of his ſleepe, called for meat and drinke, and after that became perfectly whole. G

Moreouer the ſame man reported, that he had cured many countriemen of agues with the diſtilled water of the leaues drunke a little while before the fit. H

Likewiſe there is an oile to be taken out of the leaues that healeth merry-gals, kibed heels and ſuch like. I

It is good againſt poiſon, and taketh away the malignitie thereof, if the iuice be giuen to drink or the wounds made by venemous beaſts be waſhed therewith. K

The drie leaues are vſed to be taken in a pipe ſet on fire and ſuckt into the ſtomacke, and thruſt forth againe at the noſthrils againſt the pains of the head, rheumes, aches in any part of the body whereof ſoeuer the originall proceed, whether from France, Italy, Spaine, Indies, or from our familiar and beſt knowne diſeaſes: thoſe leaues doe palliate or eaſe for a time, but neuer performe any cure abſolutely: for although they emptie the body of humours, yet the cauſe of the grieſe cannot be ſo taken away. But ſome haue learned this principle, that repletion requireth euacuation; that is, fulneſſe craueth emptineſſe, and by euacuation aſſure themſelues of health: But this doth not take away ſo much with it this day, but the next bringeth with it more: As for example, a Well doth neuer yeeld ſuch ſtore of water as when it is moſt drawne and emptied. My ſelfe ſpeake by proofe, who haue cured of that infectious diſeaſe a great many; diuers of which had couered or kept vnder the ſickeneſſe by the helpe of Tabaco as they thought, yet in the end haue beene conſtrained to haue vnto ſuch an hard knot, a crabbed wedge, or elſe had vtterly periſhed. L

Some vſe to drinke it (as it is tearmed) for wantonneſſe or rather cuſtome, and cannot forbeare it, no not in the midſt of their dinner, which kind of taking is vnwholeſome and very dangerous: although to take it ſeldome and that Phyſically is to be tolerated and may do ſome good: but I commend the ſyrrup aboue this ſume or ſmokie medicine. M

It

N It is taken of ſome phyſically in a pipe for that purpoſe once in a day at the moſt, and that in the morning faſting againſt paines in the head, ſtomacke, and griefe in the breſt and lungs: againſt catarrhes and rheumes, and ſuch as haue gotten cold and hoarſeneſſe.

O Some haue reported that it little preuaileth againſt an hot diſeaſe, and that it profiteth an hot complexion nothing at all: but experience hath not ſhewed it to bee iniurious vnto either.

P They that haue ſeene the proofe hereof haue credibly reported, that when the Moores and Indians haue fainted either for want of food or reſt, this hath beene a preſent remedie vnto them to ſupplie the one, and to helpe them to the other.

Q The prieſts and Inchanters of the hot countries do take the fume thereof vntill they be drunke, that after they haue lien for dead three or foure houres, they may tell the people what wonders, viſions, or illuſions they haue ſeene, and ſo giue them a propheticall direction or foretelling (if we may truſt the Diuell) of the ſucceſſe of their buſineſſe.

R The iuice or diſtilled water of the firſt kind is very good againſt catarrhes, the dizzineſſe of the head, and rheumes that fall downe the eies, againſt the paine called the Megram, if either you applie it vnto the temples, or take one or two greene leaues, or a dry leafe moiſtned in wine, and dried cunningly vpon the embers and laid thereto.

S It cleereth the ſight and taketh away the webs and ſpots thereof, being annointed with the iuice bloud warme.

T The oile or iuice dropped into the eares is good againſt deafeneſſe, a cloth dipped in the ſame and laid vpon the face, taketh away the lentils, redneſſe, and ſpots thereof.

V Many notable medicines are made hereof againſt the old and inueterate cough, againſt aſthmaticall or pectorall griefes, which if I ſhould ſet downe at large, would require a peculiar Volume.

X It is alſo giuen to ſuch as are accuſtomed to ſwoune, and are troubled with the Collicke and windineſſe, againſt the Dropſie, the Wormes in children, the Piles and the Sciatica.

Y It is vſed in outward medicines either the herbe boiled with oile, waxe, roſin and turpentine, as before is ſet downe in yellow Henbane, or the extraction thereof with ſalt, oile, balſame, the diſtilled water and ſuch like, againſt tumours, apoſtumes, old vlcers, of hard curation, botches, ſcabbes, ſtinging with nettles, carbuncles, poiſoned arrowes, and wounds made with gunnes or any other weapon.

Z It is excellent good in burnings and ſcaldings with fire, water, oile, lightning, or ſuch like, boiled with Hogges greace in forme of an Ointment, which I haue often prooued, and found moſt true, adding a little of the iuice of thorne apple leaues, ſpreading it vpon a cloth and ſo applying it.

A I doe make hereof an excellent balſame to cure deepe wounds and punctures, made by ſome narrow ſharpe pointed weapon. Which balſame doth bring vp the fleſh from the bottome verie ſpeedily, and alſo heale ſimple cuts in the fleſh according to the firſt intention, that is, to glew or ſoder the lips of the wound together, not procuring matter or corruption vnto it, as is commonly ſeene in the healing of wounds. The receit is this: Take oile of roſes, oile of S. Iohns wort, of either one pinte, the leaues of Tabaco ſtamped ſmall in a ſtone morter two pounds, boile them together to the conſumption of the iuice, ſtraine it and put it to the fire againe, adding thereto of Venice Turpentine two ounces, of Olibanum and maſticke of either halfe an ounce, in moſt fine and ſubtill pouder, the which you may at all times make an vnguent or ſalue by putting thereto wax and roſin to giue vnto it a ſtiffe body, which worketh exceeding well in maligne and virulent vlcers, as in wounds and punctures. I ſend this iewell vnto you women of all ſorts, eſpecially to ſuch as cure and helpe the poore and impotent of your Countrey without reward. But vnto the beggerly rabble of witches, charmers, and ſuch like couſeners, that regard more to get money, than to helpe for charitie, I wiſh theſe few medicines far from their vnderſtanding, and from thoſe deceiuers whom I wiſh to be ignorant herein. But courteous gentlewomen, I may not for the malice that I doe beare vnto ſuch, hide any thing from you of ſuch importance: and therefore take one more that followeth, wherewith I haue done very many and good cures, although of ſmall coſt, but

B regard it not the leſſe for that cauſe. Take the leaues of Tabaco two pound, hogges greaſe one pound, ſtampe the herbe ſmall in a ſtone morter, putting thereto a ſmall cup full of red or claret wine, ſtir them well together, couer the morter from filth and ſo let it reſt vntill morning; then put it to the fire and let it boile gently, continually ſtirring it vntill the conſumption of the wine; ſtraine it, and ſet it to the fire againe, putting thereto the iuice of the herbe one pound, of Venice turpentine foure ounces, boile them togethet to the conſumption of the iuice, then adde therto of

the

the roots of round *Ariſtolochia* or Birthwoort in moſt fine pouder two ounces, ſufficient waxe to giue it a body; the which keep for thy wounded poore neighbour, as alſo the old and filthy vlcers of the legs and other parts of ſuch as haue need of helpe.

† The figures were formerly tranſpoſed.

CHAP. 69. *Of Tree Nightſhade.*

Amomum Plinij.
Tree Nightſhade.

¶ *The Deſcription.*

THis rare and pleaſant Plant, called tree Nightſhade, is taken of ſome to be a kinde of Ginnie pepper, but not rightly; of others for a kinde of Nightſhade, whoſe iudgement and cenſure I gladly admit; for that it doth more fitly anſwer it both in the forme and nature. It groweth vp like vnto a ſmall ſhrubbe or wooddy hedge buſh, two or three cubits high, couered with a greeniſh barke ſet with many ſmall twiggie branches, and garniſhed with many long leaues very greene, like vnto thoſe of the Peach tree. The floures are white, with a certaine yellow pricke or pointell in the middle, like vnto the floures of garden Nightſhade. After which ſucceede ſmall round berries verie red of colour, and of the ſame ſubſtance with Winter Cherries, wherein are contained little flat yellow ſeeds. The root is compact of many ſmall hairie yellow ſtrings.

¶ *The Place.*

It groweth not wilde in theſe cold regions, but we haue them in our gardens, rather for pleaſure than profit, or any good qualitie as yet knowne.

¶ *The Time.*

It is kept in pots and tubs with earth and ſuch like in houſes during the extremity of Winter, becauſe it cannot indure the coldneſſe of our colde climate; and is ſet abroad into the Garden in March or Aprill: it floureth in May, and the fruit is ripe in September.

¶ *The Names.*

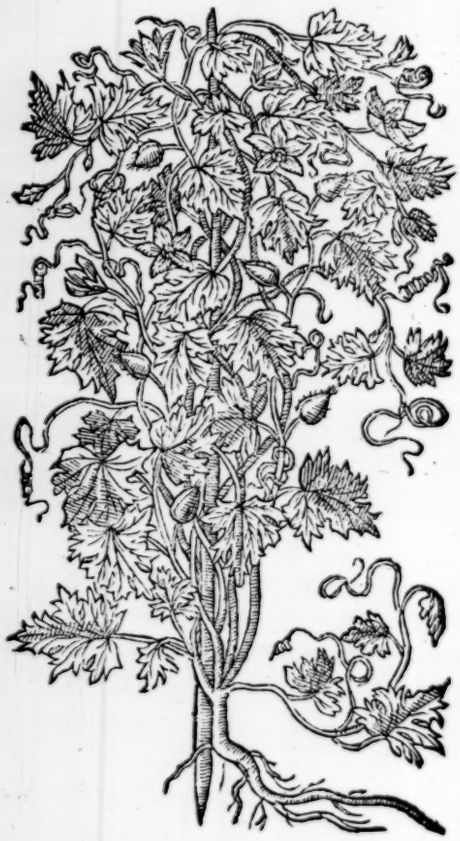
Tree Nightſhade is called in Latine *Solanum Arboreſcens*: of ſome, *Strychnodendron*: and ſome iudge it to be *Amomum* of *Plinie*: it is *Pſeudocapſicum* of *Dodonæus*.

¶ *The Nature and Vertues.*

We haue not as yet any thing ſet downe as touching the temperature or vertues of this Plant, but it is referred of ſome to the kindes of Ginnie pepper, but without any reaſon at all; for Ginny pepper though it bring forth fruit very like in ſhape vnto this plant, yet in taſte moſt vnlike, for that *Capſicum* or Ginny pepper is more ſharpe in taſte than our common pepper, and the other hath no taſte of biting at all, but is like vnto the Berries of Garden Nightſhade in taſte, although they differ in colour: which hath moued ſome to call this plant red Nightſhade, of the colour of the berries: and Tree Nightſhade, of the wooddy ſubſtance which doth continue and grow from yeare to yeare: and Ginnie pepper dieth at the firſt approch of Winter.

Chap. 70. *Of Balme Apple, or Apple of Hieruſalem.*

1 *Balſamina mas.*
The male Balſam Apple.



2 *Balſamina fœmina.*
The female Balſam Apple.

The Deſcription.

1 THe male Balme Apple hath long, ſmall, and tender branches, ſet with leaues like thoſe of the vine; and the like ſmall claſping tendrels wherewith it catcheth hold of ſuch things as do grow neere vnto it, not able by reaſon of his weakeneſſe to ſtand vpright without ſome pole or other thing to ſupport it. The floures conſiſt of fiue ſmall leaues of a meane bigneſſe, and are of a faint yellow colour: which being paſt, there doe come in place long Apples, ſomething ſharpe toward the point almoſt like an egge, rough all ouer as it were with ſmall harmeleſſe prickles, red both within and without when they be ripe, and cleaue in ſunder of themſelues: in the Apple lieth great broad flat ſeeds, like thoſe of Pompion or Citrull, but ſomething blacke when they be withered. The root is threddie, and diſperſeth it ſelfe far abroad in the ground.

2 The female Balm Apple doth not a little differ from the former: it bringeth forth ſtalks not running or climing like the other, but a moſt thicke and fat truncke or ſtocke full of iuice, in ſubſtance like the ſtalks of Purſlane, of a reddiſh color and ſomewhat ſhining. The leaues be long and narrow, in ſhape like thoſe of Willow or the Peach tree, ſomewhat toothed or notched about the edges: among which grow the floures of an incarnate colour tending to blewneſſe, hauing a ſmall ſpur or taile annexed thereto as hath the Larks heele, of a faire light crimſon colour: in their places come vp the fruit or Apples rough and hairy, but leſſer than thoſe of the former, yellow when they be ripe, which likewiſe cleaue aſunder of themſelues, and caſt abroad their ſeedes much like vnto Lentils, ſaith mine Author. But thoſe which I haue from yeare to yeare in my Garden bring forth ſeed like the Cole-florey or Muſtard ſeed; whether they be of two kindes, or the climate doe alter the ſhape, it reſteth diſputable.

¶ *The Place.*

Theſe plants do proſper beſt in hot Regions: they are ſtrangers in England, and doe with great labour and induſtrie grow in theſe cold Countries.

¶ *The Time.*

They muſt be ſowne in the beginning of Aprill in a bed of hot horſe dung, euen as Muske-Melons, Cucumbers, and ſuch like cold fruits are; and replanted abroad from the ſaid bed into the moſt hot and fertile place of the Garden at ſuch time as they haue gotten three leaues a peece.

¶ *The Names.*

Diuerſly hath this plant been named; ſome calling it by one name, and ſome by another, euery one as it ſeemed good to his fancie. *Baptiſta Sardus* calleth it *Balſamina Cucumerina*: others, *Viticella*, and *Charantia*, as alſo *Pomum Hieroſolymitanum*, or Apples of Hieruſalem: in Engliſh, Balme Apple: in Italian, *Caranza*: in the Germane tongue, **Balſam opffel**: in French, *Meruelle*: ſome of the Latines haue called it *Pomum mirabile*, or maruellous Apples. It is thought to be named *Balſamina*, becauſe the oile wherein the ripe Apples be ſteeped or infuſed, is taken to bee profitable for many things, as is *Opobalſamum*, or the liquour of the plant *Balſamum*.

The female Balſam Apple is likewiſe called *Balſamina*, and oftentimes in the Neuter Gender *Balſaminum*: *Geſner* chooſeth rather to name it *Balſamina amygdaloides*: *Valerius Cordus*, *Balſamella*: others, *Balſamina fœmina*: in Engliſh, the Female Balme Apples.

¶ *The Nature.*

The fruit or apples hereof, as alſo the leaues, doe notably drie, hauing withall a certaine moderate coldneſſe very neere to a meane temperature, that is after ſome hot, in the firſt, and drie in the ſecond degree.

¶ *The Vertues.*

The leaues are reported to heale greene wounds if they be bruiſed and laid thereon; and taken with wine they are ſaid to be a remedie for the collicke; and an effectuall medicine for burſtings and convulſions or crampes. A

The leaues of the male *Balſamina* dried in the ſhadow, and beaten into pouder and giuen in wine vnto thoſe that are mortally wounded in the body, doth cure them inwardly, and helpeth alſo the Collicke. B

The oile which is drawne forth of the fruit doth cure all greene and freſh wounds as the true naturall Balſam: it helpeth the crampes and convulſions, and the ſhrinking of ſinewes, being annointed therewith. C

It profiteth women that are in great extremitie of childe-birth in taking away the paine of the matrix, cauſing eaſie deliuerance beeing applied to the place, and annointed vpon their bellies, or caſt into the matrix with a ſyring, and eaſeth the dolour of the inward parts. D

It cureth the Hemorrhoides and all other paines of the fundament, being thereto applied with lint of old clouts. E

The leaues drunken in wine, heale ruptures. F

I finde little or nothing written of the property or vertues of the female kinde, but that it is thought to draw neere vnto the firſt in temperament and vertue. G

Oile oliue in which the fruit (the ſeede taken forth) is either ſet in the Sun, as we dowhen wee make oile of roſes, or boiled in a double glaſſe ſet in hot water, or elſe buried in hot horſe dung, taketh away inflammations that are in wounds. It doth alſo eaſily and in ſhort time conſolidate or glew them together, and perfectly cure them. H

It cureth the vlcers of the dugs or paps, the head of the yard or matrix, as alſo the inflammation thereof being iniected or conueied into the place with a ſyringe or mother peſſarie. I

This apple is with good ſucceſſe applied vnto wounds, prickes and hurts of the ſinewes. It hath great force to cure ſcaldings and burnings: it taketh away ſcarres and blemiſhes, if in the meane time the pouder of the leaues be taken for certaine daies together. K

It is reported that ſuch as be barren are made fruitfull herewith, if the woman firſt be bathed in a fit and conuenient bath for the purpoſe, & the parts about the ſhare and matrix annointed herewith, and the woman preſently haue the company of her husband. L

CHAP.

Chap. 71. *Of Ginnie or Indian Pepper.*

1 *Capſicum longioribus ſiliquis.*
Long codded Ginnie Pepper.

‡ 2 *Capſicum rotundioribus ſiliquis.*
Round codded Ginnie Pepper.

3 *Capſicum minimis ſiliquis.*
Small codded Ginnie Pepper.

‡ *Capſici ſiliquæ variæ.*
Varieties of the cods of Ginnie Pepper.

¶ The

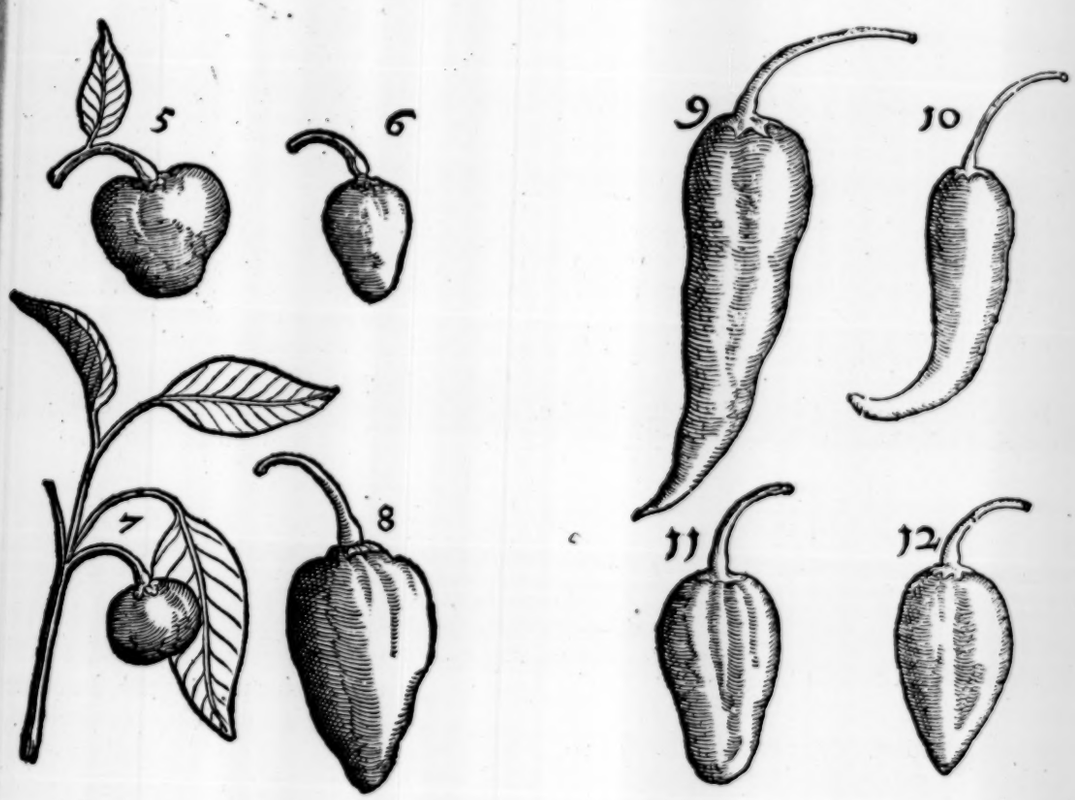
¶ *The Deſcription.*

1 THe firſt of theſe plants hath ſquare ſtalkes a foot high or ſomewhat more, ſet with many thicke and fat leaues, not vnlike to thoſe of garden Nightſhade, but narrower and ſharper pointed, of a darke greene colour. The floures grow alongſt the ſtalkes, out of the wings of the leaues, of a white colour, hauing for the moſt part fiue ſmall leaues blaſing out like a ſtar, with a greene button in the middle. After them grow the cods, greene at the firſt, and when they be ripe of a braue colour glittering like red corall, in which is contained little flat ſeeds of a light yellow colour, of a hot biting taſte like common pepper, as is alſo the cod it ſelfe: which is long, and as big as a finger, and ſharpe pointed.

‡ 2 The difference that is betweene this and the laſt deſcribed is ſmall, for it conſiſts in nothing but that the cods are pretty large and round, after the faſhion of cherries, and not ſo long as thoſe of the former. ‡

3 The third kinde of Ginnie pepper is like vnto the precedent in leaues, floures, and ſtalkes. The cods hereof are ſmall, round, and red, very like to the berries of *Dulcamara* or wooddy Nightſhade, both in bigneſſe, colour, and ſubſtance, wherein conſiſteth the difference: notwithſtanding the ſeed and cods are very ſharpe and biting, as thoſe of the firſt kinde.

‡ *Capſici ſiliquæ variæ.*
Varieties of the cods of Ginnie pepper.



‡ There are many other varieties of Ginnie pepper, which chiefly conſiſt in the ſhape and colour of the cods: wherefore I thought good (and that chiefely becauſe it is a plant that will hardly brooke our climate) only to preſent you with the figures of their ſeuerall ſhapes, whereof the cods of ſome ſtand or grow vpright, and other ſome hang downe: ſuch as deſire further information of this plant, may be aboundantly ſatisfied in *Cluſius* his *Curæ poſter.* from *pag.* 95. to *pag.* 108. where they ſhall finde theſe treated of at large in a treatiſe written in Italian by *Gregory de Regio*, a Capuchine Fryer, and ſent to *Cluſius*, who tranſlating it into Latine, left it to be ſet forth with other his obſeruations, whith was performed 2. yeares after his death, to wit *Anno Domini* 1611. The figures we here giue are the ſame which are in that tractate. ‡

¶ *The Place.*

Theſe plants are brought from forrein countries, as Ginnie, India, and thoſe parts, into Spaine

and Italy: from whence we haue receiued ſeed for our Engliſh gardens, where they come to fruit-bearing: but the cod doth not come to that bright red colour which naturally it is poſſeſſed with, which hath happened by reaſon of theſe vnkindly yeeres that are paſt: but we expect better when God ſhall ſend vs a hot and temperate yeere.

¶ *The Time.*

The ſeeds hereof muſt be ſowen in a bed of hot horſe-dung, as muske-Melons are, and remoued into a pot when they haue gotten three or foure leaues, that it may the more conueniently be caried from place to place to receiue the heate of the ſunne: and are toward Autumne to be caried into ſome houſe, to auoide the iniurie of the cold nights of that time of the yeere, when it is to beare his fruite.

¶ *The Names.*

Actuarius calleth it in Greeke κυκλάμινος: in Latine, *Capſicum*: and it is thought to be that which *Auicen* nameth *Zinziber caninum*, or dogs Ginger: and *Pliny*, *Siliquaſtrum*, which is more like in taſte to pepper than is *Panax*, and it is therefore called *Piperitis*, as he hath written in his 19. booke, 12. chap. *Panax* (ſaith he) hath the taſt of pepper and *Siliquaſtrum*, for which cauſe it is called *Piperitis*. The later Herbariſts do oftentimes call it *Piper Indianum*, or *Indicum*, ſometimes *Piper Calicuthium*, or *Piper Hiſpanicum*: in Engliſh it is called Ginnie pepper, and Indian pepper: in the Germane tongue, **Indianiſcher Pfeffer**: in low Dutch, **Bzeſilie Peper**: in French, *Poiure d' Inde*, verie well knowne in the ſhops at Billingſgate by the name of Ginnie pepper, where it is vſually to be bought.

¶ *The Temperature.*

Ginnie pepper is extreame hot and drie euen in the fourth degree: that is to ſay, far hotter and drier then *Auicen* ſheweth dogs ginger to be.

¶ *The Vertues.*

A Ginnie pepper hath the taſte of pepper, but not the power or vertue, notwithſtanding in Spaine and ſundrie parts of the Indies they do vſe to dreſſe their meate therewith, as we doe with Calecute pepper: but (ſaith my Authour) it hath in it a malicious qualitie, whereby it is an enemy to the liuer and other of the entrails. *Auicen* writeth that it killeth dogs.

B It is ſaid to die or colour like Saffron; and being receiued in ſuch ſort as Saffron is vſually taken, it warmeth the ſtomacke, and helpeth greatly the digeſtion of meates.

C It diſſolueth the ſwellings about the throat called the Kings Euill, as kernels and cold ſwellings; and taketh away ſpots and lentiles from the face, being applied thereto with honie.

Chap. 72. *Of horned Poppie.*

¶ *The Deſcription.*

1 THe yellow horned Poppie hath whitiſh leaues very much cut or jagged, ſomewhat like the leaues of garden Poppie, but rougher and more hairie. The ſtalks be long, round, and brittle. The floures be large and yellow, conſiſting of foure leaues; which being paſt, there come long huskes or cods, crooked like an horne or cornet, wherein is conteined ſmall blacke ſeede. The roote is great, thicke, ſcalie, and rough, continuing long.

2 The ſecond kinde of horned Poppie is much ſlenderer and leſſer than the precedent, and hath leaues with like deepe cuts as Rocket hath, and ſomething hairie. The ſtalks be very ſlender, brittle, and branched into diuers armes or wings; the floures ſmall, made of foure little leaues, of a red colour, with a ſmall ſtrake of blacke toward the bottome; after which commeth the ſeed, incloſed in ſlender, long, crooked cods full of blackiſh ſeed. The root is ſmall and ſingle, and dieth euery yeere.

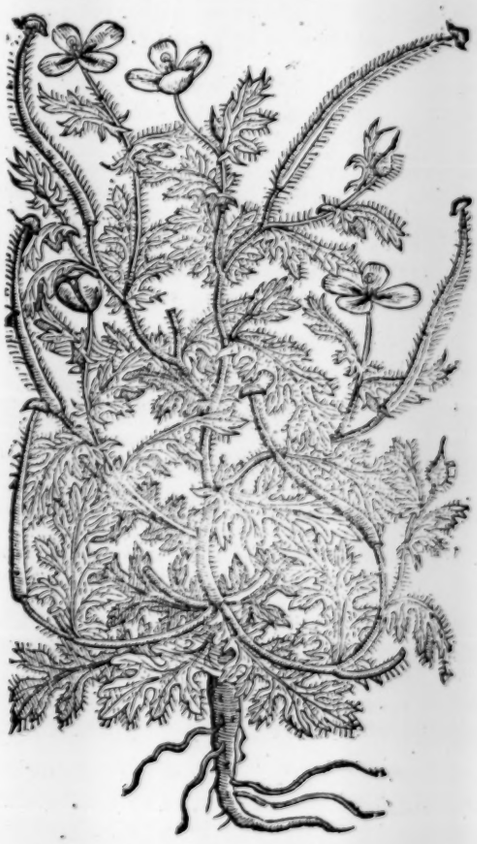
‡ 3 This is much like the laſt deſcribed, and according to *Cluſius*, rather a variety than difference. It is diſtinguiſhed from the laſt mentioned by the ſmoothnes of the leaues, and the colour of the floures, which are of a pale yellowiſh red, both which accidents *Cluſius* affirmes happen to the former, towards the later end of ſommer. ‡

4 There is another ſort of horned Poppie altogether leſſer than the laſt deſcribed, hauing tenderer leaues, cut into fine little parcels: the floure is likewiſe leſſer, of a blew purple colour like the double Violets

¶ *The*

1 *Papauer cornutum flore luteo.*
Yellow horned Poppie.

2 *Papauer cornutum flore rubro.*
Red horned Poppie.



‡ 3 *Papauer corniculatum phœniceum glabrum.*
Red horned Poppie with ſmooth leaues.

4 *Papauer cornutum flore violaceo.*
Violet coloured horned Poppie.

¶ *The Place.*

The yellow horned Poppie groweth vpon the ſands and banks of the ſea: I haue found it growing neere vnto Rie in Kent, in the Iles of Shepey and Thanet, at Lee in Eſſex, at Harwich, at Whiteſtable, and many other places alongſt the Engliſh coaſt.

The ſecond groweth not wilde in England. *Angelus Palea*, and *Bartholomæus ab Vrbe-veterum*, who haue commented vpon *Meſue*, write that they found this red horned Poppie in the kingdomes of Arragon and Caſtile in Spaine, and the fields neere vnto common paths. They doe grow in my Garden very plentifully.

¶ *The Time.*

They floure from May to the end of Auguſt.

¶ *The Names.*

Moſt Writers haue taken horned Poppie, eſpecially that with red floures to be *Glaucium*: neither is this their opinion altogether vnprobable; for as *Dioſcorides* ſaith, *Glaucium* hath leaues like thoſe of horned Poppey, but λασιώτερα, that is to ſay fatter, χαμαίζηλα, low, or lying on the ground, of a ſtrong ſmell and of a bitter taſte; the iuice alſo is much like in colour to Saffron. Now *Lobel* and *Pena* witneſſe, that this horned Poppie hath the ſame kinde of iuice, as my ſelfe likewiſe can teſtifie. *Dioſcorides* ſaith that *Glaucium* groweth about Hierapolis, a citie in Syria; but what hinedereth that it ſhould not bee found alſo ſomewhere elſe? Theſe things ſhew it hath a great affinity with *Glaucium*, if it be not the true and legitimate *Glaucium* of *Dioſcorides*. Howbeit the firſt is the *Mecon Ceratites*, or *Papauer cornuculatum* of the Antients, by the common conſent of all late Writers: in Engliſh, Sea Poppie, and Horned Poppie: in Dutch, **Geelheul** and **Hozne Heule**: in the Germane Tongue, **Gelbomag**: in French, *Pauot Cornu*: in Spaniſh, *Dormidera marina*.

¶ *The Nature.*

Horned Poppies are hot and drie in the third degree.

¶ *The Vertues.*

A The root of horned Poppie boiled in water vnto the conſumption of the one halfe, and drunke, prouoketh vrine, and openeth the ſtopping of the liuer.

B The ſeed taken in the quantitie of a ſpoonefull looſeth the belly gently.

C The iuice mixed with meale and honie, mundifieth old rotten and filthie vlcers.

D The leaues and floures put into vnguents or ſalues appropriate for greene wounds, digeſt them that is, bring them to white matter, with perfect quitture or ſanies.

† The figure that formerly was in the fourth place of this chapter vnder the title of *Papauer cornutum luteum minus*, was of a Bindeweed called by *Cluſius*, *Conuolulus fol. Althea*. You ſhall finde it hereafter in the due place. The Deſcription as far as I can iudge was of the *Cuminum corniculatum* which was pag. 909.

Chap. 73. *Of Garden Poppies.*

¶ *The Deſcription.*

1 The leaues of white Poppie are long, broad, ſmooth, longer than the leaues of Lettuce, whiter, and cut in the edges: the ſtem or ſtalke is ſtraight and brittle, oftentimes a yard and a halfe high: on the top whereof grow white floures, in which at the very beginning appeareth a ſmall head, accompanied with a number of threds or chiues, which being full growne is round, and yet ſomething long withall, and hath a couer or crownet vpon the top; it is with many filmes or thin skins diuided into coffers or ſeuerall partitions, in which is contained abundance of ſmall round and whitiſh ſeed. The root groweth deepe, and is of no eſtimation nor continuance.

2 Like vnto this is the blacke garden Poppie, ſauing that the floures are not ſo white and ſhining, but vſually red, or at leaſt ſpotted or ſtraked with ſome lines of purple. The leaues are greater, more iagged, and ſharper pointed. The ſeed is likewiſe blacker, which maketh the difference.

‡ 3 There is alſo another garden Poppie whoſe leaues are much more ſinuated, or creſted, and the floure alſo is all iagged or finely cut about the edges, and of this ſort there is alſo both blacke and white. The floures of the blacke are red, and the ſeed blacke; and the other hath both the floures and ſeed white.

4 There are diuers varieties of double Poppies of both theſe kindes, and their colours are commonly either white, red, darke purple, ſcarlet, or mixt of ſome of theſe. They differ from the former onely in the doubleneſſe of their floures.

1 *Papauer ſatiuum album.*
White garden Poppie.

2 *Papauer ſatiuum nigrum.*
Blacke Garden Poppie.

‡ 3 *Papauer fimbriatum album.*
White iagged Poppie.

4 *Papauer flo. multipl. albo & nigro.*
The double white and blacke Poppie.

5 There is alſo another kinde of Poppie which oft times is found wilde; the ſtalkes, leaues floures, and heads are like, but leſſe than thoſe of the precedent: the floures are of an euerworn blewiſh purple color; after which follow heads ſhort and round, which vnder their couer or crownet haue little holes by which the ſeed may fall out; contrarie to the heads of the former, which are cloſe and open not of themſelues. There is alſo a double one of this kinde. ‡

¶ *The Place.*

Theſe kinde of Poppies are ſowne in gardens, & do afterward come of the fallings of their ſeed.

¶ *The Time.*

They floure moſt commonly in Iune. The ſeed is perfected in Iuly and Auguſt.

5 *Papauer ſylueſtre.*
Wilde Poppie.

¶ *The Names.*

Poppie is called of the Græcians μήκων: of the Latines, *Papauer*: the ſhops keepe the Latine name: it is called in high Dutch, **Magſamen:** in low Dutch **Yuel** and **Mancop:** in Engliſh, Poppie & Cheeſebowis: in French, *Pauot*, and *Oliette*, by the Wallons.

The garden Poppie which hath blacke ſeeds, is ſurnamed of *Dioſcorides* ἥμερος, or wilde, and is as hee ſaith called ὠμὴ, becauſe *Opium* flowes from it: of *Pliny* and of the Latines, *Papauer nigrum*. whereof there be many variable colours, and of great beautie, although of euill ſmell, whereupon our gentlewomen doe call it Ione Siluer pin.

¶ *The Temperature.*

All the Poppies are cold, as *Galen* teſtifieth in his booke of the Faculties of ſimple medicines.

¶ *The Vertues.*

A This ſeed, as *Galen* ſaith in his booke of the Faculties of nouriſhments, is good to ſeaſon bread with; but the white is better than the blacke. He alſo addeth, that the ſame is cold and cauſeth ſleepe, and yeeldeth no commendable nouriſhment to the body; it is often vſed in comfits, ſerued at the table with other iunketting diſhes.

B The oile which is preſſed out of it is pleaſant and delightfull to be eaten, and is taken with bread or any other waies in meat, without any ſence of cooling.

C A greater force is in the knobs or heads, which doe ſpecially preuaile to moue ſleepe, and to ſtay and repreſſe diſtillations or rheums, and come neere in force to *Opium*, but more gentle. *Opium*, or the condenſed iuice of Poppie heads is ſtrongeſt of all: *Meconium* (which is the iuice of the heads and leaues) is weaker. Both of them any waies taken either inwardly, or outwardly applied to the head, prouoke ſleepe. *Opium* ſomewhat too plentifully taken doth alſo bring death, as *Plinie* truely writeth.

D It mitigateth all kinde of paines: but it leaueth behinde it oftentimes a miſchiefe worſe than the diſeaſe it ſelfe, and that hard to be cured, as a dead palſie and ſuch like.

E The vſe of it, as *Galen* in his 11. booke of medicines according to the places affected, ſaith, is ſo offenſiue to the firme and ſolide parts of the body, as that they had need afterwards to be reſtored.

F So alſo colliries or eie medicines made with *Opium* haue beene hurtfull to many; inſomuch that they haue weakned the eies and dulled the ſight of thoſe that haue vſed it: whatſoeuer is compounded of *Opium* to mittigate the extreeme paines of the eares bringeth hardneſſe of hearing. Wherefore all thoſe medicines and compounds are to bee ſhunned that are to be made of *Opium*, and are not to be vſed but in extreme neceſſitie; and that it is, when no other mitigater or aſſwager of paine doth any thing preuaile, as *Galen* in his third booke of Medicines, according to the places affected, doth euidently declare.

G The leaues of poppie boiled in water with a little ſugar and drunke, cauſeth ſleep: or if it be boiled without ſugar, and the head, feet, and temples bathed therewith, it doth effect the ſame.

H The heads of Poppie boiled in water with ſugar to a ſirrup cauſeth ſleepe, and is good againſt rheumes and catarrhes that diſtill & fal downe from the brain into the lungs, & eaſeth the cough.

I The greene knops of Poppie ſtamped with barley meale, and a little barrowes greaſe, helpeth S. Anthonies fire, called *Ignis ſacer*.

The

The leaues, knops and ſeed ſtamped with vineger, womans milke, and ſaffron, cureth an *Eryſipelas*, (another kinde of S. Anthonies fire, and eaſeth the gout mightily, and put in the fundament as a cliſter cauſeth ſleepe. K

The ſeed of black Poppy drunke in wine ſtoppeth the flux of the belly, and the ouermuch flowing of womens ſickneſſe. L

A Caudle made of the ſeeds of white poppy, or made into Almond milk, and ſo giuen cauſeth ſleepe. M

† It is manifeſt that this wilde Poppy (which I haue deſcribed in the fifth place) is that of which the compoſition *Diacodium* is to be made; as *Galen* hath at large treated in his ſeuenth booke of Medicines, according to the places affected. *Crito* alſo, and after him *Themiſon* and *Democrates* do appoint ἄγριον, or the wilde Poppy, to be in the ſame compoſition; and euen that ſame *Democritus* addeth, that it ſhould be that which is not ſowen: and ſuch an one is this, which groweth without ſowing. *Dod.* N

CHAP. 74. *Of Corne-Roſe, or wilde Poppy.*

1 *Papauer Rhœas.*
Red Poppy, or Corne-roſe.

‡ 4 *Papauer ſpinoſum.*
Prickly Poppy.

¶ *The Deſcription.*

1 THe ſtalkes of red Poppy be blacke, tender, and brittle, ſomewhat hairy: the leaues are cut round about with deepe gaſhes like thoſe of Succory or wilde Rocket: the floures grow forth at the tops of the ſtalks, being of a beautifull and gallant red colour, with blackiſh threds compaſſing about the middle part of the head: which being fully growne, is leſſer than that of the garden Poppy: the ſeed is ſmall and blacke.

† 2 There is alſo a kinde hereof in all points agreeing with the former, ſauing that the floures of this are very double and beautifull, and therein only conſiſts the difference. †

‡ 3 There

‡ 3 There is a ſmall kinde of red Poppy growing commonly wilde together with the firſt deſcribed, which is leſſer in all parts, and the floures are of a fainter or ouerworne red, inclining ſomewhat to orange.

‡ 4 Beſides theſe there is another rare plant, which all men, and that very fitly, haue referred to the kindes of Poppy. This hath a ſlender long and fibrous root, from which ariſes a ſtalke ſome cubit high, diuided into ſundry branches, round, creſted, prickly, and full of a white pith. The leaues are diuided after the maner of horned poppy, ſmooth, with white veins & prickly edges: the floure is yellow, and conſiſts of foure or fiue leaues; after which ſucceeds a longiſh head, being either foure, fiue, or ſix cornered, hauing many yellow threds incompaſſing it: the head whileſt it is tender is reddiſh at the top, but being ripe it is blacke, and it is ſet with many and ſtiffe pricks. The ſeed is round, blacke, and pointed, being ſix times as big as that of the ordinary Poppy. ‡

¶ *The Place.*

They grow in earable grounds, among wheat, ſpelt, rie, barley, otes, and other graine, and in the borders of fields. ‡ The double red, and prickly Poppy are not to be found in this kingdome, vnleſſe in the gardens of ſome prime herbariſts. ‡

¶ *The Time.*

The fields are garniſhed and ouerſpred with theſe wilde poppies in Iune and Auguſt.

¶ *The Names.*

† Wilde Poppy is called in Greeke of *Dioſcorides*, μήκων ἄγρια: in Latine, *Papauer erraticum*: *Gaza* according to the Greeke nameth it *Papauer fluidum*: as alſo *Lobel*, who cals it *Pap. Rhœas*, becauſe the floure thereof ſoone falleth away. Which name *Rhœas* may for the ſame cauſe be common, not onely to theſe, but alſo to the others, if it be ſo called of the ſpeedy falling of the floures: but if it be ſyrnamed *Rhœas* of the falling away of the ſeed (as it appeareth) then ſhall it be proper to that which is deſcribed in the fifth place in the foregoing chapter, out of whoſe heads the ſeed eaſily and quickly falls; as it doth alſo out of this, yet leſſe manifeſtly. They name it in French *Coquelicot*, *Confanons*, *Pauot ſauuage*: in Dutch, **Collen bloemen**, **Cozen roſen**: in high Dutch, **Klapper Roſſen**: in Engliſh, Red Poppy, and Corne-roſe.

‡ 4 Some haue called this *Ficus infernalis*, from the Italian name *Figo del inferno*. But *Cluſius* and *Bauhine* haue termed it *Papauer ſpinoſum*: and the later of them would haue it (and that not without good reaſon) to be *Glaucium* of *Dioſcorides*, *lib.* 3. *cap.* 100. And I alſo probably coniecture it to be the *Hippomanes* of *Cratenas*, mentioned by the Greeke Scholiaſt of *Theocritus*, as I haue formerly briefely declared *Chap.* 62. ‡

¶ *The Nature.*

The facultie of the wilde poppies is like to that of the other poppies; that is to ſay cold, and cauſing ſleepe.

¶ *The Vertues.*

A Moſt men being led rather by falſe experiments than reaſon, commend the floures againſt the Pleuriſie, giuing to drinke as ſoone as the paine commeth, either the diſtilled water, or ſyrrup made by often infuſing the leaues. And yet many times it happeneth that the paine ceaſeth by that meanes, though hardly ſometimes, by reaſon that the ſpittle commeth vp hardly, and with more difficultie, eſpecially in thoſe that are weake, and haue not a ſtrong conſtitution of body. *Baptiſta Sardus* might be counted the Author of this error; who hath written, That moſt men haue giuen the floures of this poppy againſt the paine of the ſides, and that it is good againſt the ſpitting of bloud.

Chap. 75. *Of Baſtard wilde Poppy.*

¶ *The Deſcription.*

THe firſt of theſe baſtard wilde Poppies hath ſlender weake ſtemmes a foot high, rough and hairy, ſet with leaues not vnlike to thoſe of Rocket, made of many ſmall leaues deeply cut or iagged about the edges. The floures grow at the top of the ſtalkes, of a red colour, with ſome ſmall blackneſſe toward the bottome. The ſeed is ſmall, contained in little round knobs. The ſeed is ſmall and threddy.

2 The ſecond is like the firſt, ſauing that the cods hereof be long, and the other more round, wherein the difference doth conſiſt.

¶ *The Place.*

Theſe plants do grow in the corne fields in Somerſetſhire, and by the hedges and high-wayes, as ye trauell from London to Bathe. *Lobel* found it growing in the next field vnto a village in Kent

called

called Southfleet, my ſelfe being in his company, of purpoſe to diſcouer ſome ſtrange plants not hitherto written of.

‡ Mr. *Robert Lorkin* and I found both theſe growing in Chelſey fields, as alſo in thoſe belonging to Hamerſmith: but the ſhorter headed one is a floure of a more elegant colour, and not ſo plentifull as the other. ‡

1 *Argemone capitulo torulo.*
Baſtard wilde Poppy.

2 *Argemone capitulo longiore.*
Long codded wilde Poppy.

¶ *The Time.*

They floure in the beginning of Auguſt, and their ſeed is ripe at the end thereof.

¶ *The Names.*

The baſtard wilde Poppy is called in Greeke Ἀργεμώνη: in Latine, *Argemone*, *Argemonia*, *Concordia*, *Concordalis*, and *Herba liburnica*: of ſome, *Pergalium*, *Arſela*, and *Sacrocolla Herba*: in Engliſh, Windroſe, and baſtard wilde poppy.

¶ *The Temperature.*

They are hot and dry in the third degree.

¶ *The Vertues.*

The leaues ſtamped, and the iuyce dropped into the eyes eaſeth the inflammation thereof; and cureth the diſeaſe of the eye called *Argema*, whereof it tooke his name: which diſeaſe when it happeneth on the blacke of the eye it appeares white; and contrariwiſe when it is in the white then it appeareth blacke of colour. A

The leaues ſtamped and bound vnto the eyes or face that are blacke or blew by meanes of ſome blow or ſtripe, doth perfectly take it away. The dry herbe ſteeped in warme water worketh the like effect. B

The leaues and roots ſtamped, and the iuyce giuen in drinke, helpeth the wringings or gripings of the belly. The dry herbe infuſed in warme water doth the ſame effectually. C

The herbe ſtamped, cureth any wound, vlcer, canker, or fiſtula, being made vp into an vnguent or ſalue, with oile, wax, and a little turpentine. D

The iuyce taken in the weight of two drammes, with wine, mightily expelleth poyſon or venome. E

The

F The iuyce taketh away warts if they be rubbed therewith; and being taken in meate it helpes the milt or ſpleene if it be waſted.

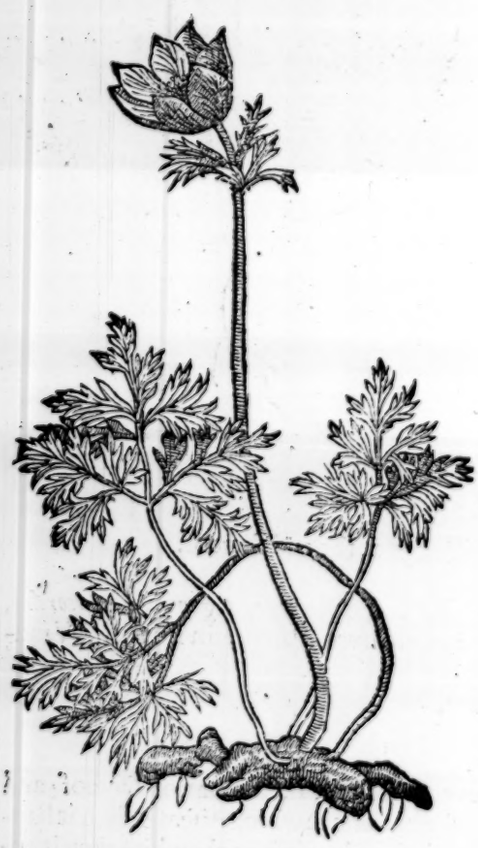
Chap. 76.

Of Winde-floures.

¶ *The Kindes.*

THe ſtocke or kindred of the *Anemones* or Winde-floures, eſpecially in their varieties of colours, are without number, or at the leaſt not ſufficiently knowne vnto any one that hath written of plants. For *Dodonæus* hath ſet forth fiue ſorts; *Lobel* eight; *Tabernamontanus* ten: My ſelfe haue in my garden twelue different ſorts: and yet I do heare of diuers more differing very notably from any of theſe; which I haue briefely touched, though not figured, euery new yeare bringing with it new and ſtrange kindes; and euery countrey his peculiar plants of this ſort, which are ſent vnto vs from far countries, in hope to receiue from vs ſuch as our countrey yeeldeth.

1 *Anemone tuberoſa radice.*
Purple Winde-floure.



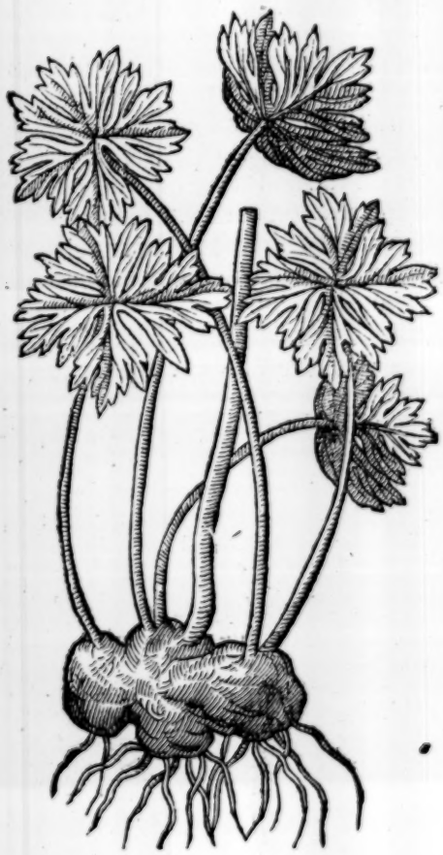
2 *Anemone coccinea multiplex.*
Double Skarlet Winde-floure.

¶ *The Deſcription.*

1 THe firſt kinde of *Anemone* or Winde-floure hath ſmall leaues very much ſnipt or iagged almoſt like vnto Camomile, or Adonis floure: among which riſeth vp a ſtalke bare or naked almoſt vnto the top; at which place is ſet two or three leaues like the other: and at the top of the ſtalke commeth forth a faire and beautifull floure compact of ſeuen leaues, and ſometimes eight, of a violet colour tending to purple. It is impoſſible to deſcribe the colour in his full perfection, conſidering the variable mixtures. The root is tuberous or knobby, and very brittle.

2 The

3 *Anemone maxima Chalcedonica polyanthos.*
The great double Winde-floure of Bithynia.



4 *Anemone Chalcedonica ſimplici flore.*
The ſingle Winde-floure of Bithynia.

5 *Anemone Bulbocaſtani radice.*
Cheſnut Winde-floure.

6 *Anemone*

2 The ſecond kind of *Anemone* hath leaues like to the precedent, inſomuch that it is hard to diſtinguiſh the one from the other but by the floures onely: for thoſe of this plant are of a moſt bright and faire skarlet colour, and as double as the Marigold; and the other not ſo. The root is knobby and very brittle, as is the former.

3 The great *Anemone* hath double floures, vſually called the *Anemone* of Chalcedon (which is a city in Bithynia) and great broad leaues deeply cut in the edges, not vnlike to thoſe of the field Crow-foot, of an ouerworne greene colour: amongſt which riſeth vp a naked bare ſtalke almoſt vnto the top, where there ſtand two or three leaues in ſhape like the others, but leſſer; ſometimes changed into reddiſh ſtripes, confuſedly mixed here and there in the ſaid leaues. On the top of the ſtalke ſtandeth a moſt gallant floure very double, of a perfect red colour, the which is ſometimes ſtriped amongſt the red with a little line or two of yellow in the middle; from which middle commeth forth many blackiſh thrums. The ſeed is not to be found that I could euer obſerue, but is carried away with the winde. The root is thicke and knobby.

4 The fourth agreeth with the firſt kind of *Anemone*, in roots, leaues, ſtalks, and ſhape of floures, differing in that, that this plant bringeth forth faire ſingle red floures, and the other of a violet colour, as aforeſaid.

5 The fifth ſort of *Anemone* hath many ſmall iagged leaues like thoſe of Coriander, proceeding from a knobby root reſembling the root of *Bulbocaſtanum* or earth Cheſnut. The ſtalke riſes vp amongſt the leaues of two hands high, bearing at the top a ſingle floure, conſiſting of a pale or border of little purple leaues, ſomtimes red, and often of a white colour ſet about a blackiſh pointall, thrummed ouer with many ſmall blackiſh haires.

6 *Anemone latifolia Cluſij.*
Broad leaued Winde-floure.

‡ 7 *Anemone latifolia duploſtauo flore.*
The double yellow wind-floure.

6 The ſixt hath very broad leaues in reſpect of all the reſt of the *Anemones*, not vnlike to thoſe of the common Mallow, but greene on the vpper part, and tending to redneſſe vnderneath, like the leaues of Sow-bread. The ſtalke is like that of the laſt deſcribed, on the top whereof growes a faire yellow ſtar-floure, with a head ingirt with yellow thrums. The root (ſaith my Author) is a finger long, thicke and knobby.

‡ 7 There is alſo another whoſe lower leaues reſemble thoſe of the laſt deſcribed, yet thoſe which grow next aboue them are more diuided or cut in: amongſt theſe leaues, riſeth vp a ſtalke ſome

8 *Anemone Geranifolia.*
Storkes bill Winde-floure.

9 *Anemone Matthioli.*
Matthiolus white Winde-floure.

10 *Anemone trifolia.*
Three leaued Winde-floure.

11 *Anemone Papaueracea.*
Poppy Winde-floure.

ſome foot high, the top whereof is adorned with a floure conſiſting of two ranks of leaues, whereof thoſe on the outſide are larger, rounder pointed, and ſometimes ſnipt in a little; the reſt are narrower and ſharper pointed: the colour of theſe leaues is yellow, deeper on the inſide, and on the outſide there are ſome ſmall purple veines running alongſt theſe leaues of the floure. The root is ſome two inches long, the thickeneſſe of ones little finger, with ſome tuberous knobs hanging thereat ‡

8 The eighth hath many large leaues deeply cut or iagged, in ſhape like thoſe of the Storks bil or Pinke-needle; among which riſeth vp a naked ſtalke, ſet about toward the top with the like leaues, but ſmaller and more finely cut, bearing at the top of the ſtalke a ſingle floure conſiſting of many ſmall blew leaues, which do change ſometimes into purple, and oftentimes into white, ſet about a blackiſh pointall, with ſome ſmall threds like vnto a pale or border. The root is thick and knobby.

9 The ninth ſort of Anemone hath leaues like vnto the garden Crow-foot: the ſtalke riſeth vp from amongſt the leaues, of a foot high, bearing at the top faire white floures made of fiue ſmall leaues; in the middle whereof are many little yellow chiues or threds. The root is made of many ſlender threds or ſtrings, contrarie to all the reſt of the Winde-floures.

10 The tenth ſort of Anemone hath many leaues like vnto the common medow Trefoile, ſleightly ſnipt about the edges like a ſaw: on the top of the ſlender ſtalkes ſtandeth a ſingle white floure tending to purple, conſiſting of eight ſmall leaues, reſembling in ſhape the floures of common field Crow-foot. The root is knobby, with certaine ſtrings faſtned thereto.

11 The eleuenth kinde of Anemone hath many iagged leaues cut euen to the middle rib, reſembling the leaues of *Geranium Columbinum*, or Doues foot. The leaues that do embrace the tender weake ſtalkes are flat and ſleightly cut: the floures grow at the top of the ſtalkes, of a bright ſhining purple colour, ſet about a blackiſh pointall, with ſmall thrums or chiues like a pale. The root is knobby, thicke, and very brittle, as are moſt of thoſe of the Anemones.

¶ *The Place.*

All the ſorts of Anemones are ſtrangers, and not found growing wilde in England; notwithſtanding all and euery ſort of them do grow in my garden very plentifully.

¶ *The Time.*

They do floure from the beginning of Ianuarie to the end of Aprill, at what time the floures do fade, and the ſeed flieth away with the winde, if there be any ſeed at all; the which I could neuer as yet obſerue.

¶ *The Names.*

Anemone, or Winde floure is ſo called, ἀπὸ τοῦ ἀνέμου; that is to ſay, of the winde; for the floure doth neuer open it ſelfe but when the winde doth blow, as *Pliny* writeth: whereupon alſo it is named of diuers *Herba venti*: in Engliſh, Winde-floure.

Thoſe with double floures are called in the Turky tongue *Giul*, and *Gul Catamer*: and thoſe with ſmall iagged leaues and double floures are called *Lalé benzede*, and *Galipoli lalé*. They do call thoſe with ſmall iagged leaues and ſingle floures *Biniſate & binizade*, and *Biniſante*.

¶ *The Temperature.*

All the kindes of Anemones are ſharpe, biting the tongue, and of a binding qualitie.

¶ *The Vertues.*

A The leaues ſtamped, and the iuyce ſniffed vp into the noſe purgeth the head mightily.

B The root champed or chewed procureth ſpitting, and cauſeth water and flegme to run forth out of the mouth, as Pellitorie of Spaine doth.

C It profiteth in collyries for the eyes, to ceaſe the inflammation thereof.

D The iuyce mundifieth and cleanſeth maligne, virulent, and corroſiue vlcers.

E The leaues and ſtalkes boyled and eaten of Nurſes cauſe them to haue much milke: it prouoketh the termes, and eaſeth the leproſie, being bathed therewith.

‡ Chap. 77. *Of diuers other Anemones, or Winde-floures.*

¶ *The Kindes.*

‡ THeſe floures which are in ſuch eſteeme for their beauty may well be diuided into two ſorts, that is, the *Latifolia*, or broad leaued, and the *Tenuifolia*, or narrow leaued: now of each of theſe ſorts there are infinite varieties, which conſiſt in the ſingleneſſe and doubleneſſe of the floures, and in their diuerſitie of colours; which would aske a large diſcourſe to handle exactly. Wherefore I onely intend (beſides thoſe ſet downe by our Authour) to giue you the figures

figures of ſome few others, with their deſcription, briefly taken out of the Workes of the learned and diligent Herbariſt *Carolus Cluſius*; where ſuch as deſire further diſcourſe vpon this ſubiect may be aboundantly ſatisfied: and ſuch as do not vnderſtand Latine may finde as large ſatisfaction in the late Worke of Mr. *Iohn Parkinſon*; whereas they ſhall not onely haue their hiſtorie at large, but alſo learne the way to raiſe them of ſeed, which hath been a thing not long knowne (except to ſome few;) and thence hath riſen this great varietie of theſe floures, wherewith ſome gardens ſo much abound.

¶ *The Deſcription.*

1 THe root of this is like to that of the great double red *Anemone* deſcribed in the third place of the precedent chapter; and the leaues alſo are like, but leſſer and deeper coloured. The ſtalke growes ſome foot high, ſlender and greene, at the top whereof groweth a ſingle floure, conſiſting of eight leaues of a bright ſhining skarlet colour on the inſide, with a paler coloured ring incompaſſing a hairy head ſet about with purple thrums: the outſide of the floure is hairy or downie. This is *Anem. latifol. ſimpl. flo.* 16. of *Cluſius*.

‡ 1 *Anemone latifolia flore coccineo.*
The broad leaued skarlet Anemone.

‡ 2 *Anemone latifolia flore magno coccineo.*
The skarlet Anemone with the large floure.

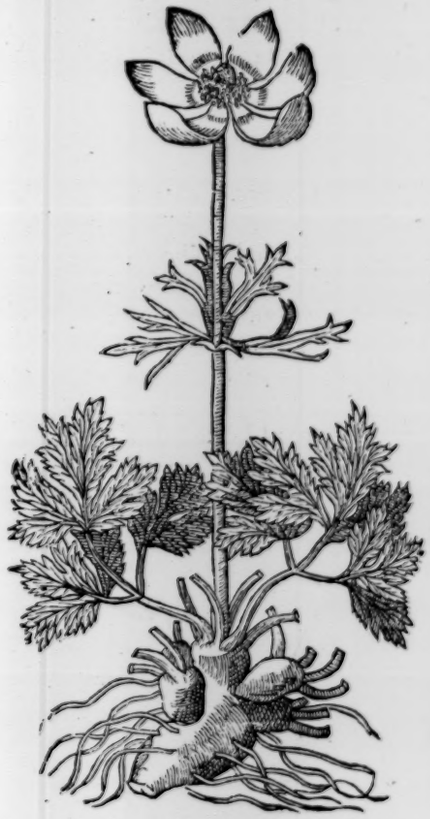
2 This in ſhape of roots & leaues is like the former, but the leaues are blacker, and more ſhining on their vpper ſides: the ſtalke alſo is like to others of this kinde, and at the top carrieth a large floure conſiſting of eight broad leaues, being on the inſide of a bright skarlet colour, without any circle; and the thrums that ingirt the hairy head are of a ſanguine colour. This head (as in others of this kindred) growes larger after the falling of the floure, and at length turnes into a downie ſubſtance, wherein a ſmooth blacke ſeed is incloſed like as in other Anemones; which ſowen as ſoone as it is ripe vſually comes vp before winter. This is *Anem. latifol. ſimpl. flore* 17. of *Cluſius*.

3 This differs not from the former but in floures, which are of an orange-tawny colour, like that of Corne-roſe, or red Poppy; and the bottomes of the leaues of the floures are of a paler colour, which make a ring or circle about the hairy head. This is the eighteenth of *Cluſius*.

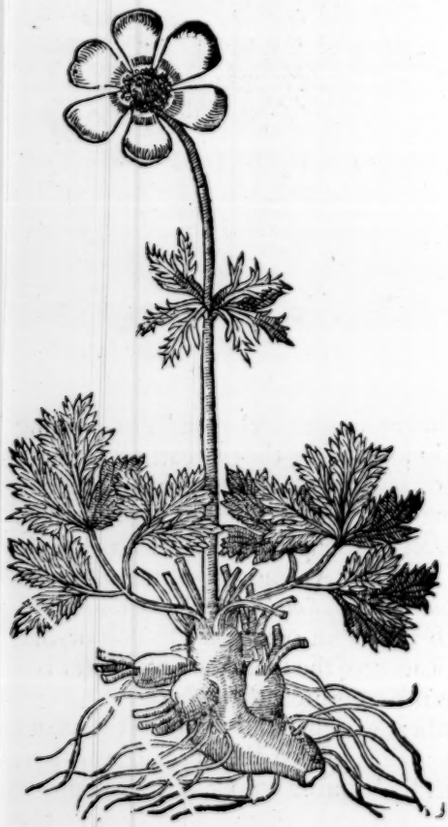
Beſides theſe varieties here mentioned, there are many others, which in the colour of the leaues of the floure, or the nailes which make a circle at the bottome thereof, doe differ each from other. Now let vs come to the narrow leaued ones, which alſo differ little but in colour of their floures.

‡ 3 *Anemone latifolia Byzantina.*
The broad leaued Anemone of Conſtantinople.

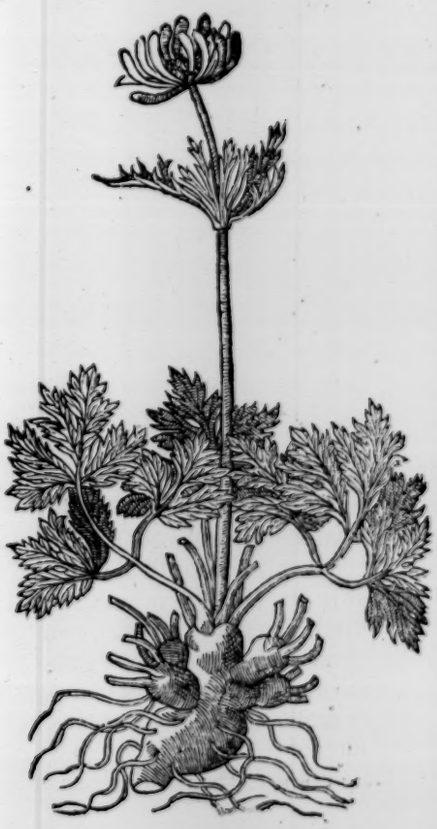
‡ 4 *Anemone tenuifolia flore amplo ſanguineo.*
Small leaued Anemone with the ſanguine floure.



‡ 5 *Anemone tenuifolia flore coccineo.*
The ſmall leaued skarlet Anemone.



‡ 6 *Anemone tenuifol. flo. dilute purpureo.*
The light purple ſmall leaued Anemone.



‡ 7 *Anemone tenuifol. flo. exalbido.*
The whitiſh ſmall leaued Anemone.

‡ 8 *Anemone tenuifolia flo. carneo ſtriato.*
The ſtriped fleſh-coloured Anemone.

‡ 9 *Anemone tenuifol. flo. pleno coccin.*
The ſmall leaued double crimſon Anemone.

‡ 10 *Anemone tenuifol. flo. pleno atropurpuraſcente.*
The double darke purple Anemone.

4 The root of this is knotty and tuberous like thoſe of other Anemones, and the leaues are much diuided and cut in like to thoſe of the firſt deſcribed in the former Chapter: the ſtalke (which hath three or foure leaues ingirting it, as in all other Anemones) at the top ſuſtaineth a faire ſanguine floure conſiſting of ſix large leaues with great white nailes. The ſeeds are contained in downie heads like as thoſe of the former. This is *Anem. tenuifol. ſimpl. flo. 6.* of *Cluſius*.

5 This differs from the former in the floure, which conſiſts of ſix leaues made ſomwhat rounder than thoſe of the precedent: their colour is betweene a skarlet and ſanguine. And there is a varietie hereof alſo of a bricke colour. This is the eighth of *Cluſius*.

6 This differs from the reſt, in that the floure is compoſed of ſome fourteene or more leaues, and theſe of a light purple, or fleſh-colour. This is the ninth of *Cluſius*.

7 The floure of this is large, conſiſting of ſix leaues, being at the firſt of a whitiſh greene, and then tending to a fleſh colour, with their nailes greene on the outſide, and white within, and the threds in the middle of a fleſh colour. There is a leſſer of this kinde, with the floure of a fleſh colour, and white on the outſide, and wholly white within, with the nailes greeniſh. Theſe are the tenth and eleuenth of *Cluſius*.

8 This floure alſo conſiſts of ſix leaues of a fleſh colour, with whitiſh edges on the outſide; the inſide is whitiſh, with fleſh coloured veines running to the middeſt thereof.

Beſides theſe ſingle kindes there are diuers double both of the broad and narrow leaued Anemones, whereof I will only deſcribe and figure two, and refer you to the forementioned Authors for the reſt, which differ from theſe onely in colour.

9 This broad leaued double Anemonie hath roots, ſtalkes, and leaues like thoſe of the ſingle ones of this kinde, and at the top of the ſtalke there ſtands a faire large floure compoſed of two or three rankes of leaues, ſmall and long, being of a kinde of skarlet or orange-tawny colour; the bottomes of theſe leaues make a whitiſh circle, which giues a great beauty to the floure, and the downie head is ingirt with ſanguine threds tipt with blew. This is the *Pano major* 1. of *Cluſius*.

10 This in ſhape of roots, leaues, and ſtalkes reſembles the formerly deſcribed narrow leaued Anemones, but the floure is much different from them; for it conſiſts firſt of diuers broad leaues, which incompaſſe a great number of ſmaller narrow leaues, which together make a very faire and beautifull floure: the outer leaues hereof are red, and the inner leaues of a purple Veluet colour.

Of this kinde there are diuers varieties, as the double white, crimſon, bluſh, purple, blew, carnation, roſe-coloured, &c.

¶ *The Place and Time.*

Theſe are onely to be found in gardens, and bring forth their floures in the Spring.

¶ *Their Names.*

I iudge it no waies pertinent to ſet downe more of the names than is already deliuered in their ſeuerall titles and deſcriptions.

¶ *Their Temper and Vertues.*

A Theſe are of a hot and biting facultie, and not (that I know of) at this day vſed in medicines, vnleſſe in ſome one or two ointments: yet they were of more vſe amongſt the Greeke Phyſitions, who much commend the iuyce of them for taking away the ſcares and ſcales which grow on the eyes; and by them are called ἄλαι, and Λευκώματα.

B *Trallianus* alſo ſaith, That the floures beaten in oyle, and ſo anointed, cauſe haire to grow where it is deficient.

The vertues ſet downe in the former Chapter do alſo belong to theſe here treated of, as theſe here deliuered are alſo proper to them. ‡

Chap. 78. *Of wilde Anemones, or Winde-floures.*

¶ *The Kindes.*

Like as there be many and diuers ſorts of the garden Anemones, ſo are there of the wild kindes alſo, which do vary eſpecially in their floures.

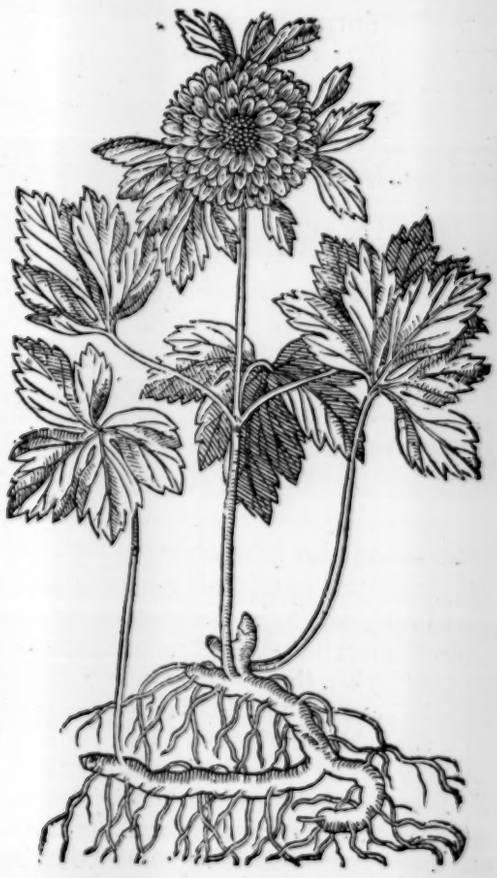
¶ *The*

1 *Anemone nemorum lutea.*
Yellow wilde Winde floure.

2 *Anemone nemorum alba.*
White winde floure.

‡ 3 *Anemone nemorum flo. pleno albo.*
The double white wood Anemone.

‡ 4 *Anemone nemorum flo. pleno purpuraſcente.*
The double purpliſh wood Anemone.



¶ *The deſcription.*

1 THe firſt of theſe wilde *Anemones* hath iagged leaues deepely cut or indented, which do grow vpon the middle part of a weake and tender ſtalke: at the top whereof doth ſtand a prettie yellow floure made of ſix ſmall leaues, and in the middle of the floure there is a little blackiſh pointell, and certaine ſlender chiues or threds. The root is ſmall, ſomewhat knottie and very brittle.

2 The ſecond hath iagged leaues, not vnlike to water Crowfoot or mountaine Crowfoot. The flower groweth at the top of the ſtalke not vnlike to the precedent in ſhape, ſauing that this is of a milke white colour, the root is like the other.

‡ There is alſo of this ſingle kinde two other varieties, the one with a purple floure, which wee may therefore call *Anemone nemorum purpurea*, the wilde purple Winde-floure. And the other with a Scarlet (or rather a Bluſh) coloured floure, which we may terme *Anemone nemorum coccinea*. The wilde Scarlet wind floure. Theſe two differ not in other reſpects from the white wind floure. ‡

3 There is in ſome choice gardens one of this kinde with white floures very double, as is that of the Scarlet *Anemone*, and I had one of them giuen mee by a worſhipfull Merchant of London, called M^r. *Iohn Franqueuille*, my very good friend.

‡ 4 This in roots and ſtalkes is like the laſt deſcribed wood *Anemones*, or winde floures. But this and the laſt mentioned double one haue leaues on two places of their ſtalks, whereas the ſingle ones haue them but in one, and that is about the middle of the ſtalkes. The floure of this double one conſiſts of ſome fortie or more little leaues, whereof the outermoſt are the biggeſt; the bottomes or nailes of theſe leaues are of a deepe purple, but the other parts of a lighter bluſh colour. ‡

¶ *The Place.*

All theſe wilde ſingle *Anemones* grow in moſt woods and copſes through England, except that with the yellow floure, which as yet I haue not ſeene: notwithſtanding I haue one of the greater kindes which beareth yellow floures, whoſe figure is not expreſſed nor yet deſcribed, for that it doth very notably reſemble thoſe with ſingle floures, but is of ſmall moment, either in beautie of the floure, or otherwiſe. ‡ The double ones grow onely in ſome few gardens. ‡

¶ *The Time.*

They floure from the middeſt of Februarie vnto the end of Aprill, or the midſt of May.

¶ *The Names.*

‡ The firſt of theſe by moſt Writers is referred to the *Ranunculi*, or Crowfeet; and *Lobel* cals it fitly *Ranunculus nemoroſus luteus*: only *Dodonæus*, *Cæſalpinus*, and our Authour haue made it an *Anemone*.

2 This with the varieties alſo, by *Tragus*, *Fuchſius*, *Cordus*, *Geſner*, *Lobell*, and others, is made a *Ranunculus*: yet *Dodonæus*, *Cæſalpinus*, and our Authour haue referred it to the *Anemones*. *Cluſius* thinkes this to be *Anemone*, ἀνεμώνη of *Theophraſtus*.

3 *Cluſius* calls this *Anemone Limonia*, or *Ranunculus ſyluarum flo. pleno albo*.

4 And he ſtiles this *Anem. limonia*, or *Ranunc. ſyl. flore pleno purpuraſcente*. ‡

¶ *The Temperature and Vertues.*

The faculties and temperature of theſe plants are referred to the garden ſorts of *Anemones*.

Chap. 79. *Of Baſtard Anemones, or Paſque floures.*

¶ *The Deſcription.*

1 THe firſt of theſe Paſque floures hath many ſmall leaues finely cut or iagged, like thoſe of Carrots: among which riſe vp naked ſtalkes, rough and hairie; whereupon doe grow beautifull floures bell faſhion, of a bright delaied purple colour: in the bottome whereof groweth a tuft of yellow thrums, and in the middle of the thrums it thruſteth forth a ſmall purple pointell: when the whole floure is paſt there ſucceedeth an head or knop compact of many gray hairy lockes, and in the ſolide parts of the knops lieth the ſeed flat and hoarie, euery ſeed hauing his owne ſmall haire hanging at it. The root is thicke and knobby, of a finger long, running right downe, and therefore not like vnto thoſe of the *Anemone*, which it doth in all other parts very notably reſemble, and whereof no doubt this is a kinde.

2 There is no difference at all in the leaues, roots, or ſeedes, betweene this red Paſque floure and the precedent, nor in any other point, but in the colour of the floures: for whereas the other

are

are of a purple colour, theſe are of a bright red, which ſetteth forth the difference.

3 The white Paſſe floures hath many fine iagged leaues, cloſely couched or thruſt together, which reſemble an Holi-water ſprinckle, agreeing with the others in rootes, ſeedes, and ſhape of floures, ſauing that theſe are of a white colour, wherein chiefely conſiſteth the difference.

‡ 4 This alſo in ſhape of roots and leaues little differs from the precedent, but the floures are leſſer, of a darker purple colour, and ſeldome open or ſhew themſelues ſo much abroad as the other of the firſt deſcribed, to which in all other reſpects it is very like.

5 There is alſo another kinde with leaues leſſe diuided, but in other parts like thoſe already deſcribed, ſauing that the floure is of a yellow colour ſomething inclining to a red. ‡

1 *Pulſatilla vulgaris.*
Purple Paſſe floure.

2 *Pulſatilla rubra.*
Red Paſſe floure.

¶ *The Place.*

Ruellius writeth, that the Paſſe floure groweth in France in vntoiled places: in Germanie they grow in rough and ſtonie places, and oftentimes on rockes.

Thoſe with purple floures doe grow verie plentifully in the paſture or cloſe belonging to the parſonage houſe of a ſmall village ſix miles from Cambridge, called Hilderſham: the Parſons name that liued at the impreſſion hereof was M^r. *Fuller*, a very kind and louing man, and willing to ſhew vnto any man the ſaid cloſe, who deſired the ſame.

¶ *The Time.*

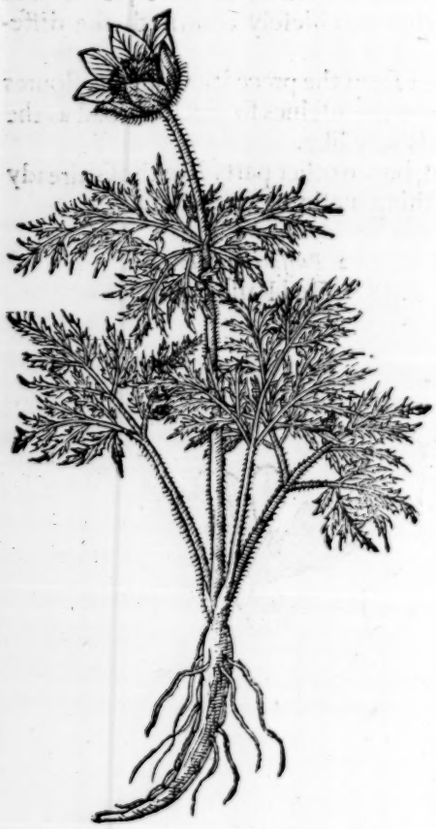
They floure for the moſt part about Eaſter, which hath mooued mee to name it *Paſque Floure*, or Eaſter floure: and often they doe floure againe in September. ‡ The yellow kinde floures in May. ‡

¶ *The Names.*

† Paſſe floure is called commonly in Latine *Pulſatilla*: and of ſome, *Apium riſus, & herba venti. Daleſchampius* would haue it to be *Anemone Limonia* & *Samolus* of *Pliny*: in French, *Coquelourdes*: in Dutch, **Kneckenſchell**: in Engliſh, Paſque floure, or Paſſe floure, and after the Latine name *Pulſatill*, or Flaw floure: in Cambridge-ſhire where they grow, they are named Couentrie bels.

¶ *The*

3 *Pulſatilla flore albo.*
White Paſſe floure.



‡ 4 *Pulſatilla flore minore.*
The leſſer purple Paſſe floure.

¶ *The Temperature.*

Paſſe floure doth extremely bite, and exulcerateth and eateth into the skinne if it be ſtamped and applied to any part of the body; whereupon it hath been taken of ſome to be a kinde of Crowfoot, and not without reaſon, for that it is not inferiour to the Crowfoots : and therefore it is hot and drie.

¶ *The Vertues.*

There is nothing extant in writing among Authours of any peculiar vertue, but they ſerue onely for the adorning of gardens and garlands, being floures of great beautie.

Chap. 80. *Of Adonis floure.*

¶ *The Deſcription.*

1 The firſt hath very many ſlender weake ſtalkes, trailing or leaning to the ground, ſet on euerie part with fine iagged leaues very deepely cut like thoſe of Camomill, or rather thoſe of May-weed : vpon which ſtalkes do grow ſmall red floures, in ſhape like the field Crowfoot, with a blackiſh greene pointell in the middle, which being growne to maturitie turneth into a ſmall greeniſh bunch of ſeeds, in ſhape like a little bunch of grapes. The root is ſmall and threddie.

2 The ſecond differeth not from the precedent in any one point, but in the colour of the floures, which are of a perfect yellow colour, wherein conſiſteth the difference.

¶ *The Place.*

The red floure of Adonis groweth wilde in the Weſt parts of England among their corne, euen as May-weed doth in other parts, and is likewiſe an enemie to corne as May-weed is : from thence I brought the ſeed, and haue ſowne it in my garden for the beautie of the floures ſake. That with the yellow floure is a ſtranger in England.

¶ *The*

1 *Flos Adonis flore rubro.*
Adonis, with red floures.

¶ *The Time.*

They floure in the Sommer moneths, May, Iune, and Iuly, and ſometimes later.

¶ *The Names.*

Adonis floure is called in Latine *Flos Adonis*, and *Adonidis*: of the Dutchmen, Fel-**Dzoſzlin**: in Engliſh wee may call it Red Maythes, by which name it is called of them that dwell where it groweth naturally, and generally Red Camomill: in Greeke, ἐρύθημον, & *Eranthemum*: our London women doe call it Roſe-a-rubie.

¶ *The Temperature.*

There hath not beene any that hath written of the Temperature hereof; notwithſtanding, ſo farre as the taſte thereof ſheweth, it is ſomething hot, but not much.

¶ *The Vertues.*

The ſeed of Adonis flower is thought to A bee good againſt the ſtone: amongſt the Ancients it was not knowne to haue any other facultie: albeit experience hath of late taught vs, that the ſeed ſtamped, and the pouder giuen in wine, ale, or beere to drinke, doth wonderfully and with great effect helpe the collicke.

CHAP. 81. *Of Dockes.*

¶ *The Kindes.*

DIoſcorides ſetteth forth foure kindes of Dockes; wilde or ſharpe pointed Docke; Garden Docke; round leafed Docke; and the Soure Docke called Sorrell: beſides theſe the later Herbariſts haue added certaine other Dockes alſo, which I purpoſe to make mention of.

¶ *The Deſcription.*

1 THat which among the Latines ſignifieth to ſoften, eaſe, or purge the bellie, the ſame ſignification hath λάπαθον, among the Græcians: whereof *Lapathum* and λάπαθος (as ſome do reade) tooke their names for herbes which are vſed in pottage and medicine, very well knowne to haue the power of cleanſing: of theſe there be many kindes and differences, great ſtore euery where growing, among whom is that which is now called ſharpe pointed Docke, or ſharpe leafed Docke. It groweth in moſt medowes and by running ſtreames, hauing long narrow leaues ſharpe and hard pointed: among the which commeth vp round hollow ſtalks of a browne colour, hauing ioynts like knees, garniſhed with ſuch like leaues, but ſmaller: at the end whereof grow many floures of a pale colour, one aboue another; and after them commeth a browniſh three ſquare ſeede, lapped in browne chaffie huskes like Patience. The roote is great, long, and yellowe within.

‡ There is a varietie of this with criſped or curled leaues whoſe figure was by our Authour giuen in the ſecond place in the following chapter, vnder the Title of *Hydrolapathum minus*. ‡

2 The ſecond kind of ſharpe pointed Docke is like the firſt, but much ſmaller, and doth beare his ſeed in rundles about his branches in chaffie huskes, like Sorrell, not ſo much in vſe as the former, called alſo ſharpe pointed Docke.

‡ 3 This in roots, ſtalkes, and ſeeds is like to the precedent; but the leaues are ſhorter, and rounder than thoſe of the firſt deſcribed, & therin conſiſts the chiefe difference betwixt this & it. ‡

¶ *The Place.*

Theſe kindes of Docks do grow, as is before ſaid, in medowes and by riuers ſides.

¶ *The*

† 1 *Lapathum acutum.*
Sharpe pointed Docke.

2 *Lapathum acutum minimum.*
Small ſharpe Docke.

‡ 3 *Lapathum ſylueſtre fol. minus acuto.*
The roundiſh leaued wilde Docke.

A

B

C

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

They are called in Latine *Lapathum acutum*, *Blomex*, *Lapatium*, & *Lapathium*: of ſome, *Oxylapathum*: in Engliſh, Docke, and ſharpe pointed Docke, the greater and the leſſer: of the Græcians, [illegible]: in high Dutch, **Wengelwurtz**, **Streifſtwurtz**: in Italian, *Rombice*: in Spaniſh, *Romaza*, *Paradilla*, in Low Dutch, **Patich** (which word is deriued of *Lapathum*) and alſo **Peerdick**: in French, *Pareille*.

‡ The third is *Lapathum folio retuſo*, or *minus acuto* of *Lobell*; and *Hippolapathum ſylueſt.* of *Tabern.*‡

¶ *The Nature and Vertues.*

Theſe herbes are of a mixture betweene cold and heat, and almoſt drie in the third degree, eſpecially the ſeed which is very aſtringent.

The pouder of any of the kinds of Docks drunk in wine, ſtoppeth the laske and bloudie flixe, and eaſeth the pains of the ſtomacke.

The roots boiled til they be very ſoft, and ſtamped with barrowes greaſe, and made into an ointment helpeth the itch and all ſcuruie ſcabs and mangines. And for the ſame purpoſe it ſhall bee neceſſarie to boile them in water, as aforeſaid, and the partie to be bathed and rubbed therewith.

† The firſt figure in the former edition was of *Hydrolapathum magnum*, being the firſt in the next chapter; and the figure of that we giue you in the third place of this chapt. was that in the firſt place of the following chap. vnder the foreſaid title.

CHAP.

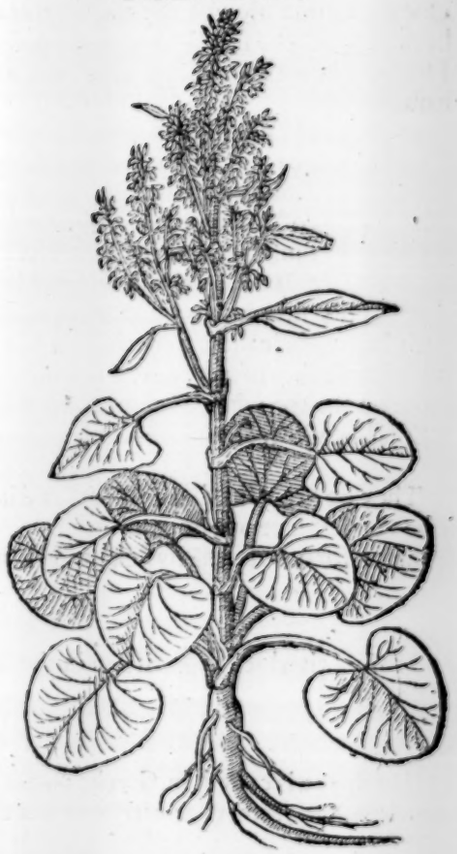
Chap. 82. *Of Water Dockes.*

† 1 *Hydrolapathum magnum.*
Great Water Docke.

† 2 *Hydrolapathum minus.*
Small Water Docke.

† 3 *Hippolapathum ſativum*
Patience, or Munkes Rubarb.

4 *Hippolapathum rotundifolium.*
Baſtard Rubarb.



‡ 5 *Lapathum ſativum ſanguineum.*
Bloudwoort.

The Deſcription.

1 THe Great water Docke hath very long and great leaues, ſtiffe, and hard, not vnlike to the Garden Patience, but much longer. The ſtalke riſeth vp to a great height, oftentimes to the height of fiue foot or more. The floure groweth at the top of the ſtalke in ſpokie tufts, brown of colour. The ſeed is contained in chaffie huskes, three ſquare, of a ſhining pale colour. The root is very great, thicke, browne without, and yellowiſh within.

2 The ſmall water Docke hath ſhort narrow leaues, ſet vpon a ſtiffe ſtalke. The floures grow from the middle of the ſtalke vpward in ſpokie rundles, ſet in ſpaces by certaine diſtances round about the ſtalke, as are the floures of Horehound: Which Docke is of all the kindes moſt common and of leſſe vſe, and taketh no pleaſure or delight in any one ſoile or dwellingplace, but is found almoſt euery where, as well vpon the land as in waterie places, but eſpecially in gardens among good and holeſome pot-herbes, being there better known than welcome or deſired: wherefore I intend not to ſpend further time about his deſcription.

3 The Garden Patience hath very ſtrong ſtalks, furrowed or chamfered, of eight or nine foot high when it groweth in fertile ground, ſet about with great large leaues like to thoſe of the water Docke, hauing alongſt the ſtalkes toward the top floures of a light purple colour declining to browneneſſe. The ſeed is three ſquare, contained in thin chaffie huskes, like thoſe of the common Docke. The root is verie great, browne without, and yellow within, in colour and taſte like the true Rubarb.

4 Baſtard Rubarb hath great broad round leaues, in ſhape like thoſe of the great Bur-docke. The ſtalke and ſeeds are ſo like vnto the precedent, that the one cannot be knowne from the other, ſauing that the ſeeds of this are ſomewhat leſſer. The root is exceeding great and thicke, very like vnto the Rha of Barbarie, as well in proportion as in colour and taſte; and purgeth after the ſame manner, but muſt be taken in greater quantitie, as witneſſeth that famous learned Phyſition now liuing, Mr. Doctor *Bright*, and others, who haue experimented the ſame.

5 This fifth kinde of Docke is beſt knowne vnto all, of the ſtocke or kindred of Dockes; it hath long thin leaues, ſometimes red in euery part thereof, and often ſtripped here and there with lines and ſtrakes of a darke red colour; among which riſe vp ſtiffe brittle ſtalkes of the ſame colour: on the top whereof come forth ſuch floures and ſeed as the common wilde docke hath. The root is likewiſe red, or of a bloudie colour.

¶ *The Place.*

They do grow for the moſt part in ditches and water-courſes, very common through England. The two laſt ſaue one do grow in gardens; my ſelfe and others in London and elſwhere haue them growing for our vſe in Phyſicke and chirurgerie. The laſt is ſowne for a pot-herbe in moſt gardens.

¶ *The Time.*

Moſt of the dockes do riſe vp in the Spring of the yeare, and their ſeed is ripe in Iune and Auguſt.

¶ *The Names.*

The docke is called in Greeke λάπαθον: in Latine, *Rumex*, and *Lapathum*; yet *Pliny* in his 19 Booke, 12. Chapter, ſeemeth to attribute the name of *Rumex* onely to the garden docke.

The

The Monkes Rubarbe is called in Latine *Rumex ſativus*, and *Patientia*, or Patience, which word is borrowed of the French, who call this herbe *Patience*: after whom the Dutch men name this pot herbe alſo **Patientie**: of ſome, *Rhabarbarum Monachorum*, or Monkes Rubarbe: becauſe as it ſhould ſeeme ſome Monke or other haue vſed the root hereof in ſtead of Rubarbe.

Bloudwoort, or bloudy Patience, is called in Latine *Lapathum ſanguineum*: of ſome, *ſanguis Draconis*, of the bloudie colour wherewith the whole plant is poſſeſt, and is of pot-herbes the chiefe or principall, hauing the propertie of the baſtard Rubarbe; but of leſſe force in his purging quality.

¶ *The Temperature.*

Generally all the Dockes are cold, ſome little and moderately, and ſome more: they doe all of them drie, but not all after one manner: notwithſtanding ſome are of opinion that they are dry almoſt in the third degree.

¶ *The Vertues.*

The leaues of the Garden Docke or Patience may be eaten, and are ſomewhat colde, but more moiſt, and haue withall a certaine clammineſſe; by reaſon whereof they eaſily and quickely paſſe through the belly when they be eaten: and *Dioſcorides* writeth, that all the Dockes beeing boiled doe mollifie the bellie: which thing alſo *Horace* hath noted in his ſecond booke of Sermons, the fourth Satyre, writing thus, A

——Si dura morabitur alvus
Mugilus, & viles pellent obſtantia conchæ,
Et lapathi breuis herba.

He calleth it a ſhort herbe, being gathered before the ſtalke be growne vp; at which time it is fitteſt to be eaten. B

And being ſodden, it is not ſo pleaſant to bee eaten as either Beetes or Spinage: it ingendreth moiſt bloud of a meane thickneſſe, and which nouriſheth little. C

The leaues of the ſharpe pointed Dockes are cold and drie: but the ſeed of Patience, and the water Docke doe coole, with a certaine thinneſſe of ſubſtance. D

The decoction of the roots of Monkes Rubarbe is drunke againſt the bloudy flix, the laske, the wambling of the ſtomacke which commeth of choler: and alſo againſt the ſtinging of ſerpents, as *Dioſcorides* writeth. E

It is alſo good againſt the ſpitting of bloud, being taken with Acacia (or his *ſuccedaneum*, the dried iuice of ſloes) as *Plinie* writeth. F

Monkes Rubarb or Patience is an excellent wholeſome pot-herbe; for being put into the pottage in ſome reaſonable quantitie, it doth looſen the belly, helpeth the iaunders, the timpany and ſuch like diſeaſes, proceeding of cold cauſes. G

If you take the roots of Monkes Rubarb, and red Madder, of each halfe a pound; Sena foure ounces; anniſe ſeed and licorice, of each two ounces; Scabiouſe and Agrimonie, of each one handfull; ſlice the roots of the Rubarb, bruiſe the anniſe ſeed and licorice, breake the herbes with your hands, and put them into a ſtone pot called a ſteane, with foure gallons of ſtrong ale to ſteepe or infuſe the ſpace of three daies; and then drinke this liquour as your ordinarie drinke for three weekes together at the leaſt, though the longer you take it, ſo much the better; prouiding in a readineſſe another ſteane ſo prepared that you may haue one vnder another, being alwaies carefull to keepe a good diet: it cureth the dropſie, the yellow iaunders, all manner of itch, ſcabbes, breaking out, and mangineſſe of the whole body: it purifieth the bloud from all corruption; preuaileth againſt the greene ſickneſſe very greatly, and all oppilations or ſtoppings: maketh young wenches to looke faire and cherrie like, and bringeth downe their tearmes, the ſtopping whereof hath cauſed the ſame. H

The ſeed of baſtard Rubarb is of a manifeſt aſtringent nature, inſomuch that it cureth the bloudy flix, mixed with the ſeed of Sorrell, and giuen to drinke in red wine. I

There haue not beene any other faculties attributed to this plant either of the antient or later writers, but generally of all it hath beene referred to the other Docks or Monks Rubarb, of which number I aſſure my ſelfe this is the beſt, and doth approch neereſt vnto the true Rubarb. Manie reaſons induce me ſo to thinke and ſay, firſt this hath the ſhape and proportion of Rubarbe, the ſame colour, both within and without, without any difference. They agree as well in taſte as ſmell: it coloureth the ſpittle of a yellow colour when it is chewed, as Rubarb doth; and laſtly it purgeth the belly after the ſame gentle manner that the right Rubarb doth, onely herein it differeth, that this muſt be giuen in three times the quantitie of the other. Other diſtinctions and differences, with the temperature and euery other circumſtance, I leaue to the learned Phyſitions of our London colledge (who are very well able to ſearch this matter) as a thing farre aboue my reach, being K

no graduate,but a Countrey Scholler,as the whole framing of this Hiſtorie doth well declare:but I hope my good meaning will be well taken, conſidering I doe my beſt; not doubting but ſome of greater learning will perfect that which I haue begun according to my ſmall skill, eſpecially the ice being broken vnto him,and the wood rough hewed to his hands. Notwithſtanding I thinke it good to ſay thus much more in mine owne defence, that although there bee many wants and defects in me,that were requiſite to performe ſuch a worke; yet may my long experience by chance happen vpon ſome one thing or other that may do the learned good: conſidering what a notable experiment I learned of one *Iohn Bennet* a Chirurgion of Maidſtone in Kent, a man as ſlenderly learned as my ſelfe,which he practiſed vpon a Butchers boy of the ſame towne, as himſelfe reported vnto me; his practiſe was this: Being deſired to cure the foreſaid lad of an ague,which did grieuouſly vex him, he promiſed him a medicine,& for want of one for the preſent (for a ſhift as himſelfe confeſſed vnto me) he tooke out of his garden three or foure leaues of this plant of Rubarb, which my ſelfe had among other ſimples giuen him,which he ſtamped & ſtrained with a draught of ale,and gaue it the lad in the morning to drinke: it wrought extremely downeward and vpward within one houre after,and neuer ceaſed vntill night. In the end the ſtrength of the boy ouercame the force of the Phyſicke, it gaue ouer working,and the lad loſt his ague; ſince which time (as hee ſaith) he hath cured with the ſame medicine many of the like maladie, hauing euer great regard vnto the quantitie,which was the cauſe of the violent working in the firſt cure. By reaſon of which accident,that thing hath been reuealed vnto poſteritie,which heretofore was not ſo much as dreamed of. Whoſe blunt attempt may ſet an edge vpon ſome ſharper wit,and greater iudgement in the faculties of plants, to ſeeke farther into their nature than any of the Antients haue done: and none fitter than the learned Phyſitions of the Colledge of London; where are many ſingularly wel learned and experienced in naturall things.

L The roots ſliced and boiled in the water of *Carduus Benedictus* to the conſumption of the third part,adding thereto a little honie,of the which decoction eight or ten ſpoonfuls drunke before the fit, cureth the ague in two or three times ſo taking it at the moſt: vnto robuſtous or ſtrong bodies twelue ſpoonfuls may be giuen. This experiment was practiſed by a worſhipfull Gentlewoman miſtreſſe *Anne Wylbraham*, vpon diuers of her poore Neighbours with good ſucceſſe.

† That figure that was in the firſt place was of the *Lapathum fol. minus acuto*, deſcribed by me in the third place of the preceding chapter. The ſecond was of *Lapathum acutum criſpum* of *Tabernamontanus*, The third was of *Hydrolapathum minus*.

Chap. 83. *Of Rubarb.*

‡ IT hath happened in this as in many other forreine medicines or ſimples,which though they be of great and frequent vſe,as Hermodactyls,Muske,Turbeth,&c. yet haue we no certaine knowledge of the very place which produces them,nor of their exact manner of growing,which hath giuen occaſion to diuers to thinke diuerſly,and ſome haue been ſo bold as to counterfeit figures out of their owne fancies,as *Matthiolus*: ſo that this ſaying of *Pliny* is found to be very true, *Nullamedicinæ pars magu incerta, quam quæ ab alio quam noſtro orbe petitur*. But we will endeauour to ſhew you more certaintie of this here treated of than was knowne vntill of very late yeres. ‡

¶ *The Deſcription.*

1 THis kinde of Rubarb hath very great leaues, ſomewhat ſnipt or indented about the edges like the teeth of a Saw,not vnlike the leaues of *Enula campana*, called by the vulgar ſort Elecampane,but greater: among which riſeth vp a ſtraight ſtalke of two cubits high, bearing at the top a ſcalie head like thoſe of Knappe-weed,or *Iacea maior*: in the middle of which knap or head thruſteth forth a faire floure conſiſting of many purple threds like thoſe of the Artichoke; which being paſt,there followeth a great quantitie of downe,wherein is wrapped long ſeede like vnto the great Centorie, which the whole plant doth very well reſemble. The root is long and thicke, blackiſh without, and of a pale colour within: which being chewed maketh the ſpittle very yellow,as doth the Rubarb of Barbarie.

‡ 2 This other baſtard Rha,which is alſo of *Lobels* deſcription, hath a root like that of the laſt deſcribed: but the leaues are narrower almoſt like thoſe of the common Docke, but hoarie on the other ſide: the ſtalke growes vp ſtraight, and beareth ſuch heads and floures as the precedent.

‡ 3 I haue thought good here to omit the counterfeit figure of *Matthiolus*, giuen vs in this place by our Authour; as alſo the Hiſtorie,which was not much pertinent,and in lieu of them to preſent you with a perfect figure and deſcription of the true *Rha Ponticum* of the Antients, which

was

1 *Rha Capitatum L'obelij.*
Turkie Rubarbe.

‡ 2 *Rha Capitatum angustifolium.*
The other baſtard Rubarbe.

‡ 3 *Rha verum antiquorum.*
The true Rubarbe of the Antients.

Rhabarbarum ſiccatum.
The drie roots of Rubarbe.

was firſt of late diſcouered by the learned *Proſper Alpinus*, who writ a peculiar tract thereof, and it is alſo againe figured and deſcribed in his worke *de Plantis exoticis*. Our Countryman M^r *Iohn Parkinſon* hath alſo ſet forth very well both the figure and deſcription hereof, in his *Paradiſus terreſtris*. This plant hath many large roots diuerſly ſpreading in the ground, of a yellow colour, from which grow vp many very great leaues like thoſe of the Butter-burre, but of a freſh greene colour, with great and manifeſt veines diſperſed ouer them. The ſtalke alſo is large and creſted, ſending forth ſundry branches bearing many ſmall white floures, which are ſucceeded by ſeeds three ſquare and browniſh, like as thoſe of other Docks. D^r. *Liſter* one of his Maieſties Phyſitions was the firſt that enricht this kingdome with this elegant and vſefull plant, by ſending the ſeedes thereof to M^r. *Parkinſon*. *Proſper Alpinus* proues this to be the true *Rha* of the Antients, deſcribed by *Dioſcorides*, *Lib.* 3. *cap.* 2. yet neither he nor any other (that I know of) haue obſerued a fault, which I more than probably ſuſpect to bee in the text of *Dioſcorides* in that place, which is in the word μέλαινα, which I iudge ſhould be μολίνη, that is, yellow, and not blacke, as *Ruellius* and others haue tranſlated it: now μέλαινα is a word frequently vſed by *Dioſcorides*, as may appeare by the Chapters of *Hieracium magnum & parvum*, *Conyra*, *Peucedanum*, *Ranunculus*, and diuers others, and I ſuſpect the like fault may bee found in ſome other places of the ſame Authour. But I will no further inſiſt vpon this, ſeeing the thing it ſelfe in all other reſpects, as alſo in yellowneſſe ſhewes it ſelfe to be that deſcribed by *Dioſcorides*, and that my coniecture muſt therefore be true. And beſides, the root wherto he compares it is ἐρυθρόεσσα, that is *Rubeſcens*, or rather *ex flauo rubeſcens*, as any verſed in reading *Dioſcorides* may eaſily gather by diuers places in him. Now I here omit his words, becauſe they are in the next deſcription alledged by our Authour, as alſo the deſcription of our ordinarily vſed Rubarb, for that it is ſufficiently deſcribed vnder the following title of the choiſe thereof. M^r. *Parkinſon* is of opinion that this is the true Rubarbe vſed in ſhops, onely leſſe heauy, bitter, and ſtrong in working, by reaſon of the diuerſity of our climat from that whereas the dried Rubarb brought vs vſually grows. This his opinion is very probable, and if you compare the roots together, you may eaſily bee induced to be of the ſame beleefe. ‡

† 4 The Ponticke Rubarbe is leſſer and ſlenderer than that of Barbarie. Touching Pontick Rubarbe *Dioſcorides* writeth thus: Rha that diuers call Rheon, which groweth in thoſe places that are beyond Boſphorus, from whence it is brought, hath yellow roots like to the great Centorie, but leſſer and redder, ἄοσμος, that is to ſay, without ſmell (*Dodonæus* thinkes it ſhould bee εὔοσμος, that is, well ſmelling) ſpongie, and ſomething light. That is the beſt which is not worme-eaten, and taſted is ſomewhat viſcide with a light aſtriction, and chewed becomes of a yellow or Saffron colour.

¶ *The Place.*

It is brought out of the Countrey of Sina (commonly called China) which is toward the Eaſt in the vpper part of India, and that India which is without the riuer Ganges: and not at all *Ex Scenitarum prouincia*, (as many do vnaduiſedly thinke) which is in Arabia the Happie, and far from China: it groweth on the ſides of the riuer Rha now called Volga, as *Amianus Marcellus* ſaith, which riuer ſpringeth out of the Hyperborean mountaines, and running through Muſcouia, falleth into the Caſpian or Hircan ſea.

‡ The Rha of the Antients growes naturally, as *Alpinus* ſaith, vpon the hill Rhodope in Thrace, now called Romania. It growes alſo as I haue been informed vpon ſome mountaines in Hungarie. It is alſo to be found growing in ſome of our choice gardens. ‡

The choice of Rubarbe.

The beſt Rubarbe is that which is brought from China freſh and new, of a light purpliſh red, with certaine veines and branches, of an vncertaine varietie of colour, commonly whitiſh: but when it is old the colour becommeth ill fauored by turning yellowiſh or pale, but more, if it bee worme eaten: being chewed in the mouth it is ſomewhat gluie and clammie, and of a ſaffron colour, which being rubbed vpon paper or ſome white thing ſheweth the colour more plainely: the ſubſtance thereof is neither hard or cloſely compacted, nor yet heauy; but ſomething light, and as it were in a middle betweene hard and looſe and ſomething ſpungie: it hath alſo a pleaſing ſmell. The ſecond in goodneſſe is that which commeth from Barbarie. The laſt and worſt from Boſphorus and Pontus.

¶ *The Names.*

It is commonly called in Latine *Rha Barbarum*, or *Rha Barbaricum*: of diuers, *Rheu Barbarum*: the Moores and Arabians doe more truely name it *Raued Seni, a Sinenſi prouincia*; from whence it is brought into Perſia and Arabia, and afterwards into Europe: and likewiſe from Tanguth, through the land of Cataia into the land of the Perſians, whereof the Sophie is the ruler, and from thence into Ægypt, and afterwards into Europe. It is called of the Arabians and the people of China, and the parts adiacent, *Rauend Cini*, *Raued Seni*, and *Raued Sceni*: in ſhops, *Rhabarbarum*: in Engliſh, Rubarb, and Rewbarbe.

¶ *The*

4 *Rha Ponticum Siccatum.*
Rubarb of Pontus dried.

¶ *The Temperature.*

Rubarb is of a mixt ſubſtance, temperature and faculties: ſome of the parts thereof are earthy, binding and drying: others thin, airious, hot, and purging.

¶ *The Vertues.*

Rubarb is commended by *Dioſcorides* againſt windineſſe, weakneſſe of the ſtomack, and all griefes thereof, convulſions, diſeaſes of the ſpleene, liuer, and kidnies, gripings and inward gnawings of the guts, infirmities of the bladder and cheſt, ſwelling about the heart, diſeaſes of the matrix, paine in the huckle bones, ſpitting of bloud, ſhortneſſe of breath, yexing, or the hicket, the bloudie flix, the laske proceeding of raw humors, fits in Agues, and againſt the bitings of venomous beaſts. A

Moreouer he ſaith, that it taketh away blacke and blew ſpots, and tetters or Ringwormes, if it be mixed with vineger, and the place anointed therewith. B

Galen affirmes it to be good for burſtings, cramps, and convulſions, and for thoſe that are ſhort winded, and that ſpit bloud. C

But touching the purging facultie neither *Dioſcorides* nor *Galen* hath written any thing, becauſe it was not vſed in thoſe daies to purge with. *Galen* held opinion, that the thinne airious parts doe make the binding qualitie of more force; not becauſe it doth reſiſt the cold and earthy ſubſtance, but by reaſon that it carrieth the ſame, and maketh it deeply to pierce, and thereby to worke the greater effect; the dry and thinne eſſence containing in it ſelfe a purging force and qualitie to open obſtructions, but helped and made more facile by the ſubtil and airious parts. *Paulus Ægineta* ſeemeth to be the firſt that made triall of the purging facultie of Rubarb; for in his firſt booke, Chap. 43. he maketh mention thereof, where he reckoneth vp Turpentine among thoſe medicines which make the bodies of ſuch as are in health ſoluble: But when we purpoſe, ſaith he, to make the turpentine more ſtrong, we adde vnto it a little Rubarb. The Arabians that followed him brought it to a further vſe in phyſicke, as chiefely purging downward choler, and oftentimes flegme. D

The purgation which is made with Rubarb is profitable and fit for all ſuch as be troubled with choler, and for thoſe that are ſicke of ſharpe and tertian feuers, or haue the yellow jaundice, or bad liuers. E

It is a good medicine againſt the pleuriſie, inflammation of the lungs, the ſquinancie or Squincie, madneſſe, frenſie, inflammation of the kidnies, bladder, and all the inward parts, and eſpecially againſt S. Anthonies fire, as well outwardly as inwardly taken. F

Rubarb is vndoubtedly an eſpeciall good medicine for the liuer and infirmities of the gall; for beſides that it purgeth forth cholericke and naughty humors, it remoueth ſtoppings out of the conduits. G

It alſo mightily ſtrengthneth the intrals themſelues: inſomuch as Rubarb is iuſtly termed of diuers the life of the liuer; for *Galen* in his eleuenth booke of the method or manner of curing, affirmeth that ſuch kinde of medicines are moſt fit and profitable for the liuer, as haue ioyned with a purging and opening qualitie an aſtringent or binding power. The quantitie that is to be giuen is from one dram to two; and the infuſion from one and a halfe to three. H

It is giuen or ſteeped, and that in hot diſeaſes, with the infuſion or diſtilled water of Succory, Endiue, or ſome other of the like nature; and likewiſe in Whay; and if there be no heate it may be giuen in Wine. I

It

K It is alſo oftentimes giuen being dried at the fire, but ſo, that the leaſt or no part thereof at all be burned; and being ſo vſed it is a remedie for the bloudy flix, and for all kindes of laskes: for it both purgeth away naughty and corrupt humors, and likewiſe withall ſtoppeth the belly.

L The ſame being dried after the ſame manner doth alſo ſtay the ouermuch flowing of the monethly ſickneſſe, and ſtoppeth bloud in any part of the body, eſpecially that which commeth thorow the bladder; but it ſhould be giuen in a little quantitie, and mixed with ſome other binding thing.

M *Meſues* ſaith, That Rubarb is an harmeleſſe medicine, and good at all times, and for all ages, and likewiſe for children and women with childe.

‡ My friend Mr. *Sampſon Iohnſon* Fellow of *Magdalen* Colledge in Oxford aſſures me, That the Phyſitions of Vienna in Auſtria vſe ſcarce any other at this day than the Rubarb of the Antients, which grows in Hungary not far from thence: and they prefer it before the dried Rubarb brought out of Perſia and the Eaſt Indies, becauſe it hath not ſo ſtrong a binding facultie as it, neither doth it heate ſo much; onely it muſt be vſed in ſomewhat a larger quantitie. ‡

Chap. 84.

Of Sorrell.

¶ *The Kindes.*

THere be diuers kindes of Sorrell, differing in many points, ſome of the garden, others wilde; ſome great, and ſome leſſer.

1 *Oxalis, ſiue Acetoſa.*
Sorrell.

2 *Oxalis tuberoſa.*
Knobbed Sorrell.

¶ *The Deſcription.*

THough *Dioſcorides* hath not expreſſed the *Oxalides* by that name, yet none ought to doubt but that they were taken and accounted as the fourth kinde of *Lapathum*. For though ſome like

like it not well that the ſeed ſhould be ſaid to be *Drimus*; yet that is to be vnderſtood according to the common phraſe, when acride things are confounded with thoſe which be ſharpe and ſoure; elſe we might accuſe him of ſuch ignorance as is not amongſt the ſimpleſt women. Moreouer, the word *Oxys* doth not onely ſignifie the leafe, but the ſauour and tartneſſe, which by a figure drawne from the ſharpneſſe of kniues edges is therefore called ſharpe: for ὀξὺς χυμὸς ſignifieth a ſharpe or ſoure iuyce which pierceth the tongue like a ſharpe knife: whereupon alſo *Lapathum* may be called *Oxalis*, as it is indeed. The leaues of this are thinner, tenderer, and more vnctuous than thoſe of *Lapatium acutum*, broader next to the ſtem, horned and creſted like Spinage and *Atriplex*. The ſtalke is much ſtreaked, reddiſh, and full of iuyce: the root is yellow and fibrous; the ſeed ſharpe, cornered and ſhining, growing in chaffie huskes like the other Docks.

2 The ſecond kinde of *Oxalis* or Sorrell hath large leaues like Patience, confuſedly growing together vpon a great tall ſtalke, at the top whereof grow tufts of a chaffie ſubſtance. The root is tuberous, much like the Peonie, or rather Filipendula, faſtned to the lower part of the ſtem with ſmall long ſtrings and laces.

3 The third kinde of Sorrell groweth very ſmall, branching hither and thither, taking hold (by new ſhoots) of the ground where it groweth, whereby it diſperſeth it ſelfe far abroad. The leaues are little and thin, hauing two ſmall leaues like eares faſtned thereto, in ſhew like the herbe *Sagittaria*: the ſeed in taſte is like the other of his kinde.

4 The fourth kinde of Sorrell hath leaues ſomewhat round and cornered, of a whiter colour than the ordinarie, and hauing two ſhort eares anexed vnto the ſame. The ſeed and root in taſte is like the other Sorrels.

3 *Oxalis tenuifolia.*
Sheepes Sorrell.

4 *Oxalis Franca ſeu Romana.*
Round leaued, or French Sorrel.

5 This kinde of curled Sorrell is a ſtranger in England, and hath very long leaues, in ſhape like the garden Sorrell, but curled and crumpled about the edges as is the curled Colewort. The ſtalke riſeth vp among the leaues, ſet here and there with the like leaues, but leſſer. The floures, ſeeds, and roots are like the common Sorrell or ſoure Docke.

6 The ſmall Sorrell that groweth vpon dry barren ſandy ditch-banks, hath ſmall graſſy leaues ſomewhat forked or croſſed ouer like the croſſe hilt of a rapier. The ſtalkes riſe vp amongſt the leaues, ſmall, weake, and tender, of the ſame ſoure taſte that the leaues are of. The floure, ſeed, and root is like the other Sorrels, but altogether leſſer.

7 The

6 Oxalis minor.
Small Sorrell.

‡ 7 The ſmalleſt ſort of Sorrell is like vnto the precedent, ſauing that the loweſt leaues that ly vpon the ground be ſomewhat round, and without the little eares that the other hath, which ſetteth forth the difference.

‡ 8 There is alſo kept in ſome gardens a verie large ſorrel, hauing leaues thicke, whitiſh, and as large as an ordinarie Docke, yet ſhaped like Sorrell, and of the ſame acide taſte. The ſtalkes and ſeed are like thoſe of the ordinary, yet whiter coloured. ‡

¶ *The Place.*

† The common Sorrell groweth for the moſt part in moiſt medowes and gardens. The ſecond by waters ſides, but not in this kingdome that I know of. The fourth alſo is a garden plant with vs, as alſo the fifth: but the third and laſt grow vpon grauelly and ſandie barren ground and ditch bankes. †

¶ *The Time.*

They flouriſh at that time when as the other kinds of Docks do floure.

¶ *The Names.*

Garden Sorrell is called in Greeke ὀξαλὶς, and αἰακὶς: of *Galen*, ὀξυδόντιον: that is to ſay, *Acidum lapathum*, or *Acidus rumex*, ſoure Docke: and in ſhops commonly *Acetoſa*: in the Germane Tongue, **Sawrampffer**: in low-Dutch, **Surckele**, and **Surinck**: the Spaniards, *Azederas*, *Agrelles*, and *Azedas*: in French, *Ozeille*, and *Surelle*, *Aigrette*: in Engliſh, Garden Sorrell.

The ſecond is called of the later Herbariſts *Tuberoſa acetoſa*, and *Tuberoſum lapathum*: in Engliſh Bunched or Knobbed Sorrell.

The third is called in Engliſh Sheepes Sorrell: in Dutch, **Schap Surkel.**

The fourth, Romane Sorrell, or round leaued Sorrell.

The fifth, Curled Sorrell.

The ſixth and ſeuenth, Barren Sorrell, or Dwarfe Sheepes Sorrell.

‡ The eighth is called *Oxalis*, or *Acetoſa maxima latifolia*, Great broad leaued Sorrell. ‡

¶ *The Nature.*

The Sorrels are moderately cold and dry.

¶ *The Vertues.*

A Sorrell doth vndoutedly coole and mightily dry; but becauſe it is ſoure it likewiſe cutteth tough humors.

B The iuyce hereof in Sommer time is a profitable ſauce in many meats, and pleaſant to the taſte: it cooleth an hot ſtomacke, moueth appetite to meate, tempereth the heate of the liuer, and openeth the ſtoppings thereof.

C The leaues are with good ſucceſſe added to decoctions which are vſed in Agues.

D The leaues of Sorrell taken in good quantitie, ſtamped and ſtrained into ſome Ale, and a poſſet made thereof, cooleth the ſicke body, quencheth the thirſt, and allayeth the heate of ſuch as are troubled with a peſtilent feuer, hot ague, or any great inflammation within.

E The leaues ſodden, and eaten in manner of a Spinach tart, or eaten as meate, ſoftneth and looſneth the belly, and doth attemper and coole the bloud exceedingly,

F The ſeed of Sorrell drunke in groſſe red wine ſtoppeth the laske and bloudy flix.

Chap.

Chap. 85. *Of Biſtort or Snake-weed.*

¶ *The Deſcription.*

1 THe great Biſtort hath long leaues much like Patience, but ſmaller, and more wrinkled or crumpled, on the vpper ſide of a darke greene, and vnderneath of a blewiſh greene colour, much like Woad. The ſtalke is long, ſmooth, and tender, hauing at the top a ſpiked knap or eare, ſet full of ſmall whitiſh floures declining to carnation. The root is all in a lumpe, without faſhion; within of a reddiſh colour like vnto fleſh, in taſte like the kernell of an Acorne.

2 The ſmall Biſtort hath leaues about three inches long, and of the bredth of a mans naile; the vpper ſide is of a greene colour, and vnderneath of an ouerworne greeniſh colour: amongſt the which riſeth vp a ſtalke of the height of a ſpanne, full of ioynts or knees, bearing at the top ſuch floures as the great Biſtort beareth; which being fallen, the ſeeds appeare of the bignes of a tare, reddiſh of colour, euery ſeed hauing one ſmall greene leafe faſtned thereunto, with many ſuch leaues thruſt in among the whole bunch of floures and ſeed. The root is tuberous like the other, but ſmaller, and not ſo much crooked.

1 *Biſtorta major.*
Snake-weed.

2 *Biſtorta minor.*
Small Snake-weed.

3 Broad leaued Snake-weed hath many large vneuen leaues, ſmooth and very greene; among which riſe vp ſmall brittle ſtalkes of two hands high, bearing at the top a faire ſpike of floures like vnto the great Biſtort. The root is knobby or bunched, crookedly turned or wrythed this way and that way, whereof it tooke his name *Biſtorta.* ‡ It differs from the firſt onely in that the root is ſomewhat more twined in, and the leaues broader and more crumpled. ‡

¶ *The Place.*

1 The great Biſtort groweth in moiſt and waterie places, and in the darke ſhadowie Woods, and is very common in moſt gardens.

2 The

2 The ſmall Biſtort groweth in great aboundance in Weſtmerland, at Crosby, Rauenſwaith, at the head of a Parke belonging to one M^r. *Pickering*: from whence it hath beene diſperſed into many gardens; as alſo ſent vnto me from thence for my garden.

¶ *The Time.*

They floure in May, and the ſeed is ripe in Iune.

¶ *The Names.*

Biſtorta is called in Engliſh Snake-weed: in ſome places, Oiſterloit: in Cheſhire, Paſſions, and Snake-weed, and there vſed for an excellent Pot-herbe. It is called *Biſtorta* of his wrythed roots, and alſo *Colubrina, Serpentaria, Brittanica; Dracontion, Plinij*; *Dracunculus, Dodonæi*; and *Limonium Geſneri.*

¶ *The Nature.*

Biſtort doth coole and dry in the third degree.

¶ *The Vertues.*

A The iuyce of Biſtort put into the noſe preuaileth much againſt the Diſeaſe called *Polypus*, and the biting of Serpents or any venomous beaſt, being drunke in Wine or the water of Angelica.

B The root boyled in wine and drunke, ſtoppeth the laske and bloudy flix; it ſtayeth alſo the ouermuch flowing of womens monethly ſickneſſes.

C The root taken as aforeſaid ſtayeth vomiting, and healeth the inflammation and ſoreneſſe of the mouth and throat: it likewiſe faſteneth looſe teeth, being holden in the mouth for a certaine ſpace, and at ſundry times.

Chap. 86. *Of Scuruy-Graſſe, or Spoon-wort.*

¶ *The Deſcription.*

1 Round leaued Scuruy-Graſſe is a low or baſe herbe: it bringeth forth leaues vpon ſmal ſtems or foot-ſtalks of a meane length, comming immediately from the root, very many in number, of a ſhining greene colour, ſomewhat broad, thicke, hollow like a little ſpoone, but of no great depth, vneuen, or cornered about the edges: among which leaues ſpring vp ſmall ſtalkes of a ſpanne high, whereon doe grow many little white floures: after which commeth the ſeed, ſmall and reddiſh, contained in little round pouches or ſeed-veſſels: the roots be ſmall, white, and threddy. The whole plant is of a hot and ſpicie taſte.

2 The common Scuruy-graſſe or Spoone-wort hath leaues ſomewhat like a ſpoone, hollow in the middle, but altogether vnlike the former: the leaues hereof are bluntly toothed about the edges, ſharpe pointed, and ſomewhat long: the ſtalkes riſe vp among the leaues, of the length of halfe a foot; whereon do grow white floures with ſome yellowneſſe in the middle: which being paſt, there ſucceed ſmall ſeed-veſſels like vnto a pouch, not vnlike to thoſe of Shepheards purſe, greene at the firſt, next yellowiſh, and laſtly when they be ripe, of a browne colour, or like a filberd nut. The root is ſmall and tender, compact of a number of threddy ſtrings very thicke thruſt together in manner of a little turfe.

¶ *The Place.*

The firſt groweth by the ſea ſide at Hull, at Boſton, and Lynne, and in many other places of Lincolnſhire neere vnto the ſea, as in Whaploade and Holbecke Marſhes in Holland in the ſame County. It hath beene found of late growing many miles from the ſea ſide, vpon a great hill in Lancaſhire called Ingleborough hill; which may ſeeme ſtrange vnto thoſe that do not know that it will be content with any ſoile, place, or clyme whatſoeuer: for proofe whereof, my ſelfe haue ſowen the ſeeds of it in my garden, and giuen them vnto others, with whom they floure, flouriſh, and bring forth their ſeed, as naturally as by the ſea ſide; and likewiſe retaine the ſame hot ſpicie taſte: which proueth that they refuſe no culture, contrary to many other ſea-plants.

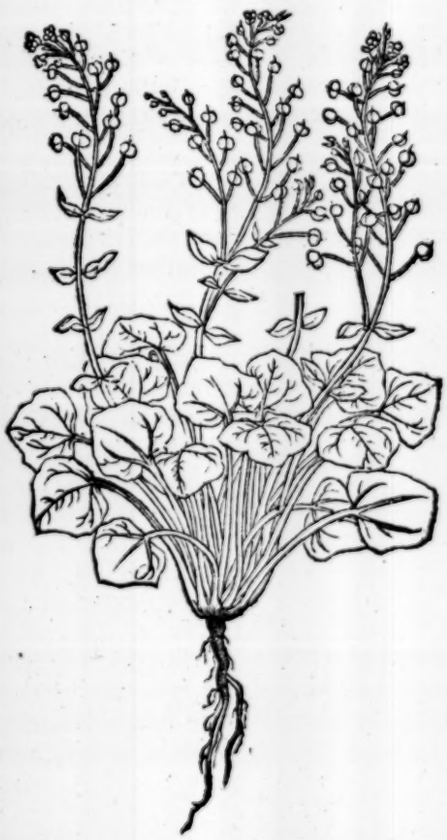
The ſecond, which is our common ſcuruie graſſe, groweth in diuers places vpon the brimmes of the famous riuer Thames, as at Woolwich, Erith, Greenhithe, Graueſend, as well on the Eſſex ſhore as the Kentiſh; at Portſmouth, Briſtow, and many other places alongſt the Weſtern coaſt: but toward the North I haue not heard that any of this kinde hath growne.

¶ *The*

¶ *The Time.*

It floureth and flouriſheth in May. The ſeed is ripe in Iune.

2 *Cochlearia rotundifolia.*
Round leafed Scuruie graſſe.



2 *Cochlearia Britannica.*
Common Engliſh Scuruie graſſe.

¶ *The Names.*

† We are not ignorant that in low Germany, this hath ſeemed to ſome of the beſt learned to be the true *Britannica*, and namely to thoſe next the Ocean in Frieſland and Holland. The Germanes call it **Leffelkraut**: that is, *Cochlearia* or Spoonwort, by reaſon of the compaſſed roundnes and hollownes of the leaues, like a ſpoone; and haue thought it to be *Plinie's Britannica*, becauſe they finde it in the ſame place growing, and endued with the ſame qualities. Which excellent plant *Cæſars* ſoldiers (when they remooued their camps beyond the Rhene) found to preuaile (as the Friſians had taught it them) againſt that plague and hurtfull diſeaſe of the teeth, gums, and ſinewes, called the Scuruie, being a depriuation of all good bloud and moiſture, in the whole bodie, called *Scorbutum*; in Engliſh, the Scuruie, and Skyrby, a diſeaſe happening at the ſea among Fiſhermen, and freſh-water ſouldiers, and ſuch as delight to ſit ſtill without labour and exerciſe of their bodies; and eſpecially aboue the reſt of the cauſes, when they make not cleane their biſket bread from the floure or mealines that is vpon the ſame, which doth ſpoile many. But ſith this agrees not with *Plinies* deſcription, and that there be many other water plants as *Naſturtium*, *Sium*, *Cardamine*, and ſuch others, like in taſte, and not vnlike in proportion and vertues, which are remedies againſt the diſeaſes aforeſaid, there can be no certaine argument drawne therefrom to prooue it to be *Britannica*. For the leaues at their firſt comming forth are ſomewhat long like *Pyrola* or Adders tongue, ſoone after ſomewhat thicker, and hollow like a nauell, after the manner of Sun-dew, but in greatneſſe like *Soldanella*, in the compaſſe ſomewhat cornered, in faſhion ſomewhat like a ſpoone: the floures white, and in ſhape like the Cuckow floures: the ſeed reddiſh, like the ſeed of *Thlaſpi*, which is not to be ſeen in *Britannica*, which is rather holden to be Biſtort or garden Patience, than Scuruie graſſe. In Engliſh it is called Spoonewort, Scruby graſſe, and Scuruie graſſe.

¶ *The Temperature.*

Scuruie graſſe is euidently hot and drie, very like in taſte and qualitie to the garden Creſſes, of an aromaticke or ſpicie taſte.

¶ *The Vertues.*

A The juice of Spoonewoort giuen to drinke in Ale or Beere, is a ſingular medicine againſt the corrupt and rotten vlcers, and ſtench of the mouth: it perfectly cureth the diſeaſe called of *Hippocrates, Voluulus Hematites*: of *Pliny, Stomacace*: of *Marcellus, Oſcedo*: and of the later writers, *Scorbutum*: of the Hollanders and Friſians, Scuerbuyck: in Engliſh, the Scuruie: either giuing the juice in drinke as aforeſaid, or putting ſix great handfuls to ſteepe, with long pepper, graines, aniſe-ſeede, and liquorice, of each one ounce, the ſpices being braied, and the herbes bruſed with your hands, and ſo put into a pot, ſuch as is before mentioned in the chapter of baſtard Rubarbe, and vſed in like maner; or boiled in milke or wine and drunke for certaine daies together it worketh the like effect.

B The juice drunke once in a day faſting in any liquor, ale, beere, or wine, doth cauſe the foreſaid medicine more ſpeedily to worke his effect in curing this filthy, lothſome, heauy, and dull diſeaſe, which is very troubleſome, and of long continuance. The gums are looſed, ſwolne, and exulcerate; the mouth greeuouſly ſtinking; the thighes and legs are withall very often full of blew ſpots, not much vnlike thoſe that come of bruſes: the face and the reſt of the body is oftentimes of a pale colour: and the feet are ſwolne, as in a dropſie.

C There is a diſeaſe (ſaith *Otaus magnus* in his hiſtorie of the Northerne regions) haunting the campes, which vexe them that are beſieged and pinned vp: and it ſeemeth to come by eating of ſalt meates, which is increaſed and cheriſhed with the cold vapors of the ſtone walls. The Germanes call this diſeaſe (as we haue ſaid) Scorbuck, the ſymptome or paſſion which hapneth to the mouth, is called of *Pliny* στόμακε: *Stomacace*: and that which belongeth to the thighes μαρσίππια: *Marcellus* an old writer nameth the infirmities of the mouth *Oſcedo*: which diſeaſe commeth of a groſſe cold and tough bloud, ſuch as malancholy juice is, not by aduſtion, but of ſuch a bloud as is the feculent or droſſie part thereof: which is gathered in the body by ill diet, ſlothfulneſſe to worke, laiſineſſe (as we terme it) much ſleepe and reſt on ſhip-boord, and not looking to make cleane the biſquet from the mealineſſe, and vncleane keeping their bodies, which are the cauſes of this diſeaſe called the ſcuruie or ſcyrby; which diſeaſe doth not onely touch the outward parts, but the inward alſo: for the liuer oftentimes, but moſt commonly the ſpleene, is filled with this kinde of thicke, cold and tough juice, and is ſwolne by reaſon that the ſubſtance thereof is ſlacke, ſpungie and porous, very apt to receiue ſuch kinde of thick and cold humors. Which thing alſo *Hippocrates* hath written of in the ſecond booke of his Prorrhetikes: their gums (ſaith he) are infected, and their mouthes ſtinke that haue great ſpleenes or milts: and whoſoeuer haue great milts and vſe not to bleed, can hardly be cured of this malladie, eſpecially of the vlcers in the legs, and blacke ſpots. The ſame is affirmed by *Paulus Ægineta* in his third booke, 49. chapter, where you may eaſily ſee the difference between this diſeaſe and the black jaunders; which many times are ſo confounded together, that the diſtinction or difference is hard to be known, but by the expert chirurgion: who oftentimes ſeruing in the ſhips, as wel her Maieſties as merchants, are greatly peſtered with the curing thereof: it ſhall be requiſite to carrie with them the herbe dried: the water diſtilled, and the juice put into a bottle with a narrow mouth, full almoſt to the necke, and the reſt filled vp with oile oliue, to keep it from putrifaction: the which preparations diſcreetly vſed, will ſtand them in great ſtead for the diſeaſe aforeſaid.

D The herbe ſtamped and laid vpon ſpots and blemiſhes of the face, will take them away within ſix houres, but the place muſt be waſhed after with water wherein bran hath been ſodden.

Chap. 87. *Of Twayblade, or herbe Bifoile.*

¶ *The Deſcription.*

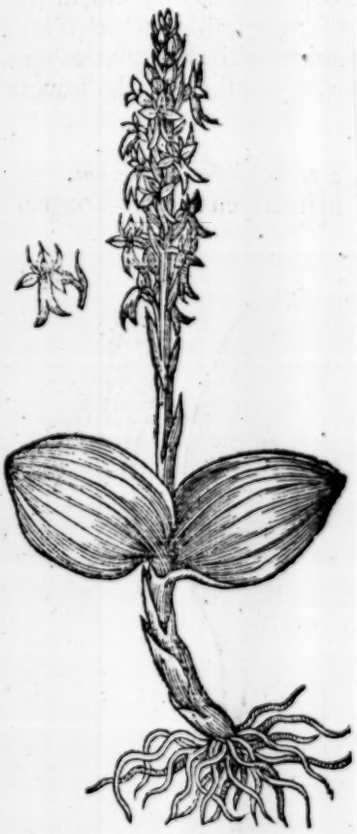
1 Herbe Byfoile hath many ſmall fibres or threddy ſtrings, faſtened vnto a ſmall knot or root, from which riſeth vp a ſlender ſtem or ſtalke, tender, fat, and full of juice; in the middle whereof are placed in comely order two broad leaues, ribbed and chamfered, in ſhape like the leaues of Plantaine: vpon the top of the ſtalke groweth a ſlender greeniſh ſpike made of many ſmall floures, each little floure reſembling a gnat, or little goſling newly hatched, very like thoſe of the third ſort of Serapias ſtones.

2 *Ophris Trifolia*, or Trefoile Twaiblade, hath roots, tender ſtalkes, and a buſh of flours like the precedent; but differeth in that, that this plant hath three leaues which do clip or embrace the ſtalke

ſtalke about; and the other hath but two, and neuer more, wherein eſpecially conſiſteth the difference: although in truth I thinke it a degenerate kinde, and hath gotten a third leafe *per accidens*, as doth ſometimes chance vnto the Adders Tongue, as ſhall be declared in the Chapter that followeth.

‡ 3 This kind of Twaiblade, firſt deſcribed in the laſt edition of *Dodonæus*, hath leaues, floures, and ſtalkes like to the ordinarie; but at the bottome of the ſtalke aboue the fibrous roots it hath a bulbe greeniſh within, and couered with two or three skins: it growes in moiſt and wet low places of Holland. ‡

1 *Ophris bifolia.*
Twaiblade.



‡ 3 *Ophris bifolia bulboſa.*
Bulbous Twaiblade.

¶ *The Place.*

The firſt groweth in moiſt medowes, fenny grounds, and ſhadowie places. I haue fonnd it in many places, as at Southfleet in Kent, in a Wood of Maſter *Sidleys* by Long-field Downes, in a Wood by London called Hampſtead Wood, in the fields by High-gate, in the Woods by Ouenden neere to Clare in Eſſex, and in the Woods by Dunmow in Eſſex. The ſecond ſort is ſeldome ſeene.

¶ *The Time.*

They floure in May and Iune.

¶ *The Names.*

It is called of the later Herbariſts, *Bifolium*, and *Ophris*.

¶ *The Nature and Vertues.*

Theſe are reported of the Herbariſts of our time to be good for greene wounds, burſtings, and ruptures; whereof I haue in my vnguents and Balſams for greene wounds had great experience, and good ſucceſſe. A

Chap. 88. *Of Adders-Tongue.*

¶ *The Deſcription.*

1 *Ophioglosſon*, or *Lingua Serpentis* (called in Engliſh Adders tongue; of ſome, Adders Graſſe, though vnproperly) riſeth forth of the ground, hauing one leafe and no more, fat or oleous in ſubſtance, of a finger long, and very like the yong and tender leaues of Marigolds: from the bottome of which leafe ſpringeth out a ſmall and tender ſtalke one finger and a halfe long, on the end whereof doth grow a long ſmall tongue not vnlike the tongue of a ſerpent, whereof it tooke the name.

2 I haue ſeene another like the former in root, ſtalke, and leafe; and differeth, in that this plant hath two, and ſometimes more crooked tongues, yet of the ſame faſhion, which if my iudgment faile not chanceth *per accidens*, euen as we ſee children borne with two thumbes vpon one hand: which moueth me ſo to thinke, for that in gathering twenty buſhels of the leaues a man ſhall hardly finde one of this faſhion.

1 *Ophioglosſon.*
Adders-Tongue.

‡ 2 *Ophioglosſon abortivum.*
Miſ-ſhapen Adders-Tongue.

¶ *The Place.*

Adders-Tongue groweth in moiſt medowes throughout moſt parts of England; as in a Meadow neere the preaching Spittle adioyning to London; in the Mantels by London, in the medowes by Cole-brooke, in the fields in Waltham Forreſt, and many other places.

¶ *The Time.*

They are to be found in Aprill and May; but in Iune they are quite vaniſhed and gone.

¶ *The Names.*

Ophioglosſum is called in ſhops *Lingua ſerpentis*, *Linguace*, and *Lingualace*: it is alſo called *Lancea Chriſti*, *Enephyllon*, and *Lingua vulneraria*: in Engliſh, Adders tongue, or Serpents tongue: in Dutch, **Natertonguen**: of the Germanes, **Nater zungelin**.

¶ *The*

¶ *The Nature.*

Adders-tongue is dry in the third degree.

¶ *The Vertues.*

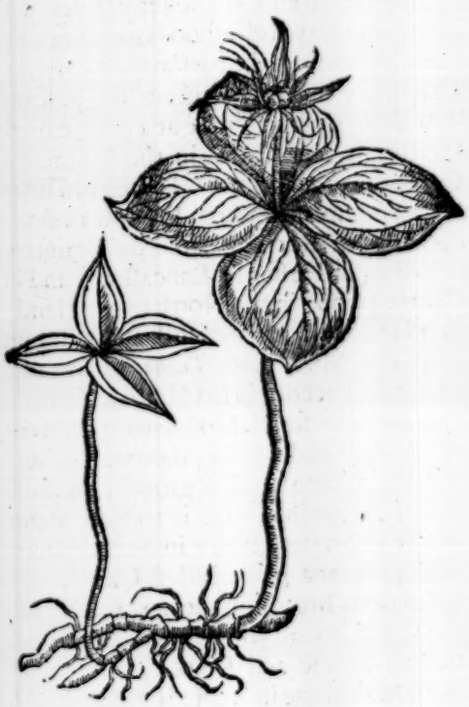
The leaues of Adders tongue ſtamped in a ſtone morter, and boyled in Oile Oliue vnto the conſumption of the iuyce, and vntill the herbes be dry and partched, and then ſtrained, will yeeld a moſt excellent greene oyle, or rather a balſam for greene wounds, comparable vnto oyle of S. *Iohns* wort, if it do not farre ſurpaſſe it by many degrees: whoſe beauty is ſuch, that very many Artiſts haue thought the ſame to be mixed with Verdigreaſe. A

CHAP. 89.

Of One-berry, or Herbe True-loue, and Moone-wort.

1 *Herba Paris.*
One-Berry, or Herbe True-loue.

2 *Lunaria minor.*
Small Moone-wort.



¶ *The Deſcription.*

1 HErbe Paris riſeth vp with one ſmall tender ſtalke two hands high; at the very top whereof come forth foure leaues directly ſet one againſt another in manner of a Burgundian Croſſe or True-loue knot: for which cauſe among the Antients it hath bin called Herbe True-loue. In the midſt of the ſaid leafe comes forth a ſtar-like floure of an herby or graſſie colour; out of the middeſt whereof there ariſeth vp a blackiſh browne berrie: the root is long and tender, creeping vnder the earth, and diſperſing it ſelfe hither and thither.

2 The ſmall Lunary ſpringeth forth of the ground with one leaſe like Adders-tongue, iagged or cut on both ſides into fiue or ſix deepe cuts or notches, not much vnlike the leaues of *Scolopendria*, or *Ceterach*, of a greene colour; whereupon doth grow a ſmall naked ſtem of a finger long, bearing at the top many little ſeeds cluſtering together; which being gathered and laid in a platter or ſuch like thing for the ſpace of three weekes, there will fall from the ſame a fine duſt or meale of a whitiſh colour, which is the ſeed if it bring forth any. The root is ſlender, and compact of many ſmall threddy ſtrings.

‡ In England (ſaith *Camerarius*) there growes a certaine kinde of *Lunaria*, which hath many leaues, and ſometimes alſo ſundry branches; which therefore I haue cauſed to be delineated, that other Herbariſts might alſo take notice hereof. Thus much *Camerarius, Epit. Mat. p. 644.* where he giues an elegant figure of a varietie hauing more leaues and branches than the ordinary, otherwiſe not differing from it.

3 Beſides this varietie there is another kinde ſet forth by *Cluſius*; whoſe figure and deſcription I thinke good here to ſet downe. This hath a root conſiſting of many fibres ſomewhat thicker than thoſe of the common kinde: from which ariſe one or two winged leaues, that is, many leaues ſet to one ſtalke; and theſe are like the leaues of the other *Lunaria*, but that they are longer, thicker, and more diuided, and of a yellowiſh greene colour. Amongſt theſe leaues there comes vp a ſtalke fat and juycie, bearing a greater tuft of floures or ſeeds (for I know not whether to cal them) than the ordinarie, but otherwiſe very like thereto. It groweth in the mountaines of Sileſia, and in ſome places of Auſtria. ‡

‡ 3 *Lunaria minor ramoſa.*
Small branched Moon-wort.

¶ *The Place.*

Herba Paris groweth plentifully in all theſe places following; that is to ſay, in Chalkney wood neere to wakes Coulne, ſeuen miles from Colcheſter in Eſſex, and in the wood by Robinhoods well, neere to Nottingham; in the parſonage orchard at Radwinter in Eſſex, neere to Saffron Walden; in Blackburne at a place called Merton in Lancaſhire; in the Moore by Canturbury called the Clapper; in Dingley wood, ſix miles from Preſton in Aunderneſſe; in Bocking parke by Braintree in Eſſex; at Heſſet in Lancaſhire, and in Cotting wood in the North of England; as that excellent painefull and diligent Phyſition Mr. Doctor *Turner* of late memorie doth record in his Herbal.

Lunaria or ſmall Moone-wort groweth vpon dry and barren mountaines and heaths. I haue found it growing in theſe places following; that is to ſay, about Bathe in Somerſetſhire in many places, eſpecially at a place called Carey, two miles from Bruton, in the next Cloſe vnto the Church-yard; on Cockes Heath betweene Lowſe and Linton, three miles from Maidſtone in Kent: it groweth alſo in the ruines of an old bricke-kilne by Colcheſter, in the ground of Mr. *George Sayer*, called Miles end: it groweth likewiſe vpon the ſide of Blacke-heath, neere vnto the ſtile that leadeth vnto Eltham houſe, about an hundred paces from the ſtile: alſo in Lancaſhire neere vnto a Wood called Faireſt, by Latham: moreouer, in Nottinghamſhire by the Weſt wood at Gringley, and at Weſton in the Ley field by the Weſt ſide of the towne; and in the Biſhops field at Yorke, neere vnto Wakefield, in the Cloſe where Sir *George Sauill* his houſe ſtandeth, called the Heath Hall, by the relation of a learned Doctor in Phyſicke called Mr. *Iohn Merſhe* of Cambridge, and many other places.

¶ *The Time.*

Herba Paris floureth in Aprill, and the berry is ripe in the end of May.
Lunaria or ſmall Moone-wort is to be ſeene in the moneth of May.

¶ *The Names.*

One-berry is alſo called Herbe True-loue, and Herbe Paris: in Latine, *Herba Paris*, and *Solanum tetraphyllum* by *Geſner* and *Lobel*.
Lunaria minor is called in Engliſh Small Lunarie, and Moon-wort.

¶ *The Nature.*

Herbe Paris is exceeding cold; whereby it repreſſes the rage and force of poiſon.
Lunaria minor is cold and dry of temperature.

¶ *The*

¶ *The Vertues.*

The berries of Herbe Paris giuen by the ſpace of twentie daies, are excellent good againſt poiſon, or the pouder of the herbe drunke in like manner halfe a ſpoonfull at a time in the morning faſting. A

The ſame is miniſtred with great ſucceſſe vnto ſuch as are become peeuiſh, or without vnderſtanding, being miniſtred as is aforeſaid, euery morning by the ſpace of twentie daies, as *Baptiſta Sardus*, and *Matthiolus* haue recorded. Since which time there hath been further experience made thereof againſt poiſon, and put in practice in the citie of Paris, in Louaine, and at the baths in Heluetia, by the right excellent Herbariſts *Matthias de L'obel*, and *Petrus Pena*, who hauing often read, that it was one of the Aconites, called *Pardalianches*, and ſo by conſequence of a poiſoning quality, they gaue it vnto dogs and lambes, who receiued no hurt by the ſame: wherefore they further proſecuted the experience thereof, and gaue vnto two dogs faſt bound or coupled together, a dram of Arſenicke, and one dram of Mercurie ſublimate mixed with fleſh (‡ in the *Aduerſaria* it is but of each halfe a dram, and there *pag.* 105. you may finde this Hiſtorie more largely ſet downe. ‡) which the dogs would not willingly eat, and therefore they had it crammed downe their throats: vnto one of theſe dogs they gaue this Antidote following in a little red wine, whereby he recouered his former health againe within a few houres: but the other dog which had none of the medicine, died incontinently. B

This is the receit.

R. *vtriuſque Angelicæ (innuit) domeſticam, & ſylueſtrem, Vicetoxici, Valerianæ domeſticæ, Polipodij querni, radicum Altheæ, & Vrticæ, ana* ʒ.iiij, *Corticis Mezerei Germanici,* ʒ.ij. *granorum herbæ Paridis, N.* 24. *foliorum eiuſdem cum toto, Num.* ʒ6. *Ex maceratis in aceto radicibus, & ſiccatis fit omnium pulvis.*

The people in Germany do vſe the leaues of Herbe Paris in greene wounds, for the which it is very good, as *Ioachimus Camerarius* reporteth; who likewiſe ſaith, that the pouder of the roots giuen to drink, doth ſpeedily ceaſe the gripings and paine of the Collicke. C

Small Moonewoort is ſingular to heale greene and freſh wounds: it ſtaieth the bloudy flix. It hath beene vſed among the Alchymiſtes and witches to doe wonders withall, who ſay, that it will looſe lockes, and make them to fall from the feet of horſes that graſe where it doth grow, and hath beene called of them *Martagon*, whereas in truth they are all but drowſie dreames and illuſions; but it is ſingular for wounds as aforeſaid. D

CHAP. 90. *Of Winter-Greene.*

¶ *The Deſcription.*

1 *Pyrola* hath many tender and verie greene leaues, almoſt like the leaues of Beete, but rather in my opinion like to the leaues of a Peare-tree, whereof it tooke his name *Pyrola*, for that it is *Pyriformis*. Among theſe leaues commeth vp a ſtalke garniſhed with prettie white floures, of a verie pleaſant ſweet ſmell, like *Lilium Conuallium*, or the Lillie of the Valley. The root is ſmall and threddie, creeping farre abroad vnder the ground.

‡ 2 This differs from the laſt deſcribed in the ſlenderneſſe of the ſtalkes, and ſmalneſſe of the leaues and floures: for the leaues of this are not ſo thicke and ſubſtantiall, but very thinne, ſharpe pointed, and very finely ſnipt about the edges, blacker, and reſembling a Peare-tree leafe. The floures are like thoſe of the former, yet ſmaller and more in number: to which ſucceed fiue cornered ſeed veſſels with a long pointell as in the precedent: the root alſo creepes no leſſe than that of the former, and here and there puts vp new ſtalkes vnder the moſſe. It growes vpon the Auſtrian and Styrian Alpes, and floures in Iune and Iuly.

3 This is an elegant plant, and ſometimes becomes ſhrubbie, for the new and ſhort branches growing vp each yeare, doe remaine firme and greene for ſome yeares, and grow ſtraight vp, vntill at length borne downe by their owne weight they fall downe and hide themſelues in the moſſe. It hath commonly at each place where new branches growe forth, two, three, or foure thicke verie greene and ſhining leaues, almoſt in forme and magnitude like to the leaues of *Laureola*, yet ſnipt about the edges, of a very drying taſte, and then bitteriſh. From among theſe leaues at the Spring of the yeare new branches ſhoot vp, hauing ſmall leaues like ſcailes vpon them, and at their toppes

grow

1 *Pyrola.*
Winter Greene.

‡ 2 *Pyrola 2 tenerior Cluſ.*
The ſmaller Winter-Greene.

‡ 3 *Pyrola 3. fruticans Cluſ.*
Shrubby Winter-Greene.

‡ 4 *Pyrola 4. minima Cluſ.*
Round leaued Winter Greene.

5 *Monophyllon.*
One Blade.

grow floures like to thoſe of the firſt deſcribed, yet ſomewhat larger, of a whitiſh purple colour; which fading, are ſucceeded by fiue cornered ſeed veſſels containing a very ſmall ſeed; the roots are long & creeping. It growes a little from Vienna in Auſtria in the woods of Entzeſtorf, and in diuers places of Bohemia and Sileſia.

4 This from creeping roots ſends vp ſhort ſtalkes, ſet at certaine ſpaces with ſmall, round, and thin leaues, alſo ſnipt about the edges, amongſt which vpon a naked ſtem growes a floure of a pretty bignes, conſiſting of fiue white ſharpiſh pointed leaues with ten threds, and a long pointell in the midſt. The ſeed is contained in ſuch heads as the former, and it is very ſmall. This growes in the ſhadowie places of the Alpes of Sneberge, Hochbergerin, Durrenſtaine, towards the roots of theſe great mountaines. *Cluſ.* ‡

5 *Monophyllon*, or *Vnifolium*, hath a leafe not much vnlike the greateſt leafe of Iuie, with many ribs or ſinewes like the Plantaine leafe; which ſingle leafe doth alwaies ſpring forth of the earth alone, but when the ſtalke riſeth vp, it bringeth vpon his ſides two leaues, in faſhion like the former; at the top of which ſlender ſtalke come forth fine ſmall floures like *Pyrola*; which being vaded, there ſucceed ſmall red berries. The roote is ſmall, tender, and creeping farre abroad vnder the vpper face of the earth.

¶ *The Place.*

1 *Pyrola* groweth in Lanſdale, and Crauen, in the North part of England, eſpecially in a cloſe called Crag-cloſe.

2 *Monophyllon* groweth in Lancaſhire in Dingley wood, ſix miles from Preſton in Aunderneſſe; and in Harwood, neere to Blackburne likewiſe.

¶ *The Time.*

1 *Pyrola* floureth in Iune and Iuly, and groweth winter and ſommer.

2 *Monophyllon* floureth in May, and the fruit is ripe in September.

¶ *The Names.*

1 *Pyrola* is called in Engliſh Winter-greene: it hath beene called *Limonium* of diuers, but vntruly.

2 *Monophyllon*, according to the etymologie of the word, is called in Latine *Vnifolium*: in Engliſh, One-blade, or One-leafe.

¶ *The Nature:*

1 *Pyrola* is cold in the ſecond degree, and drie in the third.

2 *Monophyllon* is hot and dry of complexion.

¶ *The Vertues.*

Pyrola is a moſt ſingular wound-hearbe, either giuen inwardly, or applied outwardly: the leaues whereof ſtamped and ſtrained, and the iuice made into an vnguent, or healing ſalue, with waxe, oile, and turpentine, doth cure wounds, vlcers, and fiſtulaes, that are mundified from the callous & tough matter, which keepeth the ſame from healing. A

The decoction hereof made with wine, is commended to cloſe vp and heale wounds of the entrailes, and inward parts: it is alſo good for vlcers of the kidneies, eſpecially made with water, and the roots of Comfrey added thereto. B

The leaues of *Monophyllon*, or *Vnifolium*, are of the ſame force in wounds with *Pyrola*, eſpecially in wounds among the nerues and ſinewes. Moreouer, it is eſteemed of ſome late writers a moſt perfect medicine againſt the peſtilence, and all poiſons, if a dram of the root be giuen in vineger mixed with wine or water, and the ſicke go to bed and ſweat vpon it. C

Chap.

Chap. 91. *Of Lilly in the valley, or May Lilly.*

1 *Lilium conuallium.*
Conuall Lillies.

2 *Lilium connallium floribus ſuaue-rubentibus.*
Red Conuall Lillies.

¶ *The Deſcription.*

1 THe Conuall Lillie, or Lilly of the Vally, hath many leaues like the ſmalleſt leaues of Water Plantaine; among which riſeth vp a naked ſtalke halfe a foot high, garniſhed with many white floures like little bels, with blunt and turned edges, of a ſtrong ſauour, yet pleaſant enough; which being paſt, there come ſmall red berries, much like the berries of *Aſparagus*, wherein the ſeed is contained. The root is ſmall and ſlender, creeping far abroad in the ground.

2 The ſecond kinde of May Lillies, is like the former in euery reſpect; and herein varieth or differeth, in that this kinde hath reddiſh floures, and is thought to haue the ſweeter ſmell.

¶ *The Place.*

1 The firſt groweth on Hampſted heath, foure miles from London, in great abundance: neere to Lee in Eſſex, and vpon Buſhie heath, thirteene miles from London, and many other places.

2 That other kind with the red floure is a ſtranger in England: howbeit I haue the ſame growing in my garden.

¶ *The Time.*

They floure in May, and their fruit is ripe in September.

¶ *The Names.*

The Latines haue named it *Lilium Conuallium*: *Geſner* doth thinke it to be *Callionymum*: in the Germane tongue, **Meyen blumlen**: the low Dutch, **Meyen bloemkens**: in French, *Muguet*: yet there is likewiſe another herbe which they call *Muguet*, commonly named in Engliſh, Woodroof. It is called in Engliſh Lillie of the Valley, or the Conuall Lillie, and May Lillies, and in ſome places Liriconfaneie.

¶ *The Nature.*

They are hot and drie of complexion.

¶ The

¶ *The Vertues.*

The floures of the Valley Lillie diſtilled with wine, and drunke the quantitie of a ſpoonfull, reſtoreth ſpeech vnto thoſe that haue the dum palſie and that are falne into the Apoplexie, and is good againſt the gout, and comforteth the heart. A

The water aforeſaid doth ſtrengthen the memorie that is weakened and diminiſhed; it helpeth alſo the inflammation of the eies, being dropped thereinto. B

The floures of May Lillies put into a glaſſe, and ſet in a hill of antes cloſe ſtopped for the ſpace of a moneth and then taken out, therein you ſhall find a liquour, that appeaſeth the paine & griefe of the gout, being outwardly applied; which is commended to be moſt excellent. C

Chap. 92. *Of Sea Lauander.*

1 *Limonium.*
Sea Lauander.

2 *Limonium parvum.*
Rocke Lauander.

¶ *The Deſcription.*

1 THere hath beene among writers from time to time, great contention about this plant *Limonium*, no one authour agreeing with another: for ſome haue called this herbe *Limonium*; ſome another herb by this name; & ſome in remouing the rock, haue mired themſelues in the mud, as *Matthiolus*, who deſcribed two kindes, but made no diſtinction of them, nor yet expreſſed which was the true *Limonium*; but as a man heerein ignorant, hee ſpeakes not a word of them. Now then to leaue controuerſies and cauilling, the true *Limonium* is that which hath faire leaues, like the Limon or Orenge tree, but of a darke greene colour, ſomewhat fatter, and a little crumpled: amongſt which leaues riſeth vp an hard and brittle naked ſtalke of a foot high, diuided at the top into ſundry other ſmall branches, which grow for the moſt part vpon the one ſide, full of little blewiſh floures, in ſhew like Lauander, with long red ſeed, and a thicke root like vnto the ſmall Docke.

2 There is a kinde of *Limonium* like the firſt in each reſpect, but leſſer, which groweth vpon rockes and chalkie cliffes.

‡ 3 Beſides theſe two here deſcribed, there is another elegant Plant by *Cluſius* and others referred to this kindred: the deſcription thereof is thus; from a long ſlender root come forth long greene leaues lying ſpred vpon the ground, being alſo deepely ſinuated on both ſides, and ſomewhat roughiſh. Amongſt theſe leaues grow vp the ſtalkes welted with ſlender indented skinnes, and towards their tops they are diuided into ſundry branches after the manner of the ordinarie one; but theſe branches are alſo winged, and at their tops they carry floures ſome foure or fiue clu-

cluſtering together, conſiſting of one thin criſpe or crumpled leafe of a light blew colour (which continues long, if you gather them in their perfect vigour, and ſo drie them) and in the middeſt of this blew comes vp little white floures, conſiſting of fiue little round leaues with ſome white threds in their middles. This plant was firſt obſerued by *Rauwolfius* at Ioppa in Syria: but it growes alſo vpon the coaſts of Barbarie, and at Malacca and Cadiz in Spaine: I haue ſeene it growing with many other rare plants, in the Garden of my kinde friend M^r. *Iohn Tradeſcant* at South Lambeth.

4 *Cluſius* in the end of his fourth Booke *Hiſtoriæ Plantarum*, ſets forth this, and ſaith, hee receiued this figure with one dryed leafe of the plant ſent him from Paris from *Claude Gonier* an Apothecarie of that citie, who receiued it (as you ſee it here expreſt) from Lisbone. Now *Cluſius* deſcribes the leafe that it was hard, and as if it had been a piece of leather, open on the vpper ſide, and diſtinguiſhed with many large purple veines on the inſide, &c. for the reſt of his deſcription was onely taken from the figure (as he himſelfe ſaith) which I hold impertinent to ſet downe, ſeeing I heere giue you the ſame figure, which by no meanes I could omit, for the ſtrangeneſſe thereof, but hope that ſome or other that trauell into forraine parts may finde this elegant plant, and know it by this ſmall expreſſion, and bring it home with them, that ſo we may come to a perfecter knowledge thereof. ‡

‡ 3 *Limonium folio ſinuato.*
Sea-Lauander with the indented leafe.

‡ 4 *Limonio congener, Cluſ.*
Hollow leaued Sea-Lauander.

¶ *The Place.*

1 The firſt groweth in great plentie vpon the walls of the fort againſt Graueſend: but abundantly on the bankes of the Riuer below the ſame towne, as alſo below the Kings Store-houſe at Chattam: and faſt by the Kings Ferrey going into the Iſle of Shepey: in the ſalt marſhes by Lee in Eſſex: in the Marſh by Harwich, and many other places.

2 The

The ſmall kinde I could neuer finde in any other place but vpon the chalky cliffe going from the towne of Margate downe to the ſea ſide, vpon the left hand.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

It ſhall be needleſſe to trouble you with any other Latine name than is expreſt in their titles: the people neere the ſea ſide where it groweth do call it Marſh Lauander, and ſea Lauander.

‡ This cannot be the *Limonium* of *Dioſcorides*, for the leaues are not longer than a Beet, nor the ſtalke ſo tall as that of a Lillie, but you ſhall finde more hereafter concerning this in the Chapter of water Plantaine. I cannot better refer this to any plant deſcribed by the Antients than to *Britannica* deſcribed by *Dioſcorides, lib. 4. cap. 2.* ‡

¶ *The Nature.*

The ſeed of *Limonium* is very aſtringent or binding.

¶ *The Vertues.*

The ſeed beaten into pouder, and drunke in wine, helpeth the collicke, ſtrangurie, and Dyſen- A
teria.

The ſeed taken as aforeſaid, ſtaieth the ouermuch flowing of womens termes, and all other B
fluxes of bloud.

Chap. 93. *Of Serapias Turbith, or Sea Starwort.*

1 *Tripolium vulgare majus.*
Great Sea Starwort.

‡ 2 *Tripolium vulgare minus.*
Small Sea Starwort.

¶ *The Deſcription.*

1 The firſt kinde of *Tripolium* hath long and large leaues ſomewhat hollow or furrowed, of a ſhining greene colour declining to blewneſſe, like the leaues of Woade: among which riſeth vp a ſtalke of two cubits high, and more, which toward the top is diuided into many ſmall branches garniſhed with many floures like Camomill, yellow in the middle, ſet about

or bordered with small blewish leaues, like a pale, as in the foures of Camomill, which grow into a whitish rough downe, that flieth away with the winde. The root is long and threddy.

2 There is another kinde of *Tripolium* like the first, but much smaller, wherein consisteth the difference.

¶ *The Place.*

These herbs grow plentifully alongst the English coasts in many places, as by the fort against Grauesend, in the Ile of Shepey in sundry places, in a marsh which is vnder the towne walls of Harwich, in the marsh by Lee in Essex, in a marsh which is between the Ile of Shepey and Sandwich, especially where it ebbeth and floweth: being brought into gardens, it flourisheth a long time, but there it waxeth huge, great, and ranke; and changeth the great roots into strings.

¶ *The Time.*

These herbs do floure in May and Iune.

¶ *The Names.*

It is reported by men of great fame and learning, that this plant was called *Tripolium*, because it doth change the colour of his floures thrice in a day. This rumour we may beleeue, and it may be true, for that we see and perceiue things of as great and greater wonder to proceed out of the earth. This herbe I planted in my garden, whither (in his season) I did repaire to finde out the truth hereof, but I could not espie any such variablenesse herein; yet thus much I may say, that as the heate of the sunne doth change the colour of diuers floures, so it fell out with this, which in the morning was very faire, but afterward of a pale or wan colour. Which prooueth that to be but a fable which *Dioscorides* saith is reported by some, that in one day it changeth the colour of his floures thrice: that is to say, in the morning it is white, at noone purple, and in the euening πύρρον: or crimson. But it is not vntrue, that there may be found three colours of the floures in one day, by reason that the floures are not all perfected together (as before I partly touched) but one after another by little and little. And there may easily be obserued three colours in them, which is to be vnderstood of them that are beginning to floure, that are perfectly floured, and those that are falling away. For they that are blowing and be not wide open and perfect, are of a purplish colour, and those that are perfect and wide open, of a whitish blew; and such as haue fallen away haue a white down: which changing happeth vnto sundry other plants. This herbe is called of *Serapio*, *Turbith*: women that dwell by the sea side, call it in English, blew Daisies, or blew Camomill; and about Harwich it is called Hogs beanes, for that the swine do greatly desire to feed thereon: as also for that the knobs about the roots doe somewhat resemble the Garden Beane. It is called in Greeke πόντιον: and diuers others ἄγριον: it may be fitly called *After Marinus*, or *Amellus Marinus*: in English, Sea Starwort, Serapio's Turbith: of some, Blew Daisies. The Arabian *Serapio*, doth call Sea Starwort, Turbith, and after him, *Auicen*: yet *Actuarius* the Grecian doth thinke that Turbith is the root of *Alypum*: *Mesues* iudged it to be the root of an herbe like fennell. The Historie of Turbith of the shops shall be discoursed vpon in his proper place.

¶ *The Nature.*

Tripolium is hot in the third degree, as *Galen* saith.

¶ *The Vertues.*

A The root of *Tripolium* taken in wine by the quantitie of two drams, driueth forth by siege waterish and grosse humors, for which cause it is often giuen to them that haue the dropsie.

B It is an excellent herbe against poison, and comparable with *Pyrola*, if not of greater efficacy in healing of wounds either outward or inward.

Chap. 94. *Of Turbith of Antioch.*

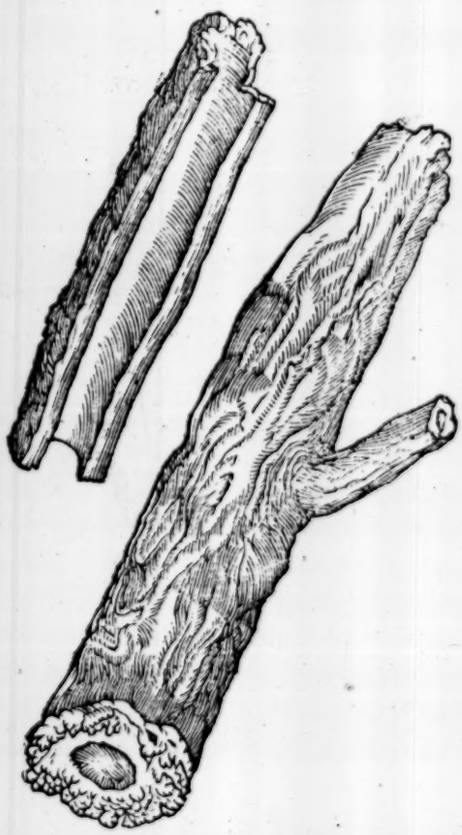
¶ *The Description.*

Garcias a Portugal Physition saith that Turbith is a plant hauing a root which is neither great nor long: the stalke is of two spans long, sometimes much longer, a finger thicke, which creepeth in the ground like Iuie, and bringeth forth leaues like those of the marish Mallow. The floures be also like those of the Mallow, of a reddish white colour: the lower part of the stalke only, which is next to the root and gummie, is that which is profitable in medicine, and is the same that is vsed in shops: they chuse that for the best which is hollow, and round like a reed, brittle, and with a smooth barke, as also that whereunto doth cleaue a congealed gum, which is said to be *gummosum*, or gummy, and somewhat white. But, as *Garcias* saith, it is not alwaies

gummie

gummie of his owne nature, but the Indians becauſe they ſee that our merchants note the beſt Turbith by the gummineſſe, are wont before they gather the ſame, either to writhe or elſe lightly to bruſe them, that the ſap or liquor may iſſue out; which root being once hardned, they picke out from the reſt to ſell at a greater price. It is likewiſe made white, as the ſaid Author ſheweth, being dried in the ſunne: for if it be dried in the ſhadow it waxeth blacke, which notwithſtanding may be as good as the white which is dried in the Sunne.

Turbith Alexandrinum officinarum.
Turpetum, or Turbith o fthe ſhops.



¶ *The Place.*

It groweth by the ſea ſide, but yet not ſo neere that the waſh or water of the ſea may come to it, but neere about, and that for two or three miles in vntilled grounds, rather moiſt than drie. It is found in Cambaya, Surrate, in the Ile Dion, Bazaim, and in places hard adioining; alſo in Guzarate, where it groweth plentifully, from whence great abundance of it is brought into Perſia, Arabia, Aſia the leſſe, and alſo into Portingale and other parts of Europe: but that is preferred which groweth in Cambaya.

¶ *The Names.*

It is called of the Arabians, Perſians, and Turkes *Turbith*: and in Guzarata *Baycaman*: in the prouince Canara, in which is the city Goa, *Tiguar*: likewiſe in Europe the learned call it diuerſly, according to their ſeuerall fancies, which hath bred ſundry controuerſies, as it hath fallen out aſwell in Hermodactyls, as in Turbith; the vſe and poſſeſſion of which we cannot ſeeme to want: but which plant is the true Turbith, we haue great cauſe to doubt; Some haue thought our *Tripolium marinum*, deſcribed in the former chapter, to be Turbith: others haue ſuppoſed it to be one of the *Tithymales*, but which kinde they know not: *Guillandinus* ſaith, that the root of *Tithymalus myrſinitis* is the true Turbith; which cauſed *Lobelius* and *Pena* to plucke vp by the roots all the kindes of *Tithymales*, and drie them very curiouſly; which when they had beheld, and throughly tried, they found it nothing ſo. The Arabians and halfe Moores that dwell in the Eaſt parts haue giuen diuers names vnto this plant: and as their words are diuers, ſo haue they diuers ſignificatious; but this name Turbith they ſeeme to interpret to be any milky root which doth ſtrongly purge flegme, as this plant doth. So that as men haue thought good, pleaſing themſelues, they haue made many and diuers conſtuctions which haue troubled many excellent learned men to know what root is the true Turbirh. But briefly to ſet downe my opinion, not varying from the iudgment of men which are of great experience; I thinke aſſuredly that the root of Scammony of Antioch is the true and vndoubted Turbith, one reaſon eſpecially that moueth me ſo to thinke is, for that I haue taken vp the roots of Scammony which grew in my garden, and compared them with the roots of Turbith, between which I found little or no difference at all

‡ Through all Spain (as *Cluſius* in his notes vpon *Garcias* teſtifies) they vſe the roots of *Thapſia* for Turbith which alſo haue been brought hither, and I keepe ſome of them by me, but they purge little or nothing at all being drie, though it may be the green root or juice may haue ſome purging faculty. ‡

¶ *The Temperature and Vertues.*

The Indian phyſitions vſe it to purge flegme, to which if there be no feuer they adde ginger, otherwiſe they giue it without in the broth of a chicken, and ſometimes in faire water. A

Meſues writeth, that Turbith is hot in the third degree; and that it voideth thicke tough flegme out of the ſtomacke, cheſt, ſinewes, and out of the furthermoſt parts of the body: but (as he ſaith) it is ſlow in working, and troubleth and ouerturneth the ſtomacke: and therefore ginger, maſticke, and other ſpices are to be mixed with it; alſo oile of ſweet almondes, or almondes themſelues, or ſugar, leaſt the body with the vſe herof ſhould pine and fall away. Others tem- B

per it with Dates, ſweet Almonds, and certaine other things, making thereof a compoſition (that the Apothecaries call an Electuarie) which is named διαφοινικῶν: common in ſhops, and in continuall vſe among expert Phyſitions.

C There is giuen at one time of this Turbith one dram (more or leſſe) two at the moſt: but in the decoction, or in the infuſion three or foure.

Chap. 95. *Of Arrow-head, or Water-archer.*

1 *Sagittaria maior.*
Great Arrow-head.

2 *Sagittaria minor.*
Small Arrow-head.

¶ *The Deſcription.*

1 THe firſt kinde of Water-archer or Arrow-head, hath large and long leaues, in ſhape like the ſigne *Sagittarius*, or rather like a bearded broad Arrow head. Among which riſeth vp a fat and thicke ſtalke, two or three foot long, hauing at the top many prettie white floures, declining to a light carnation, compact of three ſmall leaues: which being paſt, there come after great rough knops or burres wherein is the ſeed. The root conſiſteth of many ſtrings.

2 The ſecond is like the firſt, and differeth in that this kinde hath ſmaller leaues and floures, and greater burres and roots.

3 The third kinde of Arrow-head hath leaues in ſhape like the broad Arrow-head, ſtanding vpon the ends of tender foot ſtalkes a cubit long: among which riſe vp long naked ſmooth ſtalks of a greeniſh colour, from the middle whereof to the top doe grow floures like to the precedent. The root is ſmall and threddie.

¶ *The Place.*

Theſe herbes doe grow in the watrie ditches by Saint George his field neere vnto London; in the Tower ditch at London; in the ditches neere the wals of Oxford; by Chelmesford in Eſſex, and many other places, as namely in the ditch neere the place of execution, called Saint *Thomas Waterings* not far from London.

¶ *The Time.*

They floure in May and Iune.

¶ *The*

¶ *The Names.*

Sagittaria, may be called in Engliſh the Water-archer, or Arrow-head. ‡ Some would haue it the *Ibleum* of *Theophraſtus*; and it is the *Piſtana Magonis*, and *Sagitta* of *Pliny*, *lib.* 21. *cap.* 17.

¶ *The Nature and Vertues.*

I finde not any thing extant in writing either concerning their vertues or temperament, but doubtleſſe they are cold and drie in qualitie, and are like Plantaine in facultie and temperament.

CHAP. 96. *Of Water Plantaine.*

1 *Plantago aquatica maior.*
Great Water Plantaine.

2 *Plantago aquatica minor ſtellata.*
Starry headed ſmall Water Plantaine.

3 *Plantago aquatica humilis.* Dwarfe water Plantaine.

¶ *The Deſcription.*

1 THe firſt kinde of water Plantaine hath faire great large leaues like the land Plaintaine, but ſmoother, and full of ribs or ſinewes: among which riſeth vp a tall ſtemme foure foot high, diuiding it ſelfe into many ſlender branches, garniſhed with infinit ſmall white floures,

which being paſt there appeare triangle huskes or buttons wherein is the ſeed. The root is as it were a great tuft of threds or thrums.

‡ 2 This plant in his roots and leaues is like the laſt deſcribed, as alſo in the ſtalke, but much leſſe in each of them, the ſtalke being about ſome foot high; at the top whereof ſtand many pretty ſtarre-like skinny ſeed-veſſels, containing a yellowiſh ſeed. ‡

3 The ſecond kinde hath long, little, and narrow leaues, much like the Plantaine called Ribwoort: among which riſe vp ſmall and feeble ſtalks branched at the top, whereon are placed white floures, conſiſting of three ſlender leaues; which being fallen, there come to your view round knobs, or rough burs: the root is threddy.

¶ *The Place.*

1 This herbe growes about the brinkes of riuers, ponds and ditches almoſt euery where.

‡ 2 3 Theſe are more rare. I found the ſecond a little beyond Ilford, in the way to Rumford, and Mr. *Goodyer* found it alſo growing vpon Hounſlow heath. I found the third in the Company of Mr. *William Broad*, and Mr. *Leonard Buckner*, in a ditch on this ſide Margate in the Iſle of Tenet. ‡

¶ *The Time.*

They floure from Iune till Auguſt.

¶ *The Names.*

The firſt kinde is called *Plantago aquatica*, that is, water Plantaine. ‡ The ſecond *Lobell* calls *Aliſma puſillum Anguſtifolium muricatum*, and in the *Hiſt. Lugd.* it is called *Damaſonium ſtellatum*. ‡ The third is named *Plantago aquatica humilis*, that is, the low water Plantaine.

‡ I thinke it fit here to reſtore this plant to his antient dignitie, that is, his names and titles wherewith he was anciently dignified by *Dioſcorides* and *Pliny*. The former whereof calls it by ſundry names, and all very ſignificant and proper, as λειμώνιον, ποταμογείτων, νευρώδης, λογχίτης: thus many are Greek, and therefore ought not to be reiected, as they haue been by ſome without either reaſon or authoritie. For the barbarous names we can ſay nothing; now it is ſaid to be called *Limonium*, becauſe ὁ λειμὼν φύεται: it growes in wet or ouerflowen medowes: it is called *Neuroides*, becauſe the leafe is compoſed of diuers ſtrings or fibres running from the one end thereof to the other, as in Plantain, which therfore by *Dioſcorides* is termed by the ſame reaſon πολύνευος: Alſo it may be as fitly termed *Lonchitis* for the ſimilitude which the leafe hath to the top or head of a lance which λόγχη properly ſignifies, as that other plant deſcribed by *Dioſ. lib.* 3. *cap.* 161. for that the ſeed (a leſſe eminent part) reſembles the ſame thing. And for *Potamogeiton* which ſignifies a neighbour to the Riuer or water, I thinke it loues the water aſwell, and is as neere a neighbour to it as that which takes it's name from thence, and is deſcribed by *Dioſcorides*, *lib.* 4. *cap.* 101. Now to come to *Pliny*, *lib.* 20. *cap.* 8. he calls it, *Beta ſilueſtris*, *Limonion*, and *Neuroides*: the two later namesare out of *Dioſcorides*, and I ſhall ſhew you where alſo you ſhall finde the former in him. Thus much I thinke might ſerue for the vindication of my aſſertion, for I dare boldly affirme that no late writer can fit all theſe names to any other plant, and that makes me more to wonder that all our late Herbariſts as *Matthiolus*, *Dodonæus*, *Fuchſius*, *Cæſalpinus*, *Daleſchampius*, but aboue all *Pena* and *Lobell*, who *Aduerſ. pag.* 126. call it to queſtion, ſhould not allow this plant to be *Limonium*, eſpecially ſeing that *Anguillara* had before or in their time aſſerted it ſo to be; but whether he gaue any reaſons or no for his aſſertion, I cannot tell, becauſe I could neuer by any meanes get his Opinions, but only finde by *Bauhine* his *Pinax* that ſuch was his opinion hereof. But to returne from whence I digreſt, I will giue you *Dioſcorides* his deſcription, and a briefe explanation thereof, and ſo deſiſt; it is thus: It hath leaues like a Beet, thinner and larger, 10. or more; a ſtalke ſlender, ſtraight, and as tall as that of a Lilly, and full of ſeeds of an aſtringent taſte. The leaues of this you ſee are larger than thoſe of a Beet, and thin, and as I formerly told you in the names, neruous; which to be ſo may be plainely gathered by *Dioſcorides* his words in the deſcription of white Hellebore, whoſe leaues he compares to the leaues of Plantaine and the wilde Beet: now there is no wild Beet mentioned by any of the Antients, but only this by *Pliny* in the place formerly quoted, nor no leafe more fit to compare thoſe of white Hellebore to, than thoſe of water Plantaine, eſpecially for the nerues and fibres that run alongſt the leaues; the ſtalke alſo of this is but ſlender conſidering the height, and it growes ſtraight, and as high as that of a Lilly, with the top plentirifully ſtored with aſtringent ſeed; ſo that no one note is wanting in this, nor ſcarſe any to be found in the other plants that many haue of late ſet forth for *Limonium*. ‡

¶ *The Nature.*

Water Plantaine is cold and dry of temperature.

¶ *The*

¶ *The Vertues.*

The leaues of water Plantaine, as ſome Authors report, are good to be laid vpon the legs of ſuch as are troubled with the Dropſie, and hath the ſame propertie that the land Plantaine hath. A

‡ *Dioſcorides* and *Galen* commend the ſeed hereof giuen in Wine, againſt Fluxes, Dyſenteries, the ſpitting of bloud, and ouermuch flowing of womens termes. B

Pliny ſaith, the leaues are good againſt burnes. ‡ C

Chap. 97. *Of Land Plantaine.*

1 *Plantago latifolia.*
Broad leaued Plantaine.

2 *Plantago incana.*
Hoarie Plantaine.

¶ *The Deſcription.*

1 AS the Greekes haue called ſome kindes of Herbes Serpents tongue, Dogs tongue, and Oxe tongue; ſo haue they termed a kind of Plantaine *Arnogloſſon*, which is as if you ſhould ſay Lambes tongue, very well knowne vnto all, by reaſon of the great commoditie and plenty thereof growing euery where; and therefore it is needleſſe to ſpend time about them. The greatneſſe and faſhion of the leaues hath been the cauſe of the varieties and diuerſities of their names

2 The ſecond is like the firſt kinde, and differeth in that, that this kinde of Plantaine hath greater, but ſhorter ſpikes or knaps: and the leaues are of an hoarie or ouerworne greene colour: the ſtalkes are likewiſe hoary and hairy.

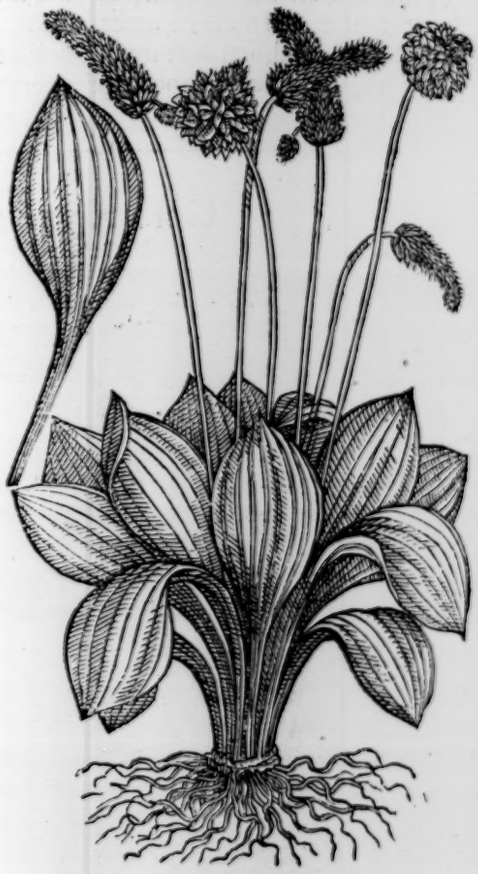
3 The ſmall Plantaine hath many tender leaues ribbed like vnto the great Plantaine, and is very like in each reſpect vnto it, ſauing that it is altogether leſſer.

4 The ſpiked Roſe Plantaine hath very few leaues, narrower than the leaues of the ſecond kinde of Plantaine, ſharper at the ends, and further growing one from another. It beareth a very double floure vpon a ſhort ſtem like a roſe, of a greeniſh colour tending to yellowneſſe. The ſeed groweth vpon a ſpikie tuft aboue the higheſt part of the plant; notwithſtanding it is but very low in reſpect of the other Plantaines aboue mentioned.

5 The

4 *Plantago Roſea ſpicata.*
Spiked Roſe Plantaine.

5 *Plantago Roſea exotica.*
Strange Roſe Plantaine.



‡ 6 *Plantago panniculis ſparſis.*
Plantaine with ſpoky tufts.

5 The fifth kinde of Plantaine hath beene a ſtranger in England and elſewhere, vntill the impreſſion hereof. The cauſe why I ſay ſo is, the want of conſideration of the beauty which is in this plant, wherein it excelleth all the other. Moreouer, becauſe that it hath not bin written of or recorded before this preſent time, though plants of leſſer moment haue beene very curiouſly ſet forth. This plant hath leaues like vnto them of the former, and more orderly ſpred vpon the ground like a Roſe: among which riſe vp many ſmall ſtalks like the other plantaines, hauing at the top of euery one a fine double Roſe altogether vnlike the former, of an hoary or ruſty greene colour.

‡ I take this ſet forth by our Author to be the ſame with that which *Cluſius* receiued from *Iames Garret* the yonger, from London; and therefore I giue you the figure thereof in this place, together with this addition to the hiſtorie out of *Cluſius*: That ſome of the heads are like thoſe of the former Roſe Plantaine; other ſome are ſpike faſhion, and ſome haue a ſpike growing as it were out of the midſt of the Roſe, and ſome heads are otherwiſe ſhaped: alſo the whole plant is more hoary than the common Roſe Plantaine.

6 This plantain muſt not here be forgot, though it be ſomwhat hard to be found: his leaues, roots, and ſtalkes are like thoſe of the ordinarie, but in ſtead of a compact ſpike it hath one much diuided after the manner as you ſee it here expreſſed in the figure, and the colour thereof is greeniſh. ‡

¶ *The*

¶ *The Place.*

The greater Plantaines do grow almoſt euery where.

The leſſer Plantaine is found on the ſea coaſts and bankes of great riuers, which are ſometimes waſhed with brackiſh water.

‡ The Roſe Plantaines grow with vs in gardens; and the ſixth with ſpokie tufts groweth in ſome places in the Iſle of Tenet, where I firſt found it, being in company with Mr. *Thomas Hickes*, Mr. *Leonard Buckner*, and other London Apothecaries, *Anno* 1632. ‡

¶ *The Time.*

They are to be ſeene from Aprill vnto September.

¶ *The Names.*

Plantaine is called in Latine *Plantago*, and in Greeke ἀρνόγλωσσα, and *Arnogloſſa*; that is to ſay, Lambes tongue: the Apothecaries keepe the Latine name: in Italian, *Piantagine*, and *Plantagine*: in Spaniſh, *Lhantem*: the Germanes, **Wegrich**: in Low-Dutch, **Wechbze**: in Engliſh, Plantain, and Weybred: in French, *Plantain*.

¶ *The Temperature.*

Plantaine (as *Galen* ſaith) is of a mixt temperature; for it hath in it a certaine waterie coldneſſe, with a little harſhneſſe, earthy, dry, and cold: therefore they are cold and dry in the ſecond degree. To be briefe, they are dry without biting, and cold without benumming. The root is of like temperature, but drier, and not ſo cold. The ſeed is of ſubtill parts, and of temperature leſſe cold.

¶ *The Vertues.*

Plantaine is good for vlcers that are of hard curation, for fluxes, iſſues, rheumes, and rottenneſſe, A
and for the bloudy flix: it ſtayeth bleeding, it heales vp hollow ſores and vlcers, as well old as new. Of all the Plantaines the greateſt is the beſt, and excelleth the reſt in facultie and vertue.

The iuyce or decoction of Plantaine drunken ſtoppeth the bloudy flix and all other fluxes of B
the belly, ſtoppeth the piſſing of bloud, ſpitting of bloud, and all other iſſues of bloud in man or woman, and the deſire to vomit.

Plantaine leaues ſtamped and made into a Tanſie, with the yelkes of egges, ſtayeth the inordi- C
nate flux of the termes, although it haue continued many yeares.

The root of Plantaine with the ſeed boyled in white Wine and drunke, openeth the conduits D
or paſſages of the liuer and kidnies, cures the jaundice, and vlcerations of the kidnies and bladder.

The juyce dropped in the eyes doth coole the heat and inflammation thereof. I finde in anci- E
ent Writers many good-morrowes, which I thinke not meet to bring into your memorie againe; as that three roots will cure one griefe, foure another diſeaſe, ſix hanged about the necke are good for another maladie, &c. all which are but ridiculous toyes.

The leaues are ſingular good to make a water to waſh a ſore throat or mouth, or the priuy parts F
of a man or woman.

The leaues of Plantaine ſtamped and put into Oyle Oliue, and ſet in the hot Sun for a moneth G
together, and after boyled in a kettle of ſeething water (which we doe call *Balneum Mariæ*) and then ſtrained, preuaileth againſt the paines in the eares, the yard, or matrix, (being dropped into the eares, or caſt with a ſyringe into the other parts before rehearſed) or the paines of the fundament; proued by a learned Gentleman Mr. *William Godowrus* Sergeant Surgeon to the Queenes Maieſtie.

Chap. 98. *Of Rib-wort.*

¶ *The Deſcription.*

1 Rib-wort or ſmall Plantaine hath many leaues flat ſpred vpon the ground, narrow, ſharp pointed, and ribbed for the moſt part with fiue nerues or ſinewes, and therefore it was called *Quinque-neruia*; in the middle of which leaues riſeth vp a creſted or ribbed ſtalke, bearing at the top a darke or dusky knap, ſet with a few ſuch white floures as are the floures of wheat. The root and other parts are like the other Plantaines.

‡ There is another leſſe kinde of this Rib-wort, which differs not from the laſt mentioned in any thing but the ſmallneſſe thereof. ‡

2 Roſe Rib-wort hath many broad and long leaues of a darke greene colour, ſharpe pointed, and ribbed with fiue nerues or ſinewes like the common Rib-wort; amongſt which riſe vp naked ſtalkes furrowed, chamfered, or creſted with certaine ſharpe edges: at the top whereof groweth a great and large tuft of ſuch leaues as thoſe are that grow next the ground, making one entire tuft

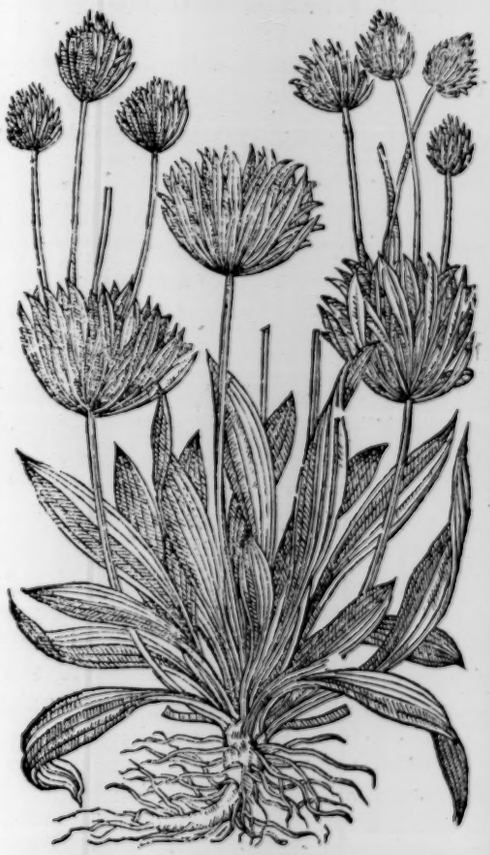
or

or vmbel, in ſhape reſembling the roſe (wherof I thought good to giue it his ſyrname Roſe) which is from his floure.

‡ This alſo I think differs not from that of *Cluſius*; wherefore I giue his figure in the place of that ſet forth by our Author. ‡

1 *Plantago quinqueneruia.*
Ribwort Plantaine.

2 *Plantago quinqueneruia roſea.*
Roſe Ribwort.



¶ *The Place.*

Ribwort groweth almoſt euery where in the borders of path-wayes and fertile fields.

Roſe Ribwort is not very common in any place, notwithſtanding it groweth in my garden, and wilde alſo in the North parts of England; and in a field neere London by a village called Hogſdon, found by a learned merchant of London Mr. *Iames Cole*, a louer of plants, and very skilfull in the knowledge of them.

¶ *The Time.*

They floure and flouriſh when the other Plantaines do.

¶ *The Names.*

Ribwort is called in Greeke, Ἀρνόγλωσσον μικρὸν: and of ſome, πτυόνευρον: in Latine, *Plantago minor*, *Quinqueneruia*, and *Lanceola*, or *Lanceolata*: in high Dutch, **Spitziger wegrich**: in French, *Lanceole*: in Low-Dutch, **Hondts ribbe**; that is to ſay in Latine, *Coſta canina*, or Dogs rib: in Engliſh, Ribwort, and Ribwort Plantaine.

The ſecond I haue thought meet to cal Roſe Ribwort in Engliſh, and *Quinqueneruia roſea* in Latine.

¶ *The Temperature.*

Ribwort is cold and dry in the ſecond degree, as are the Plantains.

¶ *The Vertues.*

The vertues are referred to the kindes of Plantaines.

Chap.

Chap. 99. *Of Sea Plantaines.*

1 *Holoſteum Salamanticum.*
Flouring ſea Plantaine.

2 *Holoſteum parvum.*
Small ſea Plantaine.

3 *Plantago marina.*
Sea Plantaine.

¶ *The Deſcription.*

1 *Carolus Cluſius* that excellent Herbariſt hath referred theſe two ſorts of *Holoſteum* vnto the kindes of Sea Plantaine. The firſt hath long leaues like the common Rib-wort, but narrower, couered with ſome hairineſſe or wollineſſe: among which there riſeth vp a ſtalke, bearing at the top a ſpike like the kindes of Plantaine, beſet with many ſmall floures of an herby colour, declining to whiteneſſe. The ſeed is like that of the Plantaine: the root is long and wooddy. This floures in Aprill or May.

2 The ſecond is like the former, but ſmaller, and not ſo gray or hoary: the floures are like to *Coronopus*, or the leſſer Ribwort. This floures at the ſame time as the former.

3 The

or vmbel, in ſhape reſembling the roſe (wherof I thought good to giue it his ſyrname Roſe) which is from his floure.

‡ This alſo I think differs not from that of *Cluſius*; wherefore I giue his figure in the place of that ſet forth by our Author. ‡

1 *Plantago quinqueneruia.*
Ribwort Plantaine.

2 *Plantago quinqueneruia roſea.*
Roſe Ribwort.

¶ *The Place.*

Ribwort groweth almoſt euery where in the borders of path-wayes and fertile fields.

Roſe Ribwort is not very common in any place, notwithſtanding it groweth in my garden, and wilde alſo in the North parts of England; and in a field neere London by a village called Hogſdon, found by a learned merchant of London M^r. *Iames Cole*, a louer of plants, and very skilfull in the knowledge of them.

¶ *The Time.*

They floure and flouriſh when the other Plantaines do.

¶ *The Names.*

Ribwort is called in Greeke, Αρνόγλωσσον μικρὸν: and of ſome, πενθόνευρον: in Latine, *Plantago minor*, *Quinqueneruia*, and *Lanceola*, or *Lanceolata*: in high Dutch, **Spitziger wegrich**: in French, *Lanceole*: in Low-Dutch, **Hondts ribbe**; that is to ſay in Latine, *Coſta canina*, or Dogs rib: in Engliſh, Ribwort, and Ribwort Plantaine.

The ſecond I haue thought meet to cal Roſe Ribwort in Engliſh, and *Quinqueneruia roſea* in Latine.

¶ *The Temperature.*

Ribwort is cold and dry in the ſecond degree, as are the Plantains.

¶ *The Vertues.*

The vertues are referred to the kindes of Plantaines.

Chap.

Chap. 99. *Of Sea Plantaines.*

1 *Holoſteum Salamanticum.*
Flouring ſea Plantaine.

2 *Holoſteum parvum.*
Small ſea Plantaine.

3 *Plantago marina.*
Sea Plantaine.

¶ *The Deſcription.*

1 *Carolus Cluſius* that excellent Herbariſt hath referred theſe two ſorts of *Holoſteum* vnto the kindes of Sea Plantaine. The firſt hath long leaues like the common Rib-wort, but narrower, couered with ſome hairineſſe or wollineſſe: among which there riſeth vp a ſtalke, bearing at the top a ſpike like the kindes of Plantaine, beſet with many ſmall floures of an herby colour, declining to whiteneſſe. The ſeed is like that of the Plantaine: the root is long and wooddy. This floures in Aprill or May.

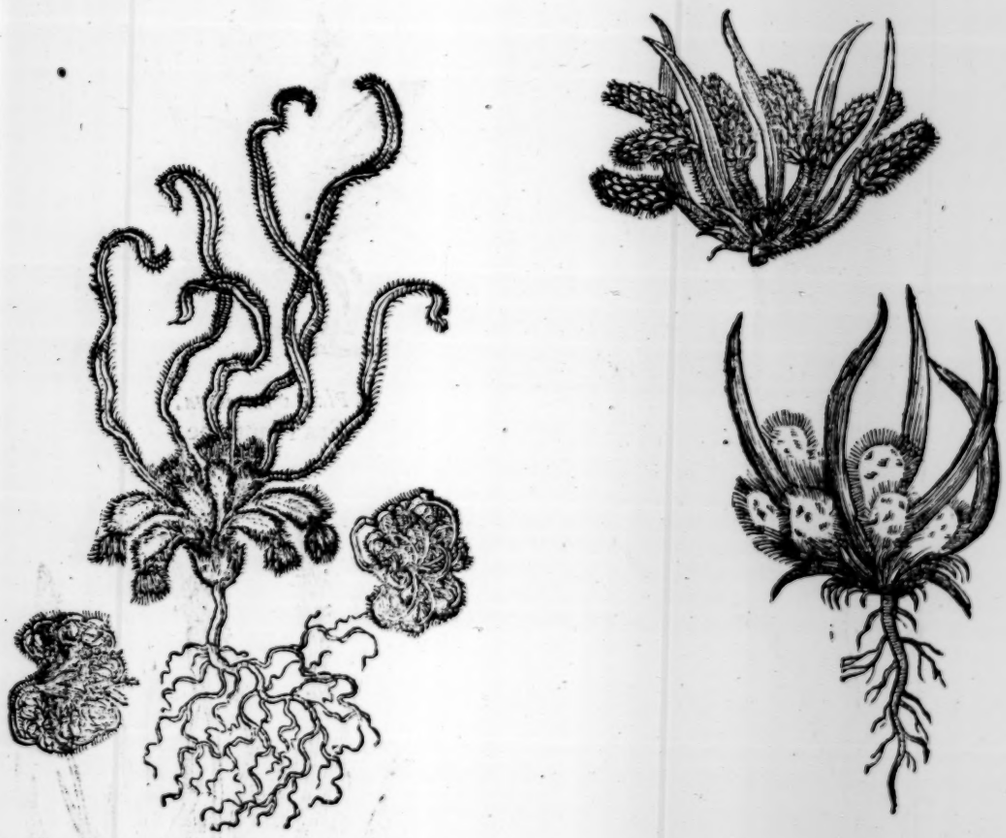
2 The ſecond is like the former, but ſmaller, and not ſo gray or hoary: the floures are like to *Coronopus*, or the leſſer Ribwort. This floures at the ſame time as the former.

3 The

3 The third kinde, which is the ſea Plantaine, hath ſmall and narrow leaues like Bucks-horn, but without any manifeſt inciſure, cuttings or notches vpon the one ſide: among which riſeth vp a ſpikie ſtalke, like the common kinde, but ſmaller.

‡ 4 *Holoſteum, ſiue Leontopodium Creticum.* Candy Lyons foot.

‡ 5 *Holoſteum, ſiue Leontopod. Cret. alterum,* The other Candy Lyons foot.



‡ 4 Theſe two following Plants are by *Cluſius* and *Bauhine* referred to this Tribe; wherefore I thinke it fitting to place them here. The former of them from a reddiſh, and as it were ſcaly root growing leſſe by litt'e and little, and diuided into fibres, ſends forth many leaues, narrow, hoary, an handfull long, and hauing three nerues or ribbes running alongſt each of them: amongſt theſe come forth diuers foot-ſtalkes, couered with a ſoft reddiſh downe, and being ſome two or three inches long, hauing heads ſomewhat thicke and reddiſh: the floures are whitiſh, with a blackiſh middle, which makes it ſeeme as if it were perforated or holed. Now when the plant growes old, and withers, the ſtalkes becomming more thicke and ſtiffe, bend downe their heads towards the root, ſo that in ſome ſort they reſemble the foot of a Lyon.

5 This Plant which is figured in the vpper place (for I take the lower to be an exacter figure of the laſt deſcribed) hath leaues like to the ſmall ſea Plantaine, but tenderer, and ſtanding vpright; and amongſt theſe on little foot-ſtalkes grow heads like thoſe of *Pſyllium*, but prettier, and of a whitiſh red colour. ‡

¶ *The Place.*

The two firſt grow in moſt of the kingdomes of Spaine. *Carolus Cluſius* writeth, that hee neuer ſaw greater or whiter than neere to Valentia a city of Spaine, by the high-waies. Since, they haue beene found at Baſtable in the iſle of Wight, and in the iſles of Gernſey and Iarſey.

The third doth grow neere vnto the ſea in all the places about England where I haue trauelled, eſpecially by the forts on both the ſides of the water at Graueſend; at Erith neere London; at Lee in Eſſex; at Rie in Kent; at Weſt-Cheſter, and at Briſtow.

‡ The fourth and fifth grow in Candy, from whence they haue been ſent to Padua and diuers other places. ‡

¶ *The*

¶ *The Names.*

Holoſteum is alſo called by *Dodonæus*, *Plantago anguſtifolia albida*, or *Plantago Hiſpanienſis*: in Engliſh, Spaniſh hairy ſmall Plantaine, or flouring ſea Plantaine.

‡ The fourth is called by *Cluſius*, *Leontopodium Creticum*: by ſome it hath beene thought to be *Catanance* of *Dioſcorides*: the which *Honorius Bellus* will not allow of: *Bauhine* calls it *Holoſteum, ſiue Leontopodium Creticum*. ‡

The fifth is *Leontopodium Creticum alterum* of *Cluſius*; the *Habbures* of *Camerarius*; and the *Holoſteum Creticum alterum* of *Bauhine*. ‡

¶ *The Temperature and Vertues,*

Galen ſaith, That *Holoſteum* is of a binding and drying facultie.

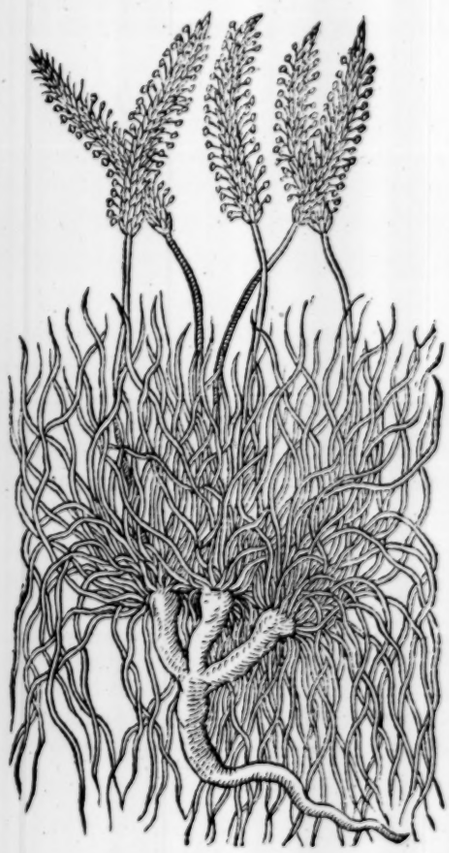
Galen, *Dioſcorides*, and *Pliny* haue proued it to be ſuch an excellent wound herbe, that it preſently cloſeth or ſhutteth vp a wound, though it be very great and large: and by the ſame authority I ſpeake it, that if it be put into a pot where many pieces of fleſh are boyling, it will ſoder them together. A

Theſe herbes haue the ſame faculties and vertues that the other Plantains haue, and are thought to be the beſt of all the kindes.

† That which was formerly in the fourth place of this chapter, vnder the name of *Holoſteum petræum*, you ſhall finde hereafter vnder the title of *Muſcus corniculatus*; for vnder that name our Author alſo gaue another figure thereof, with a deſcription; and I iudge it more fitly placed in that place, than here amongſt the Plantaines.

Chap. 100. *Of Sea Buck-horne Plantaines.*

1 *Coronopus.*
Sea Buck-horne.



2 *Coronopus, ſiue Serpentina minor.*
Small Sea Buck-horne.

¶ *The Deſcription.*

1 THe new Writers following as it were by tradition thoſe that haue written long agone, haue beene content to heare themſelues ſpeake and ſet downe certainties by vncertaine ſpeeches; which hath wrought ſuch confuſion and corruption of writings, that ſo many Writers, ſo many ſeuerall opinions; as may moſt euidently appeare in theſe plants and in others: And my ſelfe am content rather to ſuffer this ſcar to paſſe, than by correcting the error, to renew the old wound. But for mine owne opinion thus I thinke, the plant which is reckoned for a kinde of *Coronopus* is doubtleſſe a kinde of *Holoſteum*: my reaſon is, becauſe it hath graſſie leaues, or rather leaues like *Vetonica ſylueſtris* or wilde Pinks, a root like thoſe of *Garyophyllata* or Auens, and the ſpikie eare of *Holoſteum* or Sea Plantaine: which are certaine arguments that theſe writers haue neuer ſeene the Plant, but onely the picture thereof, and ſo haue ſet downe their opinions by heare-ſay.

This plant likewiſe hath beene altogether vnknowne vnto the old Writers. It groweth moſt plentifully vpon the cliffes and rocks and the tops of the barren mountains of Auergne in France, and in many places of Italy.

2 The ſecond ſort of wilde ſea Plantaine or *Serpentina* differeth not from the former but onely in quantitie and ſlenderneſſe of his ſtalkes, and the ſmallneſſe of his leaues, which exceed not the height of two inches. It groweth on the hills and rockes neere the waſhings of the ſea at Maſſilia in great plenty almoſt euery where among the *Tragacanthum*, hauing a moſt thicke and ſpreading cluſter of leaues after the manner of *Sedum minimum ſaxeum montanum*, ſomewhat like *Pinaſter*, or the wilde Pine, as well in manner of growing, as ſtiffeneſſe, and great increaſe of his ſlender branches. It hath the ſmall ſeed of Plantaine, or *Serpentina vulgaris*, contained within his ſpiky eares. The root is ſomewhat long, wooddy, and thicke, in taſte ſomewhat hot and aromaticall.

3 *Coronopus ſiue Serpentina minima.*
Small Buck-horne Plantaine.

4 *Cauda Muris.*
Mouſe-taile.

3 This ſmall ſea plant is likewiſe one of the kindes of ſea Plantaine, participating as well of Buck-horne as of *Holoſtium*, being as it were a degenerate kinde of ſea Plantaine. It hath many graſſie leaues very like vnto the herbe Thrift, but much ſmaller; among which come forth little tender foot-ſtalkes, whereon do grow ſmall ſpikie knops like thoſe of ſea Plantaine. The root is tough and threddy.

4 Mouſe-taile or *Cauda muris* reſembleth the laſt kinde of wilde *Coronopus* or ſea Plantaine, in ſmall ſpikie knops, leaues, and ſtalkes, that I know no reaſon to the contrarie, but that I may as well place this ſmall herbe among the kindes of *Coronopus* or Bucks horne, as other Writers haue placed kindes of *Holoſtium* in the ſame ſection: and if that be pardonable in them, I truſt this may be tolerated in me, conſidering that without controuerſie this little and baſe herbe is a kinde of *Holoſtium*, hauing many ſmall ſhort graſſie leaues ſpred on the ground, an inch long or ſomewhat more: among which do riſe ſmall tender naked ſtalkes of two inches long, bearing at the top a little blackiſh torch or ſpikie knop in ſhape like that of the Plantaines, reſembling very notably the taile of a Mouſe, whereof it tooke his name. The root is ſmall and threddy.

¶ *The Place.*

The firſt and ſecond of theſe plants are ſtrangers in England; notwithſtanding I haue heard ſay that they grow vpon the rocks in Silley, Garnſey, and the Iſle of man.

Mouſe-taile groweth vpon a barren ditch banke neere vnto a gate leading into a paſture on the right hand of the way, as ye go from London to a village called Hampſtead; in a field as you goe from Edmonton (a village neere London) vnto a houſe thereby called Pims, by the foot-paths ſides; in Woodford Row in Waltham Forreſt, and in the Orchard belonging to M^r. *Francis Whetſtone* in Eſſex, and in other places.

¶ *The*

¶ *The Time.*

They floure and flouriſh in May and Iune.

¶ *The Names.*

Matthiolus writeth, That the people of Goritia do commonly call theſe two former plants *Serpentaria* and *Serpentina*; but vnproperly, for that there be other plants which may better be called *Serpentina* than theſe two: we may cal them in Engliſh wild ſea Plantaine, whereof doubtleſſe they are kindes.

Mouſe-taile is called in Latine *Cauda muris*, and *Cauda murina*: in Greeke, μυόσουρος, or μυόσουρον. *Myoſuros* is called of the French-men *Queue de ſouris*: in Engliſh, Bloud-ſtrange, and Mouſe-taile.

¶ *The Temperature.*

Coronopus is cold and dry much like vnto the Plantaine. Mouſe-taile is cold and ſomthing drying, with a kinde of aſtriction or binding qualitie.

¶ *The Vertues.*

Their faculties in working are referred vnto the Plantaines and Harts-horne.

CHAP. 101.

Of Bucke-horne Plantaines, or Harts-horne.

1 *Cornu Ceruinum.*
Harts-horne.

2 *Coronopus Ruellij.*
Swines Creſſes, or Bucks-horne.

¶ *The Deſcription.*

1 BVcks-horne or Harts-horne hath long narrow hoary leaues, cut on both the ſides with three or foure ſhort ſtarts or knags, reſembling the branches of a harts horne, ſpreading it ſelfe on the ground like a ſtar: from the middle whereof ſpring vp ſmall round naked hairy ſtalks; at the top whereof do grow little knops or ſpikie torches like thoſe of the ſmal Plantaines. The root is ſlender and threddy.

2 *Ruellius* Bucks-horne or Swines Creſſes hath many ſmal and weake ſtragling branches, trailing here and there vpon the ground, ſet with many ſmall cut or iagged leaues, ſomewhat like the former, but ſmaller, and nothing at all hairy as is the other. The floures grow among the leaues, in ſmall rough cluſters, of an herby greeniſh colour: which being paſt, there come in place little flat pouches broad and rough, in which the ſeed is contained. The root is white, threddy, and in taſte like the garden Creſſes.

¶ *The Place.*

They grow in barren plaines, and vntilled places, and ſandy grounds; as in Touthill field neere vnto Weſtminſter, at Waltham twelue miles from London, and vpon Blacke-heath alſo neere London.

¶ *The Time.*

They floure and flouriſh when the Plantaines doe, whereof theſe haue beene taken to be kindes.

¶ *The Names.*

Bucks-horne is called in Latine *Cornu Ceruinum*, or Harts-horne: diuers name it *Herba ſtella*, or *Stellaria*, although there be another herbe ſo called: in low-Dutch, **Hertzhoozen:** in Spaniſh, *Guiabella:* in French, *Corne de Cerf:* It is thought to *Dioſcorides* his κερατίτης, which doth ſignifie *cornicis pedem*, a Crowes foot. It is called alſo by certaine baſtard names, as *Harenarea, Sanguinaria*, and of many, Herbe Iuy, or herbe Eue.

¶ *The Temperature.*

Bucks-horne is like in temperature to the common Plantaine, in that it bindeth, cooleth, and drieth.

¶ *The Vertues.*

A The leaues of Buckes-horne boyled in drinke, and giuen morning and euening for certaine dayes together, helpeth moſt wonderfully thoſe that haue ſore eyes, waterie or blaſted, and moſt of the griefes that happen vnto the eyes; experimented by a learned Phyſition of Colcheſter called Maſter *Duke*; and the like by an excellent Apothecarie of the ſame Towne called Mr. *Buckſtone.*

B The leaues and roots ſtamped with Bay ſalt, and tied to the wreſts of the armes, take away fits of the Ague: and it is reported to worke the like effect being hanged about the necke of the Patient in a certaine number; as vnto men nine plants, roots and all; and vnto women and children ſeuen.

Chap. 102. *Of Saracens Conſound.*

¶ *The Deſcription.*

1 Saracens Conſound hath many long narrow leaues cut or ſleightly ſnipt about the edges: among which riſe vp faire browne hollow ſtalkes of the height of foure cubits; along which euen from the bottome to the top it is ſet with long and prety large leaues like them of the Peach tree: at the top of the ſtalkes grow faire ſtarre-like yellow floures, which turne into downe, and are carried away with the winde. The root is very fibrous or threddy.

¶ *The Place.*

Saracens Conſound groweth by a wood as ye ride from great Dunmow in Eſſex, vnto a place called Clare in the ſaid countrey; from whence I brought ſome plants into my garden.

‡ I formerly in the twenty fourth Chapter of this ſecond booke told you what plant our Author tooke for Saracens Conſound, and (as I haue been credibly informed) kept in his garden for it. Now the true *Solidago* here deſcribed and figured was found *Anno* 1632, by my kinde Friends Mr. *George Bowles* and Mr. *William Coot*, in Shropſhire in Wales, in a hedge in the way as one goeth from Dudſon in the pariſh of Cherbery to Guarthlow. ‡

¶ *The Time.*

It floureth in Iuly, and the ſeed is ripe in Auguſt.

¶ *The Names.*

Saracens Conſound is called in Latine *Solidago Saracenica*, or Saracens Comfrey, and *Conſolida Saracenica:* in Dutch, **Heidiniſch woundtkraut:** of ſome, *Herba fortis:* in Engliſh, Saracens Conſound, or Saracens Wound-wort.

¶ *The*

† *Solidago Saracenica.*
Saracens Conſound.

¶ *The Nature.*

Saracens Conſound is dry in the third degree, with ſome manifeſt heate.

¶ *The Vertues.*

Saracens Conſound is not inferiour to any of the wound-herbes whatſoeuer, being inwardly miniſtred, or outwardly applied in ointments or oyles. With it I cured Maſter *Cartwright* a Gentleman of Grayes Inne, who was grieuouſly wounded into the lungs, and that by Gods permiſſion in ſhort ſpace. A

The leaues boyled in water and drunke, doth reſtraine and ſtay the waſting of the liuer, taketh away the oppilation and ſtopping of the ſame, and profiteth againſt the Iaundice and Feuers of long continuance. B

The decoction of the leaues made in water is excellent againſt the ſoreneſſe of the throat, if it be therewith gargariſed: it increaſeth alſo the vertue and force of lotion or waſhing waters, appropriate for priuy maimes, ſore mouthes, and ſuch like, if it be mixed therewith. C

† The figure that was formerly in this place was of *Conſolida paluſtris* of *Tabernamontanus*; and the true figure belonging to this hiſtorie was in the next chapter ſaue one, vnder the title of *Herba Dorea Lobelii*.

Chap. 103. *Of Golden Rod.*

¶ *The Deſcription.*

1 Golden Rod hath long broad leaues ſomwhat hoary and ſharpe pointed; among which riſe vp browne ſtalkes two foot high, diuiding themſelues toward the top into ſundry branches, charged or loden with ſmall yellow floures; which when they be ripe turne into downe which is carried away with the winde. The root is threddy and browne of colour. ‡ *Lobel* makes this with vnſnipt leaues to be that of *Arnoldus de villa noua*. ‡

2 The ſecond ſort of Golden Rod hath ſmall thin leaues broader than thoſe of the firſt deſcribed, ſmooth, with ſome few cuts or nickes about the edges, and ſharpe pointed, of a hot and harſh taſte in the throat being chewed; which leaues are ſet vpon a faire reddiſh ſtalke. It tooke his name from the floures which grow at the top of a gold yellow colour: which floures turne into Downe, which is carried away with the winde, as is the former. The root is ſmall, compact of many ſtrings or threds.

¶ *The Place.*

They both grow plentifully in Hampſtead Wood, neere vnto the gate that leadeth out of the wood vnto a Village called Kentiſh towne, not far from London; in a wood by Rayleigh in Eſſex, hard by a Gentlemans houſe called Mr. *Leonard*, dwelling vpon Dawes heath; in Southfleet and in Swaineſcombe wood alſo, neere vnto Grauesend.

¶ *The Time.*

They floure and flouriſh in the end of Auguſt.

¶ *The Names.*

It is called in Engliſh Golden Rod: in Latine, *Virga aurea*, becauſe the branches are like a golden rod: in Dutch, **Gulden roede**: in French, *verge d'or*.

1 *Virga aurea.*
Golden Rod.

2 *Virga aurea Arnoldi Villanouani.*
Arnold of the new towne his Golden rod.

¶ *The Temperature.*

Golden Rod is hot and dry in the ſecond degree: it clenſeth, with a certaine aſtriction or binding qualitie.

¶ *The Vertues.*

A Golden Rod prouoketh vrine, waſteth away the ſtones in the kidnies, and expelleth them, and withall bringeth downe tough and raw flegmatick humors ſticking in the vrine veſſels, which now and then do hinder the comming away of the ſtones, and cauſeth the grauell or ſand which is brittle to be gathered together into one ſtone. And therefore *Arnoldus Villanouanus* by good reaſon hath commended it againſt the ſtone and paine of the kidnies.

B It is of the number of thoſe plants that ſerue for wound-drinks, and is reported that it can fully performe all thoſe things that Saracens Conſound can; and in my practiſe ſhall be placed in the formoſt ranke.

C *Arnoldus* writeth, That the diſtilled water drunke with wine for ſome few dayes together, worketh the ſame effect, that is, for the ſtone and grauell in the kidnies.

D It is extolled aboue all other herbes for the ſtopping of bloud in ſanguinolent vlcers and bleeding wounds; and hath in times paſt beene had in greater eſtimation and regard than in theſe dayes: for in my remembrance I haue knowne the dry herbe which came from beyond the ſea ſold in Bucklers Bury in London for halfe a crowne an ounce. But ſince it was found in Hampſtead wood, euen as it were at our townes end, no man will giue halfe a crowne for an hundred weight of it: which plainly ſetteth forth our inconſtancie and ſudden mutabilitie, eſteeming no longer of any thing, how pretious ſoeuer it be, than whileſt it is ſtrange and rare. This verifieth our Engliſh prouerbe, Far fetcht and deare bought is beſt for Ladies. Yet it may be more truely ſaid of phantaſticall Phyſitions, who when they haue found an approued medicine and perfect remedie neere home againſt any diſeaſe; yet not content therewith, they wil ſeeke for a new farther off, and by that meanes many times hurt more than they helpe. Thus much I haue ſpoken to bring theſe new fangled fellowes backe againe to eſteeme better of this admirable plant than they haue done, which no doubt hath the ſame vertue now that then it had, although it growes ſo neere our owne homes in neuer ſo great quantitie.

Chap.

Chap. 103. *Of Captaine Andreas Dorias his Wound-woort.*

† *Herba Doria L'obelij.*
Dorias Woundwoort.

¶ *The Deſcription.*

THis plant hath long and large thicke and fat leaues, ſharp pointed, of a blewiſh greene like vnto Woad, which being broken with the hands hath a prettie ſpicie ſmell. Among theſe leaues riſeth vp a ſtalk of the height of a tal man, diuided at the top into many other branches, whereupon grow ſmall yellowiſh floures, which turneth into downe that flieth away with the wind. The root is thick almoſt like *Helleborus albus*.

Of which kinde there is another like the former, but that the leaues are rougher, ſomewhat bluntly indented at the edges, and not ſo fat and groſſe.

‡ *Herba Doria altera.*

This herbe growes vp with a green round brittle ſtalke, very much champhered, ſinewed, or ſurrowed, about foure or fiue foot high, full of white pith like that of Elder, and ſendeth forth ſmall branches: the leaues grow on the ſtalk out of order, & are ſmooth, ſharpe pointed, in ſhape like thoſe of *Herba Doria*, but much ſhorter & narrower, the broadeſt and longeſt ſeldome being aboue ten or eleuen inches long, and ſcarce two inches broad, and are more finely and ſmally nickt or indented about the edges; their ſmell being nothing pleaſant, but rather when together with the ſtalke they are broken and rubbed yeeld forth a ſmell hauing a ſmall touch of the ſmell of Hemlocke. Out of the boſomes of theſe leaues ſpring other ſmaller leaues or branches. The floures are many, and grow on ſmall branches at the tops of the ſtalkes like thoſe of *Herba Doria*, but more like thoſe of *Iacobæa*, of a yellow colour, as well the middle button, as the ſmall leaues that ſtand round about, euery floure hauing commonly eight of thoſe ſmall leaues. Which beeing paſt the button turneth into downe and containeth very ſmall long ſeedes which flie away with the winde. The root is nothing elſe but an infinite of ſmall ſtrings which moſt hurtfully ſpread in the ground, and by their infinite increaſing deſtroyeth and ſtarueth other herbes that grow neere it. Its naturall place of growing I know not, for I had it from Mr. *Iohn Coys*, and yet keep it growing in my garden. *Iohn Goodyer.* ‡

¶ *The Place.*

Theſe plants grow naturally about the borders or brinkes of riuers neere to Narbone in France, from whence they were brought into England, and are contented to be made denizons in my garden, where they flouriſh to the height aforeſaid.

¶ *The Time.*

They floured in my garden about the twelfth of Iune.

¶ *The Nature.*

The roots are ſweet in ſmell, and hot in the third degree.

¶ *The Vertues.*

Two drams of the roots of *Herba Doria* boiled in wine and giuen to drinke, draweth downe wateriſh humors, and prouoketh vrine. A

The ſame is with good ſucceſſe vſed in medicines that expell poiſon. B

‡ All

‡ All theſe Plants mentioned in the three laſt Chapters, to wit, *Solidago*, *Virga aurea* and this *Herba Dorea*, are by *Bauhine* fitly comprehended vnder the title of *Virga aurea*; becauſe they are much alike in ſhape, and for that they are all of the ſame facultie in medicine. ‡

† The figure that was here was of *Solidago Saracenica*.

Chap. 105. *Of Felwoort, or Baldmoney.*

¶ *The Kindes.*

THere be diuers ſorts of Gentians or Felwoorts, whereof ſome be of our owne countrey; others more ſtrange and brought further off: and alſo ſome not before this time remembred, either of the antient or later writers, as ſhall be ſet forth in this preſent chapter.

¶ *The Deſcription.*

THe firſt kinde of Felwoort hath great large leaues, not vnlike to thoſe of Plantaine, very well reſembling the leaues of the white Hellebore: among which riſeth vp a round hollow ſtalke as thicke as a mans thumbe, full of ioints or knees, with two leaues at each of them, and towards the top euery ioint or knot is ſet round about with ſmall yellow ſtarre-like floures, like a coronet or garland: at the bottome of the plant next the ground the leaues do ſpread themſelues abroad, embracing or clipping the ſtalke in that place round about, ſet together by couples one oppoſite againſt another. The ſeede is ſmall, browne, flat, and ſmooth like the ſeeds of the Stocke Gillo-floure. The roote is a finger thicke. The whole Plant is of a bitter taſte.

1 *Gentiana maior.*
Great Felwoort.

‡ 2 *Gentiana maior purpurea, 1. Cluſij.*
Great Purple Felwoort.

3 *Gen-*

3 *Gentiana maior ij. cæruleo flore Cluſij.*
Blew floured Felwoort.

4 *Gentiana minor Cruciata.*
Croſſewoort Gentian.

5 *Gentiana Pennei minor.*
Spotted Gentian of Dr. *Pennie.*

‡ 2 This deſcribed by *Cluſius*, hath leaues and ſtalkes like the precedent; theſe ſtalkes are ſome cubite and halfe or two cubits high, and towards the toppes they are ingirt with two or three coronets of faire purple floures, which are not ſtar-faſhioned, like thoſe of the former, but long and hollow, diuided as it were into ſome fiue or ſix parts or leaues, which towards the bottome on the inſide are ſpotted with deepe purple ſpots: theſe floures are without ſmell, & haue ſo many chiues as they haue iagges, and theſe chiues compaſſe the head, which is parted into two cells, and containes ſtore of a ſmooth, chaffie, reddiſh ſeed. The root is large, yellow on the outſide, and white within, very bitter, & it ſends forth euery yere new ſhoots. It growes in diuers places of the Alps; it floures in Auguſt, and the ſeeds are ripe in September. ‡

3 *Carolus Cluſius* alſo ſetteth forth another ſort of a great Gentian, riſing forth of the ground with a ſtiffe, firme or ſolide ſtalke, ſet with leaues like vnto *Aſclepias*, by couples one oppoſite againſt another, euen from the bottome to the top in certaine diſtances: from the boſome of the leaues

leaues there ſhoot forth ſet vpon ſlender foot-ſtalkes certaine long hollow floures like bels, the mouth whereof endeth in fiue ſharpe corners. The whole floure changeth many times his colour according to the ſoile and climate; now and then purple or blew, ſometimes whitiſh, and often of an aſhe colour. The root and ſeed is like the precedent.

4 Croſſe-woort Gentian hath many ribbed leaues ſpred vpon the ground, like vnto the leaues of Sopewoort, but of a blacker greene colour: among which riſe vp weake iointed ſtalkes trailing or leaning toward the ground. The floures grow at the top in bundles thicke thruſt together, like thoſe of ſweet Williams, of a light blew colour. The root is thicke, and creepeth in the ground far abroad, whereby it greatly increaſeth.

5 *Carolus Cluſius* hath ſet forth in his Pannonicke hiſtorie a kinde of Gentian, which he receiued from M^r. *Thomas Pennie* of London, D^r. in Phiſicke, of famous memorie, and a ſecond *Dioſcorides* for his ſingular knowledge in Plants: which *Tabernamontanus* hath ſet forth in his Dutch booke for the ſeuenth of *Cluſius*, wherein he greatly deceiued himſelfe, and hath with a falſe deſcription wronged others.

This twelfth ſort or kinde of Gentian after *Cluſius*, hath a round ſtiffe ſtalke, firme and ſolide, ſomewhat reddiſh at the bottome, iointed or kneed like vnto Croſſewoort Gentian. The leaues are broad, ſmooth, full of ribbes or ſinewes, ſet about the ſtalkes by couples, one oppoſite againſt another. The floures grow vpon ſmall tender ſtalkes, compact of fiue ſlender blewiſh leaues, ſpotted very curiouſly with many blacke ſpots and little lines; hauing in the middle fiue yellow chiues. The ſeed is ſmall like ſand: the root is little, garniſhed with a few ſtrings of a yellowiſh colour.

¶ *The Place.*

Gentian groweth in ſhadowie woods, and the mountains of Italie, Sclauonia, Germany, France, and Burgundie; from whence M^r. *Iſaac de Launa* a learned Phiſition ſent me plants for the increaſe of my garden. Croſſewoort Gentian groweth in a paſture at the Weſt end of little Rayne in Eſſex on the North ſide of the way leading from Braintree to Much-Dunmow; and in the horſe way by the ſame cloſe.

¶ *The Time.*

They floure and flouriſh in Auguſt, and the ſeed is ripe in September.

¶ *The Names.*

Gentius King of Illyria was the firſt finder of this herbe, and the firſt that vſed it in medicine, for which cauſe it was called Gentian after his owne name: in Greeke γεντιανη: which name alſo the Apothecaries retaine vnto this day, and call it *Gentiana*: it is named in Engliſh Felwoort Gentian; Bitterwoort; Baldmoyne, and Baldmoney.

1 This by moſt Writers is called *Gentiana*, and *Gentiana maior Lutea.*

2 *Geſner* calleth this *Gentiana punicea*; *Cluſius*, *Gentiana maior flore purpureo.*

3 This is *Gentiana folijs hirundinariæ* of *Geſner*: and *Gentiana Aſclepiadis folio* of *Cluſius.*

4 This, *Cruciata*, or *Gentiana Cruciata*, of *Tragus*, *Fuchſius*, *Dodon.* *Geſner* and others: it is the *Gentiana minor* of *Matthiolus.*

5 *Cluſius* calls this *Gentiana maior pallida punctis diſtincta.*

¶ *The Temperature.*

The root of Felwoort is hot, as *Dioſcorides* ſaith, clenſing or ſcouring: diuers copies haue, that it is likewiſe binding, and of a bitter taſte.

¶ *The Vertues.*

A It is excellent good, as *Galen* ſaith, when there is need of attenuating, purging, clenſing, and remouing of obſtructions, which qualitie it taketh of his extreme bitterneſſe.

B It is reported to be good for thoſe that are troubled with crampes and conuulſions; for ſuch as are burſt, or haue falne from ſome high place: for ſuch as haue euill liuers and bad ſtomacks. It is put into Counterpoiſons, as into the compoſition named *Theriaca diateſſaron*: which *Aetius* calleth *Myſterium*, a myſterie or hid ſecret.

C This is of ſuch force and vertue, ſaith *Pliny*, that it helpeth cattell which are not onely troubled with the cough, but are alſo broken winded.

D The root of Gentian giuen in pouder the quantitie of a dramme, with a little pepper and herbe Grace mixed therewith, is profitable for them that are bitten or ſtung with any manner of venomous beaſt or mad dog: or for any that hath taken poiſon.

E The decoction drunke is good againſt the ſtoppings of the liuer, and cruditie of the ſtomacke, helpeth digeſtion, diſſolueth and ſcattereth congealed bloud, and is good againſt all cold diſeaſes of the inward parts.

Chap.

Chap. 106. *Of Engliſh Felwoort.*

¶ *The Deſcription.*

Hollow leafed Felwoort or Engliſh Gentian hath many long tough roots, diſperſed hither and thither within the vpper cruſt of the earth; from which immediatly riſeth a fat thicke ſtalke, iointed or kneed by certaine diſtances, ſet at euery knot with one leafe, and ſometimes moe, keeping no certaine number: which leaues doe at the firſt incloſe the ſtalkes round about, being one whole and entire leafe without any inciſure at all, as it were a hollow trunke; which after it is growne to his fulneſſe, breaketh in one ſide or other, and becommeth a flat ribbed leafe, like vnto the great Gentian or Plantaine. The floures come forth of the boſome of the vpper leaues, ſet vpon tender foot ſtalkes, in ſhape like thoſe of the ſmall Bindweed, or rather the floures of Sopewoort, of a whitiſh colour, waſht about the brims with a little light carnation. Then followeth the ſeed, which as yet I haue not obſerued.

Gentiana concaua.
Hollow Felwoort.

¶ *The Place.*

I found this ſtrange kind of Gentian in a ſmall groue of a wood called the Spinie, neere vnto a ſmall village in Northampton ſhire called Lichbarrow: elſewhere I haue not heard of it.

¶ *The Time.*

It ſpringeth forth of the ground in Aprill, and bringeth forth his floures and ſeed in the end of Auguſt.

¶ *The Names.*

I haue thought good to giue vnto this plant, in Engliſh, the name Gentian, being doubtleſſe a kinde therof. The which hath not been ſet forth, nor remembred by any that haue written of plants vntil this time. In Latine we may call it *Gentiana concaua*, of the hollow leaues. It may be called alſo hollow leaued Felwoort.

¶ *The Temperature and Vertues.*

Of the faculties of this plant as yet I can ſay nothing, referring it vnto the other Gentians, vntill time ſhall diſcloſe that which yet is ſecret and vnknowne.

‡ *Bauhine* receiued this plant with the figure thereof from Doctor *Liſter* one of his Maieſties Phyſitions, and he referres it vnto *Saponaria*, calling it *Saponaria concaua Anglica*; and (as farre as I can coniecture) hath a good deſcription thereof in his *Prodrom. pag.* 103. Now both by our Authour and *Bauhines* Deſcription, I gather, that the roote in this Figure is not rightly expreſſed, for that it ſhould bee long, thicke, and creeping, with few fibers adhering thereunto; when as this figure expreſſeth an annuall wooddy root. But not hauing as yet ſeene the plant, I can affirme nothing of certaintie. ‡

Chap.

‡ Chap. 107. *Of Baſtard Felwoort.*

¶ *The Deſcription.*

‡ OVr Authour in this Chapter ſo confounded all, that I knew not well how, handſomely to ſet all right; for his deſcriptions they were ſo barren, that little might be gathered by them, and the figures agreed with their titles, but the place contradicts all; for the firſt figured is found in England; and the ſecond is not that euer I could learne: alſo the ſecond floures in the ſpring, according to *Cluſius* and all others that haue written thereof, and alſo by our Authours owne title, truely put ouer the figure: yet he ſaid they both floure and flouriſh from Auguſt to the end of September. Theſe things conſidered, I thought it fitter both for the Readers benefit, and my owne credit to giue you this chapter wholly new with additions, rather than mangled and confuſed, as otherwiſe of neceſſitie it muſt haue beene. ‡

‡ 1 This elegant *Gentianella* hath a ſmall yellowiſh creeping root, from which ariſe many greene ſmooth thicke hard and ſharpe pointed leaues like thoſe of the broad leaued Myrtle, yet larger, and hauing the veines running alongſt the leaues as in Plantaine. Amongſt the leaues come vp ſhort ſtalkes, bearing very large floures one vpon a ſtalke; and theſe floures are hollow like a Bel-floure, and end in fiue ſharpe points with two little eares betweene each diuiſion, and their colour is an exquiſite blew. After the floure is paſt there followes a ſharpe pointed longiſh veſſell, which opening it ſelfe into two equall parts, ſhewes a ſmall creſted darke coloured ſeede.

‡ 1 *Gentianella verna maior.*
Spring large floured Gentian.

2 *Gentianella Alpina verna.*
Alpes Felwoort of the ſpring time.

2 This ſecond riſes vp with a ſingle ſlender and purpliſh ſtalke, ſet at certaine ſpaces with ſix or eight little ribbed leaues, ſtanding by couples one againſt another. At the top ſtands a cup, out whereof comes one long floure without ſmell, and as it were diuided at the top into fiue parts; and it is of ſo elegant a colour, that it ſeemes to exceed blewneſſe it ſelfe; each of the foldes or little leaues of the floure hath a whitiſh line at the ſide, and other fiue as it were pointed leaues or appendices ſet betweene them: and in the middeſt of the floure are certaine pale coloured chiues: a longiſh ſharpe pointed veſſell ſucceeds the floure which contains a ſmall hard round ſeed. The root is ſmall, yellowiſh and creeping, putting vp here and there ſtalkes bearing floures, and in other places onely leaues lying orderly ſpred vpon the ground.

3 Be-

3 *Gentianella fugax minor.*
Baſtard or Dwarfe Felwoort.

3 Beſides theſe two whoſe roots laſt long and increaſe euery yeare, there are diuers other Dwarfe or Baſtard Gentians which are annuall, and wholly periſh euery yeare aſſoone as they haue perfected their ſeed; and therefore by *Cluſius* they are fitly called *Gentianæ fugaces*. Of theſe I haue onely obſerued two kindes (or rather varieties) in this Kingdome, which I wil here deſcribe vnto you. The firſt of theſe, which is the leſſer, & whoſe figure we here giue you, is a proper plant ſome two or three inches high, diuided immediatly from the root into three or foure or more branches, ſet at certaine ſpaces with little longiſh leaues, being broadeſt at the ſetting on, and ſo growing narrower or ſharper pointed. The tops of theſe ſtalkes are beautified with long, hollow, and pretty large floures, conſidering the magnitude of the plant, and theſe floures are of a darke purpliſh colour, and at their tops diuided into fiue parts. The root is yellowiſh, ſmall, and wooddy. The ſeede which is ſmall and round is contained in longiſh veſſels. The ſtalkes and leaues are commonly of a darke green, or elſe of a browniſh colour.

4 This from a root like, yet a little larger than the former, ſends vp a pretty ſtiffe round ſtalke of ſome ſpan high; which at certaine ſpaces is ſet with ſuch leaues as the laſt deſcribed, but larger: and out of the boſomes of theſe leaues from the bottome to the top of the ſtalke come forth little foot ſtalkes, which vſually carry three floures a piece; two ſet one againſt another, and the third vpon a ſtalke ſomewhat higher; and ſometimes there comes forth a ſingle floure at the root of theſe foot ſtalkes. The floures in their ſhape, magnitude and colour, are like thoſe of the laſt mentioned, and alſo the ſeed and ſeed veſſels. The manner of growing of this is very well preſented by the figure of the third Gentian, formerly deſcribed in the Chapter laſt ſaue one aforegoing.

¶ *The Place.*

1 2 Theſe grow not wilde in England that I know of, but the former is to bee found in moſt of our choice Gardens. As with Mr. *Parkinſon*, Maſter *Tradeſcant*, and Maſter *Tuggye*, &c.

3 4 Theſe are found in diuers places, as in the Chalke-dale at Dartford in Kent, and according to our Authour (for I know he meant theſe) in Waterdowne Foreſt in Suſſex, in the way that leadeth from Charlwoods lodge, vnto the houſe of the Lord of Abergauenie, called Eridge houſe by a brooke ſide there, eſpecially vpon a Heath by Colbrooke neere London: on the Plain of Salisburie, hard by the turning from the ſaid Plaine, vnto the right Honourable the Lord of Pembrooks houſe at Wilton, and vpon a Chalkie banke in the high way betweene Saint Albons and Goramberrie.

¶ *The Time.*

1 2 Theſe two floure in Aprill and May. The other from Auguſt vnto the end of October.

¶ *The Names.*

1 This is the *Gentiana* 4. of *Tragus*. The *Gentianella Alpina* of *Geſner*: *Gentianella campanulæ flore* and *Heluetica* of *Lobel*; the *Gentiana* 5. or *Gentianella maior verna* of *Cluſius*.

2 *Geſner* called this *Calathiana verna*: *Lobel*, *Gentianella Alpina*: and *Cluſius*, *Gentiana* 6. and *Gentianella minor verna*.

3 This is the *Calathiana vera* of *Daleſchampius*: and the *Gentiana fugax* 5. or *Gentiana* 11. *minima* of *Cluſius*.

4 I take this to bee *Cluſius* his *Gentiana fugax* 4. or *Gentiana* 10. We may call this in Engliſh, Small Autumne Gentian.

¶ *Their Temperature and Vertues.*

Theſe by their taſte and forme ſhould be much like to the greater Gentians in their operation and working, yet not altogether ſo effectuall. ‡

Chap. 106. *Of Calathian Violet, or Autumne Bel-floure.*

¶ *The Deſcription.*

AMong the number of the baſe Gentians there is a ſmal plant, which is late before it commeth vp, hauing ſtalks a ſpan high, and ſometimes higher, narrow leaues like vnto Time, ſet by couples about the ſtalkes by certaine diſtances: long hollow floures growing at the top of the ſtalks, like a cup called a Beaker, wide at the top, and narrower toward the bottome, of a deepe blew colour tending to purple, with certain white threds or chiues in the bottome: the floure at the mouth or brim is fiue cornered before it be opened, but when it is opened it appeareth with fiue clifts or pleats. The whole plant is of a bitter taſte, which plainly ſheweth it to be a kinde of wilde Gentian. The root is ſmall, and periſheth when it hath perfected his ſeed, and recouereth it ſelfe by falling of the ſame.

Pneumonanthe.
Calathian Violet.

¶ *The Place.*

It is found ſometimes in Meadowes, oftentimes in vntilled places. It groweth vpon Long-field downes in Kent, neere vnto a village called Longfield by Grauesend, vpon the chalkie cliffes neere Greene-Hythe and Cobham in Kent, and many other places. It likewiſe groweth as you ride from Sugar-loafe hill vnto Bathe, in the Weſt countrey.

‡ This plant I neuer found but once, and that was on a wet Mooriſh ground in Lincolnſhire, 2. or 3. miles on this ſide Caſter, and as I remember, the place is called Netleton Moore. Now I ſuſpect that our Authour knew it not; firſt, becauſe he deſcribes it with leaues like vnto Time, when as this hath long narrow leaues more like to Hyſſop or Roſemary. Secondly, for that he ſaith the root is ſmall & periſheth when as it hath perfected the ſeed: whereas this hath a liuing, ſtringie and creeping root. Beſides, this ſeldome or neuer growes on chalkie cliffes, but on wet Mooriſh grounds and Heaths: wherefore I ſuſpect our Authour tooke the ſmall Autumne Gentian (deſcribed by me in the fourth place of the laſt Chapter) for this here treated of. ‡

¶ *The Time.*

The gallant floures hereof be in their brauerie about the end of Auguſt, and in September.

¶ *The Names.*

‡ This is thought to be *Viola Calathiana* of *Ruellius*, yet not that of *Pliny*; and thoſe that deſire to know more of this may haue recourſe to the twelfth chapter of the firſt booke of the 2. *Pempt.* of *Dodon.* his Latine Herball, whence our Authour tooke thoſe words that were formerly in this place, though he did not well vnderſtand nor expreſſe them ‡. It is called *Viola Autumnalis*, or Autumne Violet, and ſeemeth to bee the ſame that *Valerius Cordus* doth call *Pneumonanthe*, which he ſaith is named in the Germane tongue **Lungenblumen**, or Lung-floure: in Engliſh, Autumne Bel-floures, Calathian Violets, and of ſome, Harueſt-bels.

¶ *The Temperature.*

This wilde Felwoort or Violet is in Temperature hot, ſomewhat like in facultie to Gentian, whereof it is a kinde, but far weaker in operation.

¶ *The Vertues.*

A The latter Phyſitions hold it to be effectuall againſt peſtilent diſeaſes, and the bitings & ſtingings of venomous beaſts.

Chap.

Chap. 109. *Of Venus Looking-glaſſe.*

¶ *The Deſcription.*

1 BEſides the former Bel-floures, there is likewiſe a certaine other, which is low and little; the ſtalkes whereof are tender, two ſpans long, diuided into many branches moſt commonly lying vpon the ground. The leaues about the ſtalks are little, ſleightly nicked in the edges. The floures are ſmall, of a bright purple colour tending to blewnes, very beautifull, with wide mouths like broad bels, hauing a white chiue or thred in the middle. The floures in the day time are wide open, and about the ſetting of the Sun are ſhut vp and cloſed faſt together, in fiue corners, as they are before their firſt opening, and as the other Bel-floures are. The roots be verie ſlender, and periſh when they haue perfected their ſeed.

‡ 2 There is another which from a ſmall and wooddy root ſendeth vp a ſtraight ſtalk, ſometimes but two or three inches, yet otherwhiles a foot high, when as it lights into good ground. This ſtalke is creſted and hollow, hauing little longiſh leaues crumpled or ſinuated about the edges ſet thereon: and out of the boſomes of thoſe leaues towards the top of the ſtalke and ſometimes lower, come little branches bearing little winged cods, at the tops of which in the middeſt of fiue little greene leaues ſtand ſmall purple floures, of little or no beauty; which being paſt the cods become much larger, and containe in them a ſmall yellowiſh ſeed, and they ſtill retaine at their tops the fiue longiſh greene leaues that incompaſſed the floure. This plant is an annuall like as the former. ‡

1 *Speculum Veneris.*
Venus Looking-glaſſe.

‡ 2 *Speculum Veneris minus.*
Codded corne violet.

¶ *The Place.*

It groweth in ploughed fields among the corne, in a plentifull and fruitfull ſoile. I found it in a field among the corne by Greene-hithe, as I went from thence toward Dartford in Kent, and in many other places thereabout, but not elſwhere: from whence I brought of the ſeeds for my Garden, where they come vp of themſelues from yeare to yeare by falling of the ſeed.

‡ That which is here figured and deſcribed in the firſt place I neuer found growing in England

land, I haue ſeene only ſome branches of it brought from Leiden by my friend Mr. *William Parker*. The other of my deſcription I haue diuers times found growing among the corn in Chelſey field, and alſo haue had it brought me from other places by Mr. *George Bowls*, & Mr. *Leonard Buckner*. ‡

¶ *The Time.*

It floureth in Iune and Iuly, and the ſeed is ripe in the end of Auguſt.

¶ *The Names.*

It is called *Campana Aruenſis*, and of ſome *Onobrychis*, but vnproperly, of other *Cariophyllus ſegetum*, or corne Gilloflowre, or Corne pinke, and *Speculum Veneris*, or Ladies glaſſe The Brabanders in their tongue call it **Urouwen Spiegel.**

‡ *Tabernamontanus* hath two figures thereof, the one vnder the name of *Viola aruenſis*, and the other by the title of *Viola Pentagonia*, becauſe the floure hath fiue folds or corners. 2 This of my deſcription is not mentioned by any Authour; wherefore I am content to follow that name which is giuen to the former, and terme it in Latine *Speculum Veneris minus* : and from the colour of the floure and codded ſeed veſſell, to call it in Engliſh, Codded Corne Violet.

¶ *The Temperature and Vertues.*

We haue not found any thing written either of his vertue or temperature, of the antient or late Writers.

Chap. 110. *Of Neeſing root, or Neeſewoort.*

1 *Helleborus albus.*
White Hellebor.

2 *Helleborus albus præcox.*
Timely white Hellebor.

¶ *The Deſcription.*

1 THe firſt kinde of white Hellebor hath leaues like vnto great Gentian, but much broader, and not vnlike the leaues of the great Plantaine, folded into pleats like a garment pleated to bee laied vp in a cheſt; amongſt theſe leaues riſeth vp a ſtalke a cubite long, ſet towards

towards the top full of little ſtarre-like floures, of an herbie green colour tending to whiteneſſe, which being paſt there come ſmall huskes containing the ſeed. The root is great and thicke, with many ſmall threds hanging thereat.

2 The ſecond kinde is very like the firſt, and differeth in that, that this hath blacke reddiſh floures, and commeth to flouring before the other kinde, and ſeldome in my garden commeth to ſeeding.

¶ *The Place.*

The white Hellebor groweth on the Alps, and ſuch like mountains where Gentian doth grow. It was reported vnto me by the biſhop of Norwich, that white Hellebor groweth in a wood of his owne neere to his houſe at Norwich. Some ſay likewiſe that it doth grow vpon the Mountaines of Wales. I ſpeake this vpon report, yet I thinke not, but that it may be true. Howbeit I dare aſſure you, that they grow in my garden at London, where the firſt kinde floureth and ſeedeth very well.

¶ *The Time.*

The firſt floureth in Iune, and the ſecond in May.

¶ *The Names.*

Neeſewoort is called in Greeke ἐλλέβορος λευκὸς: in Latine, *Veratrum Album*, *Helleborus albus*, and *Sanguis Herculeus*. The Germans call it **Weiſz nieſwurt**: the Dutchmen, **Nieſwortel**: the Italians, *Elleboro bianco*: The Spaniards, *Verde gambre blanco*: the French, *Ellebore blanche*: and we of England call it white Hellebor, Nieſwoort, Lingwoort, and the root Neeſing pouder.

¶ *The Temperature.*

The root of white Hellebor, is hot and drie in the third degree.

¶ *The Vertues.*

The root of white Hellebor procureth vomite mightily, wherein conſiſteth his chiefe vertue, A and by that means voideth all ſuperfluous ſlime and naughtie humors. It is good againſt the falling ſickneſſe, phrenſies, ſciatica, dropſies, poiſon, and againſt all cold diſeaſes that bee of hard curation, and will not yeeld to any gentle medicine.

This ſtrong medicine made of white Hellebor, ought not to be giuen inwardly vnto delicate B bodies without great correction, but it may more ſafely be giuen vnto Country people which feed groſſely, and haue hard, tough, and ſtrong bodies.

The root of Hellebor cut in ſmall pieces, ſuch as may aptly and conueniently be conueied into C the Fiſtulaes doth mundifie them, and taketh away the callous matter which hindereth curation, and afterward they may be healed vp with ſome incarnatiue vnguent, fit for the purpoſe. ‡ This facultie by *Dioſcorides* is attributed to the blacke Hellebor, and not to this. ‡

The pouder drawne vp into the noſe cauſeth ſneeſing, and purgeth the braine from groſſe and D ſlimie humours.

The root giuen to drinke in the weight of two pence, taketh away the fits of agues, killeth Mice E and rats being made vp with honie and floure of wheat: *Pliny* addeth that it is a medicine againſt the Louſie euill.

Chap. 111. *Of Wilde white Hellebor.*

¶ *The Deſcription.*

1 *Helleborine* is like vnto white Hellebor, and for that cauſe we haue giuen it the name of *Helleborine*. It hath a ſtraight ſtalke of a foot high, ſet from the bottome to the tuft of floures, with faire leaues, ribbed and chamfered like thoſe of white Hellebor, but nothing neere ſo large, of a darke greene colour. The floures bee orderly placed from the middle to the top of the ſtalke, hollow within, and white of colour, ſtraked here and there with a daſh of purple, in ſhape like the floures of Satyrion. The ſeed is ſmall like duſt or motes in the Sun. The root is ſmall, full of iuice, and bitter in taſte.

2 The ſecond is like vnto the firſt, but altogether greater, and the floures white, without any mixture at all, wherein conſiſteth the difference.

3 The third kind of *Helleborine*, being the 6. after *Cluſius* account, hath leaues like the firſt deſcribed,

bed, but ſmaller and narrower. The ſtalke riſeth vp to the height of two ſpans; at the top whereof grow faire ſhining purple coloured floures, conſiſtiug of ſix little leaues, within or among which lieth hid things like ſmall helmets. The plant in proportion is like the othet of this kinde. The The root is ſmall, and creepeth in the ground.

1 *Helleborine.*
Wilde white Hellebore.

3 *Helleborine anguſtifolia. 6. Cluſij.*
Narrow leafed wilde Neeſewoort.

¶ *The Place.*

They bee found in dankiſh and ſhadowie places; the firſt was found growing in the woods by Digges well paſtures, halfe a mile from Welwen in Hartfordſhire: it groweth in a wood fiue miles from London, neere vnto a bridge called Lockbridge: by Nottingham neere Robinhoods well, where my friend Mr. *Steuen Bredwell* a learned Phyſition found the ſame: in the woods by Dunmowe in Eſſex: by Southfleet in Kent; in a little groue of Iuniper, and in a wood by Clare in Eſſex.

¶ *The Time.*

They floure in May and Iune, and perfect their ſeed in Auguſt.

¶ *The Names.*

The likeneſſe that it hath with white Hellebor, doth ſhew it may not vnproperly bee named *Helleborine*, or wilde white Hellebor, which is alſo called of *Dioſcorides* and *Pliny* [illegible], or *Epipactis*; But from whence that name came it is not apparant: it is alſo named [illegible].

¶ *The Temperature.*

They are thought to be hot and drie of nature.

¶ *The Vertues.*

A The faculties of theſe wilde Hellebors are referred vnto the white Neeſewoort, whereof they are kindes.

B It is reported that the decoction of wilde Hellebor drunken, openeth the ſtoppings of the Liuer, and helpeth any imperfections of the ſame.

Chap.

Chap. 112. *Of our Ladies Slipper.*

¶ *The Deſcription.*

1 OVr Ladies Shoo or Slipper hath a thicke knobbed root, with certaine marks or notes vpon the ſame, ſuch as the roots of Solomons Seale haue, but much leſſer, creeping within the vpper cruſt of the earth: from which riſeth vp a ſtiffe and hairy ſtalke a foot high, ſet by certaine ſpaces with faire broad leaues, ribbed with the like ſinewes or nerues as thoſe of the Plantaine. At the top of the ſtalke groweth one ſingle floure, ſeldome two, faſhioned on the one ſide like an egge; on the other ſide it is open, empty, and hollow, and of the forme of a ſhoo or ſlipper, whereof it tooke his name; of a yellow colour on the outſide, and of a ſhining deepe yellow on the inſide. The middle part is compaſſed about with foure leaues of a bright purple colour, often of a light red or obſcure crimſon, and ſometimes yellow as in the middle part, which in ſhape is like an egge, as aforeſaid.

‡ 2 This other differs not from the former, vnleſſe in the colour of the floure; which in this hath the foure long leaues white, and the hollow leafe or ſlipper of a purple colour. ‡

1 *Calceolus Mariæ.*
Our Ladies Slipper.

‡ 2 *Calceolus Mariæ alter.*
The other Ladies Slipper.

¶ *The Place.*

Ladies Slipper groweth vpon the mountains of Germany, Hungary, and Poland. I haue a plant thereof in my garden, which I receiued from M^r. *Garret* Apothecary, my very good friend.

‡ It is alſo reported to grow in the North parts of this kingdome; and I ſaw it in floure with M^r. *Tradeſcant* the laſt Sommer. ‡

¶ *The Time.*

It floureth about the midſt of Iune.

¶ *The Names.*

It is commonly called *Calceolus D. Mariæ*, and *Marianus*: of ſome, *Calceolus Sacerdotis*: of ſome, *Aliſma*, but vnproperly: in Engliſh, Our Ladies ſhoo or ſlipper: in the Germane tongue, **Pfaffen Schueth, Papen ſcoen**; and of ſome, *Damaſonium notum.*

¶ *The*

¶ *The Temperature and Vertues.*

Touching the faculties of our Ladies Shoo we haue nothing to write, it being not ſufficiently knowne to the old Writers, no nor to the new.

Chap. 113. *Of Sope-wort.*

¶ *The Deſcription.*

THe ſtalkes of Sope-wort are ſlipperie, ſlender, round, ioynted, a cubit high or higher: the leaues are broad, ſet with veines very like broad leaued Plantaine, but yet leſſer, ſtanding out of euery ioynt by couples for the moſt part, and eſpecially thoſe that are the neereſt the roots bowing backwards. The floures in the top of the ſtalkes and about the vppermoſt ioynts are many, well ſmelling, ſometimes of a beautifull red colour like a Roſe; other-while of a light purple or white, which grow out of long cups conſiſting of fiue leaues, in the middle of which are certaine little threds. The roots are thicke, long, creeping aſlope, hauing certaine ſtrings hanging out of them like to the roots of blacke Hellebor: and if they haue once taken good and ſure rooting in any ground it is impoſſible to deſtroy them.

‡ There is kept in ſome of our gardens a varietie of this, which differs from it in that the floures are double and ſomewhat larger: in other reſpects it is altogether like the precedent. ‡

1 *Saponaria.*
Sope-wort, or Bruſe-wort.

¶ *The Place.*

It is planted in gardens for the floures ſake, to the decking vp of houſes, for the which purpoſe it chiefely ſerueth. It groweth wild of it ſelfe neere to riuers and running brookes in ſunny places.

¶ *The Time.*

It floureth in Iune and Iuly.

¶ *The Names.*

It is commonly called *Saponaria*, of the great ſcouring qualitie that the leaues haue: for they yeeld out of themſelues a certaine iuyce when they are bruiſed, which ſcoureth almoſt as well as Sope: although *Ruellius* deſcribe a certaine other Sopewort. Of ſome it is called *Aliſma*, or *Damaſonium*: of others, *Saponaria Gentiana*, whereof doubtleſſe it is a kinde: in Engliſh it is called Sopewort, and of ſome Bruiſe-wort.

¶ *The Temperature and Vertues.*

It is hot and dry, and not a little ſcouring withall, hauing no vſe in phyſicke ſet downe by any Author of credit.

‡ Although our Authour and ſuch as before him haue written of Plants were ignorant of the facultie of this herbe, yet hath the induſtrie of ſome later men found out the vertue thereof: and *Septalius* reports that it was one *Zapata* a Spaniſh Empericke. Since whoſe time it hath beene written of by *Rudius, lib. 5. de morbis occult. & venenat. cap. 18.* And by *Cæſar Claudinus, de ingreſſu ad infirmos, pag. 411. & pag. 417.* But principally by *Ludouicus Septalius, Animaduerſ. med. lib. 7. num. 214.* where treating of decoctions in vſe againſt the French Poxes, he mentions the ſingular effect of this herb againſt that filthy diſeaſe. His words are theſe: I muſt not in this place omit the vſe of another Alexipharmicall decoction, being very effectuall and vſefull for the poorer ſort; namely that which is made of Sope-wort, an herbe common and knowne to all. Moreouer, I haue ſometimes vſed it with happy ſucceſſe in the moſt contumacious diſeaſe: but it is of ſomewhat an vngratefull taſte,

and

and therefore it muſt be reſerued for the poorer ſort. The decoction is thus made: R. *Saponariæ virid. M.ij. infundantur per noctem in lib.viij. aquæ mox excoquantur ad coctu̇ram Saponariæ: deinde libra vna cum dimidia aquæ cum herba iam cocta excoletur cum expreſsione, quæ reſeruetur pro potione matutina ad ſudores proliciendos ſumendo ℥ vij. aut viij, quod vero ſupereſt dulcoretur cum paſſulis aut ſaccaro pro potu cum cibis: æſtate & bilioſis naturis addi poterit aut Sonchi, aut Cymbalariæ M.j. Valet & pro mulieribus ad menſtrua alba abſumenda cum M. ſ. Cymbalariæ, & addito tantundem Philipendulæ.* Thus much *Septalius*, who ſaith that he had vſed it *ſæpè ac ſæpius*, often and often againe.

Some haue commended it to be very good to be applied to greene wounds, to hinder inflammation, and ſpeedily to heale them. ‡

Chap. 114. *Of Arſmart or Water-Pepper.*

¶ *The Deſcription.*

1 Arſmart bringeth forth ſtalkes a cubit high, round, ſmooth, ioynted or kneed, diuiding themſelues into ſundry branches; whereon grow leaues like thoſe of the Peach or of the Sallow tree. The floures grow in cluſters vpon long ſtems, out of the boſome of the branches and leaues, and likewiſe vpon the ſtalkes themſelues, of a white colour tending to a bright purple: after which commeth forth little ſeeds ſomewhat broad, of a reddiſh yellow, and ſometimes blackiſh, of an hot and biting taſte, as is all the reſt of the Plant, and like vnto pepper, whereof it tooke his name; yet hath it no ſmell at all.

1 *Hydropiper.*
Arſmart.

2 *Perſicaria maculoſa.*
Dead or ſpotted Arſmart.

2 Dead Arſmart is like vnto the precedent in ſtalkes, cluſtering floures, roots and ſeed, and differeth in that, that this plant hath certaine ſpots or marks vpon the leaues, in faſhion of a halfe moone, of a darke blackiſh colour. The whole plant hath no ſharpe or biting taſte, as the other hath, but as it were a little ſoure ſmacke vpon the tongue. The root is likewiſe full of ſtrings or threds, creeping vp and downe in the ground.

‡ 3 This

‡ 3 This in roots, leaues, and manner of growing is very like the firſt deſcribed, but leſſer by much in all theſe parts: the floures alſo are of a whitiſh, and ſometimes of a purpliſh colour: it growes in barren grauelly and wet places.

4 I haue thought good to omit the impertinent deſcription of our Author fitted to this plant, and to giue one ſomewhat more to the purpoſe: the ſtalkes of this are ſome two foot high, tender, greene, and ſometimes purpliſh, hollow, ſmooth, ſucculent and tranſparent, with large and eminent ioynts, from whence proceed leaues like thoſe of French Mercurie, a little bigger, and broader toward their ſtalkes, and thereabout alſo cut in with deeper notches: from the boſomes of each of theſe leaues come forth long ſtalkes hanging downewards, and diuided into three or foure branches; vpon which hang floures yellow, and much gaping, with crooked ſpurs or heeles, and ſpotted alſo with red or ſanguine ſpots: after theſe are paſt ſucceed the cods, which containe the ſeed, and they are commonly two inches long, ſlender, knotted, and of a whitiſh greene colour, creſted with greeniſh lines; and as ſoone as the ſeed begins to be ripe, they are ſo impatient that they will by no meanes be touched, but preſently the ſeed will fly out of them into your face. And this is the cauſe that *Lobel* and others haue called this Plant *Noli me tangere*. As for the like reaſon ſome of late haue impoſed the ſame name vpon the *Sium minimum* of *Alpinus*, formerly deſcribed by me in the ſeuenth place of the eighteenth chapter of this booke, *pag.* 260. ‡

‡ 3 *Perſicaria puſilla repens.*
Small creeping Arſmart.

4 *Perſicaria ſiliquoſa.*
Codded Arſmart.

¶ *The Place and Time.*

They grow very common almoſt euery where in moiſt and wateriſh plaſhes, and neere vnto the brims of riuers, ditches, and running brookes. They floure from Iune to Auguſt.

‡ The codded or impatient Arſmart was firſt found to grow in this kingdome by the induſtrie of my good friend Mr. *George Bowles*, who found it at theſe places: firſt in Shropſhire, on the bankes of the riuer Kemlet at Marington in the pariſh of Cherberry, vnder a Gentlemans houſe called Mr. *LLoyd*; but eſpecially at Guerndee in the pariſh of Cherſtocke, halfe a mile from the foreſaid Riuer, amongſt great Alder trees in the highway. ‡

¶ *The Names.*

1 Arſmart is called in Greeke [illegible]: of the Latines, *Hydropiper*, or *Piper aquaticum*, or *Aquatile*, or water Pepper: in high-Dutch, **Waſſer Pfeffer**: in low-Dutch, **Water Peper**: in French, *Curage*,

Curage, or *Culrage*: in Spaniſh, *Pimenta aquatica*: in Engliſh, Water-Pepper, Culrage, and Arſe-ſmart, according to the operation and effect when it is vſed in the abſterſion of that part.

2 Dead Arſmart is called *Perſicaria*, or Peach-wort, of the likeneſſe that the leaues haue with thoſe of the Peach tree. It hath beene called *Plumbago* of the leaden coloured markes which are ſeene vpon it: but *Pliny* would haue *Plumbago* not to be ſo called of the colour, but rather of the effect, by reaſon that it helpeth the infirmitie of the eyes called *Plumbum*. Yet there is another *Plumbago* which is rather thought to be that of *Plinies* deſcription, as ſhal be ſhewed in his proper place. In Engliſh we may call it Peach-wort, and dead Arſmart, becauſe it doth not bite thoſe places as the other doth.

‡ 3 This is by *Lobel* ſet forth, and called *Perſicaria puſilla repens*: of *Tabernamontanus*, *Perſicaria pumila*.

4 No plant I thinke hath found more varietie of names than this: for *Tragus* calls it *Mercurialis ſylueſtris altera*; and he alſo calls it *Eſula*: *Leonicerus* calls it *Tithymalus ſylueſtris*: *Geſner*, *Camerarius*, and others, *Noli me tangere*: *Dodonæus*, *Impatiens herba*: *Cæſalpinus*, *Catanance altera*: in the *Hiſt. Lugd.* (where it is ſome three times ouer) it is called beſides the names giuen it by others, *Chryſæa*: *Lobel*, *Thalius*, and others call it *Perſicaria ſiliquoſa*: yet none of theſe well pleaſing *Columna*, he hath accurately deſcribed and figured it by the name of *Balſamita altera*: and ſince him *Bauhine* hath named it *Balſamina lutea*: yet both theſe and moſt of the other keepe the title of *Noli me tangere*. ‡

¶ *The Temperature.*

Arſmart is hot and dry, yet not ſo hot as Pepper, according to *Galen*.

Dead Arſmart is of temperature cold, and ſomething dry.

¶ *The Vertues.*

The leaues and ſeed of Arſmart do waſte and conſume all cold ſwellings, diſſolue and ſcatter congealed bloud that commeth of bruiſings or ſtripes. A

The ſame bruiſed and bound vpon an impoſtume in the ioynts of the fingers (called among the vulgar ſort a fellon or vncome) for the ſpace of an houre, taketh away the paine: but (ſaith the Author) it muſt be firſt buried vnder a ſtone before it be applied; which doth ſomewhat diſcredit the medicine. B

The leaues rubbed vpon a tyred jades backe, and a good handfull or two laid vnder the ſaddle, and the ſame ſet on againe, wonderfully refreſheth the wearied horſe, and cauſeth him to trauell much the better. C

It is reported that Dead Arſmart is good againſt inflammations and hot ſwellings, being applied in the beginning: and for greene wounds, if it be ſtamped and boyled with oyle Oliue, waxe, and Turpentine. D

‡ The faculties of the fourth are not yet knowne. *Lobel* ſaith it hath a venenate qualitie: and *Tragus* ſaith a vomitorie: yet neither of them ſeemes to affirme any thing of certaintie, but rather by heare-ſay. ‡ E

Chap. 115. *Of Bell-Floures.*

¶ *The Deſcription.*

1 COuentry-Bells haue broad leaues rough and hairy, not vnlike to thoſe of the Garden Bugloſſe, of a ſwart greene colour: among which do riſe vp ſtiffe hairie ſtalks the ſecond yeare after the ſowing of the ſeed: which ſtalkes diuide themſelues into ſundry branches, whereupon grow many faire and pleaſant bell-floures, long, hollow, and cut on the brim with fiue ſleight gaſhes, ending in fiue corners toward night, when the floure ſhutteth it ſelfe vp, as do moſt of the Bell-floures: in the middle of the floures be three or foure whitiſh chiues, as alſo much downy haire, ſuch as is in the eares of a Dog or ſuch like beaſt. The whole floure is of a blew purple colour: which being paſt, there ſucceed great ſquare or cornered ſeed-veſſels, diuided on the inſide into diuers cels or chambers, wherein doe lie ſcatteringly many ſmall browne flat ſeeds. The root is long and great like a Parſenep, garniſhed with many threddy ſtrings, which periſheth when it hath perfected his ſeed, which is in the ſecond yeare after his ſowing, and recouereth it ſelfe againe by the falling of the ſeed.

2 The ſecond agreeth with the firſt in each reſpect, as well in leaues, ſtalkes, or roots, and differeth in that, that this plant bringeth forth milke-white floures, and the other not ſo.

¶ *The*

Viola Mariana. Blew Couentry-Bells.

¶ *The Place and Time.*

They grow in woods, mountaines, and darke vallies, & vnder hedges among the buſhes, eſpecially about Couentry, where they grow very plentifully abroad in the fields, & are there called Couentry-bels; and of ſome about London Canturbury-bels, but vnproperly, for that there is another kinde of Bell-floure growing in Kent about Canturbury, which may more fitly be called Canturbury-bells, becauſe they grow there more plentifully than in any other Country. Theſe pleaſant Bel-floures we haue in our London gardens eſpecially for the beauty of their floure, although they be kindes of Rampions, and the roots eaten as Rampions are.

They floure in Iune, Iuly, and Auguſt; the ſeed waxeth ripe in the meane time; for theſe plants bring not forth their floures all at once; but when one floureth another ſeedeth.

¶ *The Names.*

Couentry bels are called in Latine *Viola Mariana:* in Engliſh, Mercuries violets, or Couentry Rapes; and of ſome, Mariets. It hath bin taken to be *Medium*, but vnfitly: of ſome it is called *Rapũ ſylueſtre:* which the Greeks cal ῥαφὺς ἄγριος

¶ *The Temperature and Vertues.*

The root is cold and ſomewhat binding, and not vſed in phyſicke, but only for a ſallet root boyled and eaten with oyle, vineger, and pepper.

Chap. 116. *Of Throat-wort, or Canturbury-Bells.*

1 *Trachelium majus.* Blew Canturbury-Bels.

3 *Trachel. majus Belg. ſiue Giganteum.* Gyant Throatwort.

¶ *The Deſcription.*

1 THe firſt of the Canterbury bells hath rough and hairy brittle ſtalkes, creſted into a certaine ſquareneſſe, diuiding themſelues into diuers branches, whereupon do grow very rough ſharpe pointed leaues, cut about the edges like the teeth of a ſawe; and ſo like the leaues of nettles, that it is hard to know the one from the other, but by touching them. The floures are hollow, hairy within, and of a perfect blew colour, bell faſhion, not vnlike to the Couentry bells. The root is white, thicke, and long laſting. ‡ There is alſo in ſome Gardens kept a variety hereof hauing double floures. ‡

2 The white Canterbury bells are ſo like the precedent, that it is not poſſible to diſtinguiſh them, but by the colour of the floures; which of this plant is a milke white colour, and of the other a blew, which ſetteth forth the difference.

4 *Trachelium minus.*
Small Canterbury bells.

‡ 5 *Trachelium majus petræum.*
Great Stone Throtewort.

‡ Our Author much miſtaking in this place (as in many other) did againe figure and deſcribe the third and fourth, and of them made a fift and ſixt, calling the firſt *Trachelium Giganteum*, and the next *Viola Calathiana*; yet the figures were ſuch as *Bauhine* could not coniecture what was meant by them, and therefore in his *Pinax*, he ſaith, *Trachelium Giganteum, & Viola Calathiana apud Gerardum, quid?* but the deſcriptions were better, wherefore I haue omitted the former deſcription and here giuen you the later. ‡

3 Giants Throtewort hath very large leaues of an ouerworne greene colour, hollowed in the middle like the Moſcouites ſpoone, and very rough, ſlightly indented about the edges. The ſtalke is two cubits high, whereon thoſe leaues are ſet from the bottome to the top; from the boſome of each leafe commeth forth one ſlender footeſtalke, whereon doth grow a faire and large floure faſhioned like a bell, of a whitiſh colour tending to purple. The pointed corners of each floure turne themſelues backe like a ſcrole, or the Dalmatian cap; in the middle whereof commeth forth a ſharpe ſtile or clapper of a yellow colour. The root is thicke, with certaine ſtrings annexed thereto.

4 The ſmaller kinde of Throtewort hath ſtalkes and leaues very like vnto the great Throte-

woort, but altogether leſſer, and not ſo hairy: from the boſome of which leaues ſhoot forth very beautifull floures bell faſhion, of a bright purple colour, with a ſmall peſtle or clapper in the middle, and in other reſpects is like the precedent.

‡ 5 This from a wooddy and wrinkled root of a pale purple colour ſends forth many rough creſted ſtalkes of ſome cubit high, which are vnorderly ſet with leaues, long, rough, and ſnipt lightly about their edges, being of a darke colour on the vpper ſide, and of a whitiſh on their vnder part. At the tops of the ſtalkes grow the floures, being many, and thicke thruſt together, white of colour, and diuided into fiue or ſeuen parts, each floure hauing yellowiſh threds, and a pointall in their middles. It floures in Auguſt, and was firſt ſet forth and deſcribed by *Pona* in his deſcription of Mount Baldus. ‡

¶ *The Place.*

The firſt deſcribed and ſometimes the ſecond growes very plentifully in the low woods and hedge-rowes of Kent, about Canterbury, Sittingborne, Grauesend, Southfleet, and Greenehyth, eſpecially vnder Cobham Parke-pale in the way leading from Southfleet to Rocheſter, at Eltham about the parke there not farre from Greenwich; in moſt of the paſtures about Watford and Buſhey, fifteene miles from London.

‡ 3 The third was kept by our Author in his Garden, as it is alſo at this day preſerued in the garden of M^r. *Parkinſon*: yet in the yeere 1626 I found it in great plenty growing wilde vpon the bankes of the Riuer Ouſe in Yorkſhire, as I went from Yorke to viſite Selby the place whereas I was borne, being ten miles from thence. ‡

The fourth groweth in the medow next vnto Ditton ferrie as you goe to Windſore, vpon the chalky hills about Greenehithe in Kent; and in a field by the high way as you go from thence to Dartford; in Henningham parke in Eſſex; and in Sion medow neere to Brandford, eight miles from London.

The fifth growes on Mount Baldus in Italy.

¶ *The Time.*

All the kindes of bell floures do floure and flouriſh from May vntill the beginning of Auguſt, except the laſt, which is the plant that hath been taken generally for the Calathian violet, which floureth in the later end of September; notwithſtanding the Calathian violet or Autumne violet is of a moſt bright and pleaſant blew or azure colour, as thoſe are of this kinde, although this plant ſometimes changeth his colour from blew to whiteneſſe by ſome one accident or other.

¶ *The Names.*

1 2 Throtewoort is called in Latine *Ceruicaria*, and *Ceruicaria major*: in Greeke, [illegible]: of moſt, *Vuularia*: of *Fuchſius*, *Campanula*: in Dutch, **Halſcruyt**: in Engliſh, Canterburie bells, Haskewoorte, Throtewoort, or *Vuula* woort, of the vertue it hath againſt the paine and ſwelling thereof.

‡ 3 This is the *Trachelium majus Belgarum* of *Lobell*, and the ſame (as I before noted) that our Author formerly ſet forth by the name of *Trachelium Giganteum*, ſo that I haue put them, as you may ſee, together in the title of the plant.

4 This is the *Trachelium maius* of *Dodonæus*, *Lobell*, and others: the *Ceruicaria minor* of *Tabernamontanus*; and *Vuularia exigua* of *Tragus*: Our Author gaue this alſo another figure and deſcription by the name of *Viola Calathiana*, not knowing that it was the laſt ſaue one which he had deſcribed by the name of *Trachelium minus*. ‡

¶ *The Temperature.*

Theſe plants are cold and dry, as are moſt of the Bell floures.

¶ *The Vertues.*

A The Antients for any thing that we know haue not mentioned, and therefore not ſet downe any thing concerning the vertues of theſe Bell floures: notwithſtanding we haue found in the later writers, as alſo of our owne experience, that they are excellent good againſt the inflammation of the throte and *Vuula* or almonds, and all manner of cankers and vlcerations in the mouth, if the mouth and throte be gargarized and waſhed with the decoction of them: and they are of all other herbes the chiefe and principall to be put into lotions, or waſhing waters, to iniect into the priuy parts of man or woman being boiled with hony and Allom in water, with ſome white wine.

Chap. 117. *Of Peach-bells and Steeple-bells.*

¶ *The Deſcription.*

1 THe Peach-leaued Bell-floure hath a great number of ſmall and long leaues, riſing in a great buſh out of the ground, like the leaues of the Peach tree: among which riſeth vp a ſtalke two cubits high: alongſt the ſtalke grow many floures like bells, ſomtime white, and for the moſt part of a faire blew colour; but the bells are nothing ſo deepe as they of the other kindes; and theſe alſo are more dilated or ſpred abroad than any of the reſt. The ſeed is ſmall like Rampions, and the root a tuft of laces or ſmall ſtrings.

2 The ſecond kinde of Bell-floure hath a great number of faire blewiſh or Watchet floures, like the other laſt before mentioned, growing vpon goodly tall ſtems two cubits and a halfe high, which are garniſhed from the top of the plant vnto the ground with leaues like Beets, diſorderly placed. This whole plant is exceeding full of milke, inſomuch as if you do but breake one leafe of the plant, many drops of a milky iuyce will fall vpon the ground. The root is very great, and full of milk alſo: likewiſe the knops wherein the ſeed ſhould be are empty and void of ſeed, ſo that the whole plant is altogether barren, and muſt be increaſed with ſlipping of his root.

1 *Campanula perſicifolia.*
Peach-leaued Bell-floure.

2 *Campanula lacteſcens pyramidalis.*
Steeple milky Bell-floure.

3 The ſmall Bell-floure hath many round leaues very like thoſe of the common field Violet, ſpred vpon the ground; among which riſe vp ſmall ſlender ſtems, diſorderly ſet with many graſſie narrow leaues like thoſe of flax. The ſmall ſtem is diuided at the top into ſundry little branches, whereon do grow pretty blew floures bell-faſhion. The root is ſmall and threddy.

4 The yellow Bell-floure is a very beautifull plant of an handfull high, bearing at the top of his weake and tender ſtalkes moſt pleaſant floures bel-faſhion, of a faire and bright yellow colour. The leaues and roots are like the precedent, ſauing that the leaues that grow next to the ground of this plant are not ſo round as the former. ‡ Certainly our Author in this place meant to ſet forth the *Campanula lutea linifolia flore volubilis*, deſcribed in the *Aduerſ. pag.* 177. and therefore I haue giuen you the figure thereof. ‡

3 *Campanula rotundifolia.*
Round leaued Bell-floure.

5 *Campanula minor alba, ſiue purpurea.*
Little white or purple Bel-floure.

† 4 *Campanula lutea linifolia.*
Yellow Bell-floure.

5 The little white Bell-floure is a kinde of wilde Rampions, as is that which followeth, and alſo the laſt ſaue one before deſcribed. This ſmall plant hath a ſlender root of the bigneſſe of a ſmall ſtraw, with ſome few ſtrings anexed thereto. The leaues are ſomwhat long, ſmooth, and of a perfect greene colour, lying flat vpon the ground: from thence riſe vp ſmall tender ſtalkes, ſet heere and there with a few leaues. The floures grow at the top, of a milke white colour.

6 The other ſmall Bell-floure or wilde Rampion differeth not from the precedent but onely in colour of the floures; for as the others are white, theſe are of a bright purple colour, which ſets forth the difference.

‡ 7 Beſides theſe here deſcribed, there is another very ſmall and rare Bell-floure, which hath not beene ſet forth by any but onely by *Bauhine*, in his *Prodrom.* vnder the title of *Campanula Cymbalariæfolijs*, and that fitly; for it hath thinne and ſmall cornered leaues much after the maner of *Cymbalaria*, and theſe are ſet without order on very ſmall weake and tender ſtalkes ſome handfull long; and at the tops of the branches grow little ſmall and tender Bell-floures of a blew colour. The root, like as the whole plant, is very ſmall and threddy. This pretty plant was firſt diſcouered to grow in England by Maſter *George Bowles*, *Anno* 1632. who found it in Montgomerie ſhire, on the dry bankes in the high-way as one rideth from Dolgeogg a Worſhipfull Gentlemans houſe called M^r. *Francis Herbert*, vnto a market towne called Mahuntleth, and in all the way from thence to the ſea ſide. It may be called in Engliſh, The tender Bell-floure. ‡

¶ *The*

¶ *The Place.*

The two firſt grow in our London gardens, and not wilde in England.

The reſt, except that ſmall one with yellow floures, do grow wilde in moſt places of England, eſpecially vpon barren ſandy heaths and ſuch like grounds.

¶ *The Time.*

Theſe Bell-floures do flouriſh from May vnto Auguſt.

¶ *The Names.*

Their ſeuerall titles ſet forth their names in Engliſh and Latine, which is as much as hath been ſaid of them.

¶ *The Temperature and Vertues.*

Theſe Bell-floures, eſpecially the foure laſt mentioned, are cold and dry, and of the nature of Rampions, whereof they be kindes.

† The figure in the fourth place was of *Rapunculus nemoroſus* 3. of Tabern. whereof you ſhall finde mention in the following chapter.

Chap. 118. *Of Rampions, or wilde Bell-floures.*

1 *Rapuntium majus.*
Great Rampion.

2 *Rapuntium parvum.*
Small Rampion.

¶ *The Deſcription.*

1 THe great Rampion being one of the Bell-floures, hath leaues which appeare or come forth at the beginning ſomewhat large and broad, ſmooth and plaine, not vnlike to the leaues of the ſmalleſt Beet. Among which riſe vp ſtemmes one cubit high, ſet with ſuch like leaues as thoſe are of the firſt ſpringing vp, but ſmaller, bearing at the top of the ſtalke a great thicke buſhy eare full of little long floures cloſely thruſt together like a Fox-taile: which ſmall floures before their opening are like little crooked hornes, and being wide opened they are ſmall blew-bells, ſometimes white, or ſometimes purple. The root is white, and as thicke as a mans thumbe.

2 The ſecond kind being likewiſe one of the bel-floures, and yet a wild kind of Rampion, hath leaues at his firſt comming vp like vnto the garden Bell-floure. The leaues which ſpring vp afterward for the decking vp of the ſtalke are ſomewhat longer and narrower. The floures grow at the top of tender and brittle ſtalkes like vnto little bells, of a bright blew colour, ſometimes white or purple. The root is ſmall, long, and ſomewhat thicke.

3 This is a wilde Rampion that growes in woods: it hath ſmall leaues ſpred vpon the ground, bluntly indented about the edges: among which riſeth vp a ſtraight ſtem of the height of a cubit, ſet from the bottome to the top with longer and narrower leaues than thoſe next the ground: at the top of the ſtalkes grow ſmall Bell-floures of a watchet blewiſh colour. The root is thicke and tough, with ſome few ſtrings anexed thereto.

‡ There is another varietie of this, whoſe figure was formerly by our Author ſet forth in the fourth place of the laſt chapter: it differs from this laſt onely in that the floures and other parts of the plant are leſſer a little than thoſe of the laſt deſcribed. ‡

3 *Rapunculus nemoroſus.*
Wood Rampions.

‡ 4 *Rapunculus Alpinus Corniculatus.*
Horned Rampions of the Alpes.

‡ 4 This which growes amongſt the rockes in the higheſt Alpes hath a wooddy and verie wrinckled root an handfull and halfe long, from which ariſe many leaues ſet on pretty long ſtalks, ſomewhat round, and diuided with reaſonable deepe gaſhes, hauing many veines, and being of a darke greene colour: amongſt theſe grow vp little ſtalkes, hauing one leafe about their middles, and three or foure ſet about the floure, being narrower and longer than the bottome leaues. The floures grow as in an vmbell, and are ſhaped like that Chymicall veſſell we vſually call a Retort, being big at their bottomes, and ſo becomming ſmaller towards their tops, and hauing many threds in them, whereof one is longer than the reſt, and comes forth in the middle of the floure: it floures in Auguſt. *Pona* was the firſt that deſcribed this, vnder the name of *Trachelium petræum minus*.

5 The roots of this other kinde of horned Rampion grow after an vnuſuall manner, for firſt or lowermoſt is a root like to that of a Rampion, but ſlenderer, and from the top of that commeth forth as it were another root or two, being ſmalleſt about that place whereas they are faſtned to the vnder root, and all theſe haue ſmall fibres comming from them. The leaues which firſt grow vp are ſmooth, and almoſt like thoſe of a Rampion, yet rounder, and made ſomwhat after the maner of a violet leafe, but nothing ſo big: at the bottome of the ſtalk come forth 7 or eight long narrow

leaues

leaues ſnipt about the edges,and ſharpe pointed,and vpon the reſt of the ſtalke grow alſo three or foure narrow ſharp pointed leaues. The floures which are of a purple colour,at firſt reſemble thoſe of the laſt deſcribed ; but afterwards parte themſelues into fiue ſlender ſtrings with threds in the middles ; which decaying,they are ſucceeded by little cups ending in fiue little pointels,and containing a ſmall yellow ſeed. This is deſcribed by *Fabius Columna*, vnder the name of *Rapuntium Corniculatum montanum:* And I receiued ſeeds and roots hereof from Mr. *Goodyer*, who found it growing plentifully wilde in the incloſed chalkie hilly grounds by Maple-Durham neere Peterſfield in Hampſhire.

6 This which is deſcribed in *Cluſius* his *Curæ poſter.* by the name of *Pyramidalis*, and was firſt found and ſent to him by *Gregory de Reggio* a Capuchine Frier, is alſo of this kindred ; wherefore I will giue you a briefe deſcription thereof. The root is white, and long laſting; from which come diuers round hairie and writhen ſtalkes,about a ſpan long more or leſſe. At the top of theſe ſtalks and all amongſt the leaues, grow many elegant blew floures,which are ſucceeded by ſeed veſſels like thoſe of the leſſer *Trachelium*, being full of a ſmall ſeed. The whole plant yeelds milke like as the reſt of this kinde, and the leaues as well in ſhape as hoarineſſe on their vnder ſides, well reſemble thoſe of the ſecond French or Golden Lungwoort of my deſcription. It was firſt found growing in the chinkes of hard rockes about the mouthes of Caues, in the mountaines of Breſcia in Italy by the foreſaid Frier. ‡

‡ 5 *Rapunculus Corniculatus montanus.*
Mountaine horned Rampions.

‡ 6 *Rapunculus ſaxatilis, ſive Pyramidalis alter.*
Rocke Rampion.

¶ *The Place.*

The firſt is ſowne and ſet in Gardens,eſpecially becauſe the rootes are eaten in Sallads.
The ſecond groweth in woods and ſhadowie places,in fat and clayie ſoiles.

¶ *The Time.*

They floure in May,Iune,and Iuly.

¶ *The Names.*

Rampions by a generall name are called *Rapuntium* and *Rapunculus* ; and the firſt by reaſon of the long ſpokie tuſte of floures is called *Rapuntium maius Alopecuri comoſo flore* by *Lobell* and *Pena*, *Rapunculum ſylueſtre* : and *Rapunculus ſylueſtris ſpicatus* by others. The ſecond,which

is

is the ordinary Rampion is called *Rapunculus*, and *Rapuntium minus*; *Lobell* thinkes it the *Pes Locuſtæ* of *Auicen*; and *Columna* iudges it to be *Erinus* of *Nicander* and *Dioſcorides*. The third is the *Rapunculus nemoroſus ſecundus* of *Tabernamontanus*; & the varietie of it is *Rapunc. nemor. tertius*. The names of the reſt are ſhewen in their deſcriptions. ‡

¶ *The Temperature.*

The roots of theſe are of a cold temperature, and ſomething binding.

¶ *The Vertues.*

A The roots are eſpecially vſed in ſallads, being boiled and eaten with oile, vineger, and pepper.
B Some affirme, that the decoction of the roots are good for all inflammations of the mouth, and Almonds of the throte, and other diſeaſes happening in the mouth and throte, as the other Throte-woorts.

Chap. 119. *Of Wall-floures, or yellow Stocke-Gillo-floures.*

¶ *The Kindes.*

‡ Theſe plants which wee terme commonly in Engliſh, Wal-floures and Stocke Gillo-floures are comprehended vnder one generall name of *Leucoion*, (i) *Viola alba*, White Violet, λευκὸς ſignifying white, and ἰὸν a Violet; which as ſome would haue it is not from the whiteneſſe of the floure, for that the moſt and moſt vſuall of them are of other colours, but from the whitenes or hoarineſſe of the leaues, which is proper rather to the Stocke Gillouers than to the wal-floures, I therefore thinke it fit to diſtinguiſh them into *Leucoia foliis viridibus*, that is VVal-floures; and *Leucoia foliis incanv*, Stocke Gillouers. Now theſe againe are diſtinguiſhed into ſeuerall ſpecies, as you may finde by the following Chapters. Moreouer you muſt remember there is another *Viola alba* or *Leucoion* (which is thought to be that of *Theophraſtus* and whereof we haue treated in the firſt booke) which is far different from this, and for diſtinction ſake called *Leucoium bulboſum*. ‡

1 *Viola Lutea.*
VVal-floure.

2 *Viola lutea multiplex.*
Double VVal-floure.

¶ *The*

† 4 *Leucoium ſylueſtre.*
Wilde wall floure.

¶ *The Deſcription.*

1 THe ſtalks of the Wall floure are full of greene branches, the leaues are long, narrow, ſmooth, ſlippery, of a blackiſh greene colour, and leſſer than the leaues of ſtocke Gilloflours. The floures are ſmall, yellow, very ſweete of ſmell, and made of foure little leaues; which being paſt, there ſucceed long ſlender cods, in which is contained flat reddiſh ſeed. The whole plant is ſhrubby, of a wooddie ſubſtance, and can eaſily endure the colde of winter.

2 The double Wall floure hath long leaues greene aud ſmooth, ſet vpon ſtiffe branches, of a wooddie ſubſtance: whereupon do grow moſt pleaſant ſweet yellow flours very double; which plant is ſo well knowne to all, that it ſhall be needleſſe to ſpend much time about the deſcription.

3 Of this double kinde we haue another ſort that bringeth his floures open all at once, whereas the other doth floure by degrees, by meanes whereof it is long in flouring.

‡ 4 This plant which was formerly ſeated in the fourth place of the following chapter, I haue brought to enjoy the ſame place in this, for that by reaſon of the greeneſſe of his leaues and other things he comes neareſt to theſe here deſcribed, alſo I wil deſcribe it anew, becauſe the former was almoſt wholly falſe: It hath many greene leaues at the top of the root like to theſe of the wall floure, but narrower, and bitter of taſte, among which riſe vp one or more ſtalks of a foot or more in height, creſted and ſet with carinated leaues. The floures grow at the tops of the ſtalkes many together, conſiſting of foure yellow leaues a piece, leſſer than thoſe of the ordinary wall floures; there floures are ſucceeded by long cods containing a flat ſeed. The root is long and whitiſh, with many fibres.

5 Beſides theſe, there is in ſome gardens kept another wall-floure differing from the firſt in the bigneſſe of the whole plant, but eſpecially of the floure, which is yellow and ſingle, yet very large and beautifull.

6 Alſo there is another with very greene leaues, and pure white and well ſmelling floures. ‡

¶ *The Place.*

The firſt groweth vpon bricke and ſtone walls, in the corners of churches euery where, as alſo among rubbiſh and ſuch other ſtony places.

The double Wall-floure groweth in moſt gardens of England.

¶ *The Time.*

They floure for the moſt part all the yeere long, but eſpecially in winter, whereupon the people in Cheſhire do call them Winter-Gilloflours.

¶ *The Names.*

The Wallfloure is called in Greeke Λευκοιον: in Latine, *Viola lutea*, and *Leucoium luteum*: in the Arabicke tongue *Keyri*: in Spaniſh, *Violettas Amarillas*: in Dutch, **Violieren**: in French, *Girofflees iaulnes, Violieres des murailles*: in Engliſh, Wall-Gilloflour, Wall-floure, yellow ſtocke Gilloflour, and Winter-Gilloflour.

¶ *The Temperature.*

All the whole ſhrub of Wall-Gilloflours, as *Galen* ſaith, is of a clenſing faculty, and of thinne parts.

¶ *The Vertues.*

Dioſcorides writeth that the yellow Wall-floure is moſt vſed in phyſicke, and more than the reſt of ſtocke-Gilloflours, whereof this is holden to be a kinde: which hath mooued me to preferre it vnto the firſt place. He ſaith, that the juice mixed with ſome vnctious or oilie thing, and boiled to the forme of a lyniment, helpeth the chops or rifts of the fundament. A

The

B The herbe boiled with white wine, honie, and a little allom, doth cure hot vlcers, and cankers of the mouth.

C The leaues ſtamped with a little bay ſalt, and bound about the wriſts of the hands, taketh away the ſhaking fits of the Ague.

D ‡ A decoction of the floures together with the leaues, is vſed with good ſucceſſe to mollifie Schirrous tumors.

E The oile alſo made with theſe is good to be vſed to anoint a Paralyticke, as alſo a goutie part to mitigate paine.

F Alſo a ſtrong decoction of the floures drunke, moueth the Courſes, and expelleth the dead childe. ‡

Chap. 120. *Of Stocke Gilloſloures.*

1 *Leucoium album, ſiue purpureum, ſiue violaceum.*
White, purple, or Violet coloured Stocke Gilloſloure.

‡ 2 *Leucoium flore multiplici.*
Double Stocke Gilloſloure.

¶ *The Deſcription.*

1 THe ſtalke of the great ſtocke Gilloſloure is two foot high or higher, round, and parted into diuers branches. The leaues are long, white, ſoft, and hauing vpon them as it were a downe like vnto the leaues of willowe, but ſofter: the floures conſiſt of foure little leaues growing all along the vpper part of the branches, of a white colour, exceeding ſweet of ſmell: in their places come vp long and narrow cods, in which is contained broad, flat, and round ſeed. The root is of a wooddy ſubſtance, as is the ſtalke alſo.

The purple ſtocke Gilloſloure is like the precedent in each reſpect, ſauing that the floures of this plant are of a pleaſant purple colour, and the others white, which ſetteth forth the difference: of which kinde we haue ſome that beare double floures, which are of diuers colours, greatly eſteemed for the beautie of their floures, and pleaſant ſweet ſmell.

This

3 *Leucoium spinosum Creticum.*
Thornie Stocke Gillouers.

This kinde of Stocke Gilloflowre that beareth floures of the colour of a Violet, that is to say of a blew tending to a purple colour, which setteth forth the difference betwixt this plant & the other stocke Gilloflowres; in euery other respect is like the precedent.

2 ‡ There were formerly 3 figures of the single Stocks, which differ in nothing but the colour of their floures; wherefore we haue made them content with one, & haue giuen (which was formerly wanting) a figure of the double Stock, of which there are many and prettie varieties kept in the garden of my kinde friend M^r. *Ralph Tuggye* at VVestminster, and set forth in the bookes of such as purposely treat of floures and their varieties. ‡

‡ 3 To these I thinke it not amisse to adde that plant which *Clusius* hath set forth vnder the name of *Leucoium spinosum Creticum*. It growes some foot or more high, bringing forth many stalkes which are of a grayish colour, and armed at the top with many and strong thorny prickles: the leaues which adorne these stalkes are like those of the stocke Gillouer, yet lesse and somewhat hoary; the floures are like those of Mulleine, of a whitish yellow colour, with some purple threds in their middles; the cods which succeede the floures are small and round, containing a little seed in them. They vse, saith *Honorius Bellus*, to heat ovens therewith in Candy, where it plentifully growes; and by reason of the similitude which the prickles hereof haue with *Stœbe* and the white colour, they cal it *Gala Stivida*, or *Galastivida*, and not becausse it yeelds milke, which *Gala* signifies.

¶ *The Place.*

1. 2. These kindes of Stocke Gilloflowres do grow in most Gardens throughout England.

¶ *The Time.*

They floure in the beginning of the Spring, and continue flouring all the Sommer long.

¶ *The Names.*

The Stocke Gilloflowre is called in Greeke [illegible]: in Latine, *Viola alba*: in Italian, *Viola bianca*: in Spanish, *Violettas blanquas*: in English, Stocke Gilloflowre, Garnsey Violet, and Castle Gilloflowre.

¶ *The Temperature and Vertues.*

They are referred vnto the VVal-floure, although in vertue much inferiour; yet are they not vsed A in Physicke, except amongst certaine Empericks and Quacksaluers, about loue and lust matters, which for modestie I omit.

Ioachimus Camerarius reporteth, that a conserue made of the floures of Stocke Gilloflowre, and B often giuen with the distilled water thereof, preserueth from the Apoplexy, and helpeth the palsie.

Chap. 121. *Of Sea Stocke Gilloflowres.*

¶ *The Kindes.*

OF Stocke Gilloflowres that grow neere vnto the Sea there bee diuers and sundrie sorts, differing as well in leaues as floures, which shall bee comprehended in this Chapter next following.

1 Lea-

1 *Leucoium marinum flore candido L'obelij.*
White Sea Stocke Gilloſloures.

5 *Leucoium marinum latifolium.*
Broad leafed ſea ſtocke Gilloſloure.

2 *Leucoium marinum purpureum L'obelij.*
Purple ſea Stocke Gilloſloures.

¶ *The Deſcription.*

1 THe Sea ſtocke Gilloſloure hath a ſmall wooddy root very threddie; from which riſeth vp an hoarie white ſtalke of two foot high, diuided into diuers ſmall branches, whereon are placed confuſedly many narrow leaues of a ſoft hoarie ſubſtance. The floures grow at the top of the branches, of a whitiſh colour, made of foure little leaues; which being paſt, there follow long coddes and ſeed, like vnto the garden ſtocke Gilloſloure.

‡ 2 The purple ſtocke Gilloſloure hath a very long tough root, thruſting it ſelfe deepe into the ground; from which riſe vp thicke, fat, ſoft, and hoarie ſtalkes. The leaues come forth of the ſtalkes next the ground, long, ſoft, thicke, full of iuice, couered ouer with a certaine downie hoarineſſe, and ſinuated ſomewhat deepe on both ſides, after the manner you may ſee expreſt in the figure of the fourth deſcribed in this Chapter. The ſtalke is ſet here and there with the like leaues, but leſſer. The floures grow at the top of the ſtalkes, compact of foure ſmall leaues, of a light purple colour. The ſeede is contained in long crooked cods like the garden ſtocke Gilloſloure.

‡ The figure of *Lobels* which here we giue you was taken of a dried plant, and therefore the leaues are not expreſt ſo ſituate as they ſhould be. ‡

3 This ſea ſtock Gilloſloure hath many broad leaues ſpred vpon the ground, ſomwhat ſnipt or cut on the edges; amongſt which riſe vp ſmall naked ſtalkes, bearing at the top many little floures of a blew colour tending to a purple. The ſeede is in long cods like the others of his kinde.

4 The

4 The great Sea ſtock Gilloflowre hath many broad leaues,growing in a great tuft,ſleightly indented about the edges. The floures grow at the top of the ſtalkes, of a gold yellow colour. The root is ſmall and ſingle.

5 The ſmall yellow Sea ſtocke Gilloflowre hath many ſmooth,hoary,and ſoft leaues,ſet vpon a branched ſtalke:on the top whereof grow pretty ſweet ſmelling yellow floures,bringing his ſeed in little long cods. The root is ſmall and threddy. ‡ The Floures of this are ſometimes of a red,or purpliſh colour. ‡

4 *Leucoium marinum luteum maius Cluſij & L'obelij.*
The yellow Sea ſtocke Gilloflowre.

5 *Leucoium marinum minus L'obelij & Cluſ.*
Small yellow Sea ſtocke Gilloflowre.

¶ *The Place.*

Theſe plants do grow neere vnto the ſea ſide,about Colcheſter,in the Iſle of Man,neere Preſton in Aunderneſſe,and about Weſtcheſter.

‡ I haue not hard of any of theſe wilde on our coaſts but onely the ſecond, which it may bee growes in theſe places here ſet downe; for it was gathered by M^r. *George Bowles* vpon the Rocks at Aberdovye in Merioneth ſhire. ‡

¶ *The Time.*

They flouriſh from Aprill to the end of Auguſt.

¶ *The Names.*

There is little to bee ſaid as touching the names,more than hath been touched in their ſeuerall titles.

¶ *The Temperature and Vertues.*

There is no vſe of theſe in Phyſicke,but they are eſteemed for the beauty of their floures.

Chap. 122. *Of Dames Violets,or Queenes Gilloflowres.*

¶ *The Deſcription.*

1 DAmes Violets or Queenes Gilloflowres, haue great large leaues of a darke greene colour,ſomewhat ſhipt about the edges: among which ſpring vp ſtalkes of the height of

two cubits, ſet with ſuch like leaues: the floures come forth at the tops of the branches, of a faire purple colour, verie like thoſe of the ſtocke Gillofloures, of a very ſweet ſmell, after which come vp long cods, wherein is contained ſmall long blackiſh ſeed. The root is ſlender and threddie.

The Queenes white Gillofloures are like the laſt before remembred, ſauing that this plant bringeth forth faire white floures, and the other purple.

‡ 2 By the induſtrie of ſome of our Floriſts, within this two or three yeares hath beene brought to our knowledge a very beautifull kinde of theſe Dame Violets, hauing very faire double white floures, the leaues, ſtalks and roots, are like to the other plants before deſcribed.‡

1 *Viola Matronalis flore purpureo, ſive albo.*
Purple, or white Dames Violets.

‡ 3 *Viola matronalis flore obſoleto.*
Ruſſet Dames Violets.

‡ 3 This plant hath a ſtalke a cubit high, and is diuided into many branches, vpon which in a confuſed order grow leaues like thoſe of the Dame Violet, yet a little broader and thicker, being firſt of ſomewhat an acide, and afterwards of an acride taſte; at the tops of the branches in long cups grow floures like thoſe of the Dames violet, conſiſting of foure leaues, which ſtand not faire open, but are twined aſide, and are of a ouerworn ruſſet colour, compoſed as it were of a yellow and browne with a number of blacke purple veines diuaricated ouer them. Their ſmell on the day time is little or none, but in the euening very pleaſing and ſweet. The floures are ſucceeded by long, and here and there ſwolne cods, which are almoſt quadrangular and containe a reddiſh ſeed like that of the common kinde. The root is fibrous, and vſually liues not aboue two yeares, for after it hath borne ſeed it dies; yet if you cut it downe and keepe it from ſeeding, it ſometimes puts forth ſhouts whereby it may bee increaſed. I very much ſuſpect that this figure and deſcription which I here giue you taken out of *Cluſius*, is no other plant than that which is kept in ſome of our gardens, and ſet foorth in the *Hortus Eyſtettenſis* by the name of *Leucoium Melancholicum*: now I iudge the occaſion of this error to haue come from the figure of *Cluſius* which we here preſent you with, for it is in many particulars different from the deſcription: firſt in that it expreſſes not many branches. ſecondly, in that the leaues are not ſnipt & diuided: thirdly, in that the Floures are not expreſt wreſted or twined: fourthly, the veins are not rightly expreſt in the floure; & laſtly, the cods are omitted. Now the *Leucoium melancholicum* hath a hairy ſtalke diuided into ſundry branches of the height formerly mentioned, and the leaues about the middle of the ſtalke are ſomewhat ſinuated or deepely or vnequally cut in; the ſhape and colour of the floure is the ſame with that now deſcribed.

‡4 *Leucoium melancholicum.*
The Melancholly floure.

deſcribed, and the ſeed veſſels the ſame, as far as I remember: for I muſt confeſſe, I did not in writing take any particular note of them though I haue diuers times ſeene them, neither did I euer compare them with this deſcription of *Cluſius*; onely I tooke ſome yeares agone an exact figure of a branch with the vpper leaues and floures, whereof one is expreſt as they vſually grow twining backe, and the reſt faire open, the better to ſet forth the veines that are ſpred ouer it. There are alſo expreſt a cod or ſeede veſſell, and one of the leaues that grow about the middle of the ſtalke; all which are agreeable to *Cluſius* deſcription in mine opinion; wherefore I onely giue you the figure that I then drew, with he title that I had it by. ‡

¶ *The Place.*

They are ſown in gardens for the beauty of their floures.

¶ *The Time.*

They eſpecially floure in Maie and Iune, the ſecond yeare after they are ſowne.

¶ *The Names.*

Dames Violet is ealled in Latine *Viola matronalis*, and *Viola Hyemalis*, or Winter Violets, and *Viola Damaſcena*: It is thought to be the *Heſperis* of *Pliny, lib. 21. cap. 7.* ſo called, for that it ſmels more, & more pleaſantly in the euening or night, than at any other time. They are called in French *Violettes des Dames, & de domas*, and *Girofflees des dames*, or *Matrones Violettes*: in Engliſh, Damaske Violets, winter Gilloſloures, Rogues Gilloſloures, and cloſe Sciences.

¶ *The Temperature.*

The leaues of Dames Violets are in taſte ſharpe and hot, very like in taſte and facultie to *Eruca* or Rocket, and ſeemeth to be a kinde thereof.

¶ *The Vertues.*

The diſtilled water of the floures hereof is counted to be a moſt effectuall thing to procure A ſweat.

CHAP. 123. *Of White Sattin floure.*

¶ *The Deſcription.*

1 *Bolbonac* or the Sattin floure hath hard and round ſtalkes, diuiding themſelues into many other ſmall branches, beſet with leaues like Dames Violets, or Queenes Gilloſloures, ſomewhat broad, and ſnipt about the edges, and in faſhion almoſt like Sauce alone, or Iacke by the hedge, but that they are longer and ſharper pointed. The ſtalkes are charged or loden with many floures like the common ſtocke Gilloſloure, of a purple colour, which being falne, the

ſeed commeth forth contained in a flat thin cod, with a ſharp point or prick at one end, in faſhion of the Moone, and ſomewhat blackiſh. This cod is compoſed of three filmes or skins, whereof the two outmoſt are of an ouerworne aſh colour, and the innermoſt, or that in the middle, whereon the ſeed doth hang or cleaue, is thin and cleere ſhining, like a ſhred of white Sattin newly cut from the peece. The whole plant dieth the ſame yeare that it hath borne ſeed, & muſt be ſowne yearely. The root is compact of many tuberous parts like key clogs, or like the great Aſphodill.

2 The ſecond kind of *Bolbonac* or white Sattin hath many great and broad leaues, almoſt like thoſe of the great burre Docke: among which riſeth vp a very tall ſtem of the height of foure cubits, ſtiffe, and of a whitiſh greene colour, ſet with the like leaues, but ſmaller. The floures grow vpon the ſlender branches, of a purple colour, compact of foure ſmall leaues like thoſe of the ſtocke Gilloflоure; after which come thin long cods of the ſame ſubſtance and colour of the former. The root is thicke, whereunto are faſtened an infinite number of long threddie ſtrings: which roote dieth not euery yeare as the other doth, but multiplieth it ſelfe as well by falling of the ſeede, as by new ſhoots of the root.

1 *Viola Lunaris ſive Bolbonac.*
White Sattin.

2 *Viola Lunaris longioribus ſiliquis.*
Long codded white Sattin.

¶ *The Place.*

Theſe plants are ſet and ſowne in gardens; notwithſtanding the firſt hath been found wilde in the woods about Pinner, and Harrow on the hill, twelue miles from London; and in Eſſex likewiſe about Horn-church.

The ſecond groweth about Watford, fifteene miles from London.

¶ *The Time.*

They floure in Aprill the next yeare after they be ſowne.

¶ *The Names.*

They are commonly called *Bolbonac* by a barbarous name: we had rather call it with *Dodonæus* & *Cluſius*, *Viola latifolia*, and *Viola lunaris*, or as it pleaſeth moſt Herbariſts, *Viola peregrina*: the Brabanders name it **Penninck bloemen**, of the faſhion of the coddes, like after a ſort to a groat or teſterne, and **Paeſch bloemen**, becauſe it alwaies floureth neere about the Feaſt of Eaſter: moſt of the later Herbariſts doe call it *Lunaria*: Others, *Lunaria Græca*, either of the faſhion of the ſeed, or of the ſiluer brightneſſe that it hath, or of the middle skinne of the cods, when the two outtermoſt skinnes or huskes and ſeedes likewiſe are falne away. We call this herbe in Engliſh Penny floure, or Money floure, Siluer Plate, Pricke-ſongwoort; in Norfolke, Sattin, and White

Sattin,

Sattin, and among our women it is called Honeſtie: it ſeemeth to be the old Herbariſts *Thlaſpi alterum*, or ſecond Treacle muſtard, and that which *Crateuas* deſcribeth, called of diuers *Sinapi Perſicum*; for as *Dioſcorides* ſaith, *Crateuas* maketh mention of a certaine *Thlaſpi* or Treacle Muſtard, with broad leaues and bigge roots, and ſuch this Violet hath, which we ſurname *Latifolia* or broad leafed: generally taken of all to be the great *Lunaria*, or Moonwoort.

¶ *Their Temperature and Vertues.*

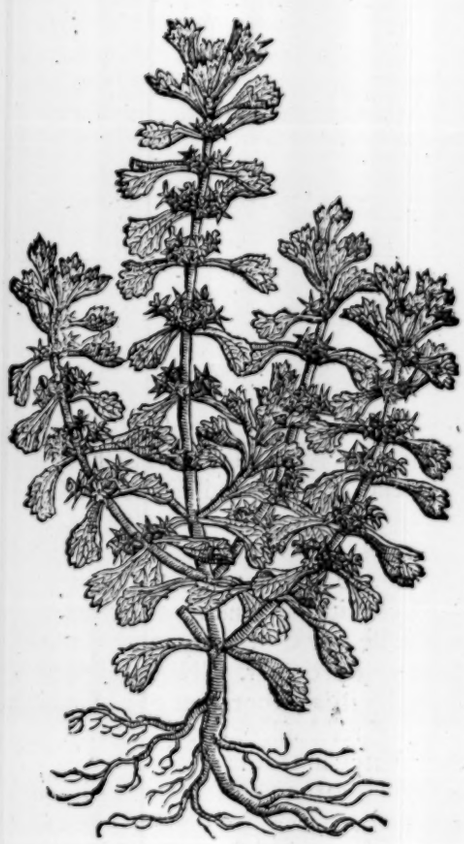
The ſeed of Bolbonac is of Temperature hot and drie, and ſharpe of taſte, and is like in taſte and A
force to the ſeed of Treacle Muſtard; the roots likewiſe are ſomewhat of a biting qualitie, but not much: they are eaten with ſallads as certaine other roots are.

A certaine Chirurgian of the Heluetians compoſed a moſt ſingular vnguent for wounds of the B
leaues of Bolbonac and Sanicle ſtamped together, adding thereto oile and wax. The ſeed is greatly commended againſt the falling ſickneſſe.

Chap. 124. *Of* Galen *and* Dioſcorides *Moonwoorts or Madwoorts.*

1 *Alyſſum Galeni.*
Galens Madwoort.

† 2 *Alyſſum Dioſcoridis.*
Dioſcorides Moonwoort or Madwoort.



¶ *The Deſcription.*

1 THis might be one of the number of the Horehounds, but that *Galen* vſed it not for a kind thereof, but for *Alyſſon*, or Madwoort: it is like in forme and ſhew vnto Horehound, and alſo in the number of the ſtalks, but the leaues thereof are leſſer, more curled, more hoary, & whiter, without any manifeſt ſmell at all. The little coronets or ſpokie whurles that compaſſe the ſtalkes round about are full of ſharpe prickles: out of which grow floures of a blewiſh purple colour like to thoſe of Horehound. The root is hard, woody, and diuerſly parted.

2 I haue one growing in my garden, which is thought to be the true & right Lunary or Moonwoort of *Dioſcorides* deſcription, hauing his firſt leaues ſomewhat round, and afterward more long, whitiſh, and rough, or ſomewhat woolly in handling: among which riſe vp rough brittle ſtalkes, ſome cubite high, diuided into many branches, whereupon doe growe many little yellow floures:

floures; the which being paſt, there follow flat and rough huskes, of a whitiſh colour, in ſhape like little targets or bucklers, wherein is contained flat ſeed, like to the ſeeds of ſtock Gilloflours, but bigger. The whole huske is of the ſame ſubſtance, faſhion, and colour that thoſe are of the white Sattin.

¶ *The Place.*

Theſe Plants are ſowne now and then in Gardens, eſpecially for the rareneſſe of the m; the ſeede beeing brought out of Spaine and Italy, from whence I receiued ſome for my Garden.

¶ *The Time.*

They floure and flouriſh in May; the ſeede is ripe in Auguſt, the ſecond yeare after their ſowing.

¶ *The Names.*

Madwoort, or Moonwoort is called of the Græcians λύσσος or λυσσα: of the Latines *Alyſſum*: in Engliſh, *Galens* Madwoort: of ſome, Heale-dog: and it hath the name thereof, becauſe it is a preſent remedy for them that are bitten of a mad dogge, as *Galen* writeth; who in his ſecond booke *De Antidotis*, in *Antonius Cous* his compoſition deſcribeth it in theſe words: Madwoort is an herbe very like to Horehound, but rougher, and more full of prickles about the floures: it beareth a floure tending to blew.

‡ 2 The ſecond by *Dodonæus*, *Lobell*, *Camerarius* and others, is reputed to bee the *Alyſſon* of *Dioſcorides*; *Geſner* names it *Lunaria aſpera*; and *Columna*, *Leucoium Montanum Lunatum*. ‡

¶ *The Temperature and Vertues.*

Galen ſaith it is giuen vnto ſuch as are inraged by the biting of a mad dogge, which thereby are
A perfectly cured, as is knowne by experience, without any artificiall application or method at all. The which experiment if any ſhall proue, he ſhall finde in the working thereof. It is of temperature meanly drie, digeſteth and ſomething ſcoureth withall: for this cauſe it taketh away the morphew and Sun-burning, as the ſame Authour affirmeth.

† That which was formerly deſcribed in the ſecond place, being a kinde of *Sideritis*, I haue here omitted, that I may giue you it more fitly amongſt the reſt of that name and kindred hereafter.

Chap. 125. *Of Roſe Campion.*

Lychnis Chalcedonica.
Floure of Conſtantinople.

¶ *The Kindes.*

THere be diuers ſorts of Roſe Campions; ſome of the Garden, and others of the Field: the which ſhal be diuided into ſeuerall chapters: and firſt of the Campion of Conſtantinople.

¶ *The Deſcription.*

THe Campion of Conſtantinople hath ſundry vpright ſtalks, two cubits high and ful of ioynts, with a certaine roughneſſe; and at euery ioynt two large leaues, of a browne greene colour. The floures grow at the top like Sweet-Williams, or rather like Dames violets, of the colour of red lead, or Orenge tawny. The root is ſomewhat ſharpe in taſte.

‡ There are diuers varieties of this, as with white and bluſh coloured floures, as alſo a double kinde with very large, double and beautiful floures of a Vermelion colour like as the ſingle one here deſcribed. ‡

¶ *The Place.*

The floure of Conſtantinople is planted in Gardens, and is very common almoſt euerie where.

‡ The white and bluſh ſingle, and the double one are more rare, and not to be found but in the Gardens of our prime Floriſts. ‡

¶ *The Time.*

It floureth in Iune and Iuly, the ſecond yeare after it is planted, and many yeares after; for it

conſiſteth of a root full of life; and endureth long, and can away with the cold of our clymate.

¶ *The Names.*

It is called *Conſtantinopolitanus flos*, and *Lychnis Chalcedonica*: of *Aldrouandus*, *Flos Creticus*, or Floure of Candy: of the Germans, *flos Hieroſolymitanus*, or Floure of Ieruſalem: in Engliſh, Floure of Conſtantinople; of ſome, Floure of Briſtow, or None-ſuch.

¶ *The Temperature and Vertues.*

Floure of Conſtantinople, beſides that grace and beauty which it hath in gardens and garlands, is, for ought we know, of no vſe, the vertues thereof being not as yet found out.

Chap. 126. *Of Roſe-Campion.*

1 *Lychnis Coronaria rubra.*
Red Roſe Campion.

2 *Lychnis Coronaria alba.*
White Roſe Campion.

¶ *The Deſcription.*

1 THe firſt kinde of Roſe-Campion hath round ſtalks very knotty and woolly, and at euerie knot or ioynt there do ſtand two woolly ſoft leaues like Mulleine, but leſſer, and much narrower. The floures grow at the top of the ſtalke, of a perfect red colour; which being paſt, there follow round cods full of blackiſh ſeed. The root is long and threddy.

2 The ſecond Roſe Campion differs not from the precedent in ſtalkes, leaues, or faſhion of the floures: the onely difference conſiſteth in the colour; for the floures of this plant are of a milke white colour, and the other red.

‡ 3 This alſo in ſtalks, roots, leaues, and manner of growing differs not from the former; but the floures are much more beautifull, being compoſed of ſome three or foure rankes or orders of leaues lying each aboue other. ‡

¶ *The*

‡ 3 *Lychnis coronaria multiplex.*
Double Roſe Campion.

¶ *The Place.*

The Roſe Campion growes plentifully in moſt gardens.

¶ *The Time.*

They floure from Iune to the end of Auguſt.

¶ *The Names.*

The Roſe Campion is called in Latine *Dominarum Roſa, Mariana Roſa, Cæli Roſa, Cæli flos:* of *Dioſcorides*, λυχνὶς στεφανωματικὴ: that is, *Lychnis Coronaria*, or *Satiua: Gaza* tranſlateth λυχνὶς, *Lucernula*, becauſe the leaues thereof be ſoft, and fit to make weekes for candles, acccording to the teſtimonie of *Dioſcorides:* it was called *Lychnis*, or *Lychnides*, that is, a torch, or ſuch like light; according to the ſignification of the word, cleere, bright, and light-giuing floures: and therefore they were called the Gardners Delight, or the Gardeners Eye: in Dutch, **Chriſtes eie:** in French, *Oeillets*, & *Oeilets Dieu:* in high-Dutch, **Marien roſzlin**, and **Himmel roſzlin.**

¶ *The Temperature.*

The ſeed of Roſe-Campion, ſaith *Galen*, is hot and dry after a ſort in the ſecond degree.

¶ *The Vertues.*

A The ſeed drunken in wine is a remedie for them that are ſtung with a Scorpion, as *Dioſcorides* teſtifieth.

Chap. 127. *Of wilde Roſe-Campions.*

¶ *The Deſcription.*

1 THe wilde Roſe-Campion hath many rough broad leaues ſomewhat hoary and woolly; among which riſe vp long ſoft and hairy ſtalkes branched into many armes, ſet with the like leaues, but leſſer. The floures grow at the top of the ſtalkes, compact of fiue leaues of a reddiſh colour: the root is thicke and large, with ſome threds anexed thereto.

‡ There alſo growes commonly wilde with vs another of this kinde, with white floures, as alſo another that hath them of a light bluſh colour. ‡

2 The ſea Roſe Campion is a ſmall herbe, ſet about with many greene leaues from the lower part vpward; which leaues are thicke, ſomewhat leſſer and narrower than the leaues of ſea Purſlane. It hath many crooked ſtalkes ſpred vpon the ground, a foot long; in the vpper part whereof there is a ſmall white floure, in faſhion and ſhape like a little cup or box, after the likeneſſe of *Behen album*, or Spatling Poppy, hauing within the ſaid floure little threds of a blacke colour, in taſte ſalt, yet not vnpleaſant.

It is reported vnto me by a Gentleman one M^r. *Tho. Hesket*, that by the ſea ſide in Lancaſhire, from whence this plant came, there is another ſort hereof with red floures.

‡ 3 This brings many ſtalkes from one root, round, long, and weaker than thoſe of the firſt deſcribed, lying vſually vpon the ground: the leaues grow by couples at each ioynt, long, ſoft, and hairy; amongſt which alternately grow the floures, about the bigneſſe of thoſe of the firſt deſcribed, and of a bluſh colour; and they are alſo ſucceeded by ſuch ſeed-veſſels, containing a reddiſh ſeed. The root is thicke and fibrous, yet commonly outliues not the ſecond yeare.

† 1 *Lychnis*

† 1 *Lychnis ſylueſtris rubello flore.*
Red wilde Campion.

2 *Lychnis marina Anglica.*
Engliſh Sea Campion.

3 *Lychnis ſylueſtris hirta, 5. Cluſij.*
Wilde hairy Campion.

4 *Lychnis ſylueſtris 8. Cluſij.*
Hoary wilde Campion.

5 *Lychnis hirta minima, 6. Cluſ.*
Small Hairy Campion.

† 6 *Lychnis ſylueſtris incana, Lob.*
Ouerworne Campion.

7 *Lychnis caliculis ſtriatis 2. Cluſij.*
Spatling Campion.

† 8 *Lychnis ſylueſtris alba 9. Cluſ.*
Whitewilde Campion.

4 The fourth kinde of wilde Campions hath long and ſlender ſtems, diuiding themſelues into ſundry other branches, which are full of ioynts, hauing many ſmall and narrow leaues proceeding from the ſaid ioynts, and thoſe of a whitiſh greene colour. The floures do grow at the top of the ſtalke, of a whitiſh colour on the inner ſide, and purpliſh on the outer ſide, conſiſting of fiue ſmall leaues, euery leafe hauing a cut in the end, which maketh it of the ſhape of a forke: the ſeed is like the wilde Poppy; the root ſomewhat groſſe and thicke, which alſo periſheth the ſecond yeare.

5 The fifth kinde of wilde Campion hath three or foure ſoft leaues ſomewhat downy, lying flat vpon the ground; among which riſeth vp an hairy aſh-coloured ſtalke, diuided into diuers branches; whereupon do grow at certaine ſpaces, euen in the ſetting together of the ſtalke and branches, ſmall and graſſe-like leaues, hairy, and of an ouerworne dusky colour, as is all the reſt of the Plant. The floures grow at the top of the branches, compoſed of fiue ſmall forked leaues of a bright ſhining red colour. The root is ſmall, and of a wooddy ſubſtance.

6 The ſixth kinde of wilde Campion hath many long thicke fat and hoary leaues ſpred vpon the ground, in ſhape and ſubſtance like thoſe of the garden Campion, but of a very duſty ouerworne colour: among which riſe vp ſmall and tender ſtalkes ſet at certaine diſtances by couples, with ſuch like leaues as the other, but ſmaller. The floures do grow at the top of the ſtalks in little tufts like thoſe of ſweet Williams, of a red colour. The root is ſmall, with many threddy ſtrings faſtned to it.

‡ 7 This growes ſome cubit high, with ſtalkes diſtinguiſhed with ſundry ioynts, at each whereof are ſet two leaues, greene, ſharpe pointed, and ſomewhat ſtiffe: the floures grow at the tops of the branches, like to thoſe of *Muſcipula* or Catch-fly, yet ſomewhat bigger, and of a darke red: which paſt, the ſeed (which is aſh-coloured, and ſomewhat large) is contained in great cups or veſſels couered with a hard and very much creſted skin or filme; whence it is called *Lychnis caliculis ſtriatis*, and not *Cauliculis ſtriatis*, as it is falſly printed in *Lobels Icones*, which ſome as fooliſhly haue followed. The root is ſingle, and not large, and dies euery yeare.

8 That which our Author figured in this place had greene leaues and red floures, which no way ſorted with his deſcription: wherefore I haue in lieu thereof giuen you one out of *Cluſius*, which may fitly carry the title. This at the top of the large fibrous and liuing root ſendeth forth many leaues ſomewhat greene, and of ſome fingers length, growing broader by degrees, and at laſt ending againe in a ſharpe point. The ſtalkes are ſome cubit high, ſet at each ioynt with two leaues as it were embracing it with their foot-ſtalkes; which leaues are leſſe and leſſe as they are higher vp, and more ſharpe pointed. At the tops of the branches grow the floures, conſiſting of fiue white leaues deepely cut in almoſt to the middle of the floure, and haue two ſharpe pointed appendices at the bottome of each of them, and fiue chiues or threds come forth of their middles: theſe when they fade contract and twine themſelues vp, and are ſucceeded by thicke and ſharpe pointed ſeed-veſſels, containing a ſmall round Aſh-coloured ſeed. I coniecture that the figure of the *Lychnis plumaria*, which was formerly here in the ninth place out of *Tabern.* might be of this plant, as well as of that which *Bauhine* refers it to, and which you ſhall finde mentioned in the end of the chapter. ‡

¶ *The Place.*

They grow of themſelues neere to the borders of plowed fields, medowes, and ditch banks, common in many places. ‡ I haue obſerued none of theſe, the firſt and ſecond excepted, growing wilde with vs. ‡

The ſea Campion groweth by the ſea ſide in Lancaſhire, at a place called Lytham, fiue miles from Wygan, from whence I had ſeeds ſent me by M^r. *Thomas Hesketh*; who hath heard it reported, that in the ſame place doth grow of the ſame kinde ſome with red floures, which are very rare to be ſeene. ‡ This plant (in my laſt Kentiſh Simpling voyage, 1632, with M^r. *Thomas Hickes*, M^r. *Broad*, &c.) I found growing in great plenty in the low mariſh ground in Tenet that lieth directly oppoſite to the towne of Sandwich. ‡

¶ *The Time.*

They floure and flouriſh moſt part of the Sommer euen vnto Autumne.

¶ *The Names.*

The wilde Campion is called in Greeke Ἀγρια ἀγρωστις: in Latine, *Lychnis ſylueſtris*: in Engliſh, wilde Roſe Campion.

¶ *The Temperature.*

The temperature of theſe wilde Campions are referred vnto thoſe of the garden.

¶ *The Vertues.*

The weight of two drammes of the ſeed of Wilde Campion beaten to pouder and drunke, A doth

doth purge choler by the ſtoole, and it is good for them that are ſtung or bitten of any venomous beaſt.

† The figure that was in the firſt place, and was intended for our ordinary wilde Campion, is that which you ſee here in the eighth place; and thoſe that were in the ſixth and eighth places you ſhall hereafter finde with *Muſcipula* or Catch-fly, whereto they are of affinitie. That figure which was in the ninth place, out of *Tabern.* vnder the title of *Lychnis plumaria*, as alſo the deſcription, I haue omitted as impertinent: for the figure *Bauhine* himſelfe (who corrected and againe ſetforth the Workes of *Tabernamontanus*) could not tell what to make thereof; but queſtions, *Quid ſit? an Muſcipula flore multiplici?* Which if it be, you ſhall finde that place hereafter deſcribed, vnder the title of *Seſamoides magnum Salmanticum*: for our Authors deſcription it is not worth the ſpeaking of, being framed onely from imagination.

‡ Chap. 128. *Of diuers other wilde Campions.*

¶ *The Deſcription.*

‡ 1 THe firſt of theſe which we here giue you is like in leaues, ſtalkes, roots, and manner of growing vnto the ordinarie wilde Campion deſcribed in the firſt place of the precedent Chapter; but the floures are very double, compoſed of a great many red leaues thicke packt together, and they are commonly ſet in a ſhort and broken huske or cod. Now the ſimilitude that theſe floures haue to the iagged cloath buttons anciently worne in this kingdome gaue occaſion to our Gentlewomen and other louers of floures in thoſe times to call them Bachelours Buttons.

2 This differs not in ſhape from the laſt deſcribed, but only in the colour of the floures, which in this plant are white.

‡ 1 *Lychnis ſyl. multiplex purpurea.*
Red Bachelors Buttons.

‡ 2 *Lychnis ſyl. alba multiplex.*
White Bachelors Buttons.

3 Neither in roots, leaues, or ſtalkes is there any difference betweene this either degenerate or accidentall varietie of Bachelors buttons, from the two laſt mentioned; onely the floures hereof are of a greeniſh colour, and ſometimes through the middeſt of them they ſend vp ſtalkes, bearing alſo tufts of the like double floures.

4 This (ſaith *Cluſius*) hath fibrous roots like to thoſe of Primroſes; out of which come leaues of

‡ 3 *Lychnis abortina flore multiplici viridi.*
Degenerate Bachelors Buttons with greene floures.

‡ 5 *Lychnis monſana repens.*
Creeping mountaine Campion.

‡ 5 *Lychnis ſyl. latifolia Cluſ.*
Broad leaued wilde Campion.

of a ſufficient magnitude, not much vnlike thoſe of the great yellow Beares-eare, yet whiter, more downy, thicke, and iuycie. The next yeare after the ſowing thereof it ſends vp a ſtalke of two or three cubits high, here and there ſending forth a viſcous and glutinous iuyce, which detaines and holds faſt flies and ſuch inſects as do chance to light thereon. At the top of the branches it yeeldeth many floures ſet as it were in an vmbel, euen ſometimes an hundred; yet ſufficiently ſmall, conſidering the magnitude of the plant; and each of theſe conſiſts of fiue little yellowiſh greene forked leaues.

5 The ſtalkes of this are ſlender, ioynted, and creeping like to thoſe of the greater Chickweed, and at each ioynt grow two leaues like thoſe of the myrtle, or of Knot-graſſe yet ſomewhat broader. The floures grow in ſuch long cups like as thoſe of *Saponaria*, and are much leſſe, yet of the ſame colour. The root is ſmall.

¶ *The Place.*

1. 2. Theſe are kept in many Gardens of this kingdome for their beauty, eſpecially the firſt, which is the more common.

The fourth growes naturally in Candy; and the fifth by riuelets in the mountainous places of Sauoy. ¶ *The Time.*

Theſe floure in Iune and Iuly with the other wild Campions.

¶ *The Names.*

1 The firſt of theſe is *Lychnis agreſtis multiflora* of *Lobel*; and *Ocymoides flore pleno* of *Camerarius*.

2 The ſecond is by *Pena* and *Lobel* alſo called *Lychnis ſylueſtris multiflora*: it is the *Ocymaſtrum multiflorum* of *Tabernamontanus*; by which title our Author alſo had it in the former edition, *p.* 551.

3 *Lobel* hath this by the name of *Lychnis agreſtis abortiua multiplici viride flore*.

4 *Cluſius* calls this *Lychnis ſylueſtris latifolia*; and he ſaith he had the ſeed from *Ioſeph de Caſa Bona*, by the name of *Muſcipula auriculæ vrſi facie*: *Bauhine* hath it by the name of *Lychnis auriculæ vrſi facie*.

5 This (according to *Bauhine*) was ſet forth by *Matthiolus*, by the name of *Cneoron aliud Theophraſti*: it is the *Ocimoides repens polygonifolia flore Saponariæ*, in the *Aduerſaria*: and *Saponaria minor Daleſchampij*, in the *Hiſt. Lugd.* It is alſo *Ocimoides Alpinum*, of *Geſner*; and *Ocymoides repens*, of *Camerarius*.

¶ *The Nature and Vertues.*

The natures and vertues of theſe, as of many others, lie hid as yet, and ſo may continue, if chance, or a more curious generation than yet is in being do not finde them out. ‡

Chap. 129. *Of Willow-herbe, or Looſe-ſtrife.*

1 *Lyſimachia lutea.*
Yellow Willow-herbe.

‡ 2 *Lyſimachia lutea minor.*
Small yellow Willow-herbe.

¶ *The Deſcription.*

1 THe firſt kinde of Willow-herbe hath long and narrow leaues of a grayiſh greene colour, in ſhape like the Willow or Sallow leaues, ſtanding three or foure one againſt another at ſeuerall diſtances round about the ſtalke; which toward the top diuideth it ſelfe into many other branches, on the tops whereof grow tufts of faire yellow floures, conſiſting of fiue leaues apiece, without ſmell: which being paſt, there commeth forth ſeed like Coriander. The root is long and ſlender.

‡ 2 This

‡ 2 This leſſer of *Cluſius* his deſcription hath a ſtalke a cubit high, and ſometimes higher firme, hard, and downy; about which at certaine diſtances grow commonly foure leaues together, yet ſometimes but three, and they are ſoft and ſomewhat downy, leſſer than thoſe of the former, being firſt of an acide taſte, and then of an acride; and they are vſually marked on their lower ſides with blacke ſpots. About the top of the ſtalke, out of the boſomes of each leafe come forth little branches bearing ſome few floures, or elſe foot-ſtalkes carrying ſingle floures, which is more vſuall towards the top of the ſtalke. The floures are yellow, with ſomewhat a ſtrong ſmell, conſiſting of fiue ſharpe pointed yellow leaues, with ſo many yellow threds in their middle. The root is ioynted, or creeping here and there, putting vp new ſhouts.

‡ 3 *Lyſimachia lutea flore globoſo.*
Yellow Willow-herbe with bunched floures.

‡ 4 *Lyſimachia lutea Virginiana.*
Tree Primroſe.

3 This alſo may fitly be referred to the former. The ſtalke is a cubit high, ſtraight, and as it were ioynted, naked oft times below by the falling away of the leaues; but from the middle to the top ſet with two leaues at a ioynt, like thoſe of the former; and out of their boſoms on ſhort ſtalks grow round tufts of ſmall yellow floures as in bunches: the root which creepes ſends forth many ſmall fibres at each ioynt. This was ſet forth by *Lobel* vnder the title of *Lyſimachia lutea altera*, or *Lyſimachia ſalicaria*: *Dodonæus* hath it by the name of *Lyſimachium aquatile*: and *Cluſius* calls it *Lyſimachia lutea tertia, ſiue minor*.

4 This Virginian hath beene deſcribed and figured onely by *Proſper Alpinus*, vnder the title of *Hyoſcyamus Virginianus*: and by Mr. *Parkinſon*, by the name of *Lyſimachia lutea ſiliquoſa Virginiana*: Alſo *Bauhine* in the Appendix of his *Pinax* hath a large deſcription thereof, by the name of *Lyſimachia lutea corniculata*. The root hereof is longiſh, white, about the thickneſſe of ones thumbe, from whence growes vp a tall ſtalke diuided into many branches of an ouerworne colour, and a little hairie: the leaues are like thoſe of the former, but ſomewhat ſinuated alongſt their edges, and hauing their middle veine of a whitiſh colour: toward the tops of the branches amongſt the leaues come vp pretty thicke cods, which growing ſmaller on their tops ſuſtaine pretty large yellow floures conſiſting of foure leaues, with a peſtill in the middle vpon which ſtand foure yellowiſh thrums

in faſhion of a croſſe; and there are alſo eight threds with their pointals in the middles of them. Theſe floures haue ſomewhat the ſmell of a Primroſe (whence Mr. *Parkinſon* gaue it the Engliſh name, which I haue alſo here giuen you:) after the floures are fallen, the cods grow to be ſome two inches long, being thicker below, and ſharper at the top, and ſomwhat twined, which in fine open themſelues into foure parts to ſhatter their ſeed, which is blacke and ſmall; and ſowne, it growes not the firſt yeare into a ſtalke, but ſends vp many large leaues lying handſomely one vpon another Roſe-faſhion. It floures in Iune, and ripens the ſeed in Auguſt. ‡

5 The ſecond kinde of Willow-herbe in ſtalks and leaues is like the firſt, but that the leaues are longer, narrower, and greener. The floures grow along the ſtalke toward the top, ſpike-faſhion, of a faire purple colour: which being withered turne into downe, which is carried away with the winde.

5 *Lyſimachia purpurea ſpicata.*
Spiked Willow-herbe.

6 *Lyſimachia ſiliquoſa.*
Codded Willow-herbe.

6 This *Lyſimachia* hath leaues and ſtalkes like vnto the former. The floure groweth at the top of the ſtalke, comming out of the end of a ſmall long cod, of a purple colour, in ſhape like a ſtocke Gilloflowre, and is called of many *Filius ante Patrem* (that is, The Sonne before the Father) becauſe that the cod commeth forth firſt, hauing ſeeds therein, before the floure doth ſhew it ſelfe abroad. ‡ The leaues of this are more ſoft, large, and hairy than any of the former: they are alſo ſnipt about the edges, and the floure is large, wherein it differs from the twelfth, hereafter deſcribed; and from the eleuenth in the hairineſſe of the leaues, and largeneſſe of the floures alſo, as you ſhall finde hereafter. ‡

7 This being thought by ſome to be a baſtard kinde, is (as I do eſteeme it) of all the reſt the moſt goodly and ſtately plant, hauing leaues like the greateſt Willow or Ozier. The branches come out of the ground in great numbers, growing to the height of ſix foot, garniſhed with braue floures of great beauty, conſiſting of foure leaues a piece, of an orient purple colour, hauing ſome threds in the middle of a yellow colour. The cod is long like the laſt ſpoken of, and full of downy matter, which flieth away with the winde when the cod is opened.

‡ 8 This alſo, which is the *Chamænerion* of *Geſner*, as alſo his *Epilobion, quaſi* ἐπὶ λοβῷ ἰοι, a Violet or floure vpon a cod, may iuſtly challenge the next place. *Dodonæus* calls it *Pſeudolyſimachium purpureum*

† 7 *Chamænerion.*
Roſe bay Willow-herbe.

‡ 8 *Chamænerion alterum anguſtifolium.*
Narrow leaued Willow-floure.

‡ 9 *Lyſimachia cærulea.*
Blew Looſe-ſtriſe.

‡ 10 *Lyſimachia galericulata.*
Hoodéd Looſe-ſtriſe.

11 *Lyſimachia campeſtris.*
Wilde Willow-herbe.

purpureum minus: and it is in the *Hiſtor. Lugdun.* vnder the name of *Linaria rubra*. It groweth vp with ſtalkes ſome foot high, ſet with many narrow leaues like thoſe of Toad-flax, of a grayiſh colour, and the ſtalke is parted into diuers branches, which at their tops vpon long cods carrie purple floures conſiſting of foure leaues apiece. The root is long, yellowiſh, and wooddy. ‡

9 There is another baſtard Looſe-ſtrife or Willow-herbe hauing ſtalkes like the other of his kinde. whereon are placed long leaues ſnipt about the edges, in ſhape like the great *Veronica* or herbe *Fluellen*. The floures grow along the ſtalkes, ſpike-faſhion, of a blew colour; after which ſucceed ſmall cods or pouches. The root is ſmall and fibrous: it may be called *Lyſimachia cærulea*, or blew Willow-herbe.

10 We haue likewiſe another Willow-herbe that groweth neere vnto the bankes of riuers and water-courſes. This I found in a waterie lane leading from the Lord Treaſurer his houſe called Theobalds, vnto the backeſide of his ſlaughter-houſe, and in other places, as ſhall be declared hereafter. Which *Lobel* hath called *Lyſimachia galericulata*, or hooded Willow-herbe. It hath many ſmall tender ſtalkes trailing vpon the ground, beſet with diuers leaues ſomwhat ſnipt about the edges, of a deep green colour, like to the leaues of *Scordium* or water Germander: among which are placed ſundrie ſmall blew floures faſhioned like a little hood, in ſhape reſembling thoſe of Ale-hoofe. The root is ſmall and fibrous, diſperſing it ſelfe vnder the earth farre abroad, whereby it greatly increaſeth.

11 The wilde Willow-Herbe hath fraile and very brittle ſtalkes, ſlender, commonly about the height of a cubit, and ſometimes higher; whereupon doe grow ſharpe pointed leaues ſomewhat ſnipt about the edges, and ſet together by couples. There come forth at the firſt long ſlender coddes, wherein is contained ſmall ſeed, wrapped in a cottony or downy wooll, which is carried away with the winde when the ſeed is ripe: at the end of which commeth forth a ſmall floure of a purpliſh colour; whereupon it was called *Filius ante Patrem*, becauſe the floure doth not appeare vntill the cod be filled with his ſeed. But there is another Sonne before the Father, as hath beene declared in the Chapter of Medow-Saffron. The root is ſmall and threddie. ‡ This differeth from the ſixth onely in that the leaues are leſſe, and leſſe hairy, and the floure is ſmaller. ‡

12 The Wood Willow-hearbe hath a ſlender ſtalke diuided into other ſmaller branches, whereon are ſet long leaues rough and ſharpe pointed, of an ouerworne greene colour. The floures grow at the tops of the branches, conſiſting of foure or fiue ſmall leaues, of a pale purpliſh colour tending to whiteneſſe: after which come long cods, wherein are little ſeeds wrapped in a certaine white Downe that is carried away with the winde. The root is threddie. ‡ This differs from the ſixth in that it hath leſſer floures. There is alſo a leſſer ſort of this hairie *Lyſimachia* with ſmall floures.

There are two more varieties of theſe codded Willow-herbes; the one of which is of a middle growth, ſomewhat like to that which is deſcribed in the eleuenth place, but leſſe, with the leaues alſo ſnipped about the edges, ſmooth, and not hairie: and it may fitly be called *Lyſimachia ſiliquoſa glabra media*, or *minor*, The leſſer ſmooth-leaued Willow-herbe. The other is alſo ſmooth leaued, but they are leſſer and narrower: wherefore it may in Latine be termed, *Lyſimachia ſiliquoſa glabra minor anguſtifolia*: in Engliſh, The leſſer ſmooth and narrow leaued Willow-herbe.

‡ 13 This leſſer purple Looſe-ſtrife of *Cluſius*, hath ſtalkes ſeldome exceeding the height of a cubit, they are alſo ſlender, weake and quadrangular, towards the top, diuided into branches growing

growing one againſt another, the leaues are leſſe and narrower than the common purple kinde, and growing by couples, vnleſſe at the top of the ſtalkes and branches, whereas they keepe no certaine order; and amongſt theſe come here and there cornered cups containing floures compoſed of ſix little red leaues with threds in their middles. The root is hard, woody, and not creeping, as in others of this kinde, yet it endures all the yeere, and ſends forth new ſhoots. It floures in Iune and Iuly, and was found by *Cluſius* in diuers wet medowes in Auſtria. ‡

¶ *The Place.*

The firſt yellow *Lyſimachia* groweth plentifully in moiſt medewos, eſpecially along the medowes as you go from Lambeth to Batterſey neere London, and in many other places throughout England.

‡ 13 *Lyſimachia purpurea minor Cluſ.*
Small purple Willow herbe.

‡ The ſecond and third I haue not yet ſeene.

The fourth groweth in many gardens. ‡

The fift groweth in places of greater moiſture, yea almoſt in the running ſtreames and ſtanding waters, or hard by them. It groweth vnder the Biſhops houſe wall at Lambeth, neere the water of Thames, and in moiſt ditches in moſt places of England.

The ſixth groweth neere the waters (and in the waters) in all places for the moſt part.

The ſeuenth groweth in Yorkſhire in a place called the Hooke, neer vnto a cloſe called a Cow paſture, from whence I had theſe plants, which doe grow in my garden very goodly to behold, for the decking vp of houſes and gardens.

‡ The eighth I haue not yet found growing.

The ninth growes wild in ſome places of this kingdome, but I haue ſeene it only in Gardens.

The tenth growes by the ponds and waters ſides in Saint Iames his Parke, in Tuthill fields and many other places. ‡

The eleuenth groweth hard by the Thames, as you goe from a place called the Diuels Neckerchiefe to Redreffe, neere vnto a ſtile that ſtandeth in your way vpon the Thames banke, among the plankes that doe hold vp the ſame banke. It groweth alſo in a ditch ſide not farre from the place of execution, called Saint Thomas Waterings.

‡ The other varieties of this grow in wet places, about ditches, and in woods and ſuch like moiſt grounds. ‡

¶ *The Time.*

Theſe herbes floure in Iune and Iuly, and oftentimes vntill Auguſt.

¶ *The Names.*

Lyſimachia, as *Dioſcorides* and *Pliny* write, tooke his name of a ſpeciall vertue that it hath in appeaſing the ſtrife and vnrulineſſe which falleth out among oxen at the plough, if it bee put about their yokes: but it rather retaineth and keepeth the name *Lyſimachia*, of King *Lyſimachus* the ſonne of *Agathocles*, the firſt finder out of the nature and vertues of this herb, as *Pliny* ſaith in his 25. book chap. 7. which retaineth the name of him vnto this day, and was made famous by *Eraſiſtratus*. *Ruellius* writeth, that it is called in French *Cornelle* and *Corneola*: in Greeke, Λυσιμαχιον: of the Latines, *Lyſimachium*: of *Pliny*, *Lyſimachia*: of the later Writers, *Salicaria*: in high Dutch, **Wederick**: in Engliſh, Willow herbe, or herbe Willow, and Looſe ſtrife.

Chamænerium is called of *Geſner*, *Epilobion*: in Engliſh, Bay Willow, or bay yellow herbe.

‡ The

‡ The names of ſuch as I haue added haue been ſufficiently ſet forth in their titles and Hiſtories. ‡

¶ *The Nature.*

The yellow *Lyſimachia*, which is the chiefe and beſt for Phyſicke vſes, is cold and drie, and very aſtringent.

¶ *The Vertues.*

A The iuice, according to *Dioſcorides*, is good againſt the bloudy flix, being taken either by potion or Cliſter.

B It is excellent good for greene wounds, and ſtancheth the bloud: being alſo put into the noſthrils, it ſtoppeth the bleeding at the noſe.

C The ſmoke of the burned herbe driueth away ſerpents, and killeth flies and gnats in a houſe; which *Pliny* ſpeaketh of in his 25. book, chap. 8. Snakes, ſaith he, craull away at the ſmell of Looſſtrife. The ſame Authour affirmeth in his 26 booke, laſt chap. that it dieth haire yellow, which is not very vnlike to be done by reaſon the floures are yellow.

D The others haue not been experimented, wherefore vntill ſome matter worthy the noting doth offer it ſelfe vnto our conſideration, I will omit further to diſcourſe hereof.

E The iuice of yellow *Lyſimachia* taken inwardly, ſtoppeth all fluxe of bloud, and the Dyſenteria or bloudy flix.

F The iuice put into the noſe, ſtoppeth the bleeding of the ſame, and the bleeding of wounds, and mightily cloſeth and healeth them, being made into an vnguent or ſalue.

G The ſame taken in a mother ſuppoſitorie of wooll or cotton, bound vp with threds (as the manner thereof is, well knowne to women) ſtaieth the inordinate flux or ouermuch flowing of womens termes.

H It is reported, that the fume or ſmoke of the herbe burned, doth driue away flies and gnats, and all manner of venomous beaſts.

Chap. 130. *Of Barren-woort.*

Epimedium.
Barren Woort.

¶ *The Deſcription.*

THis rare and ſtrange plant was ſent to me from the French Kings Herbariſt *Robinus*, dwelling in Paris at the ſigne of the blacke head, in the ſtreet called *Du bout du Monde*, in Engliſh, The end of the world. This herbe I planted in my garden, & in the beginning of May it came forth of the ground, with ſmall, hard & woodie crooked ſtalks: whereupon grow rough & ſharpe pointed leaues, almoſt like *Alliaria*, that is to ſay, Sauce alone, or Iacke by the hedge. *Lobel* and *Dod.* ſay, that the leaues are ſomewhat like Iuie; but in my iudgement they are rather like *Alliaria*, ſomwhat ſnipt about the edges, and turning themſelues flat vpright, as a man turneth his hand vpwards when hee receiueth money. Vpon the ſame ſtalkes come forth ſmall floures, conſiſting of foure leaues, whoſe outſides are purple, the edges on the inner ſide red, the bottome yellow, & the middle part of a bright red colour, and the whole floure ſomewhat hollow. The root is ſmal, and creepeth almoſt vpon the vppermoſt face of the earth. It beareth his ſeed in very ſmall cods like Saracens Conſound, (‡ to wit that of our Authour formerly

merly deſcribed, *pag.* 274.‡) but ſhorter: which came not to ripeneſſe in my garden, by reaſon that it was dried away with the extreme and vnaccuſtomed heat of the Sun, which happened in the yeare 2590. ſince which time from yeare to yeare it bringeth ſeed to perfection. Further, *Dioſcorides* and *Pliny* do report, that it is without floure or ſeed.

¶ *The Place.*

† It groweth in the moiſt medowes of Italie about Bononia and Vincentia: it groweth in the garden of my friend Mr. *Iohn Milion* in Old-ſtreet, and ſome other gardens about towne.

¶ *The Time.*

It floureth in Aprill and May, when it hath taken faſt hold and ſetled it ſelfe in the earth a yeare before.

¶ *The Names.*

It is called *Epimedium*: I haue thought good to call it Barren woort in Engliſh; not becauſe that *Dioſcorides* ſaith it is barren both of floures and ſeeds, but becauſe (as ſome authors affirme) being drunke it is an enemie to conception.

¶ *The Temperature and Vertues.*

Galen affirmeth that it is moderately cold, with a waterie moiſture: we haue as yet no vſe hereof in Phyſicke.

‡ CHAP. 131. *Of Fleabane.*

‡ 1 *Conyza maior.*
Great Fleawoort.

‡ 2 *Conyza minor vera.*
Small Fleabane.

‡ THe ſmalneſſe of the number of theſe plants here formerly mentioned, the confuſion notwithſtanding in the figures, their nominations & hiſtorie, not oneagreeing with another, hath cauſed me wholly toomit the deſcriptions of our Authour, and to giue you new, agreeable to the figures; together with an addition of diuers other plants belonging to this kindred. Beſides there is one thing I muſt aduertiſe you of, which is, that our Authour in the firſt place deſcribed the *Bacchar is Monſpelienſium* of *Lobel*, or *Conyza maior* of *Matthiolus*, & it is that which grows in Kent and Eſſex on chalkie hils; yet he gaue no figure of it, but as it were forgetting what he had don, allotted it a particular chap. afterwards, where alſo another figure was put for it; but there you ſhall now finde it, though I muſt confeſſe that this is as fit or a fitter place for it, but I will follow the courſe of my Authour, whoſe matter, not method I indeauour to amend.

¶ *The*

¶ *The Deſcription.*

1 THis great Fleawoort or Fleabane, from a thick long liuing fibrous root ſends forth many ſtalkes of ſome yard high or more; hard, wooddy, rough, fat, and of an ouerworne colour: the leaues are many, without order, and alternately embrace the ſtalkes, twice as big as thoſe of the Oliue tree, rough and fat, being as it were beſmeared with a gummineſſe or fattineſſe, and of a yellowiſh greene colour: the floures grow after a ſort ſpoke faſhion, ſtanding at the ends of footſtalkes comming out of the boſomes of the leaues, and they are yellow and round almoſt like to Groundſwell, and flie away in downe like as they doe; the ſeed is ſmall and aſh coloured. The whole plant is fattie and glutinous, with a ſtrong, yet not altogether vnpleaſant ſmell. This growes not that I know of in theſe cold Countries, vnleſſe ſowne in gardens. *Cluſius* found it by Lisbone, and in diuers places of Spaine. He, as alſo *Dodonæus*, *Lobel*, and others, call this *Conyza maior*, and it is thought to be the *Conyza mas* of *Theophraſtus*, and *Conyza maior* of *Dioſcorides*.

2 The leſſer ſeldome ſends vp more than one ſtalke, and that of a cubit high, yet vſually not ſo much: it is diuided into little branches, and alſo rough and glutinous as the precedent, but more greene. The leaues are three times leſſe than thoſe of the former, ſomewhat ſhaped like thoſe of Toad-flax, yet hairy and vnctious; the tops of the branches as in the bigger, carrie leſſe, and leſſe ſhining and ſightly floures, vaniſhing in like ſort into downe. The root is ſingle and annuall, and the whole plant more ſmelling than the former. This is iudged the *Conyza fœmina* of *Theophraſtus*; and *Con. minor* of *Dioſcorides*; it is the *Con. minor* of *Geſner*, *Lobel*, *Cluſius* and others. It growes in diuers parts of Spaine and Prouince in France, but not here, vnleſſe in Gardens.

† 3 *Conyza media.*
Middle Fleawoort.

† 4 *Conyza minima.*
Dwarfe Fleabane.

3 The root of this middle kinde is prettie large and fibrous, from whence ariſeth a branched ſtalke of ſome cubite high, engirt at certaine ſpaces with thicke, rough, grayiſh greene leaues: at the tops of the branches grow pretty faire yellow floures of the bignes of a little Marigold; which fading turne to downe, and are carried away with the winde. This floures in Iuly and Auguſt, and may be found growing in moſt places about riuers and pond ſides, as in S. Iames his Parke, Tuthill fields, &c. This is *Conyza media* of *Matthiolus*, *Dodonæus*, and others. Some haue referred it vnto the

Mints

Mints, as *Fuchſius*, who makes it *Calaminthæ 3. genus*; and *Lonicerus*, who calls it *Mentha Lutea*. In Cheape-ſide the herbe-women call it Herbe Chriſtopher, and ſell it to Empericks, who with it (as they ſay) make Medicines for the eyes, but againſt what affect of them, or with what ſucceſſe I know not.

4 In like places, or rather ſuch as are plaſhy in winter this may be plentifully found growing. The roots are ſmall and fibrous; from whence ariſeth a branched ſtalke ſome foot high, ſet with ſmall longiſh leaues ſomewhat roundiſh pointed, ſoft alſo and woolly, with a ſmell not altogether vnpleaſant, like as the laſt deſcribed: the floures are compoſed of many yellowiſh threds like to the middle part of Camomill floures, or thoſe of Tanſey: and as the former, turne into downe, and are carried away with the winde; it floures in Iuly and Auguſt. This is the *Conyza minor* of *Tragus*, *Matthiolus*, and others: *Lobel* and *Dodon.* call it *Conyza minima*.

5 This cut leaued Fleabane hath ſmall fibrous roots, from which ariſe thicke, creſted, & hollow ſtalks, diuided towards the tops into ſundry branches: the leaues that incompaſſe the ſtalke are gaſhed, or elſe onely ſinuated on the edges: the floures are ſtar faſhion and yellow, and alſo flie away in downe; the whole plant is couered ouer with a ſoft and tender downe, and hath ſomewhat the ſmell of Honie. This is a varietie of the third, and is called by *Dodon. Conyzæ mediæ ſpecies altera*. *Lobel* names it *Conyza helenitis folijs laciniatis*.

6 The figure which you haue in this ſixth place was formerly vnfitly giuen by our Authour for *Solidago Saracenica*; it hath a large root which ſends foorth many fibres, and a creſted hollow ſtalke ſome two cubites or more high, which is vnorderly ſet, with long, yet narrow ſnipt leaues ſomewhat hairie and ſharpe pointed: the toppe is diuided into branches, which beare prettie large yellow floures, made after the manner of thoſe of Ragwort, and like as they, are alſo carried away with the winde. This *Thalius* cals *Conyza maxima ſerratifolia*. It is the *Lingua maior* of *Daleſchampius*, and the *Conſolida paluſtris* of *Tabernamontanus*. It groweth neere water ſides, and floures towards the latter end of Sommer: I haue not yet heard that it doth grow wilde amongſt vs.

‡ 5 *Conyza folijs laciniatis*.
Great iagged leaued Fleabane.

‡ 6 *Conyza paluſtris ſerratifolia*.
Water ſnipt Fleabane.

7 The

‡ 7 *Conyza Auſtriaca Cluſij.*
Auſtrian Fleabane.

‡ 8 *Conyza incana.*
Hoary Fleabane.

‡ 9 *Conyza Alpina piloſiſſima.*
Hairie Fleabane of the Alpes.

† 10 *Conyza Cærulea acris.*
Blew floured Fleabane.

7 The ſtalkes of this are about a foot high, ſtraight, ſtiffe, hard, and couered with a whitiſh downe: the leaues at the root grow vpon long ſtalkes, and are ſoft and hairie; but thoſe which are higher vp, haue a ſhort, or elſe no ſtalke at all, and rubbed, they yeeld no vnpleaſant ſmell, and taſted, they are ſomwhat bitter and acride. The floures that grow vpon the tops of the branches are large, and faſhioned like thoſe of Elecampane, and are of the ſame yellow color. The root is long, ſlender and blackiſh, creeping and putting vp new ſtalkes; it hath many white fibres and a reſinous ſmell. *Cluſius* found it growing on dry hilly places in Auſtria, and calls it *Conyza 3. Auſtriaca.*

8 This which *Lobel* ſets forth vnder the title of *Conyza helentis mellita incana*, I take to be the ſame Plant that I laſt figured and deſcribed out of *Cluſius*, onely the root is better expreſt in *Cluſius* his figure; otherwiſe by the figures I cannot find any difference, though *Bauhine* reckon it vp in his *Pinax*, as differing therefrom.

9 This alſo ſeemes not much to differ from the laſt mentioned, but onely in the hairineſſe of the leaues and ſtalkes, and that the floures are ſmaller. This *Lobel* cals *Conyza Helenitis mellita incana: Helenitis*, becauſe the floures and leaues haue ſome ſemblance of Elecampane; and *Mellita*, for that they ſmell ſomewhat like Honie. Theſe laſt grow vpon mountaines, but none of them with vs in England that I can yet heare of.

10 This hath a ſmall fibrous and yellowiſh root, of a very hot and biting taſte, which ſends vp diuers longiſh leaues about the head thereof; the ſtalke is ſome foot and halfe high, and ſet alternately with twined, longiſh, narrow and ſomewhat rough leaues of an ouerworne greene colour; the top of the ſtalke and branches are adorned with floures ſet in longiſh ſcaly heads like thoſe of *Hieracium*: the outer little leaues are of a faint blew colour, and the inner threds are yellow. It floures in Auguſt, and the floures quickly turne into downe, and are carried away with the wind. It grows in many Chalkie hils, and I firſt obſerued it in the company of M^r. *George Bowles*, M^r. *John Bugs* and others, cloſe by Farmingham in Kent; and the laſt yeare M^r. *William Broad* found it growing at the Blockehouſe at Graueſend. *Tragus* calls it *Tinctorius flos alter: Dodonæus* becauſe the floure quickly turns to downe makes it *Erigeron quartum:* and *Geſner* for that the root is hot, and drawes rheume like as Pellitorie of Spaine, which therefore is vſed againſt the Tooth-ache, names it *Dentelaria*, he alſo cals it *Conyza muralis*, and *Conyzoides Cærulea: Tabernamontanus* alſo calls it *Conyza cærulea:* and laſtly, *Fabius Columna* hath it by the name of *Amellus Montanus*, to which kinde it may in mine opinion be as fitly referred, as to theſe *Conyza's*. Our Authour had the figure hereof in the third place in this Chapter.

¶ *The Place, Time, and Names.*

All theſe haue beene ſufficiently ſhewne in their particular Titles and Deſcriptions. ‡

¶ *The Nature.*

Conyza is hot and drie in the third degree.

¶ *The Vertues.*

The leaues and floures be good againſt the ſtrangurie, the iaundiſe, and the gnawing or griping of the bellie. A

The ſame taken with Vineger, helpeth the Epilepſie or falling ſickneſſe. B

If Women doe ſit ouer the decoction thereof, it greatly eaſeth their paines of the Mother. C

The Herbe burned, where flies, Gnats, fleas, or any venemous things are, doth driue them away. D

‡ The firſt was formerly of *Conyza media*; the ſecond was of *Conyza minima*; and the third of *Conyza Cærulea acris.*

Chap. 132. *Of Starre-woort.*

¶ *The Deſcription.*

1 THe firſt kinde of *Aſter* or *Inguinalis*, hath large broad leaues like *Verbaſcum Salvifolium* or the great *Conyza*: among which riſeth vp a ſtalke foure or fiue handfuls high, hard, rough and hairie, beſet with leaues like Roſe Campions, of a darke greene colour. At the top of the ſaid ſtalkes come forth floures, of a ſhining and gliſtering golden colour; and vnderneath about theſe floures grow fiue or ſix long leaues, ſharpe pointed and rough, not much in

ſhape vnlike the fiſh called *Stella marina*. The floures turne into downe, and are carried away with the winde. The root is fibrous, of a binding and ſharpe taſte.

‡ 2 The ſecond called Italian Starrewoort hath leaues not much vnlike Marigolds, but of a darke greene colour, and rough, and they are ſomewhat round at the vpper end: the ſtalkes are many, and grow ſome cubite high; and at their tops are diuided into ſundry branches, which beare faire blewiſh purple floures, yellow in their middles, and ſhaped like Marigolds, and almoſt of the ſame bigneſſe, whence ſome haue called them blew Marigolds. ‡

3 The third kinde hath leaues ſo like Italian Starwort, that a man can ſcarcely at the ſudden diſtinguiſh the one from the other The ſingle ſtalke is a cubit long, vpright and ſlender; on the top whereof grow faire yellow floures, like thoſe of *Enula Campana*, and they fly away in downe: the root is ſmall and threddie.

4 The fourth kinde in talneſſe and floure is not much vnlike that laſt before ſpecified, but in ſtalke and leaues more hairie, and longer, ſomewhat like our ſmall Houndſ-tongue; and the rootes are leſſe fibrous or threddie than the former.

5 There is another ſort that hath a browne ſtalke, with leaues like the ſmall *Coniza*. The floures are of a darke yellow, which turne into downe that flieth away with the wind like *Conyza*. The root is full of threds or ſtrings.

6 There is alſo another that hath leaues like the great Campion, ſomewhat hairie; amongſt which come vp crooked crambling ſtalkes, leaning lamely many waies. Whereupon doe growe faire yellow floures, Starre-faſhion; which paſt, the cups become ſo hard, that they will ſcarcely be broken with ones nailes to take forth the ſeed. The root is long and ſtraight as a finger, with ſome few ſtrings annexed vnto the vppermoſt part thereof. It groweth wilde in ſome parts of Spaine.

1 *After Atticus.*
Starrewoort.

‡ 2 *After Italorum.*
Italian Starrewoort.

7 There groweth another kinde of Starrewoort, which hath many leaues like Scabious, but thinner, and of a more greene colour, couered with a woollie hairineſſe, ſharpe and bitter in taſte; amongſt which ſpringeth vp a round ſtalke more than a cubite high; often growing vnto a red-

diſh

colour; ſet with the like leaues, but ſmaller and ſharper pointed, diuiding it ſelfe toward the nto ſome few branches; whereon doe grow large yellow floures like *Doronicum* or *Sonchus*. oot is thicke and crooked. ‡ This is *Aſter Pannonicus maior, ſiue tertius* of *Cluſ.* and his *Au-us primus*.

Wee haue ſeene growing vpon wilde Mountaines another ſort, which hath leaues much than the former, ſomewhat like to the leaues of Willow, of a faire greene colour, which doe ne and decke vp the ſtalke euen to the top; whereupon doe grow yellow floures ſtarre faſhion, nto the former. The root is ſmall and tender, creeping farre abroad, whereby it mightily in-eth. ‡ This is *Aſter Pannonicus ſalignis foliis: ſiue Aſter* 4. *Auſtriacus* 2. of *Cluſius*. It is *nium luteum* of *Tabern*. And our Authour gaue the Figure heereof for *Aſter Italo-*

‡

Cluſius hath ſet forth a kinde that hath an vpright ſtalke, ſomewhat hairy, two cubits high, with leaues ſomewhat woollie like to thoſe of the Sallow, hauing at the top of the ſtalke yellow floures like *Enula Campana*, which turne into down that is carried away with the wind. oot is thicke, with ſome haires or threds faſtened thereto. ‡ This is *Aſter lanuginoſo folio, ſiue Cluſius*. Our Authour gaue the figure hereof vnder the title of *Aſter Hirſutus*: it is *Aſter flore* of *Taber*.

Hee hath likewiſe deſcribed another ſort, that hath leaues, ſtalks, floures, and roots like the , but neuer groweth to the height of one cubite. ‡ It bringeth forth many ſtalkes, and the es that grow diſorderly vpon them are narrower, blacker, harder and ſharper pointed than the er, not vnlike thoſe of the common *Ptarmica*, yet not ſnipt about the edges: the floures are yel-and like thoſe of the laſt deſcribed, but leſſe. This is the *Aſter anguſtifolius ſiue ſextus* of *us*. ‡

There is likewiſe ſet forth in his Pannonicke obſeruation, a kind of *Aſter* that hath many hairie leaues like the common great Daiſie: among which riſeth vp an hairy ſtalke of a foot hauing at the top faire blew floures inclining to purple, with their middle yellow, which turn ne time of ſeeding) into a woollie downe, that flieth away with the winde. The whole plant a drying, binding, and bitter taſte. The root is threddie like the common Daiſie, or that of ious. ‡ This is *Aſper Alpinus cæruleo flore, ſiue* 7. of *Cluſius*. ‡

r montanus flore amplo. 4 *Aſter hirſutus.* ‡ 5 *Aſter Conyzoides Geſneri.*

ntaine Starwoort. Hairie Srarwoort. Fleabane Starrewoort.

‡ 6 *After Luteus ſupinus Cluſij.*
Creeping Starwoort.

‡ 7 *After luteus foliis Succiſa.*
Scabious leaued Starwoort.

‡ 8 *After Salicis folio.*
Willow leaued Starwoort.

‡ 9 *After Auſtriacus, 5 Cluſ.*
Sallow leaued Starwoort.

‡ 12 There

12 There are kept in the Gardens of Mr. *Tradeſcant*, Mr. *Tugeye*, and others, two Starre-orts different much from all theſe formerly mentioned: the firſt of them is to bee eſteemed, for it floures in October and Nouember when as few other floures are to be found: the root is e and liuing, which ſends vp many ſmall ſtalks ſome two cubits high, wooddy, ſlender, and not ow, and towards the top they are diuided into aboundance of ſmall twiggie branches: the es that grow alternately vpon the ſtalkes, are long, narrow, and ſharpe pointed, hauing foure or ſcarce diſcernable nicks on their edges: the floures which plentifully grow on ſmall branches h after the manner of thoſe of *Virga aurea*, conſiſt of twelue white leaues ſet in a ring, with ma-hreds in their middles; which being young are yellow, but becomming elder and larger they of a reddiſh colour, and at length turne into downe. I haue thought fit to call this plant, not deſcribed by any that I know of, being reported to be a Virginian, by the name of *Aſter Virginianus fruticoſus*, Shrubbie Starwoort.

13 This which in gardens floures ſome moneth before the former, growes not ſo high, neither he ſtalkes ſo ſtraight, but often crooked, yet are they diuided into many branches which beare ll blewiſh floures like thoſe of the former: the leaues are longiſh and narrow. This alſo is ſaid aue come from Canada or Virginia; and it may be called *Aſter fruticoſus minor*, Small ſhrubby woort. ‡

‡ 10 *Aſter 6. Cluſij.*
Narrow leaued Starwoort.

‡ 11 *Aſter 7. Cluſij.*
Dwarfe Daſie leaued Starwoort.

¶ *The Place.*

he kindes of Starwoort grow vpon mountaines and hillie places, and ſometimes in woods and owes lying by riuers ſides.

he two firſt kindes doe grow vpon Hampſtead heath foure miles from London, in Kent vpon hfleet Downes, and in many other ſuch downie places. ‡ I could neuer yet finde nor heare of f theſe Starfloures to grow wilde in this kingdome, but haue often ſeene the Italian Starwort ing in gardens. Theſe two kindes that our Authour mentions to grow on Hampſtead heath n Kent, are no other than two *Hieracia*, or Hauke-weedes, which are much differing from . ‡

¶ *The Time.*

hey floure from Iuly to the end of Auguſt.

¶ *The Names.*

This herbe is called in Greeke ἀστὴρ ἀττικὸς, and alſo βάτιον: in Latine, *Aſter Atticus, Bulonium*, and *Inguinalis*: of ſome, *Aſterion, Aſteriſcon*, and *Hyophthalmon*: in high Dutch, **Meget kraut**: in Spaniſh, *Bobas*: in French, *Eſtrille*, and *Aſper goutte menne*: in Engliſh, Stairwoort and Sharewoort.

¶ *The Nature.*

It is of a meane temperature in cooling and drying. *Galen* ſaith it doth moderately waſte and conſume, eſpecially while it is yet ſoft and new gathered.

That with the blew floure or purple, is thought to be that, which is of *Virgil* called *flos Amellus*: of which he maketh mention in the fourth booke of his Georgickes.

Eſt etiam flos in pratis, cui nomen Amello
Fecere agricolæ: facilis quærentibus herba;
Namque vno ingentem tollit de cæſpite ſylvam:
Aureus ipſe, ſed in foliis, quæ plurima circum
Funduntur, violæ ſublucet purpura nigræ.

In Engliſh thus.

In Meades there is a floure *Amello* nam'd,
By him that ſeekes it eaſie to be found,
For that it ſeemes by many branches fram'd
Into a little Wood: like gold the ground
Thereof appeares, but leaues that it beſet
Shine in the colour of the Violet.

¶ *The Vertues.*

A The leaues of *Aſter* or *Inguinalis* ſtamped, and applied vnto botches, impoſthumes, and venereous bubones (which for the moſt part happen *in Inguine*, that is, the flanke or ſhare) doth mightily maturate and ſuppurate them, whereof this herbe *Aſter* tooke the name *Inguinalis*.

B It helpeth and preuaileth againſt the inflammation of the fundament, and the falling forth of the gut called *Saccus ventris*.

C The floures are good to be giuen vnto children againſt the Squinancie, and the falling ſicknes.

† That figure which formerly was in the ſecond place vnder the title of *Aſter Atticus*, was of the eighth here deſcribed; alſo in the third place formerly were theſe two figures which we here giue you, whereof the former is of *Aſter montanus*, and the latter of *Aſter hirſutus*; and that which was vnder the title of *Aſter hirſutus* in the fourth place, belongs to the ninth deſcription.

Chap. 133. *Of Woade.*

¶ *The Deſcription.*

1 *Glaſtum* or Garden Woad hath long leaues of a blewiſh greene colour. The ſtalk groweth two cubits high, ſet about with a great number of ſuch leaues as come vp firſt, but ſmaller, branching it ſelfe at the top into many little twigs, whereupon do grow many ſmall yellow floures: which being paſt, the ſeed commeth forth like little blackiſh tongues: the root is white and ſingle.

2 There is a wilde kinde of VVoad very like vnto the former in ſtalks, leaues, and faſhion, ſauing that the ſtalke is tenderer, ſmaller, and browner, and the leaues and little tongues narrower; otherwiſe there is no difference betwixt them.

¶ *The Place.*

The tame or garden VVoad groweth in fertile fields, where it is ſowne: the wilde kind growes where the tame kinde hath been ſowne.

¶ *The Time.*

They floure from Iune to September.

¶ *The Names.*

VVoad is called in Greeke ἰσάτις: in Latine, *Iſatis*, and *Glaſtum*: *Cæſar* in his fifth booke of the French wars ſaith, that all the Brittons do colour themſelues with VVoad, which giueth a blew colour: the which thing alſo *Pliny* in his 22. booke, chap. 1. doth teſtifie: in France they call it *Glaſtum* which is like vnto Plantaine, wherewith the Brittiſh wiues and their daughters are coloured all ouer, and go naked in ſome kinde of ſacrifices. It is likewiſe called of diuers *Guadum*: of the Italians, *Guado*; a word as it ſeemeth, wrung out of the word *Glaſtum*. in Spaniſh and French, *Paſtel*: in Dutch, **Weet**: in Engliſh, VVoad, and VVade.

¶ *The*

1 *Glaſtum ſatiuum.*
Garden Woade.

‡ 2 *Glaſtum ſylueſtre.*
Wilde Woade.

¶ *The Nature.*

rden Woade is dry without ſharpeneſſe: the wilde Woade drieth more, and is more ſharpe iting.

¶ *The Vertues.*

e decoction of Woade drunken is good for ſuch as haue any ſtopping or hardneſſe in the A
r ſpleene, and is alſo good for wounds or vlcers in bodies of a ſtrong conſtitution, as of coun-
eople, and ſuch as are accuſtomed to great labour and hard courſe fare.
ſerueth well to dye and colour cloath, profitable to ſome few; and hurtfull to many. B

CHAP. 134. *Of Cow-Baſill.*

¶ *The Deſcription.*

THis kinde of wilde Woade hath fat long leaues like *Valeriana rubra Dodocæi*, or *Behen rubrum*: the ſtalke is ſmall and tender, hauing thereupon little purple floures conſiſting of foure leaues; which being paſt, there come ſquare cornered huskes full of blacke ſeed like Coleworts. The whole plant is couered ouer with a clammy ſubſtance like ime, ſo that in hot weather the leaues thereof will take flies by the wings (as *Muſcipula* doth) manner that they cannot eſcape away.

Ephemerum Matthioli hath long fat and large leaues like vnto Woad, but much leſſe; among riſeth vp a round ſtalke a cubit high, diuiding it ſelfe into many branches at the top, the are ſet with many ſmall white floures conſiſting of fiue leaues; which being paſt, there ſol-tle round bullets containing the ſeed. The root is ſmall and full of fibres.

¶ *The Place.*

-Baſill groweth in my garden: but *Ephemerum* is a ſtranger as yet in England.

¶ *The Time.*

y floure in May and Iune.

¶ *The*

1 *Vaccaria.*
Cow-Baſill.

2 *Ephemerum Matthioli.*
Quicke-fading floure.

‡ ¶ *The Names.*

1 Cow-Baſill is by *Cordus* called *Thamecnemon:* by ſome, according to *Geſner, Lychnis & Perfoliata rubra: Lobel* termes it *Iſatis ſylueſtris,* and *Vaccaria:* the laſt of which names is retained by moſt late Writers.

2 This by *Lobel* is ſaid to be *Ephemerum* of *Matthiolus*; yet I thinke *Matthiolus* his figure, (which was in this place formerly) was but a counterfeit, and ſo alſo doe *Columna* and *Bauhinus* iudge of it; and *Bauhine* thinkes this of *Lobel* to be ſome kinde of *Lyſimachia.* ‡

¶ *The Nature and Vertues.*

I finde not any thing extant concerning the Nature and Vertues of *Vaccaria* or Cow-Baſill.

A *Ephemerum* (as *Dioſcorides* writeth) boyled in wine, and the mouth waſhed with the decoction thereof, taketh away the tooth-ache.

Chap. 135.
Of Seſamoides, or Baſtard Weld or Woade.

¶ *The Deſcription.*

1 THe great *Seſamoides* hath very long leaues and many, ſlender toward the ſtalk, and broader by degrees toward the end, placed confuſedly vpon a thicke ſtiffe ſtalke: on the top whereof grow little fooliſh or idle white floures: which being paſt, there follow ſmall ſeeds like vnto Canarie ſeed that birds are fed withall. The root is thicke, and of a wooddy ſubſtance.

‡ 2 This leſſer *Seſamoides* of Salamanca, from a long liuing, white, hard, and prettie thicke root ſends vp many little ſtalks ſet thicke with ſmall leaues like thoſe of Line; and from the middle to the top of the ſtalke grow many floures, at firſt of a geeeniſh purple, and then putting forth yellowiſh threds; out of the midſt of which appeare as it were foure greene graines, which when the floure is fallen grow into little cods full of a ſmall blackiſh ſeed. It growes in a ſtony ſoile vpon the hills neere Salamanca, where it floures in May, and ſhortly after perfects his ſeed. ‡

3 Our

Seſamoides Salamanticum magnum.
Great baſtard Woade.

2 *Seſamoides Salamanticum parvum.*
Small Baſtard Woade.

Seſamoides parvum Matthioli.
Bucks-horne Gum-Succorie

‡ 3 Our Author formerly in the Chapter of *Chondrilla* ſpoke (in *Dodonæus* his words) againſt the making of this plant a *Seſamoides*; for of this plant were the words of *Dodonæus*; which are theſe: Diuers (ſaith he) haue taken the plant with blew floures to be *Seſamoides parvum*, but without any reaſon; for that *Seſamoides* hath borrowed his name from the likeneſſe it hath with *Seſamum*: but this herbe is not like to *Seſamum* in any one point, and therefore I thinke it better referred vnto the Gum Succories; for the floures haue the form and colour of Gum Succory, and it yeeldeth the like milky juyce. Our Authour it ſeemes was either forgetfull or ignorant of what he had ſaid; for here hee made it one, and deſcribed it meerly by the figure and his fancie. Now I following his tract, haue (though vnfitly) put it here, becauſe there was no hiſtorie nor figure of it formerly there, but both here, though falſe and vnperfect. This plant hath a root ſomewhat like that of Goatſ-beard; from which ariſe leaues rough and hairy, diuided or cut in on both ſides after the manner of Bucks-horne, and larger than they. The ſtalke is ſome foot high, diuided into branches, which on their tops carry floures of a faire blew colour like thoſe of Succorie, which ſtand in rough ſcaly heads like thoſe of Knapweed. ‡

¶ *The*

¶ *The Place.*

Theſe do grow in rough and ſtony places, but are all ſtrangers in England.

¶ *The Time.*

Theſe floure in May and Iune, and ſhortly after ripen their ſeed.

‡ ¶ *The Names.*

‡ 1 I thinke none of theſe to be the *Seſamoides* of the Antients: The firſt is ſet forth by *Cluſius* vnder the name we here giue you: it is the *Muſcipula altera muſcoſo flore* of *Lobel*: *Viſcago maior* of *Camerarius*.

2 This alſo *Cluſius* and *Lobel* haue ſet forth by the ſame name as we giue you them.

3 *Matthiolus*, *Camerarius*, and others haue ſet this forth for *Seſamoides parvum*: in the *Hiſtoria Lugd.* it is called *Catanance quorundam*: but moſt fitly by *Dodon.Chondrillæ ſpecies tertia*, The third kinde of Gum-Succory. ‡

¶ *The Temperature.*

Galen affirmeth that the ſeed containeth in it ſelfe a bitter qualitie, and ſaith that it heateth, breaketh, and ſcoureth.

¶ *The Vertues.*

A *Dioſcorides* affirmeth, that the weight of an halfe-penny of the ſeed drunke with Meade or honied water purgeth flegme and choler by the ſtoole.

B The ſame being applied doth waſte hard knots and ſwellings.

† That which here formerly enioyed the third place, by the title of *Seſamoides maius Scaligeri*, was no other than the plant that is hereafter deſcribed by the name of *Tanton-Raire Gallo-prouincie*, where you may finde both the figure and deſcription.

Chap. 136. *Of Dyers Weed.*

Luteola. Dyers weed or yellow weed.

¶ *The Deſcription.*

Dyers weed hath long narrow and greeniſh yellow leaues, not much vnlike to woad, but a great deale ſmaller and narrower; from among which commeth vp a ſtalke two cubits high, beſet with little narrow leaues: euen to the top of the ſtalke come forth ſmall pale yellow floures, cloſely cluſtering together one aboue another, which doe turne into ſmall buttons, cut as it were croſſe-wiſe, wherein the ſeed is contained. The root is very long and ſingle.

¶ *The Place.*

Dyers weed groweth of it ſelfe in moiſt, barren, and vntilled places, in and about Villages almoſt euery where.

¶ *The Names.*

Pliny, lib. 33. *cap.* 5. maketh mention by the way of this herbe, and calleth it *Lutea*: *Vitruvius* in his ſeuenth booke, *Lutum*: it is the *Anticarhinum* of *Tragus*: & *Pſeudoſtruthium* of *Mathiolus*: *Virgill*, in his Bucolickes, Eglog 4. cals it alſo *Lutum*: in Engliſh, Welde, or Dyers weed.

¶ *The Time.*

This herbe flouriſheth in Iune and Iuly.

¶ *The Nature.*

It is hot and dry of temperature.

‡ ¶ *The Vertues.*

A The root as alſo the whole herbe heates and dries in the third degree: it cuts, attenuates, reſolueth, opens, digeſts. Some alſo commend it againſt the punctures and bites of venomous creatures,

, not onely outwardly applied to the wound, but alſo taken inwardly in drinke.
lſo it is commended againſt the infection of the Plague: ſome for theſe reaſons terme it *The-* B
ria; *Mat.* ‡

CHAP. 137. *Of Staues-acre.*

Staphis-agria. Staues-acre.

¶ *The Deſcription.*

STaues-acre hath ſtraight ſtalkes of a browne colour, with leaues clouen or cut into ſundry ſections, almoſt like the leaues of the wilde Vine. The floures do grow vpon ſhort ſtems, faſhioned ſomewhat like vnto our common Monks hood, of a perfect blew colour; which being paſt, there ſucceed welted huskes like thoſe of Wolfsbane, wherein is contained triangular browniſh rough ſeed. The root is of a wooddy ſubſtance, and periſheth when it hath perfected his ſeed.

¶ *The Place.*

It is with great difficultie preſerued in our cold countries, albeit in ſome milde Winters I haue kept it couered ouer with a little Ferne, to defend it from the iniury of the March winde, which doth more harme vnto plants that come forth of hot Countries, than doth the greateſt froſts.

¶ *The Time.*

It floureth in Iune, and the ſeed is ripe the ſecond yeare of his ſowing.

¶ *The Names.*

It is called in Greeke σταφὶς ἀγρία: in Latine, *Herba Pedicularis*, and *Pedunculatia*, as *Marcellus* reporteth. *Pliny* in his 26 Booke, chap. 13. ſeemeth to name it *Vua Taminia*: of ſome, *Pituitaria*, and *Paſſula montana*: in ſhops, *Staphiſ-agria*: in Spaniſh, *Yeruapiolente*: in French, *Herbe aux poulx*: in high-Dutch, **Lens kraut**: in low-Dutch, **Luyſcruit**: in Engliſh, Staues-acre, Louſe-wort, and Louſe-pouder.

¶ *The Temperature.*

he ſeeds of Staues-acre are extreame hot, almoſt in the fourth degree, of a biting and burning itie

¶ *The Vertues.*

ifteene ſeeds of Staues-acre taken with honied water, will cauſe one to vomit groſſe flegme A
ſlimie matter, but with great violence, and therefore thoſe that haue taken them ought to
e without ſtaying, and to drinke honied water, becauſe it bringeth danger of choking and bur-
the throat, as *Dioſcorides* noteth. And for this cauſe they are reiected, and not vſed of the phy-
ns, either in prouoking vomit, or elſe in mixing them with other inward medicines.
he ſeed mingled with oyle or greaſe, drieth away lice from the head, beard, and all other parts B
e body, and cureth all ſcuruy itch and mangineſſe.
he ſame boyled in Vineger, and holden in the mouth, aſſwageth the tooth-ache. C
he ſame chewed in the mouth draweth forth much moiſture from the head, and cleanſeth the D
ne, eſpecially if a little of the root of Pellitorie of Spaine be added thereto.
he ſame tempered with vineger is good to be rubbed vpon louſie apparell, to deſtroy and driue E
y Lice.
he ſeeds hereof are perillous to be taken inwardly without good aduice, and correction of the F
e: and therefore I aduiſe the ignorant not to be ouer-bold to meddle with it, ſith it is ſo dan-
ous that many times death enſueth vpon the taking of it.

CHAP.

Chap. 138. *Of Palma Chriſti.*

¶ *The Deſcription.*

1 *Ricinus, Palma Chriſti*, or *Kik* hath a great round hollow ſtalke fiue cubits high, of a browne colour, died with a blewiſh purple vpon greene. The leaues are great and large, parted into ſundry ſections or diuiſions, faſhioned like the leaues of a fig-tree, but greater, ſpred or wide open like the hand of a man; and hath toward the top a bunch of floures cluſtering together like a bunch of grapes, whereof the loweſt are of a pale yellow colour, and wither away without bearing any fruit; and the vppermoſt are reddiſh, bringing forth three cornered huskes which containe ſeed as big as a kidney beane, of the colour and ſhape of a certaine vermine which haunteth cattell, called a Tik.

2 This *Palma Chriſti* of America growes vp to the height and bigneſſe of a ſmall tree or hedge ſhrub, of a wooddy ſubſtance, whoſe fruit is expreſſed by the figure, being of the bignes of a great beane, ſomewhat long, and of a blackiſh colour, rough and ſcaly.

1 *Ricinus.*
Palma Chriſti.

2 *Ricinus Americanus.*
Palma Chriſti of America.

¶ *The Place.*

The firſt kinde of *Ricinus* or Palma Chriſti groweth in my garden, and in many other gardens likewiſe.

¶ *The Time.*

Ricinus or Kik is ſowne in Aprill, and the ſeed is ripe in the end of Auguſt.

¶ *The Name, and cauſe thereof.*

Ricinus (whereof mention is made in the fourth chapter and ſixt verſe of the prophecie of *Ionas*)

was

alled of the Talmudiſts, כיק *Kik*, for in the Talmud we reade thus, כיק בשמן אין *Velo beſchemen* that is, in Engliſh, And not with the oile of *Kik*: which oile is called in the Arabian tongue, *ua*, as *Rabbi Samuel* the ſonne of *Hophni* teſtifieth. Moreouer, a certaine Rab bine moueth a ion, ſaying, what is *Kik?* Hereunto *Reſch Lachiſh* maketh anſwer in Ghemara, ſaying, Kik is ing elſe but *Ionas* his Kikaijon. And that this is true, it appeareth by that name κίκι: which ncient Greeke Phyſitions, and the Ægiptians vſed; which Greeke word commeth of the ew word *Kik*. Hereby it appeareth, that the old writers long agoe called this plant by the nd proper name. But the old Latine writers knew it by the name *Cucurbita*, which euidently niſeſted by an hiſtory which Saint *Auguſtine* recordeth in his Epiſtle to Saint *Icrome*, where ect he writeth thus; That name *Kikaïjon* is of ſmall moment, yet ſo ſmall a matter cauſed a tumult in Africa. For on a time a certaine Biſhop hauing an occaſion to intreat of this h is mentioned in the fourth chapter of *Ionas* his prophecie (in a collation or ſermon, which ade in his cathedrall church or place of aſſembly) ſaid, that this plant was called *Cucurbita*, urde, becauſe it encreaſed vnto ſo great a quantitie, in ſo ſhort a ſpace, or elſe (ſaith he) it is d *Hedera*. Vpon the nouelty and vntruth of this his doctrine, the people were greatly offen- nd thereof ſuddenly aroſe a tumult and hurly burly; ſo that the Biſhop was inforced to goe e Iewes, to aske their iudgment as touching the name of this plant. And when he had recei- f them the true name, which was *Kikaïjon*: he made his open recantation, and confeſſed his & was iuſtly accuſed for a falſifier of the holy ſcripture. ‡ The Greeks called this plant alſo *i. Ricinus*, by reaſon of the ſimilitude that the ſeed hath with that inſect, to wit, a Tik. ‡

¶ *The Nature.*

he ſeed of Palma Chriſti, or rather *Kik*, is hot and dry in the third degree.

¶ *The Vertues.*

cinus his ſeed taken inwardly, openeth the belly, and cauſeth vomit, drawing ſlimy flegme A holer from the places poſſeſſed therewith.

e broth of the meate ſupped vp, wherin the ſeed hath been ſodden, is good for the collicke and B out, and againſt the paine in the hips called *Sciatica*: it preuaileth alſo againſt the jaundiſe ropſie.

e oile that is made or drawne from the ſeed is called *Oleum Cicinum*: in ſhops it is called C *de Cherua*. it heateth and drieth, as was ſaid before, and is good to anoint and rub all rough eſſe and ſcuruineſſe gotten by itch.

is oile, as *Rabbi Dauid Chimchi* writeth, is good againſt extreme coldneſſe of the body. D

CHAP. 139. *Of Spurge.*

¶ *The Deſcription.*

THe firſt kinde of Sea Spurge riſeth forth of the ſands, or baich of the ſea, with ſundry reddiſh ſtems or ſtalkes growing vpon one ſingle roote, of a wooddy ſubſtance: and the ſtalkes are beſet with ſmall, fat, and narrow leaues like vnto the leaues of Flaxe. floures are yellowiſh, and grow out of little diſhes or ſaucers like the common kinde of ge. After the floures come triangle ſeeds, as in the other Tithymales.

The ſecond kinde (called *Helioſcopius*, or *Soliſequius*: and in Engliſh, according to his Greek Sunne Spurge, or time Tithymale, of turning or keeping time with the ſunne) hath ſundry h ſtalkes of a foot high: the leaues are like vnto Purſlane, not ſo great nor thicke, but ſnipt the edges: the floures are yellowiſh, and growing in little platters.

The third kinde hath thicke, fat, and ſlender branches trailing vpon the ground, beſet with like Knee-holme, or the great Myrtle tree. The ſeed and floures are like vnto the other of nde.

The fourth is like the laſt before mentioned, but it is altogether leſſer, and the leaues are ver; it groweth more vpright, otherwiſe alike.

Cypres Tithymale hath round reddiſh ſtalkes a foot high, long and narrow like thoſe of and growing buſhie, thicke together like as thoſe of the Cypres tree. The floures, ſeed, ot, are like the former, ſometimes yellow, oftentimes red.

The ſixt is like the former, in floures, ſtalkes, rootes, and ſeedes, and differeth in that, nde hath leaues narrower, and much ſmaller, growing after the faſhion of thoſe of the Pine therwiſe it is like.

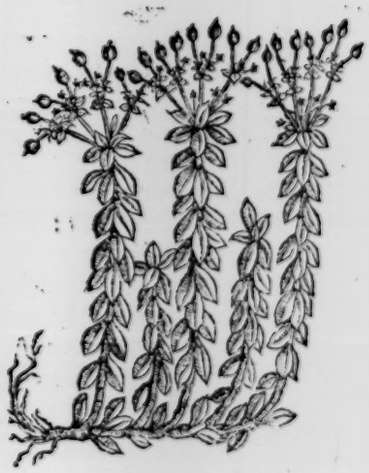
There is another kinde that groweth to the height of a man; the ſtalke is like the laſt

1 *Tithymalus paralius.*
Sea Spurge.

2 *Tithymalus Helioſcopius.*
Sunne Spurge.

3 *Tithymalus Myrtifolius latifolius.*
Broad leaued Myrtle Spurge.

4 *Tithymalus Myrſinitis anguſtifolius.*
Narrow leaued myrtle Spurge.



5 *Tithymalus Cupreſſinus.*
Cypreſſe Spurge.

6 *Tithymalus Pineus.*
Pine Spurge.

7 *Tithymalus Myrſinitis arboreſcens.*
Tree Myrtle Spurge.

† 8 *Tithymalus Characias Monſpell.*
Sweet wood Spurge.

† 9 *Tithymalus Characias Amygdaloides.*
Vnſauorie Wood-ſpurge.

‡ 10 *Tithymalus Characias anguſtifolius.*
Narrow leaued Wood-ſpurge.

‡ 11 *Tithymalus Characias ſerratifolius.*
Cut leaued Wood-ſpurge.

12 *Tithymalus platyphyllos.*
Broad leaued Spurge.

ioned, but diuided into ſundry branches a finger thicke, and ſomewhat hairy, not red as the s, but white: the leaues be long and narrow, whitiſh, and a little downy: the floures are yel. ut in other points like to the reſt of this kinde.

The eighth kinde riſeth vp with one round reddiſh ſtalke two cubits high, ſet about with thin and broad leaues like the leaues of the Almond tree: the floures come forth at the top he others, and of a yellow colour. The ſeed and root reſemble the other of his kinde.

The ninth (which is the common kinde growing in moſt woods) is like the former, but his s be ſhorter and leſſe, yet like to the leaues of an Almond tree: the floures are alſo yellow; he ſeed contained in three cornered ſeed-veſſels.

10 This fourth kinde of *Tithymalus Characias*, or Valley Tithymale (for ſo the name im-) hath long, yet ſomewhat narrower leaues than the former, whitiſh alſo, yet not hoary; the ls or tufts of floures are of a greeniſh yellow, which before they be opened do repreſent the e of a longiſh fruit, as an Almond, yet in colour it is like the reſt of the leaues: the floures and are like thoſe of the former, and the root deſcends deepe into the ground.

The fifth *Characias* hath alſo long leaues ſharpe pointed, and broader at their ſetting on, f a light greene colour, and ſnipt or cut about the edges like the teeth of a ſaw. The vmbels naller, yet carry ſuch floures and ſeeds as the former. ‡

This kinde hath great broad leaues like the yong leaues of Woad, ſet round about a ſtalk oot high, in good order: on the top whereof grow the floures in ſmall platters like the com- kinde, of a yellow colour declining to purple. The whole plant is full of milke, as are all the efore ſpecified.

Tithymalus Dendroides ex Cod. Cæſareo.
Great Tree Tithymal.

14 *Eſula maior Germanica.*
Quackſaluers Turbith.

There is another kinde of Tithymale, whoſe figure was taken forth of a Manuſcript of the rors by *Dodonæus*, that hath a ſtalke of the bigneſſe of a mans thigh, growing like a tree vnto ight of two tall men, diuiding it ſelfe into ſundry armes or branches toward the top, of a red r. The leaues are ſmall and tender, much like vnto the leaues of *Myrtus*: the ſeed is like vnto f wood Tithymale, or *Characias*, according to the authority of *Peter Bellone*.

There is a kinde of Tithymale called *Eſula maior*, which *Martinus Rulandus* had in great veneration,

veneration, as by his extraction which he vſed for many infirmities may and doth appeare at large, in his bookes entituled *Centuriæ curationum Empiricarum*, dedicated vnto the duke of Bauaria. This plant of *Kulandus* hath very great and many roots couered ouer with a thicke barke, plaited as it were with many ſurculous ſprigs; from which ariſe ſundry ſtrong and large ſtemmes of a fingers thickneſſe, in height two cubits, beſet with many pretty large and long leaues like *Lathyris*, but that they are not ſo thicke: the ſeed and floure are not vnlike the other Tithymales.

15 This is like the fifth, ſaue that it hath ſmaller and more feeble branches; and the whole plant is altogether leſſer, growing but ſome ſpan or foot high; and the floures are of a red or elſe a greene colour.

16 There is another rare and ſtrange kinde of *Eſula*, in alliance and likeneſſe neere vnto *Eſula minor*, that is the ſmall *Eſula* or *Pityuſa* vſed among the Phyſitions and Apothecaries of Venice as a kind of *Eſula*, in the Confection of their *Benedicta* and Catharticke pills, in ſtead of the true *Eſula*: It yeeldeth a fungous, rough, and browne ſtalke two cubits high, diuiding it ſelfe into ſundry branches, furniſhed with ſtiffe and fat leaues like Licorice, growing together by couples. The floures are pendulous, hanging downe their heads like ſmall bells, of a purple colour, and within they are of a darke colour like *Ariſtolochia rotunda*.

† 15 *Eſula minor, ſeu Pityuſa.*
Small Eſula.

‡ 16 *Eſula Veneta maritima.*
Venetian Sea-Spurge.

‡ 17 There growes in many chalkie grounds and ſuch dry hilly places, among corne, a ſmall Spurge which ſeldome growes to two handfuls high; the root is ſmall, and ſuch alſo are the ſtalks and leaues, which grow pretty thicke thereon; which oft times are not ſharpe, but flat pointed: the ſeed-veſſels and floures are very ſmall, yet faſhioned like thoſe of the other Tithymales. It is to be found in corne fields in Iuly and Auguſt. ‡

18 The bigger *Cataputia* or the common garden Spurge is beſt knowne of all the reſt, and moſt vſed; wherefore I will not ſpend time about his deſcription.

The ſmall kinde of *Cataputia* is like vnto the former, but leſſer, whereby it may eaſily be diſtinguiſhed; being likewiſe ſo well knowne vnto all, that I ſhall not need to deſcribe it.

‡ Theſe two (I meane the bigger and leſſer *Cataputia* of our Author) differ not but by reaſon of their age, and the fertileneſſe and barrenneſſe of the ſoile, whence the leaues are ſomtime broader, and otherwhiles narrower. ‡

19 The

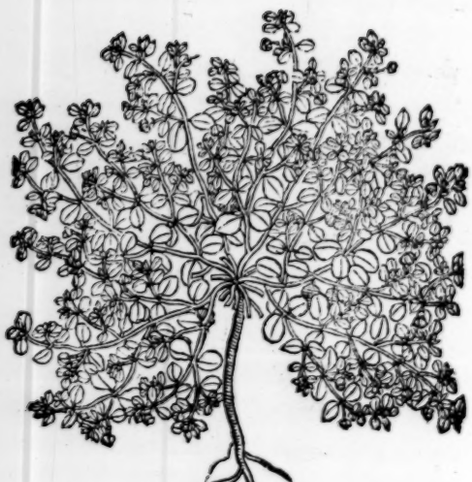
‡ 17 *Eſula exigua Tragi.*
Dwarfe Eſula.

18 *Lathyris ſeu Cataputia minor.*
Garden Spurge.

19 *Peplus, ſive Eſula rotunda.*
Pettie Spurge.

20 *Peplis.*
Iſope Spurge.

21 *Chamæſyce.*
Spurge Time.



22 *Apios vera.*
Knobbed Spurge.

‡ 23 *Apios radice oblonga.*
Long knottie rooted Spurge.

19 The fifteenth kinde called *Peplus*, hath a ſmall, and fibrous root, bringing forth many fruitfull branches two handfuls long, but little and tender, with leaues like the Sun Tithymale, but rounder and much ſmaller: it hath alſo ſmall yellow floures: which being paſt there appeareth a ſlender pouchet, three cornered like the other Tithymales, hauing within it a very medullous whitiſh ſeed like Poppie, the whole plant yeelding a milky iuice, which argueth it to be a kinde of Tithymale.

20 As in name ſo in ſhape this twentieth reſembleth *Peplus*, and commeth in likelihood neerer the ſignification of *Peplum*, or *Flammeolum* than the other; therefore *Dioſcorides* affirmeth it to be *Thamnos amphilaphes*, for that it bringeth foorth a greater plentie of branches, more cloſely knit and wound together, with ſhining twiſts and claſpers an handfull and a halfe long. The leaues are leſſer than thoſe of *Peplus*, of an indifferent likeneſſe and reſemblance betweene *Chamæſyce* and wilde Purſlane. The ſeed is great, and like that of *Peplus*: the root is ſmall and ſingle.

21 The one and twentieth kinde may be eaſily knowne from the two laſt before mentioned, although they be verie like. It hath

h many branches and leaues creeping on the ground of a pale greene colour, not vnlike to *Her-ia*, but giuing milke as all the other Tithymales doe, bearing the like ſeed, pouch, and floures, ſmaller in each reſpect.

22 The two and twentieth kinde of Tithymale hath a round root like a ſmall Turnep, as euery thour doth report: yet my ſelfe haue the ſame plant in my garden which doth greatly increaſe, which I haue giuen diuers vnto my friends, whereby I haue often viewed the roots, which do ap-are vnto me ſomewhat tuberous, and therein nothing anſwering the deſcriptions which *Dioſcori-, Pena*, and others haue expreſſed and ſet forth. This argueth, that either they were deceiued, and ſcribed the ſame by heare-ſay, or elſe the plant doth degenerate being brought from his natiue le. The leaues are ſet all alongſt a ſmall rib like *Fraxinella*, ſomewhat round, greene aboue, and ldiſh vnderneath. The ſeed groweth among the leaues like the ſeed of *Peplus*. The whole plant is ll of milke like the other Tithymales.

‡ Our Authour here wrongfully taxes other Writers of plants, & *Dioſcorides* & *Pena* by name, ich ſhewes that he either neuer read, or elſe vnderſtood not what they writ, for neither of them or any other that I know of) reſembles the root of this to a Turnep, but ſay it hath a tuberous are faſhioned root, &c as you may ſee in *Dioſc. lib. 4. cap. 177.* and in the *Aduerſaria, pag. 204.* The ues alſo grow not by couples one againſt another, as in *Fraxinella*, but rather alternately, or elſe thout any certaine order, as in other Tithymales. ‡

‡ 23 This, ſaith *Cluſius*, hath alſo a tuberous root, but not peare faſhioned like as the former, t almoſt euery where of an equall thickneſſe; beeing about an inch and ſometimes two inches ng, and the lower part thereof is diuided into foure other roots, or thicke fibers, growing ſmal-r by little and little, and ſending forth ſome few fibers: it is blacke without, and white within, & ll of a milkie iuice: the ſtalkes are ſhort and weake, ſet with little leaues like thoſe of the for-er: the floures are of a yellowiſh red colour, and the ſeede is contained in ſuch veſſels as the o-er Tithymales. This is *Tithymalus tuberoſus*, or *Iſchas altera* of *Cluſius*. ‡

¶ *The Place.*

The firſt kinde of Spurge groweth by the Sea ſide vpon the rowling Sand and Baich, as at Lee Eſſex, at Lang-tree point right againſt Harwich, at Whitſtable in Kent, and in many other aces.

The ſecond groweth in grounds that lie waſte, and in barren earable ſoile, almoſt euery where.

The third and fourth, as alſo the foureteenth and eighteenth, grow in gardens, but not wilde in ngland.

The ninth Spurge called *Characias* groweth in moſt VVoods of England that are drie and arme.

The eighteenth and nineteenth grow in ſalt marſhes neere the ſea, as in the iſle of Thanet by the a ſide, betwixt Reculvers and Margate in great plentie.

¶ *The Time.*

Theſe plants floure from Iune to the end of Iuly.

¶ *The Names.*

Sea Spurge is called in Latine *Tithymalus paralius*: in Spaniſh, *Leche treſna*: in high Dutch, **Wolfer milch**, that is to ſay *Lupinum lac*, or Wolfes milke. Wood Spurge is called *Tithymalus aracias*. The firſt is called in Engliſh Sea Spurge, or Sea VVartwoort. The ſecond, Sun Spurge, e third and fourth, Mirtle Spurge: the fifth Cypreſſe Spurge; or among women, VVelcome to r houſe; the ſixth Pine Spurge; the ſeuenth ſhrub Spurge, and tree Mirtle Spurge; the eighth d ninth VVood Spurge; the twelfth Broad leafed Spurge: the thirteenth Great Tree Spurge: e foureteenth and fifteenth Quackſaluers Spurge; the ſixteenth Venice Spurge, the ſeuenteenth warfe Spurge; the eighteenth common Spurge; the nineteenth and twentieth Petie Spurge; e one and twentieth Spurge Time: The two and twentieth, True *Apios* or the knobbed puge.

¶ *The Temperature.*

All the kinds of Tithymales or Spurges are hot and drie almoſt in the fourth degree, of a ſharp A
d biting qualitie, fretting or conſuming. Firſt the milke and ſap is in ſpeciall vſe, then the fruit d leaues, but the root is of leaſt ſtrength. The ſtrongeſt kinde of Tithymale, and of greateſt force that of the ſea.

Some write by report of others, that it inflameth exceedingly, but my ſelfe ſpeak by experience; B
r walking along the ſea coaſt at Lee in Eſſex, with a Gentleman called M^r. *Rich*, dwelling in the me towne, I tooke but one drop of it into my mouth; which neuertheleſſe did ſo inflame and ell in my throte that I hardly eſcaped with my life. And in like caſe was the gentleman, which uſed vs to take our horſes, and poſte for our liues vnto the next farme houſe to drinke ſome milk quench the extremitie of our heate, which then ceaſed.

¶ *The*

¶ *The Vertues.*

A The iuice of Tithymale, I do not meane ſea Tithymale, is a ſtrong medicine to open the bellie, and cauſing vomite, bringeth vp tough flegme and cholericke humours. Like vertue is in the ſeed and root, which is good for ſuch as fall into the dropſie, being miniſtred with diſcretion and good aduice of ſome excellent Phyſition, and prepared with his Correctories by ſome honeſt Apothecarie.

B The iuice mixed with honie, cauſeth haire to fall from that place which is anointed therewith, if it be done in the Sun.

C The iuice or milke is good to ſtop hollow teeth, being put into them warily, ſo that you touch neither the gums, nor any of the other teeth in the mouth with the ſaid medicine.

D The ſame cureth all roughneſſe of the skin, mangineſſe, leprie, ſcurfe, and running ſcabs, and the white ſcurfe of the head. It taketh away all manner of warts, knobs, and the hard callouſneſſe of Fiſtulaes, hot ſwellings and Carbuncles.

E It killeth fiſh, being mixed with any thing that they will eat.

F Theſe herbes by mine aduiſe would not be receiued into the bodie, conſidering that there be ſo many other good and wholeſome potions to be made with other herbes, that may bee taken without perill.

† The ſeuenth figure was formerly of *Tithymalus myrſinites 3. anguſtifolius* of *Tabernamontanus*: The 8. and 9. were both of the ſame plant: the 12. was the figure of the *Eſula exigua Tragi*, whoſe hiſtorie I haue giuen you in the 17. place.

Chap. 140. *Of Herbe Terrible.*

1 *Alypum montis Ceti.*
Herbe Terrible.

2 *Tarton-Raire Gallo-Prouincia.*
Gutwoort.

¶ *The Deſcription.*

1 Herbe Terrible is a ſmall ſhrub two or three cubits high, branched with many ſmall twigges, hauing a thin rinde firſt browne, then purple, with many little and thinne leaues like Myrtle. The floures are rough like the middle of Scabious floures, of a blew purple colour. The root is two fingers thicke, browne of colour, and of a wooddie ſubſtance: the whole plant very bitter, and of an vnpleaſant taſte like *Chamelæa*, yea ſomewhat ſtronger.

2 Tartonraire, called in Engliſh Gutwoort, groweth by the ſea, and is Cathartical, and a ſtranger with vs. In the mother tongue of the Maſſilians, it is called Tartonraire, of that abundant and

and vnbridled faculty of purging, which many times doth cauſe *Dyſenteriæ*, and ſuch like immoderate fluxes, eſpecially when one not skilfull in the vſe thereof ſhall adminiſter the pouder of the leaues, mixed with any liquor. This plant groweth in manner of a ſhrub, like *Chamelæa*, and bringeth forth many ſmal, tough, and pliant twigs, ſet about with a thin and cottony hairineſſe, & hath many leaues of a gliſtering ſiluer colour, growing from the loweſt part euen to the top, altogether like *Alypum* before mentioned: and vpon theſe tough and thick branches (if my memory faile not) do grow ſmall floures, firſt white, afterward of a pale yellow: the ſeed is of a ruſſet colour: theroot hard and wooddy, not very hot in the mouth, leauing vpon the tongue ſome of his inbred heat and taſte, ſomewhat reſembling common Turbith, and altogether without milke.

¶ *The Place.*

Theſe plants do grow vpon the mountains in France, and other places in the grauelly grounds, and are as yet ſtrangers in England.

¶ *The Time.*

They flouriſh in Auguſt and September. ‡ The firſt *Cluſius* found flouring in diuers parts of Spaine, in Februarie and March; and I conie&ture the other floures about the ſame time, yet I can finde nothing ſaid thereof in ſuch as haue deliuered the hiſtorie of it. ‡

¶ *The Names.*

There are not any other names appropriate to theſe plants more than are ſet forth in the titles. ‡ The firſt of theſe is the *Alypum montis Ceti*, & *Herba terribilis* of *Lobel*; *Cluſ.* calls it *Hippogloſſum Valentinum*, & in *Hiſt. Lugd.* it is named *Alypum Penæ*, & *Empetrum Phacoides*. The ſecond is the *Tartonraire Galloprouinciæ Maſſilienſium*, in the *Aduerſaria*; *Seſamoides maius multorum* of *Daleſc.* & the *Seſamoides maius Scalegeri* of *Tabern.* by which title our Author alſo gaue his figure, in the 397. *pag.* of the former Edition. ‡

¶ *The Temperature and Vertues.*

There is nothing either of their nature or vertues, more than is ſet forth in the Deſcriptions. ‡ Both theſe plants haue a ſtrong purging faculty like as the Tithymales; but the latter is far more powerfull, and comes neere to the qualitie of *Mezereon*; wherefore the vſe of it is dangerous, by reaſon of the violence and great heat thereof. ‡

CHAP. 141. *Of Herbe Aloe, or Sea Houſleeke.*

‡ 1 *Aloe vulgaris, ſiue Sempervivum marinum.*
Common *Aloe*, or Sea-Houſleeke.

2 *Aloe folio mucronato.*
Prickly herbe Aloe, or Sea Houſleeke.

¶ *The*

¶ *The Deſcription.*

1 HEarbe Alloe hath leaues like thoſe of ſea Onion, very long, broad, ſmooth, thick, bending backewards, notched in the edges, ſet with certaine little blunt prickles, full of tough and clammie iuice like the leaues of Houſleeke. The ſtalke, as *Dioſcorides* ſaith, is like to the ſtalke of Aſſodill: the floure is whitiſh; the ſeed like that of Aſſodill; the root is ſingle, of the faſhion of a thicke pile thruſt into the ground. The whole herbe is extreme bitter, ſo is the iuice alſo that is gathered thereof.

† 2 There is another herbe Aloe that groweth likewiſe in diuers prouinces of America; the leaues are two cubits long, alſo thicker, broader, greater, and ſharper pointed than the former, and it hath on the edges far harder prickles. The ſtalke is three cubits high, and a finger thicke, the which in long cups beares violet coloured floures. †

¶ *The Place.*

This plant groweth very plentifully in India, and in Arabia, Cœloſyria, & Egypt, from whence the iuice put into skins is brought into Europe. It groweth alſo, as *Dioſcorides* writeth, in Aſia, on the ſea coaſts, and in Andros, but not verie fit for iuice to be drawne out. It is likewiſe found in Apulia, and in diuers places of Granado and Andaluſia, in Spaine, but not far from the ſea: the iuice of this is alſo vnprofitable.

¶ *The Time.*

The herbe is alwaies greene, and likewiſe ſendeth forth branches, though it remaine out of the earth, eſpecially if the root be couered with lome, and now and then watered: for ſo being hanged on the ſeelings and vpper poſts of dining roomes, it doth not onely continue a long time greene, but it alſo groweth and bringeth forth new leaues: for it muſt haue a warme place in winter time, by reaſon it pineth away if it be frozen.

¶ *The Names.*

The herbe is called in Greeke ἀλόη: in Latine, and in ſhops alſo, *Aloe*: and ſo is likewiſe the iuice. The plant alſo is named ἀνδρόσαιμον, ἀψίνθιον, ἴξιον, πρασοειδὲς: but they are baſtard words: it is called ἰξιὰς, becauſe it liueth not onely in the earth, but alſo out of the earth. It is named in French, *Poroquet*: in Spaniſh, *Azeuar*, and *Yerua bauoſa*: in Engliſh, *Aloes*; herbe *Aloes*, Sea Houſeleeke, Sea Aigrene.

The hearbe is called of the latter Herbariſts oftentimes *Semperviuum*, and *Semperviuum Marinum*, becauſe it laſteth long after the manner of Houſe-leeke. It ſeemeth alſo that *Columella* in his tenth booke nameth it *Sedum*, where he ſetteth downe remedies againſt the canker-wormes in trees.

Profuit & plantis latices infundere amaros
Marrubÿ, multoque Sedi contingere ſucco.

In Engliſh thus:

Liquours of Horehound profit much b'ing pour'd on trees:
The ſame effect Sea Houſleeke works as well as theſe.

For he reciteth the iuice of *Sedum* or Houſeleeke among the bitter iuices, and there is none of the Houſleekes bitter but this.

The Temperature.

Aloë, that is to ſay, the iuice which is vſed in Phyſicke, is good for many things. It is hot, and that in the firſt or ſecond degree, but drie in the third, extreme bitter, yet without biting. It is alſo of an emplaiſticke or clammie qualitie, and ſomething binding, externally applied.

¶ *The Vertues.*

A It purgeth the belly, and is withall a wholeſome and conuenient medicine for the ſtomacke, if any at all bee wholeſome. For as *Paulus Aegineta* writeth, when all purging medicines are hurtfull to the ſtomacke, *aloës* onely is comfortable. And it purgeth more effectually if it be not waſhed: and if it be, it then ſtrengtheneth the ſtomacke the more.

B It bringeth forth choler, but eſpecially it purgeth ſuch excrements as be in the ſtomacke, the firſt veines, and in the neereſt paſſages. For it is of the number of thoſe medicines, which the Græcians call ἐκκοπρωτικὰ, of the voiding away of the Ordure; and of ſuch whoſe purging force paſſeth not far beyond the ſtomacke. Furthermore *Aloës* is an enemie to all kindes of putrefactions; and defendeth the body from all manner of corruption. It alſo preſerueth dead carkaſes from putrifying;

it

it killeth and purgeth away all manner of wormes of the belly. It is good againſt a ſtinking breath proceeding from the imperfection of the ſtomacke: it openeth the piles or hemorrhoides of the fundament; and being taken in a ſmall quantity, it bringeth down the monthly courſe: it is thought to be good and profitable againſt obſtructions and ſtoppings in the reſt of the intrals. Yet ſome there be who thinke, that it is not conuenient for the liuer.

One dramme thereof giuen, is ſufficient to purge. Now and then halfe a dramme or little more C is enough.

It healeth vp greene wounds and deepe ſores, clenſeth vlcers, and cureth ſuch ſores as are hard- D ly to bee helped, eſpecially in the fundament and ſecret parts. It is with good ſucceſſe mixed with ἐπισπαστικὰ, or medicines which ſtanch bleeding; and with plaiſters that be applied to bloudy wounds; for it helpeth them by reaſon of his emplaiſticke qualitie and ſubſtance. It is profitably put into medicines for the eies, foraſmuch as it clenſeth and drieth without biting.

Dioſcorides ſaith, that it muſt be torrified or parched at the fire, in a cleane and red hot veſſell, E and continually ſtirred with a *Spatula*, or Iron Ladle, till it bee torrified in all the parts alike: and that it muſt alſo bee waſhed, to the end that the vnprofitable and ſandie droſſe may ſinke downe vnto the bottome, and that which is ſmooth and moſt perfect bee taken and reſerued.

The ſame Authour alſo teacheth, that mixed with honie it taketh away blacke and blew ſpots, F which come of ſtripes: that it helpeth the inward ruggedneſſe of the eye-lids, and itching in the corners of the eies: it remedieth the head-ache, if the temples and forehead bee annointed therewith, being mixed with vineger and oile of Roſes: being tempered with wine, it ſtaieth the falling off of the haire, if the head be waſhed therewith: and mixed with wine and honie, it is a remedie for the ſwelling of the Vuula, and ſwelling of the Almonds of the throte, for the gums & all vlcers of the mouth.

The iuice of this herbe *Aloe*: (whereof is made that excellent and moſt familiar purger, called G *Aloe Succotrina*, the beſt is that which is cleere and ſhining, of a browne yellowiſh colour) it openeth the bellie, purging cold, flegmaticke, and cholericke humours, eſpecially in thoſe bodies that are ſurcharged with ſurfetting, either of meat or drinke, and whoſe bodies are fully repleat with humours, fairing daintily, and wanting exerciſe. This *Aloes* I ſay, taken in a ſmall quantitie after ſupper (or rather before) in a ſtewed prune, or in water the quantitie of two drammes in the morning, is a moſt ſoueraigne medicine to comfort the ſtomacke, and to clenſe and driue foorth all ſuperfluous humours. Some vſe to mixe the ſame with Cinnamon, Ginger, and Mace, for the purpoſe aboue ſaid; and for the Iaundies, ſpitting of bloud, and all extraordinarie iſſues of bloud.

The ſame vſed in vlcers, eſpecially thoſe of the ſecret parts or fundament, or made into pouder, H and ſtrawed on freſh wounds, ſtaieth the bloud, and healeth the ſame, as thoſe vlcers before ſpoken of.

The ſame taken inwardly cauſeth the Hemorrhoids to bleed, and being laid thereon it cauſeth I them to ceaſe bleeding.

Chap. 142. *Of Houſleeke or Sengreene.*

¶ *The Kindes.*

SEngreene, as *Dioſcorides* writeth, is of three ſorts, the one is great, the other ſmall, and the third is that which is called *Illecebra*, biting Stone-crop, or VVall pepper.

¶ *The Deſcription.*

1 THe great Sengreene, which in Latine is commonly called *Iouis Barba*, Iupiters beard, bringeth forth leaues hard adioyning to the ground and root, thicke, fat, full of tough iuice, ſharpe pointed, growing cloſe and hard together, ſet in a circle in faſhion of an eye, and bringing forth very many ſuch circles, ſpreading it ſelfe out all abroad: it oftentimes alſo ſendeth forth ſmall ſtrings, by which it ſpreadeth farther, and maketh new circles; there riſeth vp oftentimes in the middle of theſe an vpright ſtalke about a foot high, couered with leaues growing leſſe and leſſe toward the points, parted at the top into certaine wings or branches, about which are floures orderly placed, of a darke purpliſh colour: the root is all of ſtrings.

2 There is alſo another great Houſleek or Sengreen (ſyrnamed tree Houſleeke) that bringeth forth a ſtalke a cubit high, ſometimes higher, and often two; which is thicke, hard, woody, tough, and that can hardly be broken, parted into diuers branches, and couered with a thicke groſſe barke, which in the lower part reſerueth certaine prints or impreſſed markes of the leaues that are fallen away. The leaues are fat, well bodied, full of juice, an inch long and ſomewhat more, like little tongues, very curiouſly minced in the edges, ſtanding vpon the tops of the branches, hauing in them the ſhape of an eye. The floures grow out of the branches, which are diuided into many ſprings; which floures are ſlender, yellow, and ſpred like a ſtar; in their places commeth vp very fine ſeed, the ſprings withering away: the root is parted into many off-ſprings. This plant is alwaies greene, neither is it hurt by the cold in winter, growing in his natiue ſoile; whereupon it is named ἀειζωὸν, and *Semperuiuum*, or Sengreene.

1 *Semperuiuum maius.*
Great Houſleeke.

‡ 2 *Sedum maius arboreſcens.*
Tree Houſleeke.

3 There is alſo another of this kinde, the circles whereof are anſwerable in bigneſſe to thoſe of the former, but with leſſer leaues, moe in number, and cloſely ſet, hauing ſtanding on the edges very fine haires as it were like ſoft prickles. This is ſomewhat of a deeper greene: the ſtalke is ſhorter, and the floures are of a pale yellow. ‡ This is the third of *Dodonæus* deſcription, *Pemptad.* 1. *lib.* 5. *cap.* 8. ‡

4 There is likewiſe a third to be referred hereunto: the leaues hereof be of a whitiſh greene, and are very curiouſly nicked round about. ‡ The floure is great, conſiſting of ſix white leaues; This is that deſcribed by *Dodonæus* in the 4. place: and it is the *Cotyledon altera ſecunda* of *Cluſius*. ‡

5 There is alſo a fourth, the circles whereof are leſſer, the leaues ſharpe pointed, very cloſely ſet, of a darke red colour on the top, and hairy in the edges: the floures on the ſprigs are of a gallant purple colour. ‡ This is the fift of *Dodonæus*, and the *Cotyledon altera tertia* of *Cluſius*. ‡

¶ *The Place.*

1 The great Sengreen is well knowne not onely in Italy, but alſo in France, Germany, Bohemia, and the Lowe-Countries. It groweth on ſtones in mountaines, vpon old walls, and ancient buildings, eſpecially vpon the tops of houſes. The forme hereof doth differ according to the nature of the ſoile; for in ſome places the leaues are narrower and leſſer, but mo in number, and haue one onely circle; in ſome they are fewer, thicker, and broader: they are greene, and of a deeper greene

greene in ſome places; and in others of a lighter greene: for thoſe which we haue deſcribed grow not in one place, but in diuers and ſundry.

‡ 5 *Sedum maius anguſtifolium.*
Great narrow leaued Houſleeke.

2 Great Sengreene is found growing of it ſelfe on the tops of houſes, old walls, and ſuch like places in very many prouinces of the Eaſt, and of Greece: and alſo in the Iſlands of the Mediterranian ſea; as in Crete, which now is called Candy, Rhodes, Zant, & others, neither is Spaine without it: for (as *Carolus Cluſius* witneſſeth) it groweth in many places of Portingale; otherwiſe it is cheriſhed in earthen pots. In cold countries, and ſuch as lie Northward, as in both the Germanies, it neither groweth of it ſelfe, nor yet laſteth long, though it be carefully planted, and diligently looked vnto, but through the extremitie of the weather, and the ouermuch cold of winter it periſheth.

¶ *The Time.*

The ſtalke of the firſt doth at length floure after the Summer Solſtice, which is in Iune about Saint *Barnabies* day, and now and than in the moneth of Auguſt; but in Aprill, that is to ſay, after the æquinoctiall in the ſpring, which is about a moneth after the ſpring is begun, there grow out of this among the leaues ſmall ſtrings, which are the groundwork of the circles, by which being at length full growne, it ſpreadeth it ſelfe into very many circles.

2 Houſleeke that groweth like a tree, doth floure in Portingale at the beginning of the yeere preſently after the winter Solſtice, which is December, about S. *Lucies* day.

¶ *The Names.*

The firſt is commonly called *Iouis barba*, or Iupiters beard, and alſo *Sedum maius vulgare*: the Germanes call it **Hanſzwurtz, Gzolz Donderbaer**: they of the Low-countries, **Donderbaert**: the Hollanders, **Huyſloock**: the French-men, *Ioubarbe*: the Italians, *Sempreuiuo maggiore*: the Spaniards, *Siempreuiua, yerua pentera*: the Engliſh-men, Houſleeke, and Sengreene, and Aygreene: of ſome, Iupiters eie, Bullocks eie, and Iupiters beard: of the Bohemians, *Netreske*. Many take it to be *Cotyledon altera Diſcoridis*; but we had rather haue it one of the Sengreenes. for it is continually greene, and alwaies flouriſheth, and is hardly hurt by the extremity of winter.

The other without doubt is *Dioſcorides* his μεῖζον μέγα: that is, *Semperuiuum magnum*, or *Sedum majus*, great Houſleek, or Sengreen: *Apuleius* calleth it *Vitalis*, and *Semperflorium*: it is alſo named ζέυδαλμον, συγκλεῖν, αἰωνόβιον.

¶ *The Temperature.*

The great Houſleeks are cold in the third degree: they are alſo dry, but not much, by reaſon of the watery eſſence that is in them.

¶ *The Vertues.*

They are good againſt Saint Anthonies fire, the ſhingles, and other creeping vlcers and inflammations, as *Galen* ſaith, that proceed of rheumes and fluxes: and as *Dioſcorides* teacheth, againſt the inflammations or fiery heate in the eyes: the leaues, ſaith *Pliny*, being applied, or the juice laid on, are a remedy for rheumatike and watering eies. A

They take away the fire in burnings and ſcaldings; and being applied with Barly meale dried, do take away the paine of the gout. B

Dioſcorides teacheth, that they are giuen to them that are troubled with a hot laske: that they likewiſe driue forth wormes of the belly if they be drunke with wine. C

The juice put vp in a peſſary do ſtay the fluxes in women, proceeding of a hot cauſe: the leaues held in the mouth do quench thirſt in hot burning feauers. D

The juice mixed with Barly meale and vineger preuaileth againſt S. Anthonies fire, all hot burning and fretting vlcers, and againſt ſcaldings, burnings, and all inflammations, and alſo the gout comming of an hot cauſe. E

A The iuice of Houſleeke, Garden Nightſhade, and the buds of Poplar boiled in *Axungia porci*, or hogs greaſe, maketh the moſt ſingular Populeon that euer was vſed in Chirurgerie.

B The iuice hereof taketh away cornes from the toes and feet, if they be waſhed and bathed therwith, and euery day and night as it were implaiſtered with the skin of the ſame Houſleeke, which certainly taketh them away without inciſion or ſuch like, as hath beene experimented by my very good friend M^r. *Nicholas Belſon*, a man painefull and curious in ſearching forth the ſecrets of Nature.

C The decoction of Houſleeke, or the iuice thereof drunke, is good againſt the bloudie flixe, and cooleth the inflammation of the eies being dropped thereinto, and the bruiſed hearbe layed vpon them.

Chap. 143. *Of the Leſſer Houſleekes or Prickmadams.*

1 *Sedum minus hæmatoides.*
Pricke-madame.

2 *Sedum minus Officinarum.*
White floured Prickmadam.

¶ *The Deſcription.*

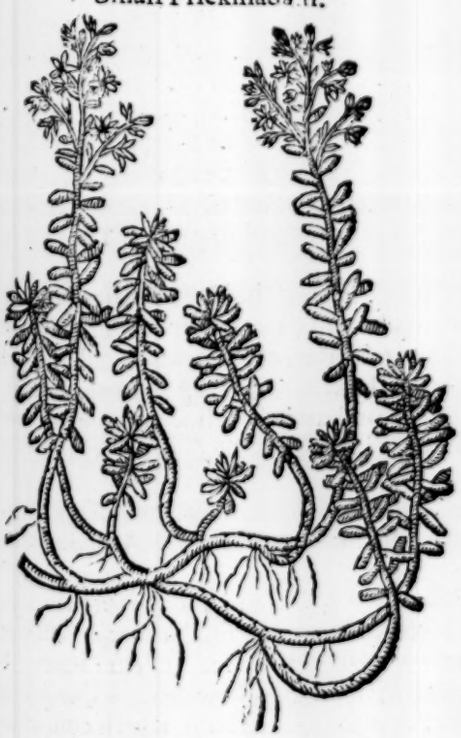
1 THe firſt of theſe is a very little herb, creeping vpon the ground with many ſlender ſtalks, which are compaſſed about with a great number of leaues, that are thicke, ful of ioints, little, long, ſharpe pointed, inclining to a greene blew. There riſe vp among theſe, little ſtalkes, a handful high, bringing forth at the top, as it were a ſhadowie tuft; and in theſe fine yellow floures: the root is full of ſtrings.

2 The other little Sengreene is alſo a ſmall herbe, bringing forth many ſlender ſtalkes, ſeldome aboue a ſpan high; on the tops whereof ſtand little floures like thoſe of the other, in ſmall looſe

‡ 3 *Sedum minus æſtivum.*
Small Sommer Sengreene.

‡ 4 *Sedum minus flore amplo.*
Small large floured Sengreene.

‡ 5 *Sedum medium teretifolium.*
Small Prickmadam.



‡ 6 *Aizoon Scorpioides.*
Scorpion Sengreene.

‡ 7 *Sedum Portlandicum.*
Portland Sengreene.

‡ 8 *Sedum petræum.*
Small rocke Sengreene.

looſe tufts; but they are white and ſomething leſſer: the leaues about the ſtalkes are few and little, but long, blunt, and round, bigger than wheaten cornes, ſomething leſſer than the kernels of the Pine Apples, otherwiſe not vnlike; which oftentimes are ſomething red, ſtalkes and all: the roote creepeth vpon the ſuperficiall or vppermoſt part of the earth, ſending downe ſlender threds.

3 There is a ſmall kinde of Stonecrop, which hath little narrow leaues, thicke, ſharpe pointed, and tender ſtalkes, full of fattie iuice; on the top whereof doe grow ſmall yellowe floures, Starre faſhion. The roote is ſmall, and running by the ground.

4 There is likewiſe another Stonecrop called Frog Stonecrop, which hath little tufts of leaues riſing from ſmall and and threddie rootes, creeping vpon the ground like vnto *Kali* or Frog-graſſe; from the which tufts of leaues riſeth a ſlender ſtalke, ſet with a few ſuch like leaues, hauing at the top prettie large yellow floures, the ſmalneſſe of the plant beeing conſidered.

‡ 5 This is like that which is deſcribed in the ſecond place, but that the ſtalks are leſſer, and not ſo tall, and the floures of this are ſtar faſhioned, and of a golden yellow colour. ‡

6 There is another Stonecrop, or Prickmadam called *Aizoon Scorpioides*, which is altogether like the great kinde of Stonecrop, and differeth in that, that this kinde of Stonecrop or Prickmadam hath his tuft of yellow floures turning again, not much vnlike the taile of a Scorpion, reſembling *Myoſitis Scorpioides*, and the leaues ſomewhat thicker, and cloſer thruſt together. The root is ſmall and tender.

7 There is a plant called *Sedum Portlandicũ*, or Portland Stonecrop, of the Engliſh Iſland called Portland, lying in the South coaſt, which hath goodly branches and a rough rinde. The leaues imitate *Laureola*, growing among the Tithymales, but thicker, ſhorter, more fat and tender. The ſtalke is of a wooddy ſubſtance like *Laurcola*, participating of the kindes of *Craſſula*, *Semperviuum*, and the Tithymales, whereof wee thinke it to bee a kinde; yet not daring to deliuer any vncertaine ſentence, it ſhall be leſſe preiudiciall to the truth, to account it as a ſhrubbe, degenerating from both kindes.

‡ *Pena* and *Lobel*, who firſt ſet this foorth knewe, not verie well what they ſhould ſay thereof; nor any ſince them: wherefore I haue onely giuen you their figure put to our Authours deſcription. ‡

8 There is a plant which hath receiued his name *Sedum Petræum*; becauſe it doth for the moſt part grow vpon the rocks, mountains, & ſuch like ſtonie places, hauing very ſmal leaues, comming forth of the ground in tufts like *Pſeudo-Moly*; that is, our common herbe called Thrift: amongſt the leaues come forth ſlender ſtalkes an handfull high, loden with ſmall yellow floures like vnto the common Prick-Madam: after which come little thicke ſharpe pointed cods, which containe the ſeed, which is ſmall, flat, and yellowiſh.

¶ *The*

¶ *The Place.*

The former of theſe groweth in gardens in the Low-countries: in other places vpon ſtone wals and tops of houſes in England almoſt euery where.

The other groweth about rubbiſh in the borders of fields, and in other places that lye open to the Sunne.

¶ *The Time.*

They floure in the Sommer moneths.

¶ *The Names.*

The leſſer kinde is called in Greeke [illegible]: in Latine, *Sedum*, and *Semperuiuum minus*: of the Germanes, **Kleyn Donderbaer**, and **Kleyn Hauſzwurtz**: of the Italians, *Semperuiuo minore*: of the Frenchmen, *Tricque-madame*: of the Engliſh men, Pricke-Madam, Dwarfe Houſe-leeke, and ſmall Sengreene.

The ſecond kinde is named in ſhops *Craſſula minor*; and they ſyrname it *minor*, for difference betweene it and the other *Craſſula*, which is a kinde of Orpin: it is alſo called *Vermicularis*: in Italian, *Pignola*, *Granelloſa*, and *Graſella*: in low-Dutch, **Blader looſen**: in Engliſh, Wilde Pricke-Madam, Great Stone-crop, or Worme-graſſe. ‡ That which is vulgarly knowne and called by the name of Stone-crop is the *Illecebra* deſcribed in the following chapter, and ſuch as grow commonly with vs of theſe ſmall Houſeleekes mentioned in this chapter are generally named Pricke-Madames: but our Author hath confounded them in this and the next chapter; which I would not alter, thinking it ſufficient to giue you notice thereof. ‡

¶ *The Temperature and Vertues.*

All theſe ſmall Sengreens are of a cooling nature like vnto the great ones, and are good for thoſe things that the others be. The former of theſe is vſed in many places in ſallads, in which it hath a fine reliſh, and a pleaſant taſte: it is good for the heart-burne.

‡ Chap. 144. *Of diuers other ſmall Sengreenes.*

¶ *The Deſcription.*

‡ 1 THe ſtalke of this ſmall water Sengreene is ſome ſpanne long, reddiſh, ſucculent, and weake: the leaues are longiſh, a little rough, and full of iuyce: the floures grow vpon the tops of the ſtalkes, conſiſting of ſix purple or elſe fleſh-coloured leaues; which are ſucceeded by as many little cods containing a ſmall ſeed: the root is ſmall and threddy, and the whole plant hath an inſipide or wateriſh taſte. This was found by *Cluſius* in ſome waterie places of Germany about the end of Iune; and he calls it *Sedum minus* 3 *ſiue paluſtre*.

2 This ſecond from ſmall fibrous and creeping roots ſends vp ſundry little ſtalkes ſet with leaues like thoſe of the ordinary Pricke-Madam, yet leſſe, thicke, and flatter, and of a more aſtringent taſte: the floures, which are pretty large, grow at the tops of the branches, and conſiſt of fiue pale yellowiſh leaues. It growes in diuers places of the Alps, and floures about the end of Iuly, and in Auguſt. This is the *Sedum minus 6.* or *Alpinum* 1. of *Cluſius*.

3 This hath ſmall little and thicke leaues, lying bedded, or compact cloſe together, and are of an Aſh colour inclining to blew: the ſtalkes are ſome two inches long, ſlender, and almoſt naked; vpon which grow commonly ſome three floures conſiſting of fiue white leaues apiece, with ſome yellow threds in the middle. This mightily encreaſes, and will mat and couer the ground for a good ſpace together. It floures in Auguſt, and growes vpon the craggy places of the Alpes. *Cluſius* calls it *Sedum minus nonum, ſiue Alpinum* 3.

4 The leaues of this are ſomewhat larger and longer, yet thicke, and ſomewhat hairy about their edges; at firſt alſo of an acide taſte, but afterwards bitteriſh and hot: it alſo ſendeth forth ſhoots, and in the middeſt of the leaues it puts forth ſtalkes ſome two inches high, which at the top as in an vmbel carry ſome ſix little floures conſiſting of fiue leaues apiece, hauing their bottomes of a yellowiſh colour. It is found in the like places, and floures at the ſame time as the former. *Cluſius* makes it his *Sedum minus* 10. *Alpinum* 4. and in the *Hiſt. Lugd.* It is called *Iaſme montana*.

5 For

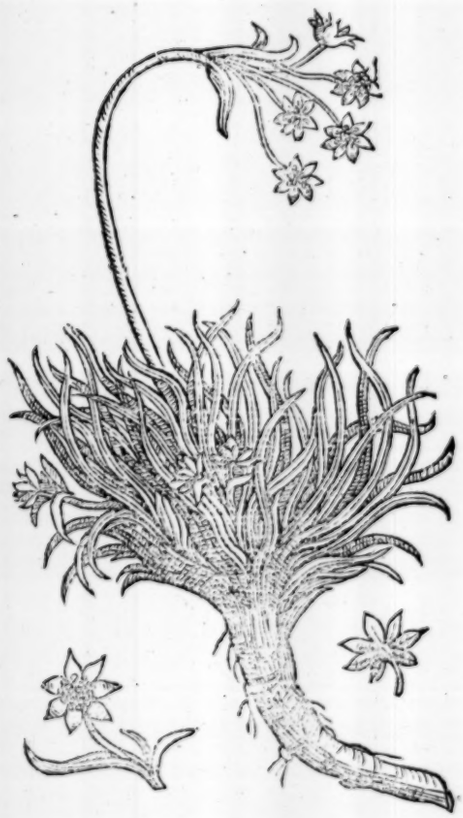
‡ 1 *Sedum minus paluſtre.*
Small water Sengreene.

‡ 2 *Sedum Alpinum* 1. *Cluſij.*
Small Sengreene of the Alps.

‡ *Sedum Alpinum* 3. *Cluſij.*
White Sengreene of the Alpes.

‡ 4 *Sedum Alpinum* 4. *Cluſij.*
Hairy Sengreene of the Alpes.

‡ 5 *Sedum petræum Bupleurifolio.*
Long leaued Rocke Sengreene.

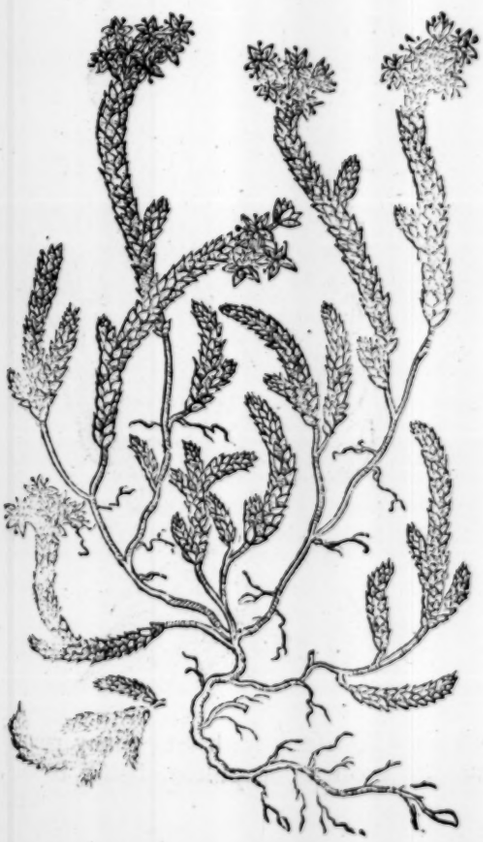


5 For theſe foure laſt deſcribed we are beholden to *Cluſius*; and for this fifth to *Pona*, who thus deſcribes it: It hath one thicke and large root with few or no fibres, but ſom knots bunching out here and there: it is couered with a thicke barke, and is of a blackiſh red colour on the outſide: the leaues are many, long and narrow, lying ſpred vpon the ground; the ſtalke grows ſome foot high, and is round and naked, and at the top carries floures conſiſting of 7 ſharpe pointed pale yellow leaues; which are ſucceeded by ſeeds like thoſe of *Bupleurum*, and of a ſtrong ſmell. It floures about the middle of Iuly, and the ſeed is ripe about the middle of Auguſt. *Pona*, who firſt obſerued this growing vpon Mount Baldus in Italy, ſets it forth by the name of *Sedum petræum Bupleurifolio*. *Bauhine* hath it by the name of *Perfoliata Alpina Gramineo folio*, and *Bupleuron anguſtifolium Alpinum*.

¶ *The Temper and Vertues.*

The three firſt deſcribed without doubt A
are cold, and partake in vertues with the other ſmall Sengreenes; but the two laſt are rather of an hot and attenuating facultie. None of them are commonly knowne or vſed in Phyſicke. ‡

Vermicularis ſiue Illecebra minor acris.
Wall-Pepper, or Stone-crop.



Chap. 145.

Of Stone-crop, called Wall-pepper.

¶ *The Deſcription.*

THis is a low and little herbe: the ſtalks be ſlender and ſhort: the leaues about theſe ſtand very thicke, and ſmall in growth, full bodied, ſharpe pointed, and full of iuyce: the floures ſtand on the top, and are maruellous little, of colour yellow, and of a ſharp biting taſte: the root is nothing but ſtrings.

¶ *The Place.*

It groweth euery where in ſtony and dry places, and in chinks and crannies of old wals, and on the tops of houſes: it is alwaies green, and therefore it is very fitly placed among the Sengreenes.

¶ *The Time.*

It floureth in the Sommer moneths.

¶ *The Names.*

This is *Tertium ſempervivum Dioſcoridis*, or *Dioſcorides* his third Sengreene, which he ſaith is called of the Grecians αἰσπερχὲς ἄγριον, and πολύφυλλος: and of the Romanes, *Illecebra*. *Pliny* alſo witneſſeth, that the Latines name it *Illecebra*. Yet there is another αἰσπερχὲς ἥμερον, and another πολύφυλλος: the Germanes call this herbe **Maurpfeffer**, and **Katzen treuble**: the French men, *Paia d'*

oiſeau:

oiſeau: the Low-countrey men, **Muer Pepper:** the Engliſh men, Stone-crop, and Stone-horе, little Stone-crop, Pricket, Mouſe-taile, Wall-Pepper, Countrey Pepper, and Iacke of the Butterie.

¶ *The Temperature.*

This little herbe is ſharpe and biting, and very hot. Being outwardly applied it raiſeth bliſters, and at length exulcerateth.

¶ *The Vertues.*

A It waſteth away hard kernels, and the Kings Euill, if it be layd vnto them, as *Dioſcorides* writes.
B The iuyce hereof extracted or drawne forth, and taken with vineger or other liquor, procureth vomit, and bringeth vp groſſe and flegmaticke humors, and alſo cholericke; and doth thereby oftentimes cure the Quartan Ague and other Agues of long continuance: and giuen in this manner it is a remedy againſt poyſons inwardly taken.

Chap. 146. *Of Orpyne.*

¶ *The Deſcription.*

1 THe Spaniſh Orpyne ſendeth forth round ſtalkes, thicke, ſlipperie, hauing as it were little ioynts, ſomewhat red now and then about the root: the leaues in like manner be thicke, ſmooth, groſſe, full of tough iuyce, ſometimes ſleightly nicked in the edges, broader leafed, and greater than thoſe of Purſlane; otherwiſe not much vnlike; which by couples are ſet oppoſit one againſt another vpon euery ioint, couering the ſtalke in order by two and two: the floures in the round tufts are of a pale yellow: the root groweth full of bumpes like vnto long kernels, waxing ſharpe toward the point: theſe ketnels be white, and haue ſtrings growing forth of them.

1 *Craſſula major Hiſpanica.*
Spaniſh Orpyne.

2 *Craſſula ſiue faba inuerſa.*
Common Orpyne.

2 The ſecond, which is our common Orpyne, doth likewiſe riſe vp with very many round ſtalkes that are ſmooth, but not ioynted at all: the leaues are groſſe or corpulent, thicke, broad, and

and oftentimes ſomewhat nicked in the edges, leſſer than thoſe of the former, placed out of order. The floures be either red or yellow, or elſe whitiſh: the root is white, well bodied, and full of kernels. This plant is very full of life: the ſtalkes ſet onely in clay continue greene a long time; and if they be now and then watered they alſo grow. We haue a wilde kinde of Orpyne growing in corne fields and ſhadowy woods in moſt places of England, in each reſpect like that of the garden, ſauing that it is altogether leſſer.

¶ *The Place.*

They proſper beſt in ſhadowie and ſtony places, in old walls made of lome or ſtone. *Oribaſius* ſaith, That they grow in Vineyards and tilled places. The firſt groweth in gardens; the other euerie where: the firſt is much found in Spaine and Hungarie; neither is Germanie without it; for it groweth vpon the bankes of the riuer of Rhene neere the Vineyards, in rough and ſtony places, nothing at all differing from that which is found in Spaine.

The ſecond groweth plentifully both in Germany, France, Bohemia, England, and in other countries among vines, in old lomie daubed and ſtony walls.

¶ *The Time.*

The Orpynes floure about Auguſt or before.

¶ *The Names.*

The firſt is that which is called of the Grecians πολιον, and ἀειζωον: of the Latines, *Telephium*, and *Sempervivum ſylueſtre*, and *Illecebra*: but *Illecebra* by reaſon of his ſharpe and biting qualitie doth much differ from it, as we haue declared in the former Chapter. Some there be that name it ἀιπύον, or *Portulaca ſylueſtris*: yet there is another *Portulaca ſylueſtris*, or wilde Purſlane, like to that which groweth in gardens, but leſſer: we may call this in Engliſh, Spaniſh Orpyne, Orpyne of Hungarie, or ioynted Orpyne.

The ſecond kinde of Orpyne is called in ſhops *Craſſula*, and *Craſſula Fabaria*, and *Craſſula maior*, that it may differ from that which is deſcribed in the chapter of little Houſleeke: it is named alſo *Fabaria*: in high-Dutch, **Wundkraut, Knauenkraut, Fotzwang**, and **Fotzweyn**: in Italian, *Faba graſſa*: in French, *Ioubarbe des vignes*, *Feue eſpeſſe*: in low-Dutch, **Smer wortele**, and **Hemel Sluetel**: in Engliſh, Orpyne; alſo Liblong, or Liue-long.

¶ *The Temperature.*

The Orpyns be cold and dry, and of thin or ſubtill parts.

¶ *The Vertues.*

Dioſcorides ſaith, That being laid on with Vineger it taketh away the white morphew: *Galen* ſaith the blacke alſo; which thing it doth by reaſon of the ſcouring or cleanſing qualitie that it hath. Whereupon *Galen* attributeth vnto it an hot facultie, though the taſte ſheweth the contrarie: which aforeſaid ſcouring facultie declareth, That the other two alſo be likewiſe cold. But cold things may as well cleanſe, if drineſſe of temperature and thinneſſe of eſſence be ioyned together in them. A

Chap. 147. *Of the ſmaller Orpyns.*

¶ *The Deſcription.*

1 The Orpyn with purple floures is lower and leſſer than the common Orpyn: the ſtalkes be ſlenderer, and for the moſt part lie along vpon the ground. The leaues are alſo thinner and longer, and of a more blew greene, yet well bodied, ſtanding thicker below than aboue, confuſedly ſet together without order: the floures in the tufts at the tops of the ſtalks be of a pale blew tending to purple. The roots be not ſet with lumpes or knobbed kernels, but with a multitude of hairy ſtrings.

2 This ſecond Orpyn, as it is knowne to few, ſo hath it found no name, but that ſome Herbariſts do call it *Telephium ſempervivum* or *virens*: for the ſtalkes of the other do wither in winter, the root remaineth greene; but the ſtalkes and leaues of this endure alſo the ſharpeneſſe of Winter; and therefore we may call it in Engliſh, Orpyn euerlaſting, or Neuer-dying Orpyn. This hath leſſer and rounder leaues than any of the former: the floures are red, and the root fibrous.

‡ 3 *Cluſius* receiued the ſeeds of this from *Ferranto Imperato* of Naples, vnder the name of *Telephium*

1 *Telephium floribus purpureis.*
Purple Orpyn.

2 *Telephium ſemper-virens.*
Neuer-dying Orpyn.

‡ 2 *Telephium legitimum Imperati.* Creeping Orpyn.

Telephium legitimum; and he hath thus giuen vs the hiſtory thereof: It produces from the top of the root many branches ſpred vpon the ground, which are about a foot long, ſet with many leaues, eſpecially ſuch as are not come to floure; for the other haue fewer: theſe leaues are ſmaller, leſſe thicke alſo and ſucculent than thoſe of the former kindes, neither are they ſo brittle: their colour is green, inclining a little to blew: the tops of the branches are plentifully ſtored with little floures growing thicke together, and compoſed of fiue little white leaues apiece: which fading, there ſucceed cornered ſeed-veſſels full of a browniſh ſeed. The root is ſometimes as thicke as ones little finger, tough, white, diuided into ſome branches, and liuing many yeares. ‡

¶ *The Place, Time, Names, Temperature, and Vertues.*

The firſt growes not in England. The ſecond flouriſhes in my garden. ‡ The third is a ſtranger with vs ‡. They floure when the common Orpyn doth. Their names are ſpecified in their ſeuerall deſcriptions: and their temperature and faculties in working are referred to the common Orpyn.

Chap.

CHAP. 148. *Of Purſlane.*

¶ *The Deſcription.*

1 THe ſtalkes of the great Purſlane be round, thicke, ſomewhat red, full of juice, ſmooth, glittering, and parted into certaine branches trailing vpon the ground: the leaues be an inch long, ſomething broad, thicke, fat, glib, ſomewhat greene, whiter on the neither ſide: the floures are little, of a faint yellow, and grow out at the bottome of the leaues. After them ſpringeth vp a little huske of a greene colour, of the bigneſſe almoſt of halfe a barly corne, in which is ſmall blacke ſeed: the root hath many ſtrings.

1 *Portulaca domeſtica.*
Garden Purſlane.

2 *Portulaca ſilveſtris.*
Wilde Purſlane.

2 The other is leſſer and hath like ſtalkes, but ſmaller, and it ſpreadeth on the ground: the leaues be like the former in faſhion, ſmoothneſſe, and thickneſſe, but farre leſſer.

¶ *The Place.*

The former is fitly ſowne in gardens, and in the waies and allies thereof being digged and dunged; it delighteth to grow in a fruitfull and fat ſoile not dry.

The other commeth vp of his owne accord in allies of gardens and vineyardes, and oftentimes vpon rocks: this alſo is delighted with watery places being once ſowne, if it be let alone till the ſeed be ripe it doth eaſily ſpring vp afreſh for certaine yeeres after.

¶ *The Time.*

It may be ſowne in March or Aprill; it flouriſheth and is greene in Iune, and afterwards euen vntill winter.

¶ *The Names.*

Purſlane is called in Greeke, ἀνδράχνη: in Latine, *Portulaca*: in high Dutch, **Burkelkraut**: in French, *Pourpier*: in Italian, *Prochaccia*: in Spaniſh, *Verdolagas*: in Engliſh, Purſlane, and Porcelane.

¶ *The Temperature.*

Purſlane is cold,and that in the third degree,and moiſt in the ſecond : but wilde Purſlane is not ſo moiſt.

¶ *The Vertues.*

A Rawe Purſlane is much vſed in ſallades,with oile, ſalt, and vineger : it cooleth an hot ſtomacke, and prouoketh appetite ; but the nouriſhment which commeth thereof is little, bad, cold, groſſe, and moiſt : being chewed it is good for teeth that are ſet on edge or aſtonied ; the juice doth the ſame being held in the mouth,and alſo the diſtilled water.

B Purſlane is likewiſe commended againſt wormes in young children, and is ſingular good,eſpecially if they be feueriſh withall, for it both allaies the ouermuch heate, and killeth the wormes : which thing is done through the ſaltnes mixed therewith,which is not only an enemy to wormes, but alſo to putrifaction.

C The leaues of Purſlane either rawe, or boiled, and eaten as ſallades, are good for thoſe that haue great heate in their ſtomackes and inward parts,and doe coole and temper the inflamed bloud.

D The ſame taken in like manner is good for the bladder and kidnies, and allaieth the outragious luſt of the body : the juice alſo hath the ſame vertue.

E The juice of Purſlane ſtoppeth the bloudy fluxe, the fluxe of the hemorroides,monthly termes, ſpitting of bloud,and all other fluxes whatſoeuer.

F The ſame thrown vp with a mother ſyringe,cureth the inflammations,frettings,and vlcerations of the matrix ; and put into the fundament with a cliſter pipe,helpeth the vlcerations and fluxe of the guts.

G The leaues eaten rawe,take away the paine of the teeth, and faſteneth them ; and are good for teeth that are ſet on edge with eating of ſharpe or ſoure things.

H The ſeed being taken, killeth and driueth forth wormes, and ſtoppeth the laske.

CHAP. 149.

Of ſea Purſlane, and of the ſhrubby Sengreens.

¶ *The Deſcription.*

1 SEa Purſlane is not a herbe as garden Purſlane,but a little ſhrub : the ſtalkes whereof be hard and wooddy : the leaues fat,full of ſubſtance, like in forme to common Purſlane, but much whiter and harder : the moſſie purple floures ſtand round about the vpper parts of the ſtalkes,as do almoſt thoſe of Blyte,or of Orach : neither is the ſeed vnlike,being broad and flat : the root is wooddy, long laſting,as is alſo the plant, which beareth out the winter with the loſſe of a few leaues.

† 2 There is another ſea Purſlane or *Halimus*, or after *Dodonæus*, *Portulaca marina*, which hath leaues like the former,but not altogether ſo white, yet are they ſomewhat longer and narrower, not much vnlike the leaues of the Oliue tree. The ſlender branches are not aboue a cubit or cubit and halfe long,and commonly lie ſpred vpon the ground,and the floures are of a deepe ouerworne herby colour, and after them follow ſeedes like thoſe of the former,but ſmaller.

‡ 3 Our ordinary *Halimus* or ſea Purſlane hath ſmall branches ſome foot or better long, lying commonly ſpred vpon the ground, of an ouerworne grayiſh colour,and ſometimes purple;the leaues are like thoſe of the laſt mentioned,but more fat and thicke, yet leſſe hoary. The floures grow on the tops of the branches,of an herby purple colour,which is ſucceeded by ſmall ſeeds like to that of the ſecond kinde. ‡

4 There is found another wilde ſea Purſlane,whereof I haue thought good to make mention; which doth reſemble the kindes of Aizoons. The firſt kinde groweth vpright,with a trunke like a ſmall tree or ſhrub,hauing many vpright wooddy branches,of an aſhe colour, with many thicke, darke,greene leaues like the ſmall Stone crop,called *Vermicularis* : the floures are of an herby yellowiſh greene colour : the root is very hard and fibrous : the whole plant is of a ſalt tang taſte, and the juice like that of Kaly.

5 There is another kinde like the former,and differeth in that,this ſtrange plant is greater,the leaues more ſharpe and narrower,and the whole plant more wooddy, and commeth neere to the forme of a tree. The floures are of a greeniſh colour.

¶ *The*

‡ 1 *Halimus latifolius.*
Tree Sea Purſlane.

‡ 2 *Halimus anguſtifolius procumbens.*
Creeping Sea Purſlane.

† 3 *Halimus vulgaris, ſiue Portulaca marina.*
Common Sea Purſlane.

‡ 4 *Vermicularis frutex minor.*
The leſſer ſhrubby Sengreen.

‡ 5 *Vermicularis frutex major.*
The greater Tree Stone-crop.

¶ *The Place.*

‡ The firſt and ſecond grow vpon the Sea coaſts of Spaine and other hot countries ‡: and the third groweth in the ſalt mariſhes neere the ſea ſide, as you paſſe ouer the Kings ferrey vnto the iſle of Shepey, going to Sherland houſe (belonging ſometime vnto the Lord *Cheiny*, and in the yeare 1590, vnto the Worſhipfull S^r. *Edward Hobby*) faſt by the ditches ſides of the ſame mariſh: it groweth plentifully in the iſle of Thanet as you go from Margate to Sandwich, and in many other places along the coaſt. The other ſorts grow vpon bankes and heapes of ſand on the Sea coaſts of Zeeland, Flanders, Holland, and in like places in other countries, as beſides the Iſle of Purbecke in England; and on Rauen-ſpurne in Holderneſſe, as I my ſelfe haue ſeene.

¶ *The Time.*

Theſe flouriſh and floure eſpecially in Iuly and Auguſt.

¶ *The Names.*

Sea Purſlane is called *Portulaca Marina:* In Greeke, ἁλιμος: it is alſo called in Latine *Halimus:* in Dutch, **Zee Pozceleijne:** in Engliſh, Sea Purſlane.

The baſtard ground Pines are called of ſome, *Chamepitys virmiculata:* in Engliſh, Sea ground Pine: ‡ or more fitly, Tree Ston-crop, or Pricket, or Shrubby Sengreene. ‡

¶ *The Temperature.*

Sea Purſlane is (as *Galen* ſaith) of vnlike parts, but the greater part thereof is hot in a meane, with a moiſture vnconcocted, and ſomewhat windie.

¶ *The Vertues.*

A The leaues (ſaith *Dioſcorides*) are boyled to be eaten: a dram weight of the root being drunke with meade or honied water, is good againſt crampes and drawings awrie of ſinewes, burſtings, and gnawings of the belly: it alſo cauſeth Nurſes to haue ſtore of milke. The leaues be in the Low-countries preſerued in ſalt or pickle as capers are, and be ſcrued and eaten at mens tables in ſtead of them, and that without any miſlike of taſte, to which it is pleaſant. *Galen* doth alſo report, that the yong and tender buds are wont in Cilicia to be eaten, and alſo laid vp in ſtore for vſe.

B ‡ *Cluſius* ſaith, That the learned Portugal Knight *Damianus a Goes* aſſured him, That the leaues of the firſt deſcribed boyled with bran, and ſo applied, mitigate the paines of the Gout proceeding of an hot cauſe. ‡

† The figure that was formerly giuen by our Author by the title of *Portulaca marina*, and is ſet forth by *Tabern.* vnder the ſame name, is either of none of theſe plants, or elſe it is vnperfect. *Bauhine* knowes not what to make of it, but queſtions, *Quid ſit?*

Chap. 150. *Of Herbe-Iuy, or Ground-Pine.*

¶ *The Deſcription.*

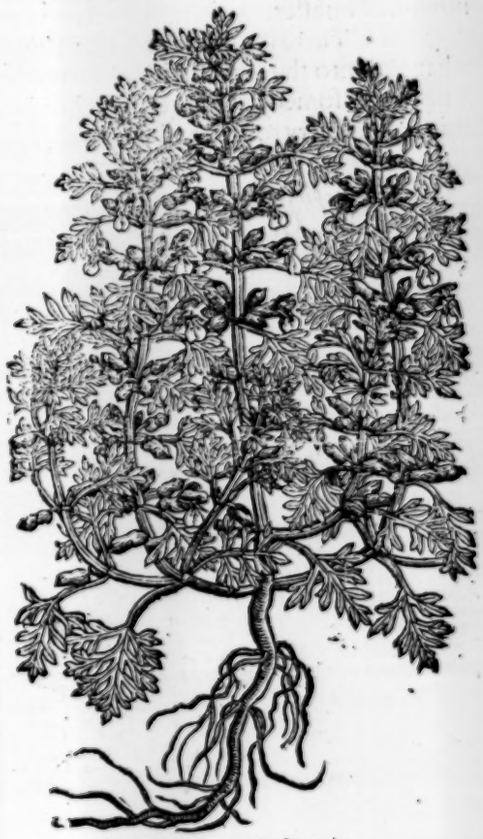
1 The common kinde of *Chamæpitys* or Ground-Pine is a ſmall herbe and very tender, creeping vpon the ground, hauing ſmall and crooked branches trailing about. The leaues be ſmall, narrow and hairy, in ſauour like the Firre or Pine tree; but if my ſence of ſmelling be perfect, me thinkes it is rather like vnto the ſmell of hempe. The floures be little, of a pale yellow colour, and ſomtimes white: the root is ſmall and ſingle, and of a wooddy ſubſtance.

† 2 The ſecond hath pretty ſtrong foure ſquare ioynted ſtalkes, brownе and hairy; from which grow pretty large hairy leaues much clouen or cut: the floures are of a purple colour, and grow about the ſtalks in roundles like the dead Nettle: the ſeed is black and round, and the whole plant ſauoureth like the former: ‡ which ſheweth this to be fitly referred to the *Chamæpytis*, and not to be well called *Chamadrys fœmina*, or Iagged Germander, as ſome haue named it. ‡

3 This

1 *Chamæpitys mas.*
The male ground Pine.

2 *Chamæpitys fœmina.*
The female ground-Pine.



3 *Chamæpitys 3. Dodon.*
Small Ground-Pine.

4 *Iua muſcata Monſpeliaca.*
French Herbe-Iuy or Ground-Pine.

3 This kinde of Herb-Iuy, growing for the moſt part about Montpelier in France, is the leaſt of all his kind, hauing ſmal white and yellow floures, in ſmell and proportion like vnto the others, but much ſmaller.

† 4 · There is a wilde or baſtard kinde of *Chamæpitys*, or ground-Pine, that hath leaues ſomewhat like vnto the ſecond kinde, but not iagged in that manner, but onely ſnipt about the edges. The root is ſomewhat bigger, wooddy, whitiſh, and bitter, and like vnto the root of Succorie. All this herbe is very rough, and hath a ſtrong vnpleaſant ſmell, not like that of the ground-Pines.

‡ 5 *Chamæpitys ſpuria altera Dodon.*
Baſtard Ground-Pine.

‡ 6 *Chamæpitys Auſtriaca.*
Auſtrian Ground-Pine.

† 5 There is another kind that hath many ſmall and tender branches beſet with little leaues for the moſt part three together, almoſt like the leaues of the ordinarie ground-Pine: at the top of which branches grow ſlender white floures; which being turned vpſide downe, or the lower part vpward, do ſomewhat reſemble the floures of *Lamium*: the ſeeds grow commonly foure together in a cup, and are ſomewhat big and round: the root is thicke, whitiſh, and long laſting.

6 There groweth in Auſtria a kinde of *Chamæpitys*, which is a moſt braue and rare plant, and of great beautie, yet not once remembred either of the ancient or new Writers, vntill of late that famous *Carolus Cluſius* had ſet it forth in his Pannonicke Obſeruations; who for his ſingular skil and induſtrie hath woon the garland from all that haue written before his time. This rare and ſtrange plant I haue in my garden, growing with many ſquare ſtalkes of halfe a foot high, beſet euen from the bottome to the top with leaues ſo like our common Roſemary, that it is hard for him which doth not know it exactly to finde the difference; being greene aboue, and ſomwhat hairy and hoarie vnderneath: among which come forth round about the ſtalkes (after the manner of roundles or coronets) certain ſmall cups or chalices of a reddiſh colour; out of which come the floures like vnto Archangell in ſhape, but of a moſt excellent and ſtately mixed colour, the outſide purple declining to blewneſſe, and ſometimes of a violet colour. The floure gapeth like the mouth of a beaſt, and hath as it were a white tongue; the lower and vpper iawes are white likewiſe, ſpotted with many bloudy ſpots: which being paſt, the ſeeds appeare very long, of a ſhining blacke colour, ſet in order in the ſmall huskes as the *Chamæpitys ſpuria*. The root is blacke and hard, with manie hairy ſtrings faſtned thereto.

¶ *The*

¶ *The Place.*

These kindes of *Chamæpitys* (except the two last) grow very plentifully in Kent, especially about Graues end, Cobham, Southfleet, Horton, Dartford, and Sutton, and not in any other shire in England that euer I could finde.

‡ None of these, except the first, for any thing I know, or can learne, grow wilde in England; the second I haue often seene in Gardens. ‡

¶ *The Time.*

They floure in Iune, and often in August.

¶ *The Names.*

Ground Pine is called in Greeke χαμαιπιτυς: in Latine, *Ibiga*, *Aiuga*, and *Abiga*: in shops, *Iua Arthritica* and *Iua moschata*: in Italian, *Iua*: in Spanish, *Chamapiteos*: in High Dutch, **Vergis mich nicht**: in low Dutch, **Uelt Cippes**: in French, *Iue moschate*: In English, Herbe Iuie, Forget me not, Ground Pine, and field Cypresse.

‡ 1 The first of these is the *Chamæpitys prima*, of *Matthiolus*, *Dodonæus* and others, and is that which is commonly vsed in shops and in Physicke.

2 This *Matthiolus* cals *Chamædrys altera*: *Lobel*, *Chamædrys Laciniatis foliis*: *Lonicerus*, *Teucrio vera*; *Tabernamontanus*, *Iua moschata*; and *Dodon.* (whom in this Chapter we chiefely follow) *Chamæpitys altera.*

3 Thirdly, this is the *Chamæpitys* 1. of *Fuchsius* and others; the *Chamæpitys* 1. *Dioscoridis odoratior* of *Lobel*; and the *Chamæpitys* 3. of *Matthiolus* and *Dodon.*

4 *Gesner* cals this *Chamæpitys species Monspelij*: *Clusius*, *Dodon.* *Anthyllis altera*; and *Lobel*, *Anthyllis Chamepityides minor*; and *Tabern. Iua Moschata Monspelensium.*

5 This is *Chamæpitys adulterina* of *Lobel*: *Pseudochamæpitys* and *Aiuga adulterina* of *Clusius*: and *Chamæpitys spuria altera* of *Dodon.*

6 This is *Chamæpitys Austriaca* of *Clusius*; and *Chamæpitys cærulea* of *Camerarius*. ‡

¶ *The Nature.*

These herbes are hot in the second degree, and drie in the third.

¶ *The Vertues.*

The leaues of *Chamæpytis* tunned vp in Ale, or infused in wine or sodden with hony, and drunke by the space of eight or ten daies, cureth the iaundies, the Sciatica, the stoppings of the liuer, the difficultie of making water, the stoppings of the spleene, and causeth women to haue their naturall sickenesse. A

Chamæpytis stamped greene with honie cureth wounds, malignant and rebellious vlcers, and dissolueth the hardnesse of womens brests or paps, and profitably helpeth against poison, or biting of any venomous beast. B

The decoction drunke, dissolueth congealed bloud, and drunke with vineger, driueth forth the dead childe. C

It clenseth the intrals: it helpeth the infirmities of the liuer and kidneies; it cureth the yellow iaundies being drunke in wine: it bringeth downe the desired sickenesse, and prouoketh vrine: being boiled in Mead or honied water and drunke, it helpeth the Sciatica in fortie daies. The people of Heraclea in Pontus do vse it against Wolfes bane in stead of a counterpoison. D

The pouder hereof taken in pils with a fig, mollifieth the bellie: it wasteth away the hardnesse of the paps: it healeth wounds, it cureth putrified vlcers being applied with hony: and these things the first ground Pine doth performe, so doth the other two: but not so effectually, as witnesseth *Dioscorides.* E

Clusius of whom mention was made, hath not said any thing of the Vertues of *Chamæpytis Austriaca*: but verily I thinke it better by many degrees for the purposes aforesaid: my coniecture I take from the taste, smell, and comely proportion of this Hearbe, which is more pleasing and familiar vnto the nature of man, than those which wee haue plentifully in our owne Countrey growing. F

Chap. 152. *Of Nauelwoort, or Penniwoort of the Wall.*

¶ *The Description.*

1 THe great Nauelwoort hath round and thicke leaues, somewhat bluntly indented about the edges, and somewhat hollow in the midst on the vpper part, hauing a short tender

stem

ſtemme faſtened to the middeſt of the leafe, on the lower ſide vnderneath the ſtalke, whereon the floures doe grow, is ſmall and hollow, an handfull high and more, beſet with many ſmall floures of an ouerworne incarnate colour. The root is round like an oliue, of a white colour.

‡ The root is not well expreſt in the figure, for it ſhould haue been more vnequall or tuberous, with the fibers not at the bottome but top thereof. ‡

2 The ſecond kinde of Wall Penniwoort or Nauelwoort hath broad thicke leaues ſomewhat deepely indented about the edges: and are not ſo round as the leaues of the former, but ſomewhat long towards the ſetting on, ſpred vpon the ground in manner of a tuft, ſet about the tender ſtalke, like to Sengreene or Houſleeke; among which riſeth vp a tender ſtalke whereon do grow the like leaues. The floures ſtand on the top conſiſting of fiue ſmall leaues of a white colour, with red ſpots in them. The root is ſmall and threddie. ‡ This by ſome is called *Sedum Serratum*. ‡

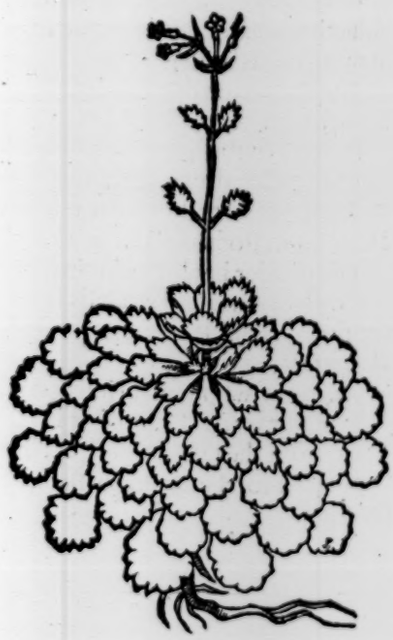
‡ 3 This third kinde hath long thicke narrow leaues, very finely ſnipt or nickt on the edges, which lie ſpred very orderly vpon the ground; and in the midſt of them riſes vp a ſtalke ſome foot high, which beares at the top thereof vpon three or foure little branches, diuers white floures conſiſting of fiue leaues apiece.

4 The leaues of this are long and thicke, yet not ſo finely ſnipt about the edges, nor ſo narrow as thoſe of the former: the ſtalke is a foot high, ſet here and there with ſomewhat ſhorter and rounder leaues than thoſe below; and towards the top thereof, out of the boſſomes of theſe leaues come ſundry little foot-ſtalkes, bearing on their tops pretty large floures of colour white, and ſpotted with red ſpots. The rootes are ſmall, and here and there put vp new tufts of leaues, like as the common Houſleeke. ‡

5 There is a kinde of Nauelwoort that groweth in waterie places, which is called of the huſbandmen Sheeps bane, becauſe it killeth ſheepe that do eat thereof: it is not much vnlike the precedent, but the round edges of the leaues are not ſo euen as the other; and this creepeth vpon the ground, and the other vpon the ſtone walls.

1 *Vmbilicus Veneris.*
Wall Penniwoort.

‡ 2 *Vmbilicus Ven. ſiue Cotyledon altera.*
Iagged or Roſe Penniwoort.



‡ 6 Becauſe ſome in Italy haue vſed this for *Vmbilicus Veneris*, and otherſome haue ſo called it, I thought it not amiſſe to follow *Matthiolus*, and giue you the hiſtory thereof in this place, rather than to omit it, or giue it in another which may be perhaps as vnfit, for indeed I cannot fitly ranke

it

it with any other plant. *Bauhine* sets it betweene *Hedera Terrestris*, and *Nasturtium Indicum*: and *Columna* refers it to the *Linaria's*, but I must confesse I cannot referre it to any; wherefore I thinke it as proper to giue it here as in any other place. The branches of this are many, long, slender, and creeping, vpon which grow without any certaine order many little smooth thicke leaues fashioned like those of Ivie, and fastened to stalkes of some inch long: and together with these stalkes come forth others of the same length, that carry spur-fashioned floures, of the shape and bignesse of those of the female Fluellen: their outside is purple, their inside blew, with a spot of yellow in the opening. The root is small, creeping, and threddie. It floures toward the end of Sommer, and growes wilde vpon walls in Italie, but in gardens with vs. *Matthiolus* calls it *Cymbalaria* (to which *Lobel* addes) *Italica Hederaceo folio*: *Lonicerus* termes it *Vmbilicus Veneris Officinarum*: and lastly *Columna* cals it *Linaria hederæ folio*. ‡

¶ *The Place.*

The first kind of Penniwoort groweth plentifully in Northampton vpon euery stone wall about the towne, at Bristow, Bathe, Wells, and most places of the West Countrie vpon stone walls. It groweth vpon Westminster Abbey, ouer the doore that leadeth from *Chaucers* tombe to the old palace. ‡ In this last place it is not now to be found. ‡

The second, third, and fourth grow vpon the Alpes neere Piedmont, and Bauier, and vpon the mountaines of Germanie: I found the third growing vpon Bieston Castle in Cheshire.

‡ The fifth growes vpon the Bogges vpon Hampstead Heath, and many such rotten grounds in other places. ‡

¶ *The Time.*

They are greene and flouriſh especially in VVinter: They floure also in the beginning of Sommer.

¶ *The Names.*

Nauelwoort is called in Greeke κοτυλήδων: in Latine, *Vmbilicus Veneris*, and *Acetabulum*: of diuers, *Herba Coxendicum*: *Iacobus Manlius* nameth it *Scatum Cœli*, and *Scatellum*: in Dutch, **Nauelcrupt**: in Italian, *Cupertoiule*: in French, *Escuelles*: in Spanish, *Capadella*: of some, *Hortus Veneris*, or Venus garden, and *Terræ vmbilicus*, or the Nauel of the earth: in English, Penniwoort, Wall-penniwoort, Ladies nauell, Hipwoort and Kidney-woort.

VVater Penniwoort is called in Latine *Cotyledon palustris*: in English, Sheepe-killing Pennigrasse, Penny-rot, and in the North Countrey VVhite-rot: for there is also Red-rot, which is *Rosa solis*: in Northfolke it is called Flowkwoort. ‡ *Columna* and *Bauhine* fitly refer this to the *Ranunculi*, or Crowfeet; for it hath no affinitie at all with the Cotyledons (but onely in the roundnesse of the leafe) the former of them cals it *Ranunculus aquaticus vmbilicato folio*, and the later, *Ranunculus aquat. Cotyledonis folio*.

¶ *The Temperature.*

Nauelwoort is of a moist substance and somewhat cold, and of a certaine obscure binding qualitie: it cooleth, repelleth, or driueth backe, scoureth, and consumeth, or wasteth away, as *Galen* testifieth.

‡ The VVater Pennywoort is of an hot and vlcerating qualitie, like to the Crowfeet, whereof it is a kinde. The bastard Italian Nauelwoort seemes to partake with the true in cold and moisture. ‡

¶ *The Vertues.*

The iuice of VVall Pennywoort is a singular remedie against all inflammations and hot tumors, A as Erysipelas, Saint Anthonies fire, and such like: and is good for kibed heeles, being bathed therwith, and one or more of the leaues laid vpon the heele.

The leaues and rootes eaten doe breake the stone, prouoke vrine, and preuaile much against the B dropsie.

The ignorant Apothecaries doe vse the VVater Pennywoort in stead of this of the wall, which C they cannot doe without great error, and much danger to the patient: for husbandmen know well, that it is noisome vnto Sheepe, and other cattell that feed thereon, and for the most part bringeth death vnto them, much more to men by a stronger reason.

Chap.

3 *Vmbilicus Veneris minor.*
Small Nauelwoort.

‡ 4 *Cotyledon minor montana altera.*
The other ſmall mountaine Nauelwoort.

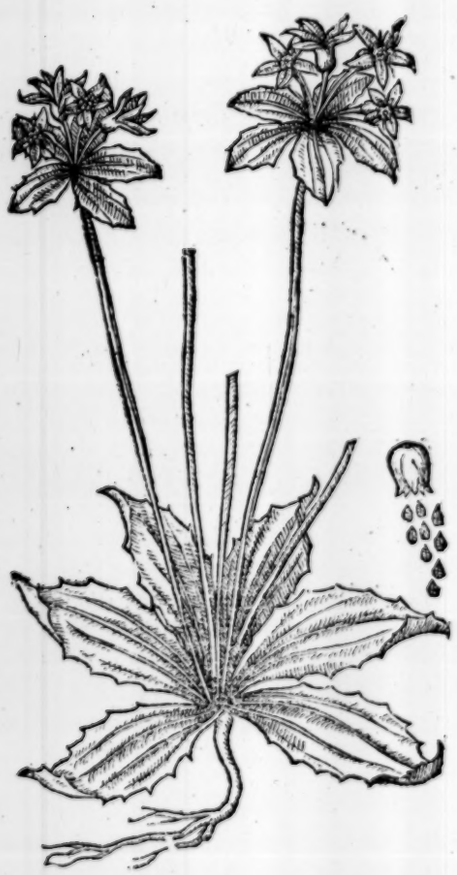
5 *Cotyledon paluſtris.*
Water Penniwoort.

‡ 6 *Cymbalaria Italica.*
Italian Baſtard Nauelwoort.

CHAP. 152. *Of Sea Pennywoort.*

1 *Androſace Matthioli.*
Sea Nauel-woort.

2 *Androſace annua ſpuria.*
One Sommers Nauell-woort.



¶ *The Deſcription.*

1 THe Sea Nauel-woort hath many round thicke leaues like vnto little ſaucers, ſet vpon ſmall & tender ſtalks, bright, ſhining, and ſmooth, of two inches long, for the moſt part growing vpon the furrowed ſhels of cockles or the like, euery ſmall ſtem bearing vpon the end or point, one little buckler and no more, reſembling a nauell; the ſtalke and leafe ſet together in the middle of the ſame. Whereupon the Herbariſts of Montpelier haue called it *Vmbilicus Marinus*, or ſea Nauel. The leaues and ſtalkes of this plant, whileſt they are yet in the water, are of a pale aſh colour, but being taken forth, they preſently waxe white, as Sea Moſſe, called *Corallina*, or the ſhel of a Cockle. It is thought to be barren of ſeed, and is in taſte ſaltiſh.

2 The ſecond *Androſace* hath little ſmooth leaues, ſpred vpon the ground like vnto the leaues of ſmall Chickweed or Henbit, whereof doubtles it is a kind: among which riſeth vp a ſlender ſtem, hauing at the top certaine little chaffie floures of a purpliſh colour. The ſeed is contained in ſmall ſcaly husks, of a reddiſh colour, & a bitter taſte. The whole plant periſheth when it hath perfected his ſeede, and muſt be ſowne againe the next yeare: which plant was giuen to *Mathiolus* by *Cortuſus*, who (as he affirmeth) receiued it from Syria; but I thinke hee ſaid ſo to make *Matthiolus* more ioyfull: but ſurely I ſurmiſe he picked it out of one old wal or other, where it doth grow euen as the ſmall Chickweed, or Nailewoort of the wall do.

‡ The figure that was here was that vnperfect one of *Matthiolus*; and the deſcription of our Authour was framed by it, vnleſſe the laſt part therof, which was taken out of the *Aduerſaria pag.* 166. to amend both theſe, we here preſent you with the true figure and deſcription, taken out of the workes of the iudicious and painfull Herbariſt *Carolus Cluſius*. It hath (ſaith he) many leaues lying flat vpon the ground, like to thoſe of Plantaine, but leſſer and of a pale greene colour, and toothed about the edges, ſoft alſo and iuicie, and of ſomewhat a biting taſte. Amongſt theſe leaues riſe vp fiue or ſix ſtalkes of an handfull high, commonly of a green, yet ſometimes of a purple colour, naked and ſomewhat hairy, which at their tops carry in a circle fiue roundiſh leaues alſo a little toothed and hairy; from the midſt of which ariſe fiue or more foot-ſtalks, each bearing a greeniſh rough or hairie, cup & parted alſo into fiue little leaues or iags, in the middeſt

midſt of which ſtands a little white floure parted alſo into fiue; after which ſucceed pretty large ſeed veſſels which containe an vnequall red ſeed like that of Primroſes, but bigger: the root is ſingle and ſlender, and dies as ſoon as the ſeed is perfected. It growes naturally in diuers places of Auſtria, and amongſt the corne about the Bathes of Baden; whereas it floures in Aprill, and ripens the ſeed in May and Iune. ‡

¶ *The Place.*

Androſace will not grow any where but in water: great ſtore of it is about Frontignan by Montpellier in Languedoc, where euery fiſher-man doth know it.

The ſecond groweth vpon old ſtone and mud walls: notwithſtanding I haue (the more to grace *Matthiolus* great iewell) planted it in my garden.

¶ *The Time.*

The baſtard *Androſace* floureth in Iuly, and the ſeed is ripe in Auguſt.

¶ *The Names.*

Androſace is of ſome called *Vmbilicus marinus*, or ſea Nauell.

‡ The ſecond is knowne and called by the name of *Androſace altera Matthioli*. ‡

¶ *The Temperature.*

The ſea Nauell is of a diureticke qualitie, and more drie than *Galen* thought it to be, and leſſe hot than others haue deemed it: there can no moiſture be found in it.

¶ *The Vertues.*

A Sea Nauelwoort prouoketh vrine, and digeſteth the filthineſſe and ſlimineſſe gathered in the ioints.

B Two drams of it, as *Dioſcorides* ſaith, drunke in wine, bringeth downe great ſtore of vrine out of their bodies that haue the dropſie, and maketh a good plaiſter to ceaſe the paine of the gout.

Chap. 153. *Of Roſe-woort, or Roſeroot.*

Rhodia radix, Roſe-root.

¶ *The Deſcription.*

Roſewoort hath many ſmall, thicke, and fat ſtems, growing from a thicke and knobby root: the vpper end of it for the moſt part ſtandeth out of the ground, and is there of a purpliſh colour, bunched & knobbed like the root of Orpin, with many hairy ſtrings hanging therat, of a pleaſant ſmell when it is broken, like the damaske roſe, whereof it tooke his name. The leaues are ſet round about the ſtalks, euen from the bottome to the top, like thoſe of the field Orpin, but narrower, and more ſnipt about the edges. The floures grow at the top of a faint yellow colour.

¶ *The Place.*

It groweth very plentifully in the North part of England, eſpecially in a place called Ingleborough Fels, neere vnto the brookes ſides, and not elſewhere that I can as yet finde out, from whence I haue had plants for my garden.

¶ *The Time.*

It floureth and flouriſheth in Iuly, and the ſeed is ripe in Auguſt.

¶ *The Names.*

Some haue thought it hath taken the name *Rhodia* of the Iſland in the Mediterranean ſea, called Rhodes: but doubtleſſe it took his name *Rhodia radix*, of the root which ſmelleth like a roſe: in Engliſh, Roſe-root, and Roſe-woort.

¶ *The Vertues.*

There is little extant in writing of the faculties of Roſewoort: but this I haue found, that if the root be ſtamped with oile of Roſes and laid to the temples of the head, it eaſeth the paine of the head.

CHAP.

CHAP. 144. *Of Sampier.*

1 *Crithmum marinum.*
Rocke Sampier.

2 *Crithmum Spinoſum.*
Thornie Sampier.

3 *Crithmum chryſanthemum.*
Golden Sampier.

¶ *The Deſcription.*

1 ROcke Sampier hath many fat and thicke leaues, ſomewhat like thoſe of the leſſer Purſlane, of a ſpicy taſte with a certaine ſaltneſſe; amongſt which riſeth vp a ſtalke, diuided into many ſmal ſpraies or ſprigs; on the top wherof doe grow ſpokie tufts of whitefloures, like the tufts of Fenell or Dill; after that commeth the ſeed like the ſeed of Fenell, but greater. The root is thicke and knobbie, being of ſmell delightfull & pleaſant

2 The ſecond Sampier called *Paſtinaca marina*, or Sea Parſnep, hath long fat leaues, very much iagged or cut euen to the middle rib, ſharpe or prickley pointed, which are ſet vpon large fat iointed ſtalks; on the top whereof do grow tuftes of whitiſh, or els reddiſh floures. The ſeed is wrapped in thornie huskes. The root is thick and long, not vnlike to the Parſnep, very good and wholeſome to be eaten.

3 Golden Sampier bringeth forth many ſtalks from one root, compaſſed about with a multitude of long fat leaues, ſet together by equall diſtances; at the top whereof come yellow floures. The ſeed is like thoſe of the Rocke Sampier.

¶ *The Place.*

Rocke Sampier groweth on the rockie cliffes at Douer, VVinchelſey, by Rie,' about Southampton, the Iſle of VVight,and moſt rockes about the Weſt and North-weſt parts about England.

The ſecond groweth neere the Sea vpon the ſands,and Bayche between Whitſtable and the Iſle of Thanet,by Sandwich,and by the ſea neere Weſtcheſter.

The third groweth in the myrie marſh in the Iſle of Shepey,as you go from the Kings Ferrie,to Sherland houſe.

¶ *The Time.*

Rocke Sampier flouriſheth in May and Iune, and muſt be gathered to be kept in pickle in the beginning of Auguſt.

¶ *The Names.*

Rocke Sampier is called in Greeke κριθμον: in Latine, *Crithmum*: and of diuers, *Bati*: in ſome ſhops,*Creta marina*: of *Petrus Creſcentius*, *Cretamum*, and *Rincum marinum*: in high Dutch, **Meerfenchel**: which is in Latine, *Fœniculum marinum*,or Sea Fenell: in Italian,*Fenocchio marino*, *Herba di San Pietro*; and hereupon diuers name it *Sampetra*: in Spaniſh, *Perexil de la mer*, *Hinoio marino*, *Fenolmarin*: in Engliſh, Sampier,and Rocke Sampier,and of ſome, Creſtmarine; and theſe bee the names of the Sampier generally eaten in ſallads.

The other two be alſo *Crithma* or Sampiers, but moſt of the later writers would draw them to ſome other plant: for one calleth the ſecond *Paſtinaca marina*,or ſea Parſnep,and the third *Aſter atticus marinus*; and *Lobel* names it *Chryſanthemum Littoreum*: but we had rather entertaine them as *Matthiolus* doth,among the kindes of *Crithmum*,or Sampier.

¶ *The Temperature.*

Sampier doth drie,warme,and ſcoure,as *Galen* ſaith.

¶ *The Vertues.*

A The leaues,ſeeds, and roots,as *Dioſcorides* ſaith, boiled in wine and drunke,prouoke vrine, and womens ſickneſſe,and preuaile againſt the iaundies.

B The leaues kept in pickle,and eaten in ſallads with oile and vineger,is a pleaſant ſauce for meat, wholeſome for the ſtoppings of the liuer,milt, kidneies and bladder: it prouoketh vrine gently; it openeth the ſtoppings of the intrals,and ſtirreth vp an appetite to meat.

C It is the pleaſanteſt ſauce,moſt familiar, and beſt agreeing with mans body,both for digeſtion of meats,breaking of the ſtone,and voiding of grauell in the reines and bladder.

Chap. 155. *Of Glaſſe Saltwoort.*

¶ *The Deſcription.*

1 GLaſſewoort hath many groſſe, thicke and round ſtalkes a foot high, full of fat and thicke ſprigges, ſet with many knots or ioints,without any leaues at all,of a reddiſh greene colour. The whole Plant reſembleth a branch of Corall. The root is very ſmall and ſingle.

2 There is another kinde of Saltwoort, which hath been taken among the antient Herbariſts for a kinde of Sampier. It hath a little tender ſtalke a cubite high, diuided into many ſmall branches,ſet full of little thicke leaues very narrow,ſomewhat long and ſharpe pointed, yet not pricking; amongſt which commeth forth ſmall ſeed, wrapped in a crooked huske,turned round like a crooked perwinkle. The ſtalkes are of a reddiſh colour. The whole plant is of a ſalt and biting taſte. The root is ſmall and threddie.

† 3 There is likewiſe another kinde of *Kali*,whereof *Lobel* maketh mention vnder the name of *Kali minus*,which is like to the laſt before remembred,but altogether leſſer,‡ hauing many ſlender weake branches lying commonly ſpred vpon the ground, and ſet with many ſmall round long ſharpe pointed leaues,of a whitiſh green colour:the ſeed is ſmall and ſhining,not much vnlike that of Sorrell: the root is ſlender with many fibers;the whole plant hath a ſaltiſh taſte like as the former. *Dodon.* cals this *Kali album*. ‡

¶ *The*

1 *Salicornia, ſive Kali geniculatum.*
Glaſſewoort, Saltwoort, or Sea-grape.

‡ 2 *Kali maius ſemine cochleato.*
Snaile Glaſſewoort.

‡ 3 *Kali minus.*
Small Glaſſewoort.

¶ *The Place.*

Theſe plants are to be found in ſalt marſhes almoſt euery where.

‡ The ſecond excepted, which growes not here, but vpon the coaſts of the Mediterranean ſea. ‡

¶ *The Time.*

They floure and flouriſh in the Sommer moneths.

¶ *The Names.*

Saltwoort is called of the Arabians *Kali*, and *Alkali*. *Auicen*, chap. 724. deſcribeth them vnder the name of *Vſnen*, which differeth from *Vſnee*: for *Vſnee* is that which the Græcians call βρύον: and the Latines, *Muſcus*, or Moſſe of ſome, as *Baptiſta Montanus*: it hath bin iudged to be *Empetron*.

The axen or aſhes hereof are named of *Matthæus Siluaticus*, *Soda*: of moſt, *Sal Alkali*: diuers call it *Alumen catinum*. Others make this kind of difference betweene *Sal Kali*, and *Alumen catinum*, that *Alumen catinum* is the aſhes it ſelf: and that the ſalt that is made of the aſhes is *Sal Alkali*.

Stones are beaten to pouder, & mixed with aſhes, which beeing melted together become the matter wherof glaſſes are made. VVhich while it is made red hot in the furnace, and is melted, becomming liquide and fit to work vpon, doth yeeld as it were a fat floting aloft; which, when it is cold, waxeth as hard as a ſtone, yet it is brittle, and quickely broken. This is commonly called *Axungia vitri*. In Engliſh, Sandeuer: in French, *Suin de Voirre*: in Italian, *Fior de criſtalo*, (i) Floure of Chriſtall. The Herbe is alſo called

of diuers *Kali articulatum*, or iointed Glaſſe-wo ort: and in Engliſh, Crabbe-graſſe, and Frogge-graſſe.

¶ *The Temperature.*

Glaſſe-woort is hot and drie: the aſhes are both drier and hotter, and that euen to the fourth degree: the aſhes haue a cauſticke or burning qualitie.

¶ *The Vertues.*

A A little quantitie of the herbe taken inwardly, doth not onely mightily prouoke vrine, but in like ſort caſteth forth the dead childe. It draweth forth by ſiege wateriſh humours, and purgeth away the dropſie.

B A great quantitie taken is miſchieuous and deadly. The ſmell and ſmoke alſo of this hearbe being burnt doth driue away ſerpents.

C The aſhes are likewiſe tempered with thoſe medicines that ſerue to take away ſcabs and filth off the skin: it eaſily conſumeth proud and ſuperfluous fleſh that groweth in poiſonſome vlcers, as *Auicen* and *Serapio* report.

D Wee read in the copies of *Serapio*, that Glaſſe-woort is a tree ſo great, that a man may ſtand vnder the ſhadow thereof: but it is very like, that this errour proceedeth rather from the interpreter, than from the Authour himſelfe.

E The floure of Chriſtall, or (as they commonly terme it, Sandeuer) doth wonderfully drie. It eaſily taketh away ſcabbes and mangineſſe, if the foule parts be waſhed and bathed with the water wherein it is boiled.

Chap. 156. *Of Thorow Waxe.*

1 *Perfoliata vulgaris.*
Common Thorow-waxe.

2 *Perfoliata ſiliquoſa.*
Codded Thorow-waxe

¶ The

¶ *The Deſcription.*

1 THorow-wax or Thorow-leafe, hath a round, ſlender, and brittle ſtalk, diuided into many ſmall branches, which paſſe or goe thorow the leaues, as though they had beene drawne or thruſt thorow, and to make it more plaine, euery branch doth grow thorow euery leafe, making them like hollow cups or ſaucers. The ſeed groweth in ſpokie tufts or rundles like Dill, long and blackiſh. The floures are of a faint yellow colour. The root is ſingle, white and threddie.

2 Codded Thorow-wax reckoned by *Dodonæus* among the Braſſickes or Colewoorts, and making it a kinde thereof, and calling it *Braſſica ſylueſtris perfoliata*: though in mine opinion without reaſon, ſith it hath neither ſhape, affinitie, nor likeneſſe with any of the Colewoorts, but altogether moſt vnlike, reſembling very well the common Thorow-wax; whereunto I rather refer it. It hath ſmall, tender, and brittle ſtalkes two foot high, bearing leaues, which wrap and incloſe themſelues round about, although they do not run thorow as the other do, yet they grow in ſuch manner, that vpon the ſudden view thereof, they ſeeme to paſſe thorow as the other: vpon the ſmall branches do grow little white floures: which being paſt, there ſucceed ſlender and long cods like thoſe of Turneps or Nauewes, whoſe leaues and cods do ſomewhat reſemble the ſame, from whence it hath the name *Napifolia*, that is, Thorow-wax with leaues like vnto the Nauew. The root is long and ſingle, and dieth when it hath brought forth his ſeed.

There is a wilde kinde hereof growing in Kent, in many places among the corne, like to the former in each reſpect, but altogether leſſer: the which no doubt brought into the garden would proue the very ſame.

¶ *The Place.*

‡ The firſt deſcribed growes plentifully in many places about Kent, and betweene Farningham and Ainsford it growes in ſuch quantitie (as I haue been informed by M^r. *Bowles*) in the corne fields on the tops of the hils, that it may well be termed the infirmitie of them.

The later growes not wilde with vs that euer I could finde, though *Lobell* ſeemes to affirme the contrary. ‡

They grow in the gardens of Herbariſts, and in my garden likewiſe.

¶ *The Time.*

They floure in May and Iune, and their ſeed is ripe in Auguſt.

¶ *The Names.*

1 It hath beene called from the beginning *Perfoliata*, becauſe the ſtalke doth paſſe thorow the leafe, following the ſignification of the ſame: wee call it in Engliſh, Thorow-waxe, or Thorow-leafe.

‡ 2 This by the moſt and beſt part of VVriters (though our Authour be of another opinion) is very fitly referred to the wilde Cole-woorts, and called *Braſſica campeſtris* by *Cluſius* and by *Camerarius*; *Braſſica agreſtis* by *Tragus*: yet *Lobel* calleth it *Perfoliata Napifolia Anglorum ſiliquoſa*. ‡

The Temperature.

Thorow-waxe is of a dry complexion.

¶ *The Vertues.*

The decoction of Thorow-wax made of water or wine, healeth wounds. The iuice is excellent for wounds made either into an oile or vnguent. A

The greene leaues ſtamped, boiled with wax, oile, roſine and turpentine, maketh an excellent vnguent or ſalue to incarnate, or bring vp fleſh in deepe wounds. B

Chap. 157. *Of Honie-woort.*

¶ *The Deſcription.*

1 *Cerinthe* or Honie-woort riſeth forth of the ground after the ſowing of his ſeed, with two ſmall leaues like thoſe of Baſil, betweene the which leaues commeth forth a thick fat, ſmooth, tender, and brittle ſtalk full of iuice, that diuideth it ſelfe into many other branches; which alſo are diuided in ſundry other armes or branches likewiſe, crambling or leaning toward the ground, being not able without props to ſuſtaine it ſelfe, by reaſon of the great weight

1 *Cerinthe maior.*
Great Honie-woort.

‡ 2 *Cerinthe aſperior flore flavo.*
Rough Honie-woort.

3 *Cerinthe minor.*
Small Honie-woort.

of leaues, branches, & much iuice, the whole plant is ſurcharged with; vpon which branches are placed many thicke rough leaues, ſet with very ſharpe prickles like the rough skinne of a Thornebacke, of a blewiſh green colour, ſpotted very notably with white ſtrakes and ſpots, like thoſe leaues of the true *Pulmonaria* or Cowſlips of Ieruſalem, and in ſhape like thoſe of the codded Thorow-waxe, which leaues do clip or embrace the ſtalkes round about: from the boſome whereof come forth ſmall cluſters of yellow floures, with a hoope or band of bright purple round about the middle of the yellow floure. The floure is hollow, faſhioned like a little boxe, of the taſte of honie when it is ſucked, in the hollowneſſe whereof are many ſmal chiues or threds; which being paſt, ther ſucceed round blacke ſeed, contained in ſoft skinnie husks. The root periſheth at the firſt approch of Winter. ‡ This varies in the colour of the floures, which are yellow, or purple, and ſometimes of both commixt. ‡

‡ 2 The leaues of this other great Honie-wort (of *Cluſ.* deſcription) are ſhaped like thoſe laſt deſcribed, but that they are narrower at their ſetting on, and rougher; the floures are alſo yellow of color, but in ſhape & magnitude like the former, as it is alſo in the ſeeds, & all the other parts thereof. ‡

3 This

3 This other *Cerinth* or Honywort hath ſmall long and ſlender branches, reeling this way and that way, as not able to ſuſtaine it ſelfe, very brittle, beſet with leaues not much vnlike the precedent, but leſſer, neither ſo rough nor ſpotted, of a blewiſh greene colour. The floures be ſmall, hollow, and yellow. The ſeed is ſmall, round, and as blacke as Iet: the root is white, with ſome fibres, the which dieth as the former. There is a taſte as it were of new wax in the floures or leaues chewed, as the name doth ſeeme to import.

¶ *The Place.*

Theſe plants do not grow wilde in England, yet I haue them in my garden; the ſeeds wherof I receiued from the right honorable the Lord *Zouch*, my honorable good friend.

¶ *The Time.*

They floure from May to Auguſt, and periſh at the firſt approch of Winter, and muſt be ſowen againe the next Spring.

‡ ¶ *The Names.*

‡ 1 The firſt of theſe by *Geſner* is called *Cynogloſſa montana* and *Cerinthe*: *Dodonæus* calleth it *Maru herba*: and *Lobel* and others, *Cerinthe major*.

2 The ſecond is *Cerinthe quorundam major flauo flore* of *Cluſius*.

3 The third by *Dodonæus* is called *Maru herba minor*: and by *Cluſius*, *Cerinthe quorundam minor flauo flore*: *Lobel* alſo calls it *Cerinthe minor*. ‡

¶ *The Temperature and Vertues.*

Pliny and *Auicen* ſeeme to agree, that theſe herbes are of a cold complexion; notwithſtanding there is not any experiment of their vertues worth the writing.

CHAP. 158. *Of S. Iohns wort.*

1 *Hypericum.*
S. Iohns wort.

2 *Hypericum Syriacum.*
Rew S. Iohns wort.

¶ *The*

¶ *The Deſcription.*

1 SAint Iohns wort hath browniſh ſtalkes beſet with many ſmall and narrow leaues, which if you behold betwixt your eyes and the light do appeare as it were bored or thruſt thorow in an infinite number of places with pinnes points. The branches diuide themſelues into ſundry ſmall twigs, at the top whereof doe grow many yellow floures, which with the leaues bruiſed do yeeld a reddiſh iuyce of the colour of bloud. The ſeed is contained in little ſharpe pointed huskes, blacke of colour, and ſmelling like Roſin. The root is long, yellow, and of a wooddy ſubſtance.

2 The ſecond kinde of S. Iohns wort named *Syriacum*, of thoſe that haue not ſeene the fruitfull and plentifull fields of England, wherein it groweth aboundantly, hauing ſmall leaues almoſt like to Rew or Herbe-Grace: wherein *Dodonæus* hath failed, entituling the true *Androſæmum* by the name of *Ruta ſylueſtris*; whereas indeed it is no more like Rew than an Apple to an Oiſter. This plant is altogether like the precedent, but ſmaller, wherein conſiſteth the difference. ‡ It had beene fitter for our Author to haue giuen vs a better and perfecter deſcription of this plant (which as he ſaith growes ſo aboundantly with vs) than ſo abſurdly to cauill with *Dodonæus*, for calling, as he ſaith, the true *Androſæmum*, *Ruta ſylueſtris*: for if that be the true *Androſæmum* which *Dodonæus* made mention of by the foreſaid name, why did not our Author figure and deſcribe it in the next chapter ſaue one, for *Androſæmum*, but followed *Dodonæus* in figuring and deſcribing *Tutſan* for it? See more hereof in the chapter of *Tutſan*. I cannot ſay I haue ſeene this plant; but *Lobel* the Author and ſetter forth thereof thus briefely deſcribes it: the leaues are foure times leſſer than thoſe of ours, which grow thicke together as in rundles vpon ſtalkes, being a cubit high. The floures are yellow, and like thoſe of our common kinde. ‡

3 Woolly S. Iohns wort hath many ſmall weake branches trailing vpon the ground, beſet with many little leaues, couered ouer with a certaine ſoft kinde of downineſſe: among which commeth forth weake and tender branches charged with ſmall pale yellow floures. The ſeeds and roots are like vnto the true S. Iohns wort.

‡ 3 *Hypericum tomentoſum Lobelij.* *Lobels* woolly S. Iohns wort.

‡ The figure that our Author gaue was of that which I here giue you ſecond in the third place, vnder the title of *Hyper. tomen. Cluſij*; for *Cluſius* ſaith it was his, and blames *Lobel* for making it all one with that he found about Montpelier; whoſe figure alſo I giue you firſt in the third place, that you may ſee what difference you can obſerue by them: for *Cluſius* ſaith *Lobels* is but an handfull high; yet tells he not vs how high his growes, neither inſtances how they differ, neither can I gather it by *Lobels* deſcription: but I conie&ture it is thus; That of *Cluſius* his deſcription is taller, more white and hairy, and hath the floures growing along little foot-ſtalks, and not in manner of an vmbel, as in the other.

‡ 4 Beſides theſe two creeping hoary S. Iohns worts here deſcribed, there is another ſmall kinde which is called by *Dodonæus*, *Hypericum minus*; and by *Lobel*, *Hypericum minimum ſupinum Septentrionale*. It growes ſome handfull or more high, with weake and ſlender branches ſet with leaues like thoſe of the ordinarie kinde, but leſſe: the floures are alſo like thoſe of the firſt deſcribed, but fewer in number, and leſſe. It is to be found in dry and barren grounds, and floures at the ſame time as the the former.

5 I haue obſerued growing in S. Iohns wood and other places, that kinde of S. Iohn Wort which

which by *Tragus* is called *Hypericum pulchrum*; and both by him and *Lonicerus* is thought to be *Dioſcorides* his *Androſæmum*; the which we in Engliſh may for diſtinctions ſake call Vpright Saint Johns wort. It hath roots like thoſe of the ordinarie kinde; from which ariſe ſtraight ſlender ſtalks ſome cubit high, ſet at equall ſpaces with pretty ſmooth leaues, broad, and almoſt incompaſſing the ſtalke at their ſetting on, and being ſometimes of a green, and otherwhiles of a reddiſh colour: towards the top they are parted into ſome few branches, which beare ſuch yellow floures as the common kinde, but ſomewhat ſmaller. It floures about the ſame time as the former, or a little after. ‡

3 *Hypericum tomentoſum Cluſij.*
Woolly S. Iohns wort of *Cluſius*.

‡ 4 *Hypericum ſupinum glabrum.*
Small creeping S. Iohns wort.

¶ *The Place.*

They grow very plentifully in the paſtures in euery countrey.

¶ *The Time.*

They floure and flouriſh for the moſt part in Iuly and Auguſt.

¶ *The Names.*

S. Iohns wort is called in Greeke ὑπέρικον: in Latine, *Hypericum*: in ſhops, *Perforata*: of diuers, *Fuga dæmonum*: in Dutch, **San Johans kraut**: in Italian, *Hyperico*: in Spaniſh, *Caraconzillo*: in French, *Mille Pertuys*: in Engliſh, S. Iohns wort, or S. Iohns graſſe.

¶ *The Temperature.*

S. Iohns wort (as *Galen* teacheth) is hot and dry, being of ſubſtance thinne.

¶ *The Vertues.*

S. Iohns wort with his floures and ſeed boyled and drunken, prouoketh vrine, and is right good A againſt the ſtone in the bladder, and ſtoppeth the laske. The leaues ſtamped are good to be layd vpon burnings, ſcaldings, and all wounds; and alſo for rotten and filthy vlcers.

The leaues, floures, and ſeeds ſtamped, and put into a glaſſe with oyle Oliue, and ſet in the hot B Sunne for certaine weekes together, and then ſtrained from thoſe herbes, and the like quantitie of new put in, and ſunned in like manner, doth make an oyle of the colour of bloud, which is a moſt precious remedy for deepe wounds, and thoſe that are thorow the body, for ſinewes that are prickt, or any wound made with a venomed weapon. I am accuſtomed to make a compound oyle hereof; the making of which ye ſhall receiue at my hands, becauſe that I know in the world there is not a better, no not naturall balſam it ſelfe; for I dare vndertake to cure any ſuch wound as abſolutely in each reſpect, if not ſooner and better, as any man whatſoeuer ſhall or may with naturall balſam.

Take white wine two pintes, oyle oliue foure pounds, oile of Turpentine two pounds, the leaues, C floures, and ſeeds of S. Iohns wort, of each two great handfulls gently bruiſed; put them all together into a great double glaſſe, and ſet it in the Sunne eight or ten dayes; then boyle them in the ſame glaſſe *per balneum Mariæ*, that is, in a kettle of water with ſome ſtraw in the bottome, wherein the glaſſe muſt ſtand to boyle: which done, ſtraine the liquor from the herbes, and do as you did before, putting in the like quantitie of herbes, floures, and ſeeds, but not any more wine. And ſo haue you a great ſecret for the purpoſes aforeſaid.

Dioſcorides

E *Dioſcorides* ſaith, That the ſeed drunke for the ſpace of fourty dayes together, cureth the *Sciatica*, and all aches that happen in the hips.

F The ſame Author ſaith, That being taken with Wine it taketh away Tertian and Quartane Agues.

Chap. 159.

Of Saint Peters wort, or ſquare S. Johns Graſſe.

1 *Aſcyron.*
S. Peters wort.

¶ *The Deſcription.*

1 SAint Peters wort groweth to the height of a cubit and a halfe, hauing a ſtraight vpright ſtalke ſomewhat browne, ſet by couples at certaine diſtances, with leaues much like thoſe of S. Iohns wort, but greater, rougher, and rounder pointed: from the boſome of which leaues come forth many ſmaller leaues, the which are not bored through, as thoſe of S. Iohns wort are; yet ſometime there be ſome few ſo bored through. The floures grow at the top of the branches of a yellow colour: the leaues and floures when they are bruiſed do yeeld forth a bloudy iuyce as doth S. Iohns wort, whereof this is a kinde. The root is tough, and of a wooddy ſubſtance.

‡ 2 Vpon diuers boggy grounds of this kingdome is to be found growing that S. Peters Wort which *Cluſius* deſcribes in his *Auctarium*, by the name of *Aſcyrum ſupinum* &c. This ſends forth diuers round hairy creeping ſtalkes, which heere and there put out new fibres or roots; and theſe are ſet at certaine ſpaces with very round and hairie leaues of a whitiſh colour, two at a ioynt, and on the tops of theſe ſtalkes grow a few ſmall yellow floures which conſiſt of fiue leaues a piece; theſe ſtalks ſeldome ſend forth branches, vnleſſe it be one or two at the tops. It may well be called in Engliſh, Round leaued S. Peters wort. ‡

¶ *The Place.*

S. Peters wort, or S. Iohns Graſſe groweth plentifully in the North part of England, eſpecially in Landſdale and Crauen: I haue found it in many places of Kent, eſpecially in a copſe by Maſter *Sidleys* houſe neere Southfleet.

¶ *The Time.*

It floureth and flouriſheth when S. Iohns wort doth.

¶ *The Names.*

It is called in Greeke ἀσκυρον: the Latines haue no other name but this Greeke name *Aſcyron*. It is called of ſome *Androſæmum*: *Galen* maketh it both a kinde of Tutſan, and S. Iohns Wort: and ſaith it is named *Aſcyron*, and *Aſcyroides*: in Engliſh, S. Peters wort, Square or great S. Iohns graſſe: and of ſome, Hardhay. Few know it from S. Iohns wort.

¶ *The Temperature.*

This herbe is of temperature hot and dry.

¶ *The Vertues.*

A It is endued with the ſame vertues that S. Iohns wort is endued withall. The ſeed, ſaith *Dioſcorides*, being drunke in foure ounces and a halfe of Meade, doth plentifully purge by ſiege cholericke excrements. *Galen* doth likewiſe affirme the ſame.

Chap.

Chap. 160. *Of Tutſan or Parke-leaues.*

¶ *The Deſcription.*

1 THe ſtalkes of Tutſan be ſtraight, round, chamfered or creſted, hard and wooddy, being for the moſt part two foot high. The leaues are three or foure times bigger than thoſe of S. Iohns wort, which be at the firſt greene; afterwards, and in the end of Sommer of a dark red colour: out of which is preſſed a iuyce not like blacke bloud, but Claret or Gaſcoigne wine. The floures are yellow, and greater than thoſe of S. Peters wort; after which riſeth vp a little round head or berry, firſt greene, afterwards red, laſt of all blacke; wherein is contained yellowiſh red ſeed. The root is hard, wooddy, and of long continuance.

‡ 2 This (which *Dodonæus* did not vnfitly call *Ruta ſylueſtris Hypericoides*, and which others haue ſet forth for *Androſæmum*, and our Author the laſt chapter ſaue one affirmed to be the true *Androſæmum*, though here it ſeemes he had either altered his minde, or forgot what he formerly wrot) may fitly ſtand in competition with the laſt deſcribed, which may paſſe in the firſt place for the *Androſæmum* of the Antients; for *adhuc ſub judice lis eſt*. I will not here inſiſt vpon the point of controuerſie, but giue you a deſcription of the plant, which is this. It ſends vp round ſlender reddiſh ſtalkes ſome two cubits high, ſet with fewer yet bigger leaues than the ordinarie S. Iohns Wort, and theſe alſo more hairy: the floures and ſeeds are like thoſe of the common S. Iohns wort, but ſomewhat larger. It growes in ſome mountainous and wooddy places; and in the *Aduerſaria* it is called *Androſæmum excellentius, ſeu magnum*: and by *Dodonæus* (as we but now noted) *Ruta ſylueſtris Hypericoides*, thinking it to be the *Ruta ſylueſtris* which is deſcribed by *Dioſcorides, lib. 3. cap.* 48. in the old Greeke edition of *Manutius*, Κιφ. υμζ. And in that of *Marcellus Virgilius* his Interpretation, in the chapter and booke but now mentioned; but reiected amongſt the *Notha* in the Paris Edition *Anno* 1549. You may finde the deſcription alſo in *Dodonæus, Pempt. primæ, lib.* 3. *cap.* 25. whither I refer the curious, being loath here to inſiſt further vpon it. ‡

1 *Clymenon Italorum.*
Tutſan, or Parke leaues.

‡ 2 *Androſæmum Hypericoides.*
Tutſan S. Iohns wort.

¶ *The*

¶ *The Place.*

Tutſan groweth in woods and by hedges, eſpecially in Hampſted wood, where the Golden rod doth grow; in a wood by Railie in Eſſex, and many other places.

¶ *The Time.*

It floureth in Iuly and Auguſt: the ſeed in the meane time waxeth ripe. The leaues becom cred in Autumne; at that time is very eaſily preſſed forth his winie iuyce.

¶ *The Names.*

It is called in Greeke αἰθεγενίων: and the Latines alſo *Androſæmon*: it is likewiſe called *Dionyſias*, as *Galen* witneſſeth. They are farre from the truth that take it to be *Clymenum*, and it is needleſſe to finde fault with their error. It is alſo called *Siciliana*, and *Herba Siciliana*: in Engliſh, Tutſan, and Parke-leaues.

¶ *The Temperature.*

The faculties are ſuch as S. Peters wort, which doth ſufficiently declare it to be hot and dry.

¶ *The Vertues.*

A The ſeed hereof beaten to pouder, and drunke to the weight of two drams, doth purge cholericke excrements, as *Dioſcorides* writeth; and is a ſingular remedie for the Sciatica, prouided that the Patient do drinke water for a day or two after purging.

B The herbe cureth burnings, and applied vpon new wounds it ſtancheth the bloud, and healeth them.

C The leaues laid vpon broken ſhins and ſcabbed legs healeth them, and many other hurts and griefes, whereof it tooke his name Tout-ſaine, or Tutſane, of healing all things.

‡ Chap. 161. *Of Baſtard S. Johns wort.*

‡ 1 *Coris Matthioli.*
Matthiolus his baſtard S. Iohns wort.

‡ 2 *Coris cærulea Monſpeliaca.*
French baſtard S. Iohns wort.

‡ THe diligence of theſe later times hath beene ſuch to finde out the *Materia medica* of the Antients, that there is ſcarſe any plant deſcribed by them, but by ſome or other of late there haue been two or more ſeuerall plants referred thereto: and thus it hath happened vnto that which

which *Dioſcorides lib. 3. cap. 174.* hath ſet forth by the name of *Coris*; and preſently deſcribes after the kindes of *Hypericon*, and that with theſe words; ἡ δὲ τῶν ὑπερίκων καλουμένη. Some alſo call this *Hypericon*; to which *Matthiolus* and others haue fitted a plant, which is indeed a kinde of *Hypericon*, as you may perceiue by the figure and deſcription which I giue you in the firſt place. Some (as *Hyſychius*) referre it to *Chamæpytis*, (and indeed by *Dioſcorides* it is placed betweene *Androſæmon* and *Chamæpytis*) and to this that which is deſcribed by *Pena* and *Lobel* in the *Aduerſ.* and by *Cluſius* in his Hiſtorie, may fitly be referred: this I giue you in the ſecond place.

¶ *The Deſcription.*

1 THe firſt hath a wooddy thicke and long laſting root, which ſendeth vp many branches ſome foot or more high, and it is ſet at certaine ſpaces with round leaues like thoſe of the ſmall Glaſſe-wort or Sea-Spurry, but ſhorter: the tops of the ſtalkes are diuided into ſundrie branches, which carry floures like thoſe of S. Iohns wort, of a whitiſh red colour, with threds in their middles hauing little yellow pendants. It growes in Italy and other hot countries, in places not far from the ſea ſide. This is thought to be the true *Coris*, by *Matthiolus*, *Geſner*, *Lonicerus*, *Lacuna*, *Bellus*, *Pona*, and others.

2 This from a thicke root red on the outſide ſendeth vp ſundry ſtalkes, ſome but an handfull, other ſome a foot or more long, ſtiffe, round, purpliſh, ſet thicke with leaues like thoſe of Heath, but thicker, more ſucculent and bitter, which ſometimes grow orderly, and otherwhiles out of order. The ſpikes or heads grow on the tops of the branches, conſiſting of a number of little cups, diuided into fiue ſharpe points, and marked with a blacke ſpot in each diuiſion: out of theſe cups comes a floure of a blew purple colour, of a moſt elegant and not fading colour; and it is compoſed of foure little bifide leaues, whereof the two vppermoſt are the larger: the ſeed, which is round and blackiſh, is contained in ſeed-veſſels hauing points ſomewhat ſharpe or prickly. It floures in Aprill and May, and is to be found growing in many places of Spaine, as alſo about Mompelier in France; whence *Pena* and *Lobel* called it *Coris Monſpeliaca*; and *Cluſius*, *Coris quorundam Gallorum & Hiſpanorum*.

¶ *The Temperature.*

Theſe Plants ſeeme to be hot in the ſecond or third degree,

¶ *The Vertues.*

Dioſcorides ſaith, That the ſeed of *Coris* drunke moue the courſes and vrine, are good againſt the biting of the Spider *Phalangium*, the Sciatica; and drunke in Wine, againſt that kinde of Convulſion which the Greekes call *Opiſthotonos*, (which is when the body is drawne backwards) as alſo againſt the cold fits in Agues. It is alſo good anointed with oyle, againſt the aforeſaid Convulſion. ‡ A

CHAP. 162. *Of the great Centorie.*

¶ *The Deſcription.*

1 THe great Centory bringeth forth round ſmooth ſtalkes three cubits high: the leaues are long, diuided as it were into many parcels like to thoſe of the Walnut tree, and of an ouerworne grayiſh colour, ſomewhat ſnipt about the edges like the teeth of a ſaw. The floures grow at the top of the ſtalks in ſcaly knaps like the great Knapweed, the middle thrums whereof are of a light blew or ſky colour: when the ſeed is ripe the whole knap or head turneth into a downy ſubſtance like the head of an Artichoke, wherein is found a long ſmooth ſeed, bearded at one end like thoſe of Baſtard Saffron, called *Cartamus*, or the ſeed of *Cardus Benedictus*. The root is great, long, blacke on the outſide, and of a ſanguine colour on the inſide, ſomewhat ſweet in taſte, and biting the tongue.

2 There is likewiſe another ſort, hauing great and large leaues like thoſe of the water Docke, ſomewhat ſnipt or toothed about the edges. The ſtalke is ſhorter than the other, but the root is more oleous or fuller of iuyce, otherwiſe like. The floure is of a pale yellow purpliſh colour, and the ſeed like that of the former.

1 *Centaurium magnum.*
Great Centorie.

‡ 2 *Centaurium maius alterum.*
Whole leaued great Centorie.

¶ *The Place.*

The great Centorie ioyeth in a fat and fruitfull ſoile, and in Sunny bankes full of Graſſe and herbes. It groweth very plentifully, ſaith *Dioſcorides*, in Lycia, Peloponneſus, Arcadia, and Morea: and it is alſo to be found vpon Baldus a mountaine in the territories of Verona, and likewiſe in my garden.

¶ *The Time.*

It floureth in Sommer, and the roots may be gathered in Autumne.

¶ *The Names.*

It is called in Greeke Κεντάυριον μικρὸν: of *Theophraſtus* alſo *Centauris*: in diuers ſhops falſly *Rha Ponticum*: for *Rha Ponticum* is *Rha* growing in the countries of Pontus; a plant differing from great Centorie. *Theophraſtus* and *Pliny* ſet downe among the kindes of *Panaces* or All-heales, this great Centorie, and alſo the leſſer, whereof we will write in the next chapter following. *Pliny* reciting the words of *Theophraſtus*, doth in his twenty fifth booke and fourth chapter write, that they were found out by *Chiron* the Centaure, and ſyrnamed *Centauria*. Alſo affirming the ſame thing in his ſixth chapter (where he more largely expoundeth both the Centauries) hee repeateth them to be found out by *Chiron*: and thereupon he addeth, that both of them are named *Chironia*. Of ſome it is reported, That the ſaid *Chiron* was cured therewith of a wound in his foot, that was made with an arrow that fell vpon it when he was entertaining *Hercules* into his houſe; whereupon it was called *Chironium*: or of the curing of the wounds of his ſouldiers, for the which purpoſe it is moſt excellent.

¶ *The Temperature.*

It is hot and dry in the third degree. *Galen* ſaith, by the taſte of the root it ſheweth contrarie qualities, ſo in the vſe it performeth contrarie effects.

¶ *The Vertues.*

A The root taken in the quantitie of two drams is good for them that be burſten, or ſpit bloud; againſt the crampe and ſhrinking of ſinewes, the ſhortneſſe of wind or difficultie of breathing, the cough and gripings of the belly.

B There is not any part of the herbe but it rather worketh miracles than ordinarie cures in greene wounds; for it ioyneth together the lips of ſimple wounds in the fleſh, according to the firſt intention, that is, glewing the lips together, not drawing to the place any matter at all.

The

The root of this Plant (ſaith *Dioſcorides*) is a remedie for ruptures, conuulſions, and cramps, taken in the weight of two drams, to be giuen with wine to thoſe that are without a feuer, and vnto thoſe that haue, with water. A

Galen ſaith, that the iuyce of the leaues thereof performeth thoſe things that the root doth; which is alſo vſed in ſtead of *Lycium*, a kinde of hard iuyce of a ſharpe taſte. B

Chap. 163. *Of Small Centorie.*

¶ *The Deſcription.*

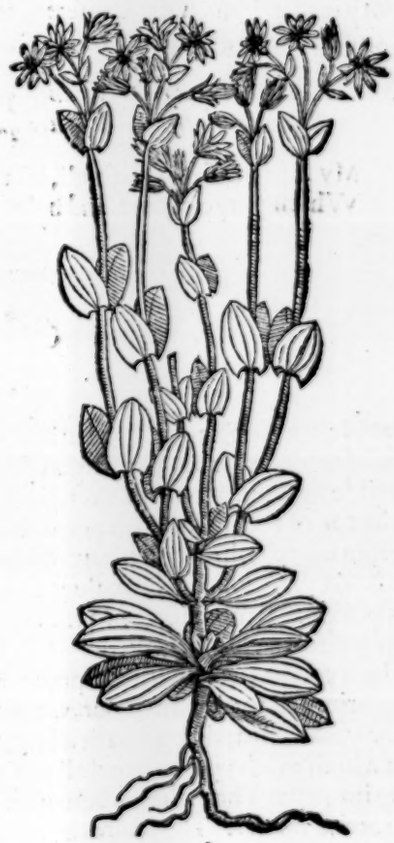
1 THe leſſer Centorie is a little herbe: it groweth vp with a cornered ſtalke halfe a foot high, with leaues in forme and bigneſſe of S. Iohns wort: the floures grow at the top in a ſpoky buſh or rundle, of a red colour tending to purple; which in the day time and after the Sun is vp do open themſelues, but towards euening ſhut vp againe: after them come forth ſmall ſeed-veſſels, of the ſhape of wheat cornes, in which are contained very little ſeeds. The root is ſlender, hard, and ſoone fading.

2 The yellow Centorie hath leaues, ſtalkes, and ſeed like the other, and is in each reſpect alike, ſauing that the floures hereof are of a perfect yellow colour, which ſetteth forth the difference.

‡ This is of two ſorts; the one with broad leaues through which the ſtalkes paſſe; and the other hath narrow leaues like thoſe of the common Centorie. ‡

1 *Centaurium parvum.*
Small Centorie.

2 *Centaurium parvum luteum Lobelij.*
Yellow Centorie.



¶ *The Place.*

1 The firſt is growing in great plenty throughout all England, in moſt paſtures and graſſie fields.

2 The yellow doth grow vpon the chalkie cliffes of Greenhithe in Kent, and ſuch like places.

¶ *The Time.*

They are to be gathered in their flouring time, that is in Iuly and Auguſt: of ſome that gather them ſuperſtitiouſly they are gathered betweene the two Lady dayes.

¶ *The Names.*

The Greekes call this Κενταυριον μικρὸν: in Latine it is called *Centaurium minus*; yet *Pliny* nameth it *Libadion*, and by reaſon of his great bitterneſſe, *Fel terræ*. The Italians in Hetruria call it *Biondella*: in Spaniſh, *Centoria*: in low-Dutch, **Centorye**: in Engliſh, Small, little, or common Centorie: in French, *Centoire*.

¶ *The Temperature.*

The ſmall Centorie is of a bitter qualitie, and of temperature hot and dry in the ſecond degree; and the yellow Centorie is hot and dry in the third degree.

¶ *The Vertues.*

A Being boyled in water and drunke it openeth the ſtoppings of the liuer, gall, and ſpleene, it helpeth the yellow jaundice, and likewiſe long and lingering agues: it killeth the wormes in the bellie; to be briefe, it cleanſeth, ſcoureth, and maketh thinne humors that are thicke, and doth effectually performe whatſoeuer bitter things can.

B *Dioſcorides*, and *Galen* after him report, that the decoction draweth downe by ſiege choler and thicke humors, and helpeth the Sciatica; but though wee haue vſed this often and luckily, yet could we not perceiue euidently that it purges by the ſtoole any thing at all, and yet it hath performed the effects aforeſaid.

C This Centorie being ſtamped and laid on whileſt it is freſh and greene, doth heale and cloſe vp greene wounds, cleanſeth old vlcers, and perfectly cureth them.

D The iuyce is good in medicines for the eyes; mixed with honey it cleanſeth away ſuch things as hinder the ſight; and being drunke it hath a peculiar vertue againſt the infirmities of the ſinues, as *Dioſcorides* teacheth.

E The Italian Phyſitions do giue the pouder of the leaues of yellow Centorie once in three daies in the quantitie of a dram, with anniſe or caraway ſeeds, in wine or other liquor, which preuaileth againſt the dropſie and greene ſickneſſe. Of the red floured, *Ioannes Poſtius* hath thus written:

Flos mihi ſuaue rubet, ſed ineſt quoque ſuccus amarus,
Qui juvat obſeſſum bile, aperitque jecur.

My floure is ſweet in ſmell, bitter my iuyce in taſte,
Which purge choler, and helps liuer, that elſe would waſte.

Chap. 164. *Of Calues ſnout, or Snapdragon.*

¶ *The Deſcription.*

1 THe purple Snapdragon hath great and brittle ſtalks, which diuideth it ſelfe into many fragile branches, whereupon do grow long leaues ſharpe pointed, very greene, like vnto thoſe of wilde flax, but much greater, ſet by couples one oppoſite againſt another. The floures grow at the top of the ſtalkes, of a purple colour, faſhioned like a frogs mouth, or rather a dragons mouth, from whence the women haue taken the name Snapdragon. The ſeed is blacke, contained in round huskes faſhioned like a calues ſnout, (whereupon ſome haue called it Calues ſnout) or in mine opinion it is more like vnto the bones of a ſheeps head that hath beene long in the water, the fleſh conſumed cleane away.

2 The ſecond agreeth with the precedent in euery part, except in the colour of the floures, for this plant bringeth forth white floures, and the other purple, wherein conſiſts the difference.

3 The yellow Snapdragon hath a long thicke wooddy root, with certain ſtrings faſtned thereto; from which riſeth vp a brittle ſtalke of two cubits and a halfe high, diuided from the bottome to the top into diuers branches, whereupon doe grow long greene leaues like thoſe of the former, but greater and longer. The floures grow at the top of the maine branches, of a pleaſant yellow colour, in ſhape like vnto the precedent.

4 The ſmall or wilde Snapdragon differeth not from the others but in ſtature: the leaues are leſſer and narrower: the floures purple, but altogether ſmaller: the heads or ſeed-veſſels are alſo like thoſe of the former.

‡ 5 There is another kinde hereof which hath many ſlender branches lying oft times vpon the ground: the leaues are much ſmaller than theſe of the laſt deſcribed: the floures and ſeed-veſſels are alſo like, but much leſſer, and herein conſiſts the onely difference. ‡

¶ The

1. 2. *Antirrhinum purpureum ſiue album.*
Purple or white floured Snapdragon.

3 *Antirrhinum luteum.*
Yellow Snapdragon.

4 *Antirrhinum minus.*
Small Snapdragon.

‡ 5 *Antirrhinum minimum repens.*
Small creeping Snapdragon.

¶ *The Place.*

The three firſt grow in moſt gardens; but the yellow kinde groweth not common, except in the gardens of curious Herbariſts.

‡ The fourth and fifth grow wilde amongſt corne in diuers places. ‡

¶ *The Time.*

That which hath continued the whole Winter doth floure in May, and the reſt of Sommer afterwards; and that which is planted later, and in the end of Sommer, floureth in the ſpring of the following yeare: they do hardly endure the iniurie of our cold Winter.

¶ *The Names.*

Snapdragon is called in Greeke ἀντίρρινον: in Latine alſo *Antirrhinum*: of *Apuleius*, *Canis cerebrum*, *Herba Simiana*, *Veneſta minor*, *Opalis grata*, and *Orontium*: it is thought to be *Leo herba*, which *Columella*, *lib.* 10. reckons among the floures: yet *Geſner* hath thought that this *Leo* is *Columbine*, which for the ſame cauſe he hath called *Leontoſtomium*: but this name ſeemeth to vs to agree better with Calues ſnout than with Columbine; for the gaping floure of Calues ſnout is more like to Lyons ſnap than the floure of Columbine: it is called in Dutch Dzant: in Spaniſh, *Cabeza de ternera*: in Engliſh, Calues ſnout, Snapdragon, and Lyons ſnap: in French, *Teſte de chien*, and *Teſte de Veau*.

¶ *The Temperature.*

They are hot and dry, and of ſubtill parts.

¶ *The Vertues.*

A The ſeed of Snapdragon (as *Galen* ſaith) is good for nothing in the vſe of phyſicke; and the herb it ſelfe is of like facultie with *Bubonium* or Star-wort, but not ſo effectuall.

B They report (ſaith *Dioſcorides*) that the herbe being hanged about one preſerueth a man from being bewitched, and that it maketh a man gracious in the ſight of people.

C *Apuleius* writeth, that the diſtilled water, or the decoction of the herbe and root made in water, is a ſpeedy remedy for the watering of eyes proceeding of a hot cauſe, if they be bathed therewith.

Chap. 165. *Of Tode-Flax.*

1 *Linaria vulgaris lutea.*
Great Tode-flax.

2 *Linaria purpurea odorata.*
Sweet purple Tode-flax.

¶ *The*

¶ *The Deſcription.*

1 *Linaria* being a kinde of *Antyrrhinum*, hath ſmall, ſlender, blackiſh ſtalkes; from which do grow many long narrow leaues like flax. The floures be yellow, with a ſpur hanging at the ſame like vnto a Larkes ſpur, hauing a mouth like vnto a frogs mouth, euen ſuch as is to bee ſeene in the common Snapdragon; the whole plant before it come to floure ſo much reſembleth *Eſula minor*, that the one is hardly knowne from the other, but by this old verſe:

Eſula lacteſcit, ſine lacte Linaria creſcit:

‡ *Eſula* with milke doth flow,
Toad-flax without milke doth grow. ‡

2 The ſecond kinde of Tode-flax hath leaues like vnto *Bellis maior*, or the great Daſie, but not ſo broad, and ſomewhat iagged about the edges. The ſtalke is ſmall and tender, of a cubit high, beſet with many purple floures like vnto the former in ſhape. The root is long, with many threds hanging thereat, the floures are of a reaſonable ſweet ſauour.

3 The third, being likewiſe a kinde of Tode-flax, hath ſmall and narrow leaues like vnto the firſt kinde of *Linaria*: the ſtalke is a cubit high, beſet with floures of a purple colour, in faſhion like *Linaria*, but that it wanteth the taile or ſpurre at the end of the floure which the other hath. The root is ſmall and threddie.

† 4 *Linaria Valentina* hath leaues like the leſſer Centorye, growing at the bottome of the ſtalke by three and three, but higher vp towards the top, without any certaine order: the ſtalkes are of a foot high; and it is called by *Cluſius*, *Valentina*, for that it was found by himſelfe in *Agro Valentino*, about Valentia in Spaine, where it beareth yellow floures about the top of the ſtalke like common *Linaria*, but the mouth of the floure is downie, or moſſie, and the taile of a purple colour. It floureth at Valentia in March, and groweth in the medowes there, and hath not as yet been ſeene in theſe Northerne parts.

5 *Oſyris alba* hath great, thick, and long roots, with ſome threds or ſtrings hanging at the ſame, from which riſe vp many branches very tough and pliant, beſet towards the top with floures not much vnlike the common Toad-flaxe, but of a pale whitiſh colour, and the inner part of the mouth ſomewhat more wide and open, and the leaues like the common Tode-flax.

† 3 *Linaria purpurea altera.*
Variable Tode-flax.

† 4 *Linaria Valentia Cluſ.*
Tode-flax of Valentia.

† 6 *Oſyris*

† 5 *Oſyris alba, Lob.*
White Tode-flax.

6 Oſyris purpurocærulea is a kinde of Tode-flax that hath many ſmall and weake branches, trailing vpon the ground, beſet with many little leaues like flaxe. The floures grow at the top of the ſtalke like vnto the common kinde, but of a purple colour declining to blewneſſe. The root is ſmall and threddie.

‡ 7 This hath many ſmall creeping branches ſome handfull or better high, and hath ſuch leaues, floures, and ſeed, as the common kinde, but all of them much leſſe, and therein conſiſteth the difference. It growes naturally in the dry fields about Salamanca in Spaine, and floures all Sommer long. *Lobel* calls it *Oſyris flaua ſylueſtris*; and *Cluſius, Linaria Hiſpanica.*

8 The branches of this eight kind are ſpred vpon the ground, and of the length of thoſe of the laſt deſcribed: the leaues are leſſer than thoſe of the common Tode-flax, thicke, iuicie, and of a whitiſh greene colour, and they grow not diſorderly vpon the ſtalks, but at certaine ſpaces ſometimes three, but moſt vſually foure together: the floures in ſhape are like thoſe of the ordinarie kinde, but of a moſt perfect Violet colour, and the lower lip where it gapes of a golden yellow, the taſte is bitter. After the floures are paſt come veſſels round & thick, which contain a flat black ſeed in two partitions or cells: the root is ſlender, white, and long laſting, and it floures vnto the end of Autumne. It grows naturally vpon the higheſt Alps. *Geſner* cals it *Linaria Alpina:* and *Cluſius, Linaria tertia Styriaca.* ‡

† 6 *Oſyris Purpurocærulea repens.* Purple Tode-flaxe.

† 9 Foraſmuch as this plant is ſtalked and leafed like common Flaxe, and thought by ſome to be *Oſyris*; the new writers haue called it *Linoſyris*: it hath ſtalkes very ſtiffe and wooddie, beſet with leaues like the common *Linaria*, with floures at the top of the ſtalkes of a faint ſhining yellow colour, in forme and ſhape ſomewhat like vnto *Conyza maior*. The whole plant groweth to the height of two cubits, and is in taſte ſharpe and clammie, or glutinous, and ſomewhat bitter. The root is compact of many ſtrings, intangled one within another.

† 10 *Guillandinus* calleth this plant *Hyſſopus vmbellifera Dioſcoridis*, that is, *Dioſcorides* his Hyſſope,

ſope, which beareth a tuft in all points like *Linoſyris*, whereof it is a kinde, not differing from it in ſhew & leaues. The ſtalks are a cubit high, diuided aboue into many ſmall branches, the tops whereof are garniſhed with tufts of ſmall floures, each little floure being parted into fiue parts with a little thred or peſtell in the middle, ſo that it ſeemes full of many golden haires or thrums. The ſeed is long and blackiſh, and is carried away with the winde. ‡ *Bauhine* in his *Pinax* makes this all one with the former, but vnfitly, eſpecially if you marke the deſcriptions of their floures which are far vnlike. *Fabius Columna* hath proued this to be the *Chryſocome* deſcribed by *Dioſc. lib. 4. cap. 55.* ‡

‡ 7 *Oſyris flaua ſylueſtris.* Creeping yellow Tode-flax.

‡ 8 *Linaria quadrifolia ſupina.*
Foure leaued creeping Tode-flax.

† 9 *Linoſyris Nuperorum, Lob.*
Golden Star-floured Tode-flax.

† It Sco-

10 *Linaria aurea Tragi.*
Golden Tode-flax.

11 *Scoparia ſive Oſyris Græcorum.*
Buſhieor Beſome Tode-flax.

† 12 *Paſſerina linariæ folio, Lob.*
Sparrowes Tode-flax.

† 13 *Paſſerina altera.*
Sparrow-tongue.

‡ 14 *Linaria adulterina.*
Baſtard Tode-flax.

† 11 *Scoparia*, or after *Dodonæus*, *Oſyris*, which the Italians cal *Belvidere*, hath very many ſhoots or ſprigs riſing from one ſmal ſtalk, making the whole plant to reſemble a Cypres tree, the branches grow ſo handſomely: now it growes ſome three foot high, and very thick and buſhie, ſo that in ſome places where it naturally groweth they make beſomes of it, whereof it tooke the name *Scoparia*. The leaues be ſmall and narrow, almoſt like to the leaues of flax. The floures be ſmall, and of an hearbie colour, growing among the leaues, which keep greene all the Winter. ‡ I neuer knew it here to ripen the ſeed, nor to out-liue the firſt froſt. ‡

12 This plant alſo for reſemblance ſake is referred to the Linaries, becauſe his leaues be like *Linaria*. At the top of the ſmall branched ſtalks do grow little yellowiſh floures, pale of colour, ſomewhat like the tops of *Chryſocome*. *Iohn Mouton* of Turnay taketh it to be *Chryſocome altera*. And becauſe there hath bin no concordance among Writers, it's ſufficient to ſet forth his deſcription with his name *Paſſerina*. ‡ *Bauhine* refers it to the *Gromills*, and calls it *Lithoſpermum Linariæ folio Monſpeliacum*.

‡ 13 This which *Tabern.* calls *Lingua Paſſerina*, and whoſe figure was giuen by our Authour for the former, hath a ſmall ſingle whitiſh root, from which it ſends vp a ſlender ſtalke ſome cubit and halfe high, naked on the lower part, but diuided into little branches on the vpper, which branches are ſet thicke with little narrow leaues like thoſe of Winter Sauorie or Tyme: amongſt which grow many little longiſh ſeeds of the bigneſſe and taſte of Millet, but ſomewhat hotter and bitterer. The floures conſiſt of foure ſmall yellow leaues. *Tragus* calls this *Paſſerina*; *Dodonæus* makes it *Lithoſpermum minus*: and *Columna* hath ſet it forth by the name of *Linaria altera botryodes montana*. ‡

‡ 14 This which *Cluſius*, hath ſet forth by the name of *Anonymos*, or Nameleſſe, is called in the *Hiſt. Lugd. pag.* 1150. *Anthyllis montana*; and by *Tabern. Linaria adulterina*. It hath many hard pale greene branches of ſome foot high; and vpon theſe without any order grow many hard narrow long leaues like thoſe of flaxe, at firſt of a very tart, and afterwards of a bitteriſh taſte: the tops of the ſtalkes are branched into ſundry foot-ſtalkes, which carry little white floures conſiſting of fiue ſmall leaues lying ſtarre-faſhion, with ſome threds in their middles: after which at length come ſingle ſeeds fiue cornered, containing a white pith in a hard filme or skin. The root is white, diuided into ſundry branches, and liues long, euery yeare ſending vp many ſtalkes, and ſometimes creeping like that of Tode-flax. It floures in May, and grows vpon mountainous places of Germany; M^r. *Goodyer* found it growing wilde on the ſide of a chalkie hill in an incloſure on the right hand of the way, as you goe from Droxford to Poppie hill in Hampſhire. ‡

¶ *The Place.*

The kindes of Tode-flax grow wilde in many places, as vpon ſtone walls, grauelly grounds, barren medowes, and along by hedges.

‡ I do not remember that I haue ſeene any of theſe growing wilde with vs, vnleſſe the firſt ordinary kinde, which is euery where common. ‡

¶ *The Time.*

They floure from Iune to the end of Auguſt.

¶ *The Names.*

† Tode-flax is called of the Herbariſts of our time, *Linaria*, or Flax-weed, and *Vrinalis*: of ſome, *Oſyris*, in high Dutch, **Lynkraut**, and **Onſer fraumen flaſch**: low Dutch, **Wilt Vlas**: in Engliſh, Wild-flax, Tode-flax, and Flax-weed: the eleuenth is called in Italian, *Bel-videre*, or Faire in ſight. The ſame plant is alſo called *Scoparia*, and *Herba ſtudioſorum*, becauſe it is a fit thing to make brooms of,

of,wherewith ſchollers and ſtudents may ſweepe their owne ſtudies and cloſets. The particular names are expreſſed both in Latine and Engliſh in their ſeuerall titles, whereby they may be diſtinguiſhed.‡ It is thought by moſt that this *Belvidere*,or *Scoparia* is the *Oſyris* deſcribed by *Dioſcorides lib.4.cap.143.* For beſides the notes,it hath agreeing with the deſcription:it is at this day by the Greeks called ἀξυρις. ‡

¶ *The Temperature.*

The kindes of Tode-flax are of the ſame temperature with wilde Snap-dragons,whereof they are kindes.

¶ *The Vertues.*

A The decoction of Tode-flax taketh away the yellowneſſe and deformitie of the skinne, beeing waſhed and bathed therewith.

B The ſame drunken, openeth the ſtoppings of the Liuer and ſpleene,and is ſingular good againſt the iaundiſe which is of long continuance.

C The ſame decoction doth alſo prouoke vrine,in thoſe that piſſe drop after drop,vnſtoppeth the kidneies and bladder.

† The figure in this chapter were moſt of them falſe placed,as thus: The third was of *Linaria Pannonica* 1. of *Cluſius*,being the *Linaria alba* of *Lobel*,deſcribed in the fifth place.The fourth was of the *Oſyris flauaſyl.* of *Lobel*,deſcribed here by me in the fifth place.The ſeuenth was of *Linaria* 3.*Stiriaca* of *Cluſius*,which you may find deſcribed by me in the eighth place. The ſixth was of *Linaria aurea minor* of *Tabern.* being onely a varietie of the *Linaria aurea* ſet forth in the tenth place.‡ The ſeuenth was of the *Linaria Adulterina*, whoſe hiſtorie I haue giuen you in the fourteenth place. That which was formerly vnder the title of *Paſſerina Linaria* is with a hiſtorie fitted thereto in the thirteenth place.

Chap. 166. *Of Garden flaxe.*

† 1 *Linum ſatiuum.*
Garden flax.

The Deſcription.

Flaxe riſeth vp with ſlender and round ſtalks The leaues thereof bee long, narrow, and ſharpe pointed: on the tops of the ſprigs are faire blew floures, after which ſpring vp little round knops or buttons,in which is contained the ſeed,in forme ſomewhat long,ſmooth,glib or ſlipperie,of a dark colour. The roots be ſmal and threddie.

¶ *The Place.*

It proſpereth beſt in a fat and fruitfull ſoile, in moiſt and not drie places; for it requireth as *Columella* ſaith a very fat ground,and ſomewhat moiſt. Some,ſaith *Palladius*,do ſow it thicke in a leane ground,& by that means the flax groweth fine. *Pliny* ſaith that it is to be ſowne in grauelly places, eſpecially in furrowes: *Nec magis feſtinare aliud*: and that it burneth the ground,and maketh it worſer:which thing alſo *Virgil* teſtifieth in his Georgickes.

Vrit lini campum ſeges,vrit Auena.
Vrunt lethæo perfuſa papauera ſomno.

In Engliſh thus:

Flaxe and Otes ſowne conſume
The moiſture of a fertile field:
The ſame worketh Poppie,whoſe
Iuice a deadly ſleepe doth yeeld.

¶ *The*

¶ *The Time.*

Flaxe is sowne in the spring, it floureth in Iune and Iuly. After it is cut downe (as *Pliny* in his 19. booke, first chapter saith) the stalkes are put into the water subject to the heate of the sunne, and some weight laid on them to be steeped therein; the loosenes of the rinde is a signe when it is well steeped: then is it taken vp and dried in the sunne, and after vsed as most huswiues can tell better than my selfe.

¶ *The Names.*

It is called both in Greeke and Laine also *Linum*: in high Dutch, **Flachs**: in Italian and Spanish, *Lino*: in French, *Dulin*: in low Dutch, **Vlas**: in English, Flaxe, and Lyne.

¶ *The Temperature and Vertues.*

Galen in his first booke of the faculties of nourishments saith, that diuers vse the seed hereof A
parched as a sustenacne with *Garum*, no otherwise than made salt.

They also vse it mixed with hony, some likewise put it among bread but it is hurtfull to the B
stomacke, and hard of digestion, and yeeldeth to the body but little nourishment: but touching the quality which maketh the belly soluble, neither will I praise or dispraise it; yet that it hath some force to prouoke vrine, is more apparant when it is parched: but then it also stayeth the belly more.

The same author in his bookes of faculties of simple medicines saith, that Lineseed being ea- C
ten is windy although it be parched, so full is it of superfluous moisture: and it is also after a sort hot in the first degree, and in a meane betweene moist and dry. But how windy the seed is, and how full of superfluous moisture it is in euery part, might very well haue been perceiued a few yeeres since as at Middleborough in Zeland, where for want of graine and other corne, most of the Citizens were faine to eate bread and cakes made hereof with hony and oile, who were in short time after swolne in the belly below the short ribs, faces, & other parts of their bodies in such sort, that a great number were brought to their graues thereby: for these symptomes or accidents came no otherwise than by the superfluous moisture of the seed, which causeth windinesse.

Lineseed as *Dioscorides* hath written, hath the same properties that Fenugreeke hath: it wasteth D
away and mollifieth all inflammations or hot swellings, as well inward as outward, if it be boiled with hony, oile, and a little faire water, and made vp with clarified hony: it taketh away blemishes of the face, and the sunne burning, being raw and vnboiled; and also foule spots, if it be mixed with salt-peter and figs: it causeth rugged and ill fauoured nailes to fall off, mixed with hony and water Cresses.

It draweth forth of the chest corrupted flegme and other filthy humors, if a composition with E
hony be made thereof to licke on, and easeth the cough.

Being taken largely with pepper and hony made into a cake, it stirreth vp lust. F

The oile which is pressed out of the seed, is profitable for many purposes in physicke and surge- G
ry; and is vsed of painters, picture makers, and other artificers.

It softeneth all hard swellings; it stretcheth forth the sinewes that are shrunke and drawne to- H
gether, mitigateth paine, being applied in maner of an ointment.

Some also giue it to drinke to such as are troubled with paine in the side and collicke; but it I
must be fresh and newly drawne: for if it be old and ranke, it causeth aptnesse to vomit, and withall it ouermuch heateth.

Lineseed boiled in water with a little oile, and a quantity of Anniseed impoudered and im- K
plaistered vpon an *angina*, or any swelling in the throat, helpeth the same.

It is with good successe vsed plaisterwise, boiled in vineger, vpon the diseases called *Coliaca* and L
Dysenteria, which are bloudy fluxes and paines of the belly.

The seeds stamped with the roots of wilde Cucumbers, draweth forth splinters, thornes, broken M
bones, or any other thing fixed in any part of the body.

The decoction is an excellent bath for women to sit ouer for the inflammation of the secret N
parts, because it softeneth the hardnesse thereof, and easeth paine and aking.

The seed of Line and Fenugreek made into powder, boiled with Mallowes, violet leaues, Smal- O
lage, and Chickweed, vntill the herbs be soft; then stamped in a stone morter with a little hogs grease to the forme of a cataplasme or pulteese, appeaseth all maner of paine, softneth all cold tumors or swellings, mollifieth and bringeth to suppuration all apostumes; defendeth wounded members from swellings and rankling, and when they be already rankled, it taketh the same away being applied very warme euening and morning.

† The figure that was formerly in this place for the ordinary flaxe was of *Linum sylvestre latifolium* 3. of *Clusius*, which is described by me in the fifth place in the ensuing Chapter.

Chap. 167. *Of Wilde Flaxe.*

¶ *The Deſcription.*

1 THis Wilde kinde of Line or Flaxe hath leaues like thoſe of garden Flaxe, but narrower, growing vpon round bright and ſhining ſprigs, a foot long, and floures like the manured flaxe, but of a white colour. The root is tough and ſmall, with ſome fibres annexed thereto. ‡ This is ſometimes found with deep blew floures, with violet coloured floures, and ſometimes with white, ſtreaked with purple lines. ‡

1 *Linum ſylveſtre floribus albis.*
Wilde white flaxe.

2 *Linum ſylveſtre tenuifolium.*
Thin leaued wilde flaxe.

2 The narrow and thinne leafed kinde of Line is very like to the common flaxe, but in all points leſſer. The floures conſiſt of fiue leaues, which do ſoone fade and fall away, hauing many ſtalkes proceeding from one root, of a cubit high, beſet with ſmall leaues, yea leſſer than thoſe of *Linaria purpurea*.

‡ Our Author in the former edition gaue two figures vnder this one title of *Linum ſylveſtre tenuifolium*, making them the ſecond and third; but the deſcription of the third was of the Rough broad leaued wilde flaxe, whoſe figure therefore we haue put in that place. Now the two whoſe figures were formerly here are but varieties of one ſpecies, and differ thus; the former of them (whoſe figure we haue omitted as impertinent) hath fewer leaues, which therefore ſtand thinner vpon the ſtalke, and the floures are either blew or elſe white. The later, whoſe figure you may finde here ſet forth, hath more leaues, and theſe growing thicker together: the floure is of a light purple or fleſh colour. ‡

3 There is a kinde of wilde flaxe which hath many hairy branches, riſing vp from a very ſmall root, which doth continue many yeeres without ſowing, increaſing by roots into many other plants, with ſtalkes amounting to the height of one cubite, beſet with many rough and hairy broad leaues: at the top of the ſtalkes do grow many blew floures, compact of fiue leaues, much greater and fairer than common Line or flaxe; which being paſt, there ſucceed ſmall ſharpe pointed heads full of ſeeds, like Lineſeed, but of a blackiſh ſhining colour.

4 *Chamælinum*

4 *Chamælinum* (of ſome called *Linum ſylueſtre perpuſillum*, and may be called in Engliſh very low or Dwarfe wilde flaxe; for this word *Chame* ioined to any ſimple, doth ſignifie, that it is a low or dwarfe kinde thereof) beeing ſcarce an handfull high, hath pale yellow floures: but as it is in all things like vnto flaxe, ſo the floures, leaues, and ſtalkes, and all other parts thereof, are foure times leſſer than *Linum*.

‡ 5 There is alſo growing wilde in this kingdome a ſmall kinde of wilde flaxe, which I take to be the *Linocarpos* deſcribed by *Thalius*, and mentioned by *Camerarius*, by the name of *Linum ſylueſtre puſillum candicantibus floribus*. *Anno* 1629, when as I firſt found it, in a Iournall (written of ſuch plants as we gathered) I ſet downe this by the name of *Linum ſylueſtre puſillum candidis floribus*, which my friend M^r. *Iohn Goodyer* ſeeing, he told me he had long knowne the plant, and refer'd it to *Lines*: but there were ſome which called it in Engliſh, Mil-mountaine, and vſed it to purge, and of late he hath ſent me this hiſtorie of it, which you ſhall haue as I receiued it from him.

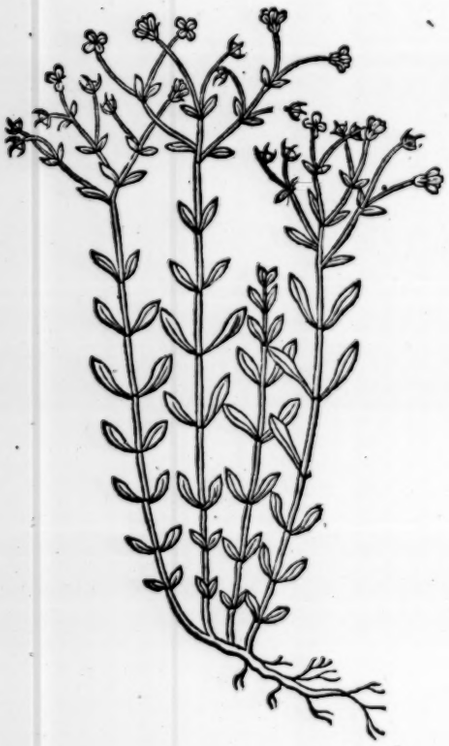
Linum ſylueſtre catharticum. Mil-mountaine.

It riſeth vp from a ſmall white threddy crooked root, ſometime with one, but moſt commonly with fiue or ſix or more round ſtalks, about a foot or nine inches high, of a browne or reddiſh color, euery ſtalk diuiding it ſelfe neere the top, or from the middle vpward into many parts or branches of a greener colour than the lower part of the ſtalke: the leaues are ſmall, ſmooth, of colour green, of the bignes of Lentill leaues, and haue in the middle one rib or ſinew, and no more that may bee perceiued, & grow alongſt the ſtalke in very good order by couples, one oppoſite againſt the other: at the tops of the ſmall branches grow the floures, of a white colour, conſiſting of fiue ſmall leaues apiece, the nailes whereof are yellow: in the inſide are placed ſmall ſhort chiues alſo of a yellow colour, after which come vp little knobs or buttons, the top whereof when the ſeede is ripe diuideth it ſelfe into fiue parts; wherein is contained ſmall, ſmooth, flat, ſlippery, yellow ſeed: when the ſeed is ripe the herbe periſheth: the whole herbe is of a bitter taſte, and herby ſmell. It groweth plentifully in the vnmanured incloſures of Hampſhire, on chalkie downs, & on Purfleet hils in Eſſex, and in many other places. It riſeth forth of the ground at the beginning of the Spring, and floureth all the Sommer.

‡ 3 *Linum ſylueſtre latifolium*.
Broad leaued Wilde flax.

4 *Chamælinum perpuſillum*.
Dwarfe Wilde flax.

‡ 5 *Linum ſyl. catharticum.*
Mil-mountaine.



‡ 6 *Linum ſyl. latifolium* 3. *Cluſ.*
The third broad leaued Wilde flax.

‡ 7 *Linum marinum Luteum.*
Yellow floured Wilde flax.

I came to know this herbe by the name of Mil-mountaine, and his vertue by this meanes. On the ſecond of October 1617. going by Mr. *Colſons* ſhop an Apothecary of VVincheſter in Hampſhire, I ſaw this herbe lying on his ſtall, which I had ſeene growing long before: I deſired of him to know the name of it, he told me that it was called Mill-mountain, and he alſo told me that beeing at Doctour *Lake* his houſe at Saint Croſſe a mile from VVincheſter, ſeeing a man of his haue this hearbe in his hand, he deſired the name; hee told him as before, and alſo the vſe of it, which is this.

Take a handfull of Mill mountaine, the whole plant, leaues, ſeedes, floures and all, bruiſe it and put it in a ſmall tunne or pipkin of a pinte filled with white VVine, and ſet in on the embers to infuſe all night, and drinke that wine in the morning faſting, and hee ſaid it would giue eight or tenne ſtooles. This Doctour *Lake* was afterward made Biſhop of Bath and VVells, who alwaies vſed this hearbe for his purge, after the ſaid manner, as his man affirmed, Iuly 20. 1619. *Iohn Goodyer.*

I haue not as yet made tryall hereof, but ſince in *Geſn. de Lunarijs pag.* 34. I haue found the

A

I haue found the like or a more purging facultie attributed to this herbe, as I thinke (for I cannot referre it to any other) where hee would haue it to be *Helleborine* of the Antients: I thinke it not amiſſe here to ſet downe his words, becauſe the booke is not commonly to be had, being ſet forth *Anno* 1555. *Ante annos* 15. *aut circiter cum Anglus quidam, ex Italia rediens, me ſalutaret* (Turnerus *is fuerit, vir excellentis tum in re medica tum alijs pleriſque diſciplinis doctrinæ, aut alius quiſpiam, vix ſatis memini*) *inter alias rariorum ſtirpium icones quas depingendas commodabat, Elleborinem quoque oſtendebat pictam, herbulam fruticoſam, pluribus ab vna radice cauliculis quinque fere digitorum proceritate erectis, foliolis perexiguis, binis per intervalla (eiuſmodi vt ex aſpectu genus quoddam Alſinæ exiguum videretur) vaſculis in ſummo exiguis, rotundis tanquam lini. Hanc ajebat creſcere in pratis ſiccis, vel clivis Montium, inutili radice, ſubamara, purgare vtrinque & in Anglia vulgo vſurpari a ruſticis.* Thus much for *Geſner*.

6 *Cluſius* amongſt other wilde Lines or Flaxes hath ſet forth this, which from a liuing, thicke, writhen root, ſendeth vp many ſtalkes almoſt a cubite high, ſomewhat red and ſtiffe, ſet with prettie large and thicke leaues not rough and hairie, but ſmooth and hard; the floures grow plentifully on the tops of the ſtalkes, being large, and compoſed of fiue leaues of a faire yellow colour, with fiue threds comming forth of their middles, with as many ſmaller and ſhorter haires. The ſeed is contained in flatter heads than thoſe of the firſt deſcribed, containing a blacke, but not ſhining ſeed. It floures in Iune and Iuly, and ripens the ſeed in Auguſt. It growes naturally vpon diuers hils in Germany.

7 *Matthiolus* and *Dodonæus* haue vnder the name of *Linum ſylueſtre*; and *Lobel* by the name of *Linum marinum luteum Narbonenſe*, ſet forth another yellow floured wilde flaxe. This growes with ſlender ſtalkes ſome cubite high, ſet with leaues like thoſe of flaxe, but ſomewhat leſſer, and fewer in number: at the tops of the ſtalkes grow floures ſmaller than thoſe of the common Line, and yellow of colour. It growes naturally vpon the coaſts of France that lie towards the Mediterranean ſea, but not in England that I haue heard of. ‡

¶ *The Place.*

They grow generally in grauelly grounds. The firſt groweth in well mannured places, as in gardens and ſuch like ſoiles. The ſecond groweth by the ſea ſide. The third and fourth grow vpon rockes and cliffes neere to the ſea ſide. I haue ſeene them grow vpon the ſea bankes by Lee in Eſſex, and in many places of the Iſle of Shepey. They grow alſo betweene Quinborow and Sherland houſe.

‡ I haue not ſeene any of theſe growing wilde, but onely the fifth of my deſcription. ‡

¶ *The Time.*

They floure from May to the middeſt of Auguſt.

¶ *The Names.*

Their names are ſufficiently expreſt in their ſeuerall titles.

¶ *The Nature and Vertues.*

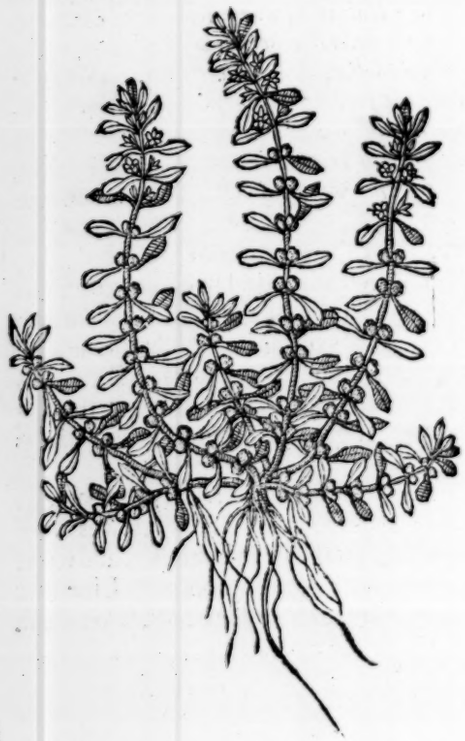
The facultie of theſe kindes of Wilde-flax are referred vnto the manured flax, but they are ſeldome vſed either in Phyſicke or chirurgerie.

CHAP. 168. *Of Blacke Saltwoort.*

¶ *The Deſcription.*

IN old time, ſay the Authours of the *Aduerſaria*, this plant was vſed for meat, and receiued among the *Legumina*. It was called *Glaux*, by reaſon of the colour of the leaues, which are of a blewiſh gray colour, called in Latine, *Glaucus color*, ſuch as is in the Sallow leafe: of others it is called *Galax* or *Glax*; and *Eugalacton*, *quaſi lactea* or *lactifica*, becauſe it is good to increaſe milke in the breſts of women, if it be much vſed. *Ruellius* and others haue ſet downe *Galega*, *Securidica*, *Polygala*, and many other plants for the true *Glaux*, which hath bred a confuſion. The true *Glaux* of *Dioſcorides* hath many ſmall branches, ſome creeping on the ground, and ſome ſtanding vpright, tender, and ſmall, beſet with many little fat leaues like *Tribulus terreſtris*, or *Herniaria*, growing along the ſtalks by couples; betweene whom grow ſmall purple floures, which being paſt, there ſucceed certaine little bullets or ſeed veſſels. The root is very ſmall and threddy, and taking hold of the vpper face of the earth, as it doth run abroad, by which meanes it doth mightily increaſe.

Glaux exigua maritima.
Blacke Saltwoort.



¶ *The Place.*

The true *Glaux* or Milkwoortgroweth very plentifully in ſalt places & marſhes neere the ſea,from whence I haue brought it into my garden, where it proſpereth as well as in his natiue ſoile. I found it eſpecially betweene Whitſtable and the Iſle of Thanet in Kent,and by Grauesend in the ſame countie,by Tilbery Block-houſe in Eſſex, and in the iſle of Shepey,going from Kings ferry to Sherland houſe.

¶ *The Time.*

It floureth in May, and the ſeed is ripe in Iune.

¶ *The Names.*

The names haue beene ſufficiently ſpoken of in the deſcription. It ſhall ſuffice to call it in Engliſh, Sea Milkwoort.

¶ *The Nature.*

Paulus Aegineta ſaith,it is hot and moiſt of temperature.

¶ *The Vertues.*

This Milkwoort taken with milke,drinke, or pottage,ingendereth ſtore of milke, and therefore it is good to be vſed by nurſes that want the ſame.

Chap. 169. *Of Milke-woort.*

¶ *The Deſcription.*

1 THere haue beene many plants neerely reſembling *Polygala*,and yet not the ſame indeed, which doth verifie the Latine ſaying, *Nullum ſimile eſt idem*. This neere reſemblance doth rather hinder thoſe that haue ſpent much time in the knowledge of ſimples, than increaſe their knowledge. And this alſo hath been an occaſion that many haue imagined a ſundry *Polygala* vnto themſelues,and ſo of other plants. Of which number,this (whereof I ſpeake) is one, obtaining this name of the beſt writers and herbariſts of our time,deſcribing it thus. It hath many thick ſpreading branches, creeping on the ground: bearing leaues like them of *Herniaria*, ſtanding in rowes like the Sea Milkwoort; among which do grow ſmall whorles,or crownets of white floures, the root being exceeding ſmall and threddie.

2 The ſecond kinde of *Polygala* is a ſmall herbe with pliant ſlender ſtems, of a wooddie ſubſtance,an handfull long,creeping by the ground;the leaues be ſmall & narrow like to Lintels,or little Hyſſope. The floures grow at the top,of a blew color,faſhioned like a little bird, with wings, taile, and bodie, eaſie to be diſcerned by them that doe obſerue the ſame: which being paſt,there ſucceed ſmall pouches,like thoſe of *Burſa paſtoris*,but leſſer. The root is ſmall and wooddie

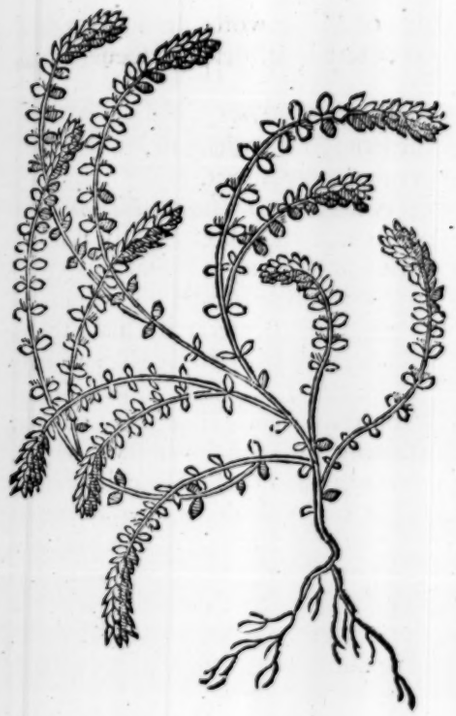
3 This third kinde of *Polygala* or Milkewoort,hath leaues and ſtalkes like the laſt before mentioned,and differeth from it herein, that this kinde hath ſmaller branches,and the leaues are not ſo thicke thruſt together, and the floures are like the other, but that they bee of a red or purple colour.

4 The fourth kinde is like the laſt ſpoken of in euery reſpect,but that it hath white floures; otherwiſe it is very like.

5 Purple Milkewoort differeth from the others in the colour of the floures;it bringeth foorth moe branches than the precedent, and the floures are of a purple colour; wherein eſpecially conſiſteth the difference.

6 The

1 *Polygala repens.*
Creeping Milke-wort.



2 *Polygala flore cæruleo.*
Blew Milke-wort.

3 *Polygala rubris floribus.*
Red Milkewort.

4 *Polygala albis floribus.*
White Milkewort.

6 The ſixth Milke-wort is like vnto the reſt in each reſpect, ſauing that the floures are of an ouerworne ill fauoured colour, which maketh it to differ from all the other of his kinde.

5 *Polygala purpurea.*
Purple Milke-wort.

¶ *The Place.*

Theſe plants or Milke-worts grow commonly in euery wood or fertil paſture whereſoeuer I haue trauelled.

¶ *The Time.*

They floure from May to Auguſt.

¶ *The Names.*

Milke-wort is called by *Dodonæus*, *Flos Ambarualis*; ſo called becauſe it doth eſpecially flouriſh in the Croſſe or Gang weeke, or Rogation weeke; of which floures the maidens which vſe in the countries to walke the Proceſſion doe make themſelues garlands and noſegaies: in Engliſh we may call it Croſſe-floure, Proceſſion-floure, Gang-floure, Rogation-floure, and Milkewort, of their vertues in procuring milke in the breſts of nurſes. *Hieronymus Tragus*, as alſo *Dioſcorides* calleth it *Polygalon*. ‡ *Geſner* calls this *Crucis flos*; and in his Epiſtles he nameth it *Amarella*: it is vulgarly knowne in Cheapſide to the herbe-women by the name of Hedge-Hyſſop; for they take it for *Gratiola*, or Hedge-Hyſſop, and ſell it to ſuch as are ignorant for the ſame. ‡

¶ *The Vertues.*

Galen, *Dioſcorides*, and *Theophraſtus* doe account theſe for Milkeworts, and that they may without error be vſed for thoſe purpoſes whereunto *Glaux* ſerueth.

‡ I doubt that this is not the *Polygalon* of *Dioſcorides*; for *Geſner* affirmes that an handful hereof ſteeped all night in wine, and drunke in the morning, will purge choler effectually by ſtoole without any danger, as he himſelfe had tried. ‡

Chap. 170. *Of Knot-Graſſe.*

¶ *The Deſcription.*

1 The common male Knot-graſſe creepes along vpon the ground, with long ſlender weake branches full of knots or ioynts, whereof it tooke his name. The leaues grow vpon the weake branches, like thoſe of ſmall S. Iohns wort, but longer and narrower. The floures are maruellous little, and grow out of the knots, of an herby colour; in their places come vp triangular ſeed. The root is long, ſlender, and full of ſtrings.

2 The ſecond differeth not from the former, but onely that it is altogether leſſer, wherein eſpecially conſiſteth the difference. ‡ Becauſe the difference is no otherwiſe, I haue thought good to omit the figure.

3 The Authors of the *Aduerſaria* mention another larger Knot-graſſe which growes in diuers places of the coaſt of the Mediterranean ſea, hauing longer and larger branches and leaues, and thoſe of a white ſhining colour. The ſeeds grow at the ioynts in chaffie white huskes; and the whole plant is of a ſalt and aſtringent taſte. They call it *Polygonum marinum maximum*. ‡

¶ *The Place.*

Theſe Knot-graſſes do grow in barren and ſtony places almoſt euery where.

¶ *The Time.*

They are in floure and ſeed all the Sommer long.

¶ *The*

1 *Polygonum mas vulgare.*
Common Knot-graſſe.

¶ *The Names.*

Knot-graſſe is called of the Grecians, πολύγονον ἄρρεν: that is to ſay, *Polygonum mas*, or Male Knot-graſſe: in Latine, *Seminalis, Sanguinaria:* of *Columella, Sanguinalis:* in ſhops, *Centumnodia*, and *Corrigiola:* of *Apuleius, Proſerpinaca:* in high-Dutch, **Woagdzyt:** in low-Dutch, **Verkens gras**, and **Duyſent knop:** in Italian, *Polygono:* in Spaniſh, *Corriola:* in French, *Renouee:* in Wallon, *Mariolaine de Cure:* in Engliſh, Knot-graſſe, and Swines graſſe: In the North, Birds tongue.

¶ *The Temperature.*

Knot-graſſe (as *Galen* teacheth) is of a binding qualitie, yet is it cold in the ſecond, if not in the beginning of the third degree.

¶ *The Vertues.*

The iuyce of Knot-graſſe is good againſt A
the ſpitting of bloud, the piſſing of bloud, and all other iſſues or fluxes of bloud, as *Braſanolus* reporteth: and *Camerarius* ſaith he hath cured many with the iuyce thereof, that haue vomited bloud, giuen in a little ſtipticke Wine. It greatly preuaileth againſt the *Gonorrhæa*, that is, the running of the reines, and the weakneſſe of the backe comming by meanes thereof, being ſhred and made in tanſie with egges and eaten.

The decoction of it cures the diſeaſe afore- B
ſaid in as ample manner as the iuyce: or giuen in pouder in a reare egge it helpeth the backe very much.

The herbe boyled in wine and hony cureth the vlcers and inflammations of the ſecret parts of C
man or woman, adding thereto a little allom, and the parts waſhed therewith.

Dioſcorides ſaith that it prouoketh vrine, and helpeth ſuch as do piſſe drop after drop, when the D
vrine is hot and ſharpe.

It is giuen vnto Swine with good ſucceſſe, when they are ſicke and will not eate their meate; E
whereupon the countrey people do call it Swines graſſe and Swines skir.

Chap. 171. *Of ſundry ſorts of Knot-Graſſes.*

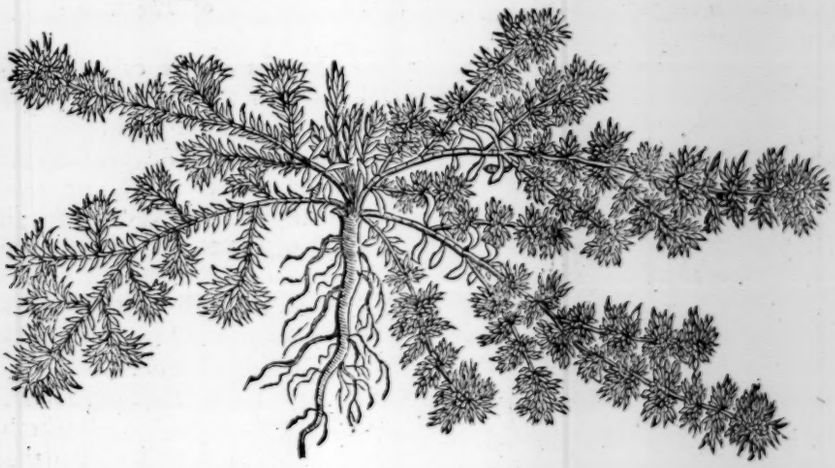
¶ *The Deſcription.*

1 THe ſnowie white and leaſt kinde of *Polygonum* or Knot-graſſe, called of *Cluſius, Paronychia Hiſpanica*, is a ſtrange and worthy plant to behold, handle, and conſider, although it be but ſmall. It is ſeldome aboue a foot long, hauing ſmall branches, thicke, tough, hard, and full of ioynts; out of which the leaues come forth like ſmall teeth, leſſer than the leaues of *Herniaria*, or *Thymum tenuifolium*. At the top of the ſtalkes ſtand moſt delicate floures framed by nature as it were, with fine parchment leaues about them, ſtanding in their ſingular whiteneſſe and ſnowie colour, reſembling the perfect white ſilke, ſo many in number at the top, and ſo thicke, that they ouerſhadow the reſt of the plant beneath. The root is ſlender, and of a wooddy ſubſtance. The ſeed is couered as it were with chaffe, as it were with chaffe, and is as ſmall as duſt, or the motes in the Sunne.

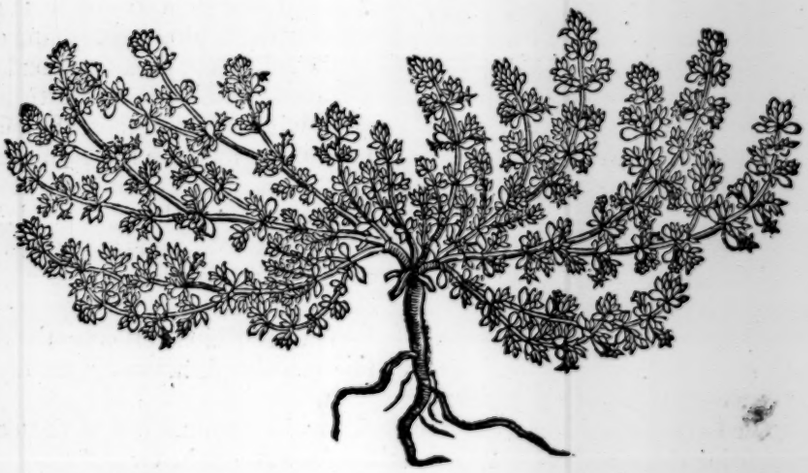
2 *Anthyllis* of Valentia, being likewiſe a kinde of Knot-graſſe, hath ſmall leaues like *Glaux exigua*, or rather like *Chamæſyce*, ſet orderly by couples at the ioynts: among which come floures conſiſting of foure little whitiſh purple leaues, and other ſmall leaues like the firſt but altogether leſſer. The root is ſmall, blacke, and long, and of a wooddy ſubſtance.

‡ Our Author, though he meant to haue giuen vs the figure of Knawell in the third place, as may be perceiued by the title, yet he deſcribed it in the fourth, and in the third place went about to

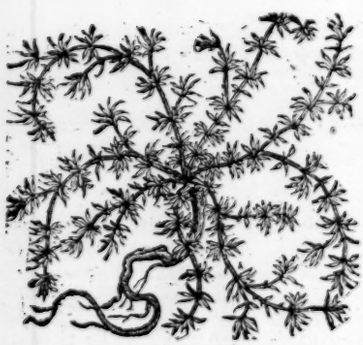
1 *Polygonum montanum.* Mountaine Knot-graſſe.



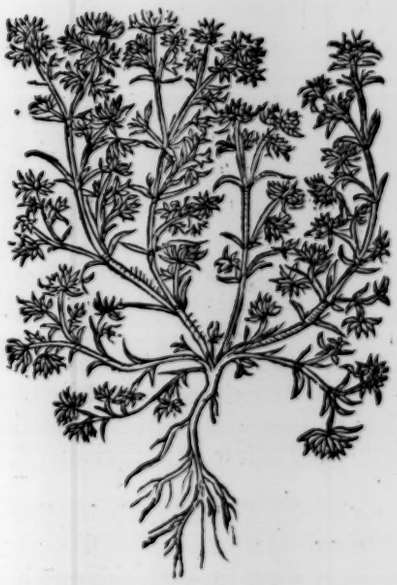
‡ 2 *Anthyllis Valentina Cluſij.* Valentia Knot-graſſe.



‡ 3 *Polygonum ſerpillifolium.*
Small round leaued Knot-graſſe.



† 4 *Polygonum Selinoides, ſiue Knawel.*
Parſley Piert.



to deſcribe *Polygonum Serpillifolio* of *Pena*; as may be gathered by the deſcription which ſhould haue ſtood, but that I opportunely receiued a better from my oft mentioned friend Mr. *Goodyer*, which therefore I thought good to impart vnto you.

Polygonum alterum puſillo vermiculato Serpilli foliolo Pena.

This hath many ſmall round ſmooth wooddy branches, ſomewhat reddiſh, trailing vpon the ground, nine inches or a foot long; whereon by ſmall diſtances on ſhort ioynts grow tufts of very ſmall ſhort blunt topped ſmooth greene leaues, in a maner round, like thoſe of the ſmalleſt Time, but much ſmaller, and without ſmell, diuiding themſelues at the boſomes of thoſe leaues into ſmall branches; at the tops of which branches grow ſmall floures, one floure on a branch, and no more, conſiſting of foure little round topped leaues apiece of a faint or pale purpliſh colour: I obſerued no ſeed. The root is wooddy, blackiſh without, very bitter, with ſome taſte of heate, and groweth deepe into the ground. The leaues are nothing ſo full of iuyce as Aizoon. I found it flouring the third day of September, 1621, on the ditch bankes at Burſeldon ferrey by the ſea ſide in Hampſhire. *Io. Goodyer.* ‡

4 Among the Knot-graſſes may well be ſuted this ſmall plant, but lately written of, and not ſo commonly knowne as growing in England, being about an handfull high, and putting out from a fibrous root ſundry ſlender ſtalkes full of little branches and ioynts: about which grow confuſedly many narrow leaues, for the moſt part of an vnequall quantitie, yet here and there two longer than the reſt, and much alike in greatneſſe: at the outmoſt parts of the branches and ſtalks (where it hath thickeſt tufts) appeare out of the middeſt of the leaues little floures of an herby colour, which are ſucceeded by ſeed-veſſels ending in fiue ſharpe points: the whole plant is of a whitiſh colour. If my memorie faile me not, *Pena* means this herbe where he ſpeaketh of *Saxifr. Angl.* in his *Aduer. p.* 103. and alſo reporteth that he found this plant by the way ſide as he rode from London to Briſtow, on a little hill not far from Chipnam: his picture doth very well reſemble the kinde of Knot-graſſe called among the Germanes **Knawel:** and calling it *Saxifraga Anglicana* cauſeth me to thinke, that ſome in the Weſt parts where he found it do call it Saxifrage, as we do call ſundry other herbes, eſpecially if they ſerue for the ſtone. My friend Mr. *Stephen Bredwel*, Practitioner of phyſicke in thoſe parts, heard of a ſimple man who did much good with a medicine that he made with Parſley Piert againſt the ſtone, which he miniſtred vnto all ſorts of people. This my friend requeſted the poore man to ſhew him the herbe called Parſley Piert; who frankly promiſed it him, and the next morning brought him an handfull of the herbe, and told him the compoſition of his medicine withall, which you ſhall finde ſet downe in the vertues, and proued by ſundry of good account to be a ſingular remedie for the ſame.

† 5 *Saxifraga Anglicana alſinefolia.*
Chick-weed Breake-ſtone.

‡ 6 *Saxifraga paluſtris alſinefolia.*
Small water Saxifrage.

‡ 5 Our

‡ 4 Our Author here in the fourth place described the Knawel, and he figured it in the second place, vnder the title of *Anthyllis Valentina Clusij*: for the figure which was in the third place we here giue you in the fifth; and I coniecture it is not of Knawel, but of *Saxifraga Anglicana* of the *Aduersa*. So that our Authors words are true, if he meant of the picture which he set forth by the name of *Polygonum scleynoides siue Knawel*; but false if of the plant which he described. But if the coniecture of *Pena* and *Lobel* be true, who iudge their *Saxifraga Anglicana* to be *Synanchice Daleschampij*, then it is neither of *Knawel*, as our Author would haue it, nor of this which I here giue, but of a small plant which you shall finde amongst the *Rubia's*. Now this plant that I take to be the *Saxifraga Anglicana* of *Pena* and *Lobel*, is a small little herbe growing thicke, with very many branches some two or three inches high, with some stalkes standing vpright, and other some creeping: at each ioynt grow two short narrow sharpe pointed greene leaues, out of whose bosomes come diuers lesser leaues: at the tops of the branches vpon pretty long stalkes grow vpon each stalke one round whitish scaly head, consisting commonly of foure vnder greenish leaues which make the cup, and foure grayish or whitish leaues which are the floure. Now after these come to some maturitie they appeare all of a whitish colour, and through the thinne filmes of these heads appeares the seed, which at the first view seems to be pretty large and blacke; for it lies all clustering together; but if you rub it out you shall finde it as small as sand, and of a darke reddish colour. The taste of this plant is very hot and piercing, like that of Golden rod or our common Saxifrage, and without doubt it is more effectuall to moue vrine than the former Knawel. I haue found it growing in many places about bricke and stone walls, and vpon chalky barren grounds. I called this in my Iournall *Anno* 16 12. *Saxifraga minor altera floſculis albis ſemine nigro*; and questioned whether it were not *Alsine Saßifraga angustifolia minima montana* of *Columna*. But now I thinke it rather (if the number of leaues in the floure did not disagree) the other which is described in the next place, of which I since that time haue receiued both the figure and description, as also a dry plant from M^r. *Goodyer*. He coniectures it may be this plant which I haue here described, that is set forth in the *Historia Lugd. pag.* 1235. by the name of *Alsine muscosa*.

Alsine palustris folijs tenuißimis: siue Saxifraga palustris alsinefolia.

6 This hath a great number of very small grasse-like leaues, growing from the root, about an inch long, a great deale smaller and slenderer than small pinnes; amongst which spring vp many small slender round smooth firme branches some handfull or handfull and halfe high, from which sometimes grow a few other smaller branches, whereon at certaine ioynts grow leaues like the former, and those set by couples with other shorter comming forth of their bosomes; and so by degrees they become shorter and shorter towards the top, so that toward the top this plant somwhat resembleth *Thymum durius*. The floures are great for the slenderneſse of the plant, growing at the tops of the branches, each floure consisting of fiue smal blunt roundish topped white floures, with white chiues in the middest. The seed I obserued not. The root is small, growing in the myre with a few strings. This groweth plentifully on the boggy ground below the red Well of Wellingborough in Northampton shire. This hath not beene described that I finde. I obserued it at the place aforesaid, August 12. 1625. *Iohn Goodyer*. ‡

¶ *The Place.*

† The first and second are strangers in England: the rest grow in places mentioned in their descriptions.

¶ *The Time.*

These floure for the most part from May to September.

¶ *The Names.*

That which hath beene said of their names in their seuerall descriptions shall suffice.

¶ *The Nature.*

They are cold in the second degree, and dry in the third, astringent and making thicke.

‡ These, especially the three last, are hot in the second or third degree, and of subtill parts; but the Parsley Piert seemes not to be so hot as the other two. ‡

¶ *The Vertues.*

Here according to my promise I haue thought good to insert this medicin made with Knawel;
A which herbe is called (as I said before) Parsley Piert, but if I might without offence it should be called *Petra pungens*: for that barbarous word Parsley Piert was giuen by some simple man (‡ as also the other, that sauors of as much simplicitie ‡) who had not wel learned the true terme. The composition which followeth must be giuen in warme white wine, halfe a dram, two scruples, or more, according to the constitution of the body which is to receiue it.

The

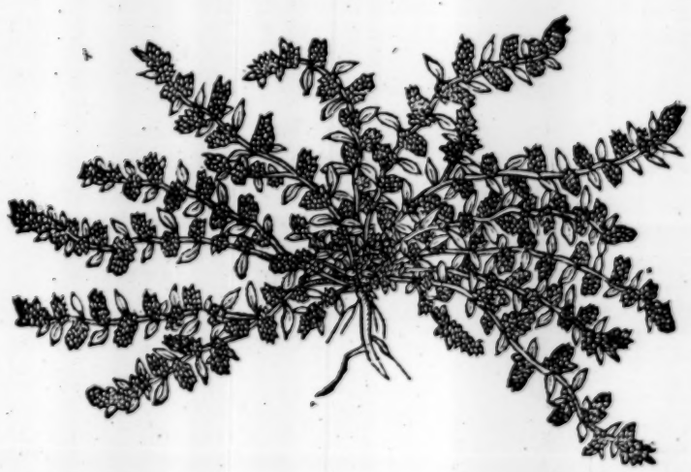
The leaues of Parſley Piert, Mouſ-eare, of each one ounce when the herbes be dried, bay berryes, E
Turmericke, Cloues, the ſeeds of the great Burre, the ſeeds in the berryes of Hippes, or Briertree, Fenugreeke, of each one ounce, the ſtone in the oxe gall, the weight of 24. Barley cornes, or halfe a dram, made together into a moſt fine and ſubtill pouder, taken and drunke in maner aforeſaid hath been proued moſt ſingular for the diſeaſe aforeſaid.

‡ The fifth and ſixth are of the ſame faculty, and may be vſed in the like caſes. ‡

† The figure that formerly was in the ſecond place was of Knawell, and that in the third place of *polygonum minus polycarpon* of *Tabern.*

CHAP. 172. *Of Rupture woort.*

1 *Herniaria.* Rupture woort.



‡ 2 *Millegrana minima.* Dwarfe Allſeed.

¶ *The Deſcription.*

1 THere is alſo a kinde of Knot graſſe commonly called in Latine *Herniaria:* in Engliſh, Rupture woort, or Rupture graſſe. It is a baſe and low creeping herbe, hauing many ſmall ſlender branches trailing vpon the ground, yet very tough, and full of little knots ſomewhat reddiſh, whereupon do grow very many ſmall leaues like thoſe of Time; among which come forth little yellowiſh floures which turne into very ſmall ſeed, and great quantity thereof, conſidering the ſmallneſſe of the plant, growing thicke cluſtering together by certaine ſpaces. The whole plant is of a yellowiſh greene colour. The root is very ſlender and ſingle.

2 There is another kinde of *Herniaria*, called *Mille grana* or All-ſeed, that groweth vpright a handfull high, with many ſmall and tender branches, ſet with leaues like the former, but few in number, hauing as it were two ſmal leaues & no more. The whole plant ſeemeth as it were couered ouer with ſeeds or graines, like the ſeed of Panicke, but much leſſer. ‡ I haue not ſeen many plants of this, but all that euer I yet ſaw neuer attained to the height of two inches. ‡

¶ *The Place.*

1 It ioyeth in barren and ſandy grounds, and is likewiſe found in dankiſh places that lie wide open to the ſunne: it doth grow and proſper in my garden exceedingly. ‡ 2 I found this in Kent on a Heath not farre from Chiſte-hurſt, being in company with M^r. *Bowles* and diuers others, in Iuly, 1630.

¶ *The Time.*

It floureth and flouriſheth in May, Iune, Iuly, and Auguſt.

¶ *The Names.*

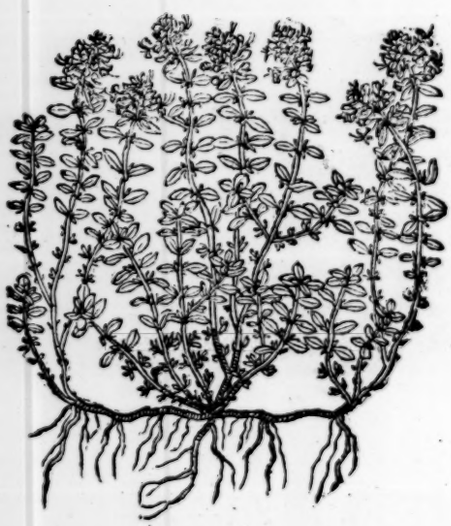
It is called of the later Herbariſts *Herniaria* and *Herniola*; taken from the effect in curing the diſeaſe *Hernia:* of diuers, *Herba Turca*, and *Empetron*; in French, *Boutonet:* in Engliſh, Rupture woort, and Burſtwoort.

¶ *The Temperature and Vertue.*

A Rupture woort doth notably drie, and throughly cloſeth vp together and faſteneth. It is reported that being drunke it is ſingular good for Ruptures, and that very many that haue been burſten, were reſtored to health by the vſe of this herbe; alſo the pouder hereof taken with wine, doth make a man to piſſe that hath his water ſtopt; it alſo waſteth away the ſtones in the kidnies, and expelleth them.

Chap. 173. *Of wilde Time.*

1 *Serpillum vulgre.*
Wilde Time.



3 *Serpillum majus flore purpureo.*
Great purple wilde Time.

¶ *The Deſcription.*

1 Both *Dioſcorides* and *Pliny* make two kindes of *Serpillum*, that is, of creeping or wilde Time; whereof the firſt is our common creeping Time, which is ſo well knowne, that it needeth no deſcription; yet this ye ſhall vnderſtand, that it beareth floures of a purple colour, as euery body knoweth. Of which kinde I found another ſort, with floures as white as ſnow, and haue planted it in my garden, where it becommeth an herbe of great beauty:

2 This wilde Time that bringeth forth white floures differeth not from the other, but only in the colour of the floures, whence it may be called *Serpillum vulgare flore albo.* White floured Wilde Time.

There is another kinde of *Serpillum*, which groweth in gardens, in ſmell and ſauour reſembling Marjerome. It hath leaues like Organy, or wilde Marjerome, but ſomewhat whiter, putting forth many ſmall ſtalkes, ſet full of leaues like Rue, but longer, narrower, and harder. The floures are of a biting taſte, and pleaſant ſmell. The whole plant groweth vpright, whereas the other creepeth along vpon the earth, catching hold where it growes, & ſpreading it ſelfe farabroad.

3 This great wilde Time creepeth not as the others doe, but ſtandeth vpright, and bringeth forth little ſlender branches full of leaues like thoſe of Rue; yet narrower, longer, and harder. The flours be of a purple colour, and of a twinging biting taſte: it groweth vpon rocks, and is hotter than any of the others.

4 This other great one with white floures differeth not from the precedent, hauing many knaps or heads, of a milke white colour, which ſetteth forth the difference; and it may be called *Serpillum maius flore albo.* Great white floured wilde Time.

5 This wilde Time creepeth vpon the ground, ſet with many leaues by couples like thoſe of Marjerom, but leſſer, of the ſame ſmel: the flours are of a reddiſh color. The root is very threddy.

6 Wilde Time of Candy is like vnto the other wild Times, ſauing that his leaues are narrower and longer and more in number at each joint. The ſmell is more aromaticall than any of the others, wherein is the difference.

7 There is a kinde of wilde Time growing vpon the mountaines of Italy, called *Serpillum Citratum,*

5 *Serpillum foliis amaraci.*
Marjerome Time.

6 *Serpillum Creticum.*
Wilde Time of Candy.

‡ 7 *Serpillum citratum.*
Limon Time.

‡ 8 *Serpillum hirſutum.*
Hoary wilde Time.

Citratum, that is, hauing the ſmel of a Pome Citron, or a limon, which giueth it the difference from the other wilde times. ‡ It growes in many gardens alſo, and (as I haue been told) wilde in diuers places of Wales.

8 This (which is the *Serpillum Pannonicum* 3. of *Cluſius*) runnes or ſpreds it ſelfe far vpon the ground. For though it haue a hard and wooddy root like as the former kindes, yet the branches which lie ſpred round about here and there take root, which in time become as hard and wooddy as the former. The leaues and ſtalkes are like thoſe of the laſt deſcribed, but rough and hoarie: the floures alſo are not vnlike thoſe of the common kind. The whole plant hath a kinde of reſinous ſmell. It floures in Iune with the reſt, and growes vpon the like mountainous places; bnt whether with vs in England or no I cannot yet affirme any thing of certaintie. ‡

¶ *The Place.*

The firſt groweth vpon barren hills and vntoiled places: the ſecond groweth in gardens. The white kinde I found at Southfleet in Kent, in a barren field belonging to one M^r. *William Swan.*

¶ *The Time.*

They floure from May to the end of Sommer.

¶ *The Names.*

Wild Time is called in Latine *Serpillum*, *à ſerpendo*, of creeping: in high and low-Dutch, **Quendel**, and **wilden Thymus**, and alſo **Onſer Vzouwen bedſtroo:** in Spaniſh, *Serpoll:* in Italian, *Serpillo:* in French, *Pillolet:* in Engliſh, Wilde Time, Puliall Mountaine, Pella mountaine, running Time, creeping Time, Mother of Time: in ſhops it is called *Serpyllum*; yet ſome call it *Pulegium montanum:* and it is euery where (ſaith *Dodonæus*) thought to be the *Serpyllum* of the Antients. Notwithſtanding it anſwereth not ſo wel to the wilde Times as to *Dioſcorides* his *Saxifranga*; for if it be diligently compared with the deſcription of both the *Serpilla* and the *Saxifranga*, it ſhal be found to be little like the wilde Times, but very much like the *Saxifranga:* for (ſaith *Dioſcorides*) *Saxifranga* is an herbe like Time, growing on rockes, where our common wilde Time is oftentimes found.

Ælianus in his ninth booke of his ſundry Hiſtories ſeemeth to number wilde Time among the floures. *Dionyſius Iunior* (ſaith he) comming into the city Locris in Italy, poſſeſſed moſt of the houſes of the city, and did ſtrew them with roſes, wild Time, and other ſuch kindes of floures. Yet *Virgil* in the ſecond Eclog of his Bucolicks doth moſt manifeſtly teſtifie that wilde Time is an herbe, in theſe words:

Theſtylis & rapido feſſis meſſoribus æſtu
Allia, ſerpillumque, herbas contundit olentes.

Theſtilis for mowers tyr'd with parching heate,
Garlicke, wilde Time, ſtrong ſmelling herbes doth beate.

Out of which place it may be gathered, that common wilde time is the true and right *Serpillum*, or wilde Time, which the Grecians call ἡρπύλλιον. *Marcellus* an old antient Author among the Frenchmen ſaith it is called *Gilarum*; as *Plinius Valerianus* ſaith it is called of the ſame, *Laurio.*

¶ *The Temperature.*

Wilde Time is of temperature hot and dry in the third degree: it is of thin and ſubtill parts, cutting and much biting.

¶ *The Vertues.*

A It bringeth downe the deſired ſickneſſe, prouoketh vrine, applied in bathes and fomentations it procureth ſweat: being boyled in wine, it helpeth the ague, it eaſeth the ſtrangurie, it ſtayeth the hicket, it breaketh the ſtones in the bladder, it helpeth the Lethargie, frenſie, and madneſſe, and ſtayeth the vomiting of bloud.

B Wilde Time boyled in wine and drunke, is good againſt the wambling and gripings of the bellie, ruptures, convulſions, and inflammations of the liuer.

C It helpeth againſt the bitings of any venomous beaſt, either taken in drinke, or outwardly applied.

D *Aetius* writeth, That *Serpillum* infuſed well in Vineger, and then ſodden and mingled with roſe water, is a right ſingular remedie to cure them that haue had a long phrenſie or lethargie.

E *Galen* preſcribeth one dram of the iuyce to be giuen in vineger againſt the vomiting of bloud, and helpeth ſuch as are grieued with the ſpleene.

Chap.

Chap. 174. *Of Garden Time.*

¶ *The Deſcription.*

1 THe firſt kinde of Time is ſo well knowne that it needeth no deſcription; becauſe there is not any which are ignorant what *Thymum durius* is, I meane our common garden Time.

2 The ſecond kinde of Time with broad leaues hath many wooddy branches riſing from a threddy root, beſet with leaues like *Myrtus*. The floures are ſet in rundles about the ſtalke like Horehound. The whole plant is like the common Time in taſte and ſmell.

1 *Thymum durius.*
Hard Time.

† 2 *Thymum latifolium.*
Great or broad leaued Time.

3 Time of Candy is in all reſpects like vnto common Time, but differeth in that, that this kinde hath certaine knoppy tufts not much vnlike the ſpikes or knots of *Stœcados*, but much leſſer, beſet with ſlender floures of a purple colour. The whole plant is of a more gracious ſmell than any of the other Times, and of another kinde of taſte, as it were ſauouring like ſpice. The root is brittle, and of a wooddy ſubſtance.

4 Doubtleſſe that kinde of Time whereon *Epithymum* doth grow, and is called for that cauſe *Epithymum*, and vſed in ſhops, is nothing elſe than Dodder that growes vpon Time; and is all one with ours, though *Matthiolus* makes a controuerſie and difference thereof: for *Pena* trauelling ouer the hills in Narbone neere the ſea, hath ſeene not onely the garden Time, but the wilde Time alſo loden and garniſhed with this *Epithymum*. So that by his ſight and mine owne knowledge I am aſſured, that it is not another kinde of Time that beareth *Epithymum*, but is common Time: for I haue often found the ſame in England, not onely vpon our Time, but vpon Sauorie, and other herbes alſo: notwithſtanding thus much I may conieƈture, that the clymate of thoſe Countries doth yeeld the ſame forth in greater aboundance than ours, by reaſon of the intemperance of cold, whereunto our countrey is ſubieƈt.

† 3 *Thymum Creticum.*
Time of Candy.

4 *Epithymum Græcorum.*
Laced Time.

¶ *The Place.*

Theſe kindes of Time grow plentifully in England in moſt gardens euery where, except that with broad leaues, and Time of Candy, which I haue in my garden.

¶ *The Time.*

They flouriſh from May vnto September.

¶ *The Names.*

The firſt may be called hard Time, or common garden Time: the ſecond, Broad leaued Time: the third, Time of Candy; our Engliſh women call it Muske Time: the laſt may be called Dodder Time.

¶ *The Temperature.*

Theſe kindes of Time are hot and dry in the third degree.

¶ *The Vertues.*

A Time boyled in water and hony drunken, is good againſt the cough and ſhortnes of the breath; it prouoketh vrine, expelleth the ſecondine or after-birth, and the dead childe, and diſſolues clotted or congealed bloud in the body.

B The ſame drunke with vineger and ſalt purgeth flegme: and boyled in Mede or Methegline, it cleanſeth the breaſt, lungs, reines, and matrix, and killeth wormes.

C Made into pouder, and taken in the weight of three drams with Mede or honied vineger, called Oxymel, and a little ſalt, purgeth by ſtoole tough and clammie flegme, ſharpe and cholericke humors, and all corruption of bloud.

D The ſame taken in like ſort, is good againſt the Sciatica, the paine in the ſide and breſt, againſt the winde in the ſide and belly, and is profitable alſo for ſuch as are fearefull, melancholike, and troubled in minde.

E It is good to be giuen vnto thoſe that haue the falling ſickneſſe to ſmell vnto.

F *Epithymum*, after *Galen*, is of more effectuall operation in phyſicke than Time, being hot and dry in the third degree, more mightily cleanſing, heating, drying, and opening than *Cuſcuta*, hauing right good effect to eradicat melancholy, or any other humor in the ſpleen, or other diſeaſe, ſprung by occaſion of the ſpleene.

It

It helpeth the long continued paines of the head, and beſides his ſingular effects about ſplene- G
ticall matters, it helpeth the lepry, or any diſeaſe of melancholy; all quartaine agues, and ſuch like griefes proceeding from the ſpleene.

Dioſcorides ſaith, *Epithymum* drunke with honied water, expelleth by ſiege, flegme, and melan- H
choly.

Of his natiue propertie it relieueth them which be melancholieke, ſwolne in the face and other I
parts, if you pound *Epithymum*, and take the fine pouder thereof in the quantity of foure ſcruples in the liquour which the Apothecaries call *Paſſum*, or with Oxymell and ſalt, which taketh away all flatuous humours and ventoſities.

† The ſecond figure was of *Serpillum Citratum* deſcribed in the ſeuenth place of the foregoing chapter; the third was of *Matrum Matthioli*, Tabern. being the *Polygonum alterum* of *Lobel*.

Chap. 175. *Of Sauorie.*

¶ *The Kindes.*

THere be two kindes of Sauorie, the one that indureth VVinter, and is of long continuance: the other an annuall or yearely plant, that periſheth at the time when it hath perfected his ſeed, and muſt be ſowne againe the next yeare; which we call Sommer Sauorie, or Sauorie of a yeare. There is likewiſe another, which is a ſtranger in England, called of *Lobel Thymbra S. Iuliani*, denying it to be the right *Satureia*, or Sauorie: whether that of *Lobel*, or that we haue in our Engliſh gardens be the true winter Sauorie, is yet diſputable, for we thinke that of S. Iulians rocke to be rather a wilde kinde than otherwiſe. ‡ *Pena* and *Lobel* do not denie, but affirme it in theſe words, *Nullus non fatetur Satureiam veram*; that is, which none can denie to be the true *Satureia* or Sauorie. *Vid. Aduerſar. pag.* 182. ‡

1 *Satureia hortenſis.*
VVinter Sauorie.

2 *Satureia hortenſis æſtiua.*
Sommer Sauorie.

¶ *The*

¶ *The Deſcription.*

1 WInter Sauorie is a plant reſembling Hyſſope, but lower, more tender, and brittle: it bringeth forth very many branches, compaſſed on euery ſide with narrow and ſharpe pointed leaues, longer than thoſe of Time; among which grow the floures from the bottome to the top, out of ſmall husks, of colour white, tending to a light purple. The root is hard and wooddie, as is the reſt of the plant.

2 Sommer Sauorie groweth vp with a ſlender brittle ſtalke of a foot high, diuided into little branches: the leaues are narrow, leſſer than thoſe of Hyſope, like the leaues of winter Sauorie, but thinner ſet vpon the branches. The floures ſtand hard to the branches, of a light purple tending to whiteneſſe. The root is ſmall, full of ſtrings, and periſheth when it hath perfected his ſeed.

3 *Satureia Sancti Iuliani.*
Rocke Sauorie.

3 This ſmall kinde of Sauorie, which *Lobel* hath ſet forth vnder the title of *Thymbra S. Iuliani*, becauſe it groweth plentifully vpon the rough cliffes of the Tyrrhenian ſea in Italie, called Saint Iulians rocke, hath tender twiggie branches an handfull high, of a wooddie ſubſtance, ſet ful of leaues from the bottome to the top, very thicke thruſt together like vnto thoſe of Time, ſauing that they be ſmaller & narrower, bringing forth at the top of the ſprigs a round ſpikie tuft of ſmall purpliſh floures. The whole plant is whitiſh, tending to a bleake colour, and of a verie hot and ſharpe taſte, and alſo well ſmelling.

‡ 4 *Satureia Cretic.*
Candie Sauorie.

‡ 4 This in the opinion of *Honorius Bellus*, *Cluſius*, and *Pona*, is thought, and not without good reaſon, to be the true *Thymbra*, or *Satureia* of *Dioſcorides* and the Antients, for (beſides that it agrees with their deſcription, it is to this day called in Candie σπεζη and σπεζα.) *Cluſius* deſcribes it thus: It ſends forth many branches immediately from the roote like as Tyme, and thoſe quadrangular, rough, and of a purpliſh colour: vpon theſe growe alternately little roughiſh leaues much like thoſe of the true Tyme; and out of their boſomes come little branches ſet with the like, but leſſer leaues. The toppes of the branches are compaſſed with a rundle made of manie little leaues, whereout come floures of a fine purple colour, and like the floures of Tyme, beeing diuided into foure parts, whereof the lower is the broader, and hangs downe: The vpper is alſo broad but ſhorter, and the other two leſſe. Out of the middle of the floure come fiue whitiſh threds, pointed with browne, and a forked ſtile. The ſeed is ſmall and blacke like that of Tyme. The root hard and wooddie. It floured with *Cluſius* (who receiued the ſeedes out of Candie from *Honorius Bellus*) in October and Nouember. ‡

¶ *The Place.*

They are ſowne in Gardens, and bring foorth their floures the firſt yeare of their ſowing.

¶ *The*

¶ *The Time.*

They floure in Iuly and Auguſt.

¶ *The Names.*

Sauorie is called in Greeke σάμβρα, neither hath it any other true name in Latine than *Thymbra*. The Interpreters would haue it called *Satureia*, wherein they are repugnant to *Columella* a Latine Writer, who doth ſhew a manifeſt difference betweene *Thymbra* and *Satureia*, in his tenth booke, where hee writeth, that Sauorie hath the taſte of Tyme, and of *Thymbra* or the Winter Sauorie.

Et Satureia Thymi referens Thymbræq; ſaporem.

† Notwithſtanding this aſſertion of *Columella*, *Pliny lib.* 19. *cap.* 8. makes *Satureia*, or Sauorie, to be that *Thymbra* which is called alſo *Cunila*. Sauorie in High Dutch is called **Kunel Saturey**, and **Sadaney**: in Low Dutch, **Ceulen**: which name, as it ſeemeth, is drawne out *Cunila*: in Italian, *Sauoreggia*: in Spaniſh, *Axedrea*, and *Sagorida*: in French, *Sarriette*: in Engliſh, Sauorie, Winter Sauorie, and Sommer Sauorie.

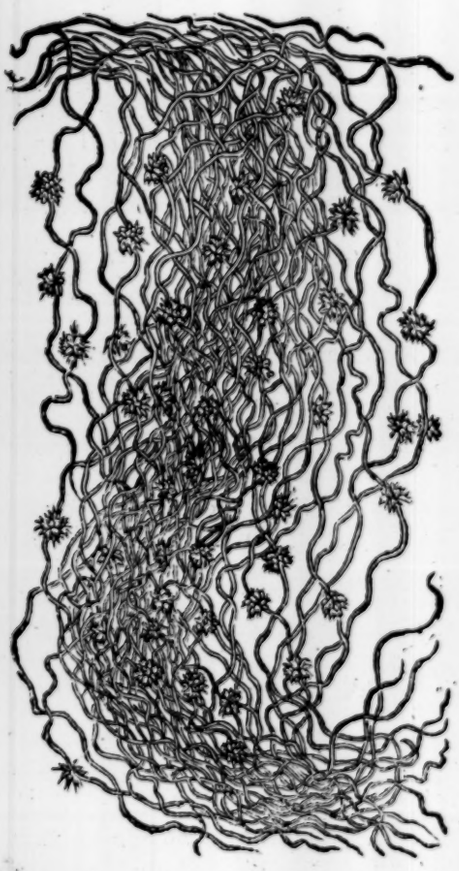
¶ *The Temperature and Vertues.*

Winter Sauorie is of temperature hot and drie in the third degree, it maketh thin, cutteth, it clenſeth the paſſages: to be briefe, it is altogether of like vertue with Time. A

Sommer Sauorie is not full ſo hot as winter Sauorie, and therefore ſaith *Dioſcorides*, more fit to be vſed in medicine: it maketh thin, and doth maruellouſly preuaile againſt winde: therefore it is with good ſucceſſe boiled and eaten with beanes, peaſon, and other windie pulſes, yea if it be applied to the belly in a fomentation, it forthwith helpeth the affects of the mother proceeding from winde. B

Chap. 176. *Of Dodder.*

Cuſcuta ſive Caſſutha.
Dodder.



¶ *The Deſcription.*

Cuſcuta, or Dodder, is a ſtrange herbe, altogether without leaues or root, like vnto threds very much ſnarled or wrapped together, confuſedly winding it ſelfe about buſhes and hedges, and ſundry kindes of herbes. The threds are ſomewhat red: vpon which grow here & there little round heads or knops, bringing forth at the firſt ſlender white floures, afterward a ſmall ſeed.

¶ *The Place.*

This herbe groweth vpon ſundry kindes of herbes, as vpon Tyme, VVinter Sauorie, Germander, and ſuch like, taking his name from the herbe whereupon it doth grow, as that vpon Tyme is called *Epithymum*, vpon Line or flaxe *Epilinum*: and ſo of others, as *Dodonæus* ſetteth forth at large: yet hath he forgotten one among the reſt, which groweth very plentifully in Sommerſetſhire vpon nettles: neither is it the leaſt among many, either in beautie or operation, but comparable to the beſt *Epithymum*: following therefore the example of *Dioſcorides*, I haue thought good to call it *Epiurtica*, or rather Ἐπιτιθύμον, and ſo of the reſt according to the herbes whereon they do grow.

¶ *The Names.*

The greateſt is called in ſhops euery where *Cuſcuta*: and of diuers becauſe it groweth vpon

Flaxe

flaxe or Lyne, *Podagra Lini*; the better learned do name it *Caſſutha*, or *Caßytha*: and *Geſnerus*, κισθυμον: the Arabians, *Keſſuth* and *Chaſuth*: in Dutch, **Schoꝛfte**, and **Wꝛanghe**: in High Dutch, **Filkraut**: in French, *Goute d'Lin*, and *Tigne de Lin*: in Engliſh, Dodder.

The leſſer and ſlenderer which wrappeth it ſelfe vpon Time and Sauorie, is called of *Dioſcorides* κισθυμον: the Apothecaries keep the name *Epithymum*: others, among whom is *Actuarius*, name that *Epithymum* which groweth vpon Tymé onely, and that which groweth on Sauorie *Epithymbrum*, and that alſo which hangeth vpon *Staebe*, they terme *Epiſtæbe*, giuing a peculiar name to euery kind.

¶ *The Nature.*

The nature of this herb changeth and altereth, according to the nature and qualitie of the herbs whereupon it groweth: ſo that by ſearching of the nature of the plant you may eaſily finde out the temperament of the laces growing vpon the ſame. But more particularly: it is of temperature ſomewhat more drie than hot, and that in the ſecond degree: it alſo clenſeth with a certaine aſtrictiue or binding qualitie, and eſpecially that which is found growing vpon the bramble: for it alſo receiueth a certaine nature from his parents on which it groweth; for when it groweth vpon the hotter herbes, as Tyme and Sauory, it becommeth hotter and drier, and of thinner parts: that which commeth of Broome prouoketh vrine more forcibly, and maketh the belly more ſoluble: and that is moiſter which groweth vpon flaxe: that which is found vpon the bramble hath ioined with it as wee haue ſaid a binding qualitie, which by reaſon of this facultie ioyned with it is good to cure the infirmities of the Liuer and Milt: for ſeeing that it hath both a purging and binding facultie vnited to it, it is moſt ſingular good for the entrals: for *Galen* in his thirteenth Booke of the Methode of curing, doth at large declare that ſuch Medicines are fitteſt of all for the Liuer and Milt.

¶ *The Vertues.*

A Dodder remooueth the ſtoppings of the liuer and of the milt or ſpleene, it disburdeneth the veines of flegmaticke, cholericke, corrupt and ſuperfluous humours: prouoketh vrine gently, and in a meane openeth the kidneies, cureth the yellow iaundiſe which are ioyned with the ſtopping of the liuer and gall: it is a remedie againſt lingring agues, baſtard and long tertians, quartains alſo, and properly agues in infants and young children, as *Meſues* ſaith in *Scrapio*; who alſo teacheth, that the nature of Dodder is to purge choler by the ſtoole, and that more effectually if it haue Wormewood ioined with it; but too much vſing of it is hurtfull to the ſtomacke: yet *Auicen* writeth that it doth not hurt it, but ſtrengtheneth a weake or feeble ſtomacke; which opinion alſo we do better allow of.

B *Epithymum*, or the Dodder which groweth vpon Tyme, is hotter and drier than the Dodder that groweth vpon flax, that is to ſay euen in the third degree, as *Galen* ſaith. It helpeth all the infirmities of the milt: it is a remedy againſt obſtructions and hard ſwellings. It taketh away old headaches, the falling ſickneſſe, madneſſe that commeth of Melancholy, and eſpecially that which proceedeth from the ſpleene and parts thereabout: it is good for thoſe that haue the French diſeaſe, and ſuch as be troubled with contagious vlcers, the leproſie, and the ſcabbie euill.

C It purgeth downewards blacke and Melancholicke humours, as *Aetius*, *Actuarius*, and *Meſue* write, and alſo flegme, as *Dioſcorides* noteth: that likewiſe purgeth by ſtoole which groweth vpon Sauorie and Scabious, but more weakly, as *Actuarius* ſaith.

D *Cuſcuta*, or Dodder that groweth vpon flax, boiled in water or wine and drunke, openeth the ſtoppings of the liuer, the bladder, the gall, the milt, the kidneies and veines, and purgeth both by ſiege and vrine cholericke humours.

E It is good againſt the ague which hath continued a long time, and againſt the iaundiſe, I meane that Dodder eſpecially that groweth vpon brambles.

F *Epiurtica* or Dodder growing vpon nettles, is a moſt ſingular and effectuall medicine to prouoke vrine, and to looſe the obſtructions of the body, and is proued oftentimes in the Weſt parts with good ſucceſſe againſt many maladies.

Chap. 177. *Of Hyſſope.*

¶ *The Deſcription.*

1 *Dioſcorides* that gaue ſo many rules for the knowledge of ſimples, hath left Hyſſope altogether without deſcription, as beeing a plant ſo well knowne that it needed none: whoſe example I follow not onely in this plant, but in many others which bee common, to auoid tediouſneſſe to the Reader.

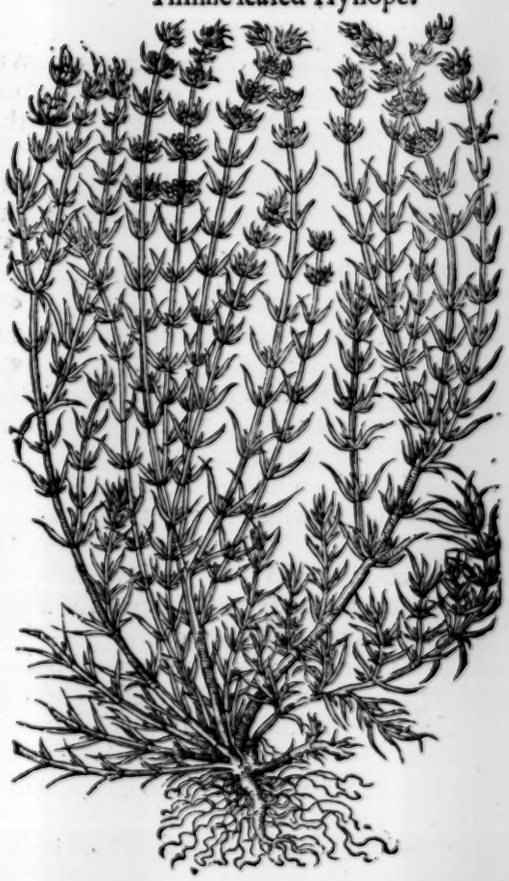
2 The

1 *Hyſſopus Arabum.*
Hyſſope with blew floures.

2 *Hyſſopus Arabum flore rubro.*
Hyſſope with reddiſh floures.

† 3 *Hyſſopus albis floribus.*
VVhite floured Hyſſope.

4 *Hyſſopus tenuifolia.*
Thinne leafed Hyſſope.



‡ 5 *Hyſſopus parua anguſtis foliis.*
Dwarfe narrow leaued Hyſſope.

2 The ſecond kind of Hyſſope is like the former, which is our common Hyſſope, and differeth in that, that this Hyſſope hath his ſmall and ſlender branches decked with faire red floures.

3 The third kinde of Hyſſop hath leaues ſtalkes, branches, ſeed, and root, like the common Hyſſope, and differeth in the floures only, which are as white as ſnow.

4 This kinde of Hyſſope of all the reſt is of the greateſt beauty; it hath a wooddie root tough, and full of ſtrings, from which riſe vp ſmall, tough, and ſlender flexible ſtalkes, whereupon do grow infinite numbers of ſmall Fennel-like leaues, much reſembling thoſe of the ſmalleſt graſſe, of a pleaſant ſweet ſmel, & aromatick taſte, like vnto the reſt of the Hyſſops but much ſweeter; at the top of the ſtalks do grow amongſt the leaues ſmal hollow floures, of a blewiſh colour tending to purple. The ſeeds as yet I could neuer obſerue.

‡ 5 This differs from the firſt deſcribed, in that the ſtalkes are weaker and ſhorter, the leaues alſo narrower, and of a darker colour: the floures grow after the ſame manner, & are of the ſame colour as thoſe of the common kinde. ‡

We haue in England in our gardens another kinde, whoſe picture it ſhall be needleſſe to expreſſe, conſidering that in few words it may be deliuered. It is like vnto the former, but the leaues are ſome of them white, ſome greene, as the other; and ſome green and white mixed and ſpotted, very goodly to behold.

Of which kinde we haue in our gardens moreouer another ſort, whoſe leaues are wonderfully curled, rough, and hairie, growing thicke thruſt together, making as it were a tuft of leaues; in taſte and ſmell, and in all other things like vnto the common Hyſſope.

I haue likewiſe in my garden another ſort of Hyſſope, growing to the forme of a ſmall wooddie ſhrub, hauing very faire broad leaues like vnto thoſe of *Numularia*, or Monywoort, but thicker, fuller of iuice, and of a darker greene colour; in taſte and ſmell like the common Hyſſope.

¶ *The Place.*

All theſe kindes of Hyſſope do grow in my garden, and in ſome others alſo.

¶ *The Time.*

They floure from Iune to the end of Auguſt.

¶ *The Names.*

Hyſſope is called in Latine *Hyſſopus*: the which name is likewiſe retained among the Germans, Brabanders, French-men, Italians, and Spaniards. Therefore that ſhall ſuffice which hath been ſet downe in their ſeuerall titles.

‡ This is by moſt Writers iudged to be Hyſſope vſed by the Arabian Phyſitions, but not that of the Greekes, which is neerer to *Origanum* and Maricrome, as this is to *Satureia* or Sauorie. ‡

¶ *The Temperature and Vertues.*

A A decoction of Hyſſope made with figs, and gargled in the mouth and throte, ripeneth & breaketh the tumors and impoſthumes of the mouth and throte, and eaſeth the difficultie of ſwallowing, comming by cold rheumes.

B The ſame made with figges, water, honie, and rue, and drunken, helpeth the inflammation of the lungs, the old cough, and ſhortneſſe of breath, and the obſtructions or ſtoppings of the breaſt.

C The ſirrup or iuice of Hyſſope taken with the ſirrup of vineger, purgeth by ſtoole tough and clammie flegme, and driueth forth wormes if it be eaten with figges.

D The diſtilled water drunke, is good for thoſe diſeaſes before named, but not with that ſpeed and force.

† That figure in the third place was of the *Satureia Romana*. ſ. of *Tabernæmontanus*.

CHAP.

Chap. 178. *Of Hedge Hyſſope.*

¶ *The Deſcription.*

1 HEdge Hyſſope is a low plant or herbe about a ſpan long, very like vnto the common Hyſſope, with many ſquare ſtalkes or ſlender branches, beſet with leaues ſomewhat larger than Hyſſope, but very like. The floures grow betwixt the leaues vpon ſhort ſtems, of a white colour declining to blewneſſe. All the herbe is of a moſt bitter taſte, like the ſmall Centory. The root is little and threddy, dilating it ſelfe farre abroad; by which meanes it multiplieth greatly, and occupieth much ground where it groweth.

1 *Gratiola.* Hedge Hyſſope.

‡ 2 *Gratiola anguſtifolia.* Graſſe Poley.

3 *Gratiola latifolia.* Broad leaued Hedge Hyſſope.

‡ 2 Narrow leaued Hedge Hyſſope from a ſmall fibrous white root ſends vp a reddiſh round creſted ſtalke diuided into ſundry branches, which are ſet with leaues like thoſe of knot graſſe of a pale greene colour, and without any ſtalkes: out of the boſome of theſe come floures ſet in long cups compoſed of foure leaues of a pleaſing blew colour, which are ſucceeded by longiſh ſeed-veſſells conteyning a ſmall dusky ſeed. The whole plant is without ſmell, neither hath it any bitterneſſe or other manifeſt taſte. It varies in leaues, ſometimes broader, and otherwhiles narrower, the plant growing ſometimes but an handfull, and otherwhiles a foot high. *Geſner* called this *Gratiola minor*: and *Camerarius*, *Hyſſopoides*: and *Bauhine* onely hath figured it, and that by the name of *Hyſſopifolia ſiue Gratiola minor*. *Cordus* firſt mentioned it, and that by the Dutch name of Graſſe Poley, which name we may alſo very fitly retaine in Engliſh. ‡

3 Broad leaued hedge Hyſſope hath many ſmall and tender branches, foure ſquare, and ſomewhat hollow or furrowed, beſet with leaues by couples one oppoſite againſt another, like vnto the former, but ſomewhat ſhorter, and much broader: among which grow the floures of a purple

colour, ſpotted on the inſide with white, and of a brighter purple than the reſt of the floure, faſhioned like the ſmalleſt *Antirrhinum*, or leaſt Snapdragon; which being paſt, there ſucceed little ſeed veſſels, faſhioned like the nut of a croſſebow, which containe ſmall yellowiſh ſeed, extreame bitter of taſte. The whole plant is likewiſe bitter, as the common or well knowne *Gratiola*. The root is compact of a great number of whitiſh ſtrings, entangled one within another, which mightily encreaſeth and ſpreadeth abroad.

‡ This plant is onely a leſſer kinde of the *Lyſimachia galericulata* of *Lobell*, which ſome haue called *Gratiola latifolia*: our Authors figure was very ill, wherefore I haue endeauoured by the helpe of ſome dried plants and my memory to preſent you with a better expreſſion thereof. ‡

¶ *The Place.*

The firſt groweth in low and moiſt places naturally, which I haue planted in my Garden. ‡ The ſecond was found growing by my oft mentioned friend Mr. *Bowles* at Dorcheſter in Oxfordſhire, at the backe ſide of the encloſed grounds on the left hand of the towne, if you would ride from thence to Oxford in the graſſie places of the Champion corne fields. ‡ The third groweth likewiſe in moiſt places. I found it growing vpon the bog or marriſh ground at the further end of Hampſtead heath, and vpon the ſame heath towards London, neere vnto the head of the ſprings that were digged for water to be conueied to London, 1590. attempted by that carefull citizen *Iohn Hart* Knight, Lord Major of the City of London: at which time my ſelfe was in his Lordſhips company, and viewing for my pleaſure the ſame goodly ſprings, I found the ſaid plant, not heretofore remembred.

¶ *The Time.*

The firſt floureth in May: the ſecond in Iune and Iuly: the third in Auguſt.

¶ *The Names in generall.*

Hedge Hyſſope is called in Latine *Gratiola*, and *Gratia Dei*, or the Grace of God; notwithſtanding there is a kind of *Geranium*, or Storkes bill, called by the later name. Of *Cordus*, *Limneſium*, and *Centauroides*: of *Anguillaria* it is thought to be *Dioſcorides* his *Papauer ſpumeum*, or Spatling Poppy: but ſome think *Papauer ſpumeum* to be that which we call *Behen album*: in Dutch it is called **Gods gratie**: in Italian, *Stanca cauallo*, becauſe that horſes when they haue eaten thereof do wax leane, and languiſh thereupon: and in Engliſh, Gratia Dei, and Hedge Hyſſope. The ſeed hereof is called *Gelbenech*, which name the Arabians retaine vnto this day.

‡ ¶ *Names in particular.*

‡ 1 *Matthiolus*, *Dodonæus* and others haue called this *Gratiola*; *Anguillara*, *Gratia Dei*; *Cordus*, *Limneſium*, *Centauroides*; he alſo thought it but vnfitly to be the *Eupatoreum* of *Meſue*: *Geſner* thinks it may be *Polemonium paluſtre amarum* of *Hippocrates*, that write of the diſeaſes of cattell. ‡

2 *Cordus* called this Graſſe Poley; *Geſner*, *Gratiola minor*; *Camerarius*, *Hyſſopoides*: and *Bauhine*, *Hyſſopifolia*.

3 This is not ſet forth by any but our Author, and it may fitly be named *Lyſimachia galericulata minor*, as I haue formerly noted. ‡

¶ *The Temperature.*

Hedge Hyſſope is hot and dry of temperature. And the firſt is onely vſed in medicine.

¶ *The Vertues.*

A Who ſo taketh but one ſcruple of *Gratiola* bruſed, ſhall perceiue euidently his effectuall operation and vertue, in purging mightely, and that in great abundance, wateriſh, groſſe, and ſlimy humors. *Conradus Geſnerus* experimented this, and found it to be true, and ſo haue I my ſelfe, and many others.

B *Gratiola* boiled, and the decoction drunke or eaten with any kinde of meate, in manner of a ſallade, openeth the belly, and cauſeth notable looſenes, and to ſcoure freely, and by that meanes purgeth groſſe flegme and cholericke humors.

C *Gratiola* or Hedge Hyſſope boiled in wine and giuen to drinke, helpeth feuers of what ſort ſoeuer, and is moſt excellent in dropſies, and ſuch like diſeaſes proceeding of cold and watery cauſes.

D The extraction giuen with the powder of cinamon and a little of the iuice of Calamint, preuaileth againſt tertian and quotidian feuers, ſet downe for moſt certaine by the learned *Ioachimus Camerarius*.

Chap.

Chap. 179. *Of Lauander Spike.*

¶ *The Deſcription.*

1 Lauander Spike hath many ſtiffe branches of a wooddie ſubſtance, growing vp in the manner of a ſhrubbe, ſet with many long hoarie leaues, by couples for the moſt part; of a ſtrong ſmell, and yet pleaſant enough to ſuch as doe loue ſtrong ſauours. The floures grow at the top of the branches ſpike faſhion, of a blew colour. The roote is hard and wooddie.

2 The ſecond differeth not from the precedent, but in the colour of the floures: For this Plant bringeth milke white floures; and the other blew, wherein eſpecially conſiſteth the difference.

3 Wee haue in our Engliſh gardens a ſmall kinde of Lauander, which is altogether leſſer than the other, ‡ and the floures are of a more purple colour and grow in much leſſe and ſhorter heads, yet haue they a farre more gratefull ſmell: the leaues are alſo leſſe and whiter than thoſe of the ordinarie ſort. This did, and I thinke yet doth grow in great plentie, in his Maieſties priuate Garden at White-hall. And this is called Spike, without addition, and ſometimes Lauander Spike: and of this by diſtillation is made that vulgarly known and vſed oile which is termed *Oleum ſpicæ*, or oile of Spike. ‡

1 *Lavandula flore cæruleo.*
Common Lauander.

2 *Lavandula flore albo.*
VVhite floured Lauander.

¶ *The Place.*

In Spaine and Languedocke in France, moſt of the mountaines and deſert fields, are as it were couered

3 *Lauendula minor, ſive Spica.*
Lauander Spike.

couered ouer with Lauander. In theſe cold countries they are planted in gardens.

¶ *The Time.*

They floure and flouriſh in Iune and Iuly.

¶ *The Names.*

Lauander Spike is called *i*n Latine *Lauendula*, and *Spica:* in Spaniſh, *Spigo*, and *Languda*. The firſt is the male, and the ſecond the female. It is thought of ſome to be that ſweet herbe *Caſia*, whereof Virgil maketh mention in the ſecond Eclog of his Bucolicks:

Tum Caſia atque alijs intexens ſuauibus herbis,
Mollia luteola pingit vacinia Calatha.

(infold)
And then ſhee'l Spike and ſuch ſweet herbs
And paint the Iacinth with the Marygold.

And likewiſe in the fourth of his Georgicks, where hee intreateth of chooſing of ſeats and places for Bees, and for the ordering thereof, he ſaith thus:

Hæc circum Caſiæ virides, & olentia late
Serpilla, & grauiter ſpirantis copia Thymbræ
Floreat; &c. ——→——.

About them let freſh Lauander and ſtore
Of wild Time with ſtrong Sauorie to floure.

Yet there is another *Caſia* called in ſhops *Caſia Lignea*, as alſo *Caſia nigra*, which is named *Caſia fiſtula*; and another a ſmall ſhrubbie plant extant among the ſhrubs or hedge buſhes, which ſome thinke to be the *Caſia Poetica*, mentioned in the precedent verſes.

¶ *The Temperature.*

Lauander is hot and drie, and that in the third degree, and is of a thin ſubſtance, conſiſting of many airie and ſpirituall parts. Therefore it is good to be giuen any way againſt the cold diſeaſes of the head, and eſpecially thoſe which haue their originall or beginning not of abundance of humours, but chiefely of a cold quality onely.

¶ *The Vertues.*

A The diſtilled water of Lauander ſmelt vnto, or the temples and forehead bathed therewith, is a refreſhing to them that haue the Catalepſie, a light Migram, & to them that haue the falling ſickneſſe, and that vſe to ſwoune much. But when there is abundance of humours, eſpecially mixt with bloud, it is not then to be vſed ſafely, neither is the compoſition to be taken which is made of diſtilled wine: in which ſuch kinde of herbes, floures, or ſeeds, and certaine ſpices are infuſed or ſteeped, though moſt men do raſhly and at aduenture giue them without making any difference at all For by vſing ſuch hot things that fill and ſtuffe the head, both the diſeaſe is made greater, and the ſicke man alſo brought into danger, eſpecially when letting of bloud, or purging haue not gone before. Thus much by way of admonition, becauſe that euery where ſome vnlearned Phyſitions and diuers raſh and ouerbold Apothecaries, and other fooliſh women, do by and by giue ſuch compoſitions, and others of the like kinde, not only to thoſe that haue the Apoplexy; but alſo to thoſe that are taken, or haue the Catuche or Catalepſis with a Feuer; towhom they can giue nothing worſe, ſeeing thoſe things do very much hurt, and oftentimes bring death it ſelfe.

B The floures of Lauander picked from the knaps, I meane the blew part and not the huske, mixed with Cinamon, Nutmegs, and Cloues, made into pouder, and giuen to drinke in the diſtilled water thereof, doth helpe the panting and paſſion of the heart, preuaileth againſt giddineſſe, turning, or ſwimming of the braine, and members ſubiect to the palſie.

C Conſerue made of the floures with ſugar, profiteth much againſt the diſeaſes aforeſaid, if the quantitie of a beane be taken thereof in the morning faſting.

D It profiteth them much that haue the palſie, if they bee waſhed with the diſtilled water of the floures,

floures, or annointed with the oile made of the floures, and oile oliue, in ſuch manner as oile of roſes is, which ſhall be expreſſed in the treatiſe of Roſes.

Chap. 180. *Of French Lauander, or Stickeadoue.*

¶ *The Deſcription.*

1 French Lauander hath a bodie like Lauander, ſhort, and of a wooddie ſubſtance, but ſlenderer, beſet with long narrow leaues, of a whitiſh colour, leſſer than thoſe of Lauander: it hath in the top buſhy or ſpikie heads, well compact or thruſt together; out of the which grow forth ſmall purple floures, of a pleaſant ſmell. The ſeede is ſmall and blackiſh: the roote is hard and wooddie.

2 This iagged Sticadoue hath many ſmall ſtiffe ſtalks of a wooddy ſubſtance; whereupon do grow iagged leaues in ſhape like vnto the leaues of Dill, but of an hoarie colour: on the top of the ſtalkes do grow ſpike floures of a blewiſh colour; and like vnto the common Lauander Spike: the root is likewiſe wooddie. ‡ This by *Cluſius* who firſt deſcribed it, as alſo by *Lobel*, is called *Lavendula multifido folio*, or Lauander with the diuided leafe; the plant more reſembling Lauander than Sticadoue. ‡

3 There is alſo a certaine kinde hereof, differing in ſmalneſſe of the leaues onely, which are round about the edges nicked or toothed like a ſaw, reſembling thoſe of Lauander cotton. The root is likewiſe wooddie.

‡ 4 There is alſo another kinde of *Stœchas* which differs from the firſt or ordinarie kind, in that the tops of the ſtalkes are not ſet with leaues almoſt cloſe to the head as in the common kinde, but are naked and wholly without leaues: alſo at the tops of the ſpike or floures (as it were to recompence their defect below) there growe larger and fairer leaues than in the other ſorts. The other parts of the plant differ not from the common *Stœchas*. ‡

†1 *Stœchas ſive ſpica hortulana.*
Sticadoue and Sticados.

2 *Stœchas multifida.*
Iagged Sticados.

3 *Stœchas folio ſerrato.*
Toothed Sticadoue.

‡ 4 *Stœchas ſummis cauliculis nudis.*
Naked Sticadoue.

¶ *The Place.*

Theſe herbes do grow wilde in Spaine, in Languedocke in France, and the Iſlands called Stœchades ouer againſt Maſſilia: we haue them in our gardens, and keepe them with great diligence from the iniurie of our cold clymate.

¶ *The Time.*

They are ſowne of ſeed in the end of Aprill, and couered in the Winter from the cold, or els ſet in pots or tubs with earth, and carried into houſes.

¶ *The Names.*

The Apothecaries call the floure *Stœcados*: *Dioſcorides*, στοιχὰς: *Galen*, στοιχὰς, by the diphthong ω in the firſt ſyllable: in Latine, *Stœchas*: in High Dutch, **Stichas kraut**: in Spaniſh, *Thomani*, and *Cantueſſo*: in Engliſh, French Lauander, Steckado, Stickadoue, Caſſidonie, and ſome ſimple people imitating the ſame name do call it Caſt me downe.

¶ *The Temperature.*

French Lauander ſaith *Galen* is of temperature compounded of a little cold earthie ſubſtance, by reaſon whereof it bindeth: it is of force to take away obſtructions, to extenuate or make thinne, to ſcoure and clenſe, and to ſtrengthen not onely all the entrails, but the whole bodie alſo.

¶ *The Vertues.*

A *Dioſcorides* teacheth that the decoction hereof doth helpe the diſeaſes of the cheſt, and is with good ſucceſſe mixed with counterpoiſons.

B The later Phyſitions affirme, that *Stœchas*, and eſpecially the floures of it, are moſt effectuall againſt paines of the head, and all diſeaſes thereof proceeding of cold cauſes, and therefore they be mixed in all compoſitions almoſt which are made againſt head-ache of long continuance, the Apoplexie, the falling ſickneſſe, and ſuch like diſeaſes.

C The decoction of the husks and floures drunke, openeth the ſtoppings of the liuer, the lungs, the milt, the mother, the bladder, and in one word all other inward parts, clenſing and driuing forth all cuill and corrupt humours, and procuring vrine.

Chap.

Chap. 181. *Of Flea-wort.*

¶ *The Deſcription.*

1 *Pſyllium*, or the common Flea-wort hath many round and tender branches, ſet full of long and narrow leaues ſomewhat hairy. The top of the ſtalkes are garniſhed with ſundrie round chaffie knops, beſet with ſmall yellow floures: which being ripe containe many little ſhining ſeeds, in proportion, colour, and bigneſſe like vnto fleas.

2 The ſecond kinde of *Pſyllium* or Flea-wort hath long and tough branches, of a wooddy ſubſtance like the precedent, but longer and harder, with leaues reſembling the former, but much longer and narrower. The chaffie tuft which containeth the ſeed is like the other, but more like the eare of *Phalaris*, which is the eare of *Alpiſti*, the Canarie ſeed which is meate for birds that come from the Iſlands of Canarie. The root hereof laſteth all the Winter, and likewiſe keepeth his greene leaues, whereof it tooke this addition of *Sempervirens*.

1 *Pſyllium ſiue pulicaris herba.*
Flea-wort.

2 *Pſyllium ſempervirens Lobelij.*
Neuer dying Flea-wort.

¶ *The Place.*

Theſe plants are not growing in our fields of England, as they doe in France and Spaine, yet I haue them growing in my garden.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

Flea-wort is called in Greeke ψυλλιον: in Latine, *Pulicaria*, and *Herba Pulicaris*: in ſhops, *Pſyllium*: in Engliſh, Flea-wort; not becauſe it killeth fleas, but becauſe the ſeeds are like fleas: of ſome, Flea-bane, but vnproperly: in Spaniſh, *Zargatona*: in French, *L'herbe aus pulces*: in Dutch, **Dupls vloye-cruyt.**

¶ *The Temperature.*

Galen and *Serapio* record, that the ſeed of *Pſyllium* (which is chiefely vſed in medicine) is co'd in the ſecond degree, and temperate in moiſture and drineſſe.

¶ *The*

¶ *The Vertues.*

A The ſeed of Flea-wort boyled in water or infuſed, and the decoction or infuſion drunke, purgeth downewards aduſt and cholericke humors, cooleth the heate of the inward parts, hot feauers, burning agues, and ſuch like diſeaſes proceeding of heate, and quencheth drought and thirſt.

B The ſeed ſtamped, and boyled in water to the forme of a plaiſter, and applied, taketh away all ſwellings of the ioynts, eſpecially if you boyle the ſame with vineger and oyle of Roſes, and apply it as aforeſaid.

C The ſame applied in manner aforeſaid vnto any burning heate, called S. Anthonies fire, or any hot and violent impoſtume, aſſwageth the ſame, and bringeth it to ripeneſſe.

D Some hold that the herbe ſtrowed in the chamber where many fleas be, will driue them away; for which cauſe it tooke the name Flea-wort: but I thinke it is rather becauſe the ſeed doth reſemble a flea ſo much, that it is hard to diſcerne the one from the other.

¶ *The Danger.*

Too much Flea-wort ſeed taken inwardly is very hurtful to mans nature: ſo that I wiſh you not to follow the minde of *Galen* and *Dioſcorides* in this point, being a medicine rather bringing a maladie, than taking away the griefe: remembring the old prouerbe, A man may buy gold too deare; and the hony is too deare that is lickt from thornes.

‡ *Dioſcorides* nor *Galen* mention no vſe of this inwardly; but on the contrarie, *Dioſcorides* in his ſixth booke, which treats wholly of the curing and preuenting of poyſons, mentions this in the tenth chapter for a poyſon, and there ſets downe the ſymptomes which it cauſes, and refers you to the foregoing chapter for the remedies. ‡

Chap. 185. *Of Gloue Gilloſloures.*

1 *Caryophyllus maximus multiplex.*
The great double Carnation.

2 *Caryophyllus multiplex.*
The double Cloue Gilloſloure.

¶ *The Kindes.*

THere are at this day vnder the name of *Caryophyllus* comprehended diuers and ſundry ſorts of plants, of ſuch various colours, and alſo ſeuerall ſhapes, that a great and large volume would not

not ſuffice to write of euery one at large in particular; conſidering how infinite they are, and how euery yeare euery clymate and countrey bringeth forth new ſorts, ſuch as haue not heretofore bin written of; ſome whereof are called Carnations, others Cloue Gilloſloures, ſome Sops in wine, ſome Pagiants, or Pagion colour, Horſe-fleſh, blunket, purple, white, double and ſingle Gilloſloures, as alſo a Gilloſloure with yellow floures: the which a worthipfull Merchant of London Mr. *Nicolas Lete* procured from Poland, and gaue me thereof for my garden, which before that time was neuer ſeene nor heard of in theſe countries. Likewiſe there be ſundry ſorts of Pinkes comprehended vnder the ſame title, which ſhall be deſcribed in a ſeuerall chapter. There be vnder the name of Gilloſloures alſo thoſe floures which wee call Sweet-Iohns and Sweet-Williams. And firſt of the great Carnation and Cloue Gilleſloure.

‡ There are very many kindes both of Gilloſloures, Pinkes, and the like, which differ very little in their roots, leaues, ſeeds, or manner of growing, though much in the colour, ſhape, and magnitude of their floures; wherof ſome are of one colour, other ſome of more; and of them ſome are ſtriped, others ſpotted, &c. Now I (holding it a thing not ſo fit for me to inſiſt vpon theſe accidentall differences of plants, hauing ſpecifique differences enough to treat of) refer ſuch as are addicted to theſe commendable and harmleſſe delights to ſuruey the late and oft mentioned Worke of my friend Mr. *Iohn Parkinſon*, who hath accurately and plentifully treated of theſe varieties; and if they require further ſatisfaction, let them at the time of the yeare repaire to the garden of Miſtreſſe *Tuggy* (the wife of my late deceaſed friend Mr. *Ralph Tuggy*) in Weſtminſter, which in the excellencie and varietie of theſe delights exceedeth all that I haue ſeene: as alſo hee himſelfe whileſt he liued exceeded moſt, if not all of his time, in his care, induſtry, and skill in raiſing, encreaſing, and preſeruing of theſe plants and ſome others; whoſe loſſe therefore is the more to be lamented by all thoſe that are louers of plants. I will onely giue you the figures of ſome three or foure more, whereof one is of the ſingle one, which therefore ſome terme a Pinke, though in mine opinion vnfitly, for that it is produced by the ſeed of moſt of the double ones, and is of different colour and ſhape as they are, varying from them onely in the ſingleneſſe of the floures. ‡

‡ *Caryophyllus maior & minor, rubro & albo variegati.*
The white Carnation, and Pageant.

‡ *Caryophyllus purpureus profunde laciniatus.*
The blew, or deep purple Gilloſloure.

¶ The

¶ *The Deſcription.*

1 THe great Carnation Gillow-floure hath a thicke round wooddy root, from which riſeth vp many ſtrong ioynted ſtalkes ſet with long greene leaues by couples: on the top of the ſtalkes do grow very faire floures of an excellent ſweet ſmell, and pleaſant Carnation colour, whereof it tooke his name.

2 The Cloue Gilloſloure differeth not from the Carnation but in greatneſſe as well of the floures as leaues. The floure is exceeding well knowne, as alſo the Pinks and other Gilloſloures, wherefore I will not ſtand long vpon the deſcription.

‡ *Caryophyllus ſimplex maior.*
The ſingle Gilloſloure or Pinke.

¶ *The Place.*

Theſe Gilloſloures, eſpecially the Carnations, are kept in pots from the extremity of our cold Winters. The Cloue Gilloſloure endureth better the cold, and therefore is planted in gardens.

¶ *The Time.*

They flouriſh and floure moſt part of the Sommer.

¶ *The Names.*

The Cloue Gilloſloure is called of the later Herbariſts *Caryophyllcus flos*, of the ſmell of cloues wherewith it is poſſeſſed: in Italian, *Garofoli*: in Spaniſh, *Clauel*: in French, *Oeilletz*: in low-Dutch, **Ginoffelbloemen**: in Latine of moſt, *Ocellus Damaſcenus*, *Ocellus Barbaricus*, and *Barbarica*: in Engliſh, Carnations, and Cloue Gilloſloures. Of ſome it is called *Vetonica*, and *Herba Tunica*. The which *Bernardus Gordonius* hath ſet downe for *Dioſcorides* his *Polemonium*.

That worthy Herbariſt and learned Phyſition of late memorie Mr. Doctor *Turner* maketh *Caryophyllus* to be *Cantabrica*; which *Pliny*, *lib.* 23. *cap.* 8. writeth to haue beene found out in Spaine about *Auguſtus* time, and that by thoſe of Biſcay.

Iohannes Ruellius ſaith, That the Gilloſloure was vnknowne to the old writers: whoſe iudgment is very good, eſpecially becauſe this herbe is not like to that of *Vetonica* or *Cantabrica*. It is maruell, ſaith he, that ſuch a famous floure, ſo pleaſant and ſweet, ſhould lie hid, and not be made knowne by the old Writers: which may be thought not inferiour to the roſe in beauty, ſmell, and varietie.

¶ *The Temperature.*

The Gilloſloure with the leaues and roots for the moſt part are temperate in heate and drineſſe.

¶ *The Vertues.*

A The conſerue made of the floures of the Cloue Gilloſloure and ſugar, is exceeding cordial, and wonderfully aboue meaſure doth comfort the heart, being eaten now and then.

B It preuaileth againſt hot peſtilentiall feuers, expelleth the poyſon and furie of the diſeaſe, and greatly comforteth the ſicke, as hath of late beene found out by a learned Gentleman of Lee in Eſſex, called Mr. *Rich.*

Chap. 183. *Of Pinks, or wilde Gilloſloures.*

¶ *The Deſcription.*

1 THe double purple Pinke hath many graſſie leaues ſet vpon ſmall ioynted ſtalkes by couples, one oppoſite againſt another, whereupon doe grow pleaſant double purple floures,

1 *Caryophyllus ſylueſtris ſimplex.*
Single purple Pinks.

2 *Caryophyllus ſylueſtris ſimplex, ſuaue rubens.*
Single red Pinks.

3 *Caryophyllus plumarius albus.*
White jagged Pinks.

‡ *Caryophyllus plumarius albus odoratior.*
Large white jagged Pinks.

floures of a moſt fragrant ſmell, not inferiour to the Cloue Gilloflowre. The root is ſmall and wooddy.

‡ There is alſo a ſingle one of this kinde, whoſe figure I here giue you in ſtead of the double one of our Author. ‡

2 The ſingle red Pinke hath likewiſe many ſmall graſſie leaues leſſer than the former: The floures grow at the top of the ſmall ſtalkes ſingle, and of a ſweet bright red colour.

3 The white iagged Pinke hath a tough wooddy root: from which riſe immediately many graſſie leaues, ſet vpon a ſmall ſtalke full of ioynts or knees, at euery ioynt two one againſt another euen to the top; whereupon do grow faire double purple floures of a ſweet and ſpicie ſmell, conſiſting of fiue leaues, ſometimes more, cut or deepely iagged on the edges, reſembling a feather: whereupon I gaue it the name *Plumarius*, or feathered Pinke. The ſeed is ſoft, blackiſh, and like vnto Onion ſeed.

‡ There is another varietie of this, with the leaues ſomewhat larger and greener than the laſt mentioned: the floures alſo are ſomewhat bigger, more cut in or diuided, and of a much ſweeter ſmell. ‡

4 This purple coloured Pinke is very like the precedent in ſtalkes, roots, and leaues. The floures grow at the top of the branches leſſer than the laſt deſcribed, and not ſo deepely iagged; of a purple colour tending to blewneſſe, wherein conſiſteth the difference.

There be diuers ſorts of Pinks more, whereof to write particularly were to ſmall purpoſe, conſidering they are all well knowne to the moſt, if not to all. Therefore theſe few ſhall ſerue at this time for thoſe that we do keepe in our gardens: notwithſtanding I thinke it conuenient to place theſe wilder ſorts in this ſame chapter, conſidering their nature and vertues doe agree, and few or none of them be vſed in phyſicke, beſides their neereneſſe in kindred and neighbourhood.

4 *Caryophyllus plumarius purpureus.*
Purple jagged Pinkes.

5 *Cariophyllus plumarius ſylueſtris albus.*
Whitewilde jagged Pinkes.

5 This wilde iagged Pinke hath leaues, ſtalkes, and floures like vnto the white iagged Pinke of the garden, but altogether leſſer, wherein they eſpecially differ.

6 The purple mountaine or wilde Pinke hath many ſmall graſſie leaues: among which riſe vp ſlender ſtalks ſet with the like leaues, but leſſer; on the top whereof do grow ſmall purple floures, ſpotted finely with white or elſe yellowiſh ſpots, and much leſſer than any of the others before deſcribed.

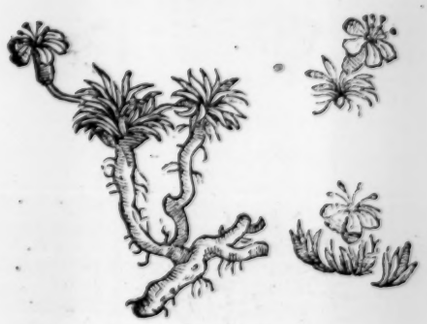
7 The

6 *Caryophyllus montanus purpureus.*
Wilde Purple iagged Pinke.

7 *Caryophyllus montanus Cluſij.*
Cluſius mountaine Pinke.

‡ 8 *Caryophyllus pumilio Alpinus.*
Dwarfe Mountaine Pinke.

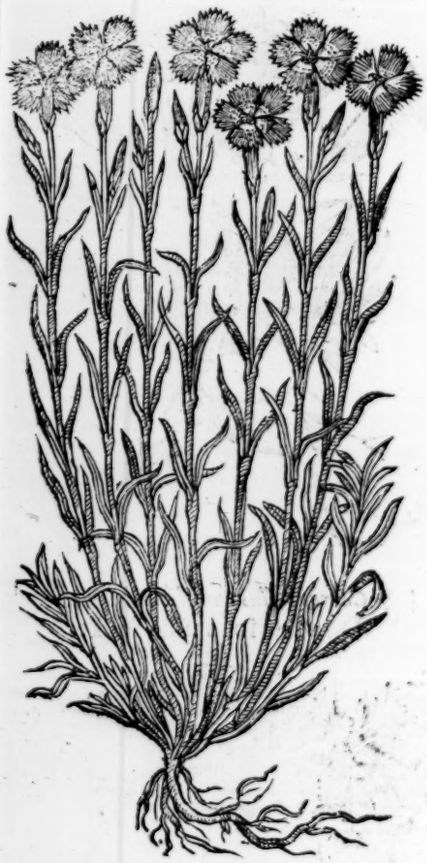
9 *Caryophyllus cæruleus ſiue Aphyllanthos.*
Leafeles Pinke, or ruſhy Pinke.



7 The mountaine Pinke of *Cluſius* his deſcription hath many leaues growing into a tuft like vnto thoſe of Thrift, and of a bitter taſte: amongſt which riſe vp ſmall ſlender foot-ſtalkes, rather than ſtalkes or ſtems themſelues, of the height of two inches; whereupon do grow ſuch leaues as thoſe that were next the ground, but leſſer, ſet by couples one oppoſite to another: at the top of each ſmall foot-ſtalke doth ſtand one red floure without ſmell, conſiſting of fiue little leaues ſet in a rough hairy huske or hoſe fiue cornered, of a greeniſh colour tending to purple. The root is tough and thicke, caſting abroad many ſhoots, whereby it greatly encreaſeth.

‡ 8 This for his ſtature may iuſtly take the next place; for the ſtalke is ſome inch high, ſet with little ſharpe pointed greene graſſie leaues: the floures which grow vpon theſe ſtalks are compoſed of fiue little fleſh-coloured leaues a little diuided in their vpper parts: the ſeed is contained in blacke ſhining heads, and it is ſmall and reddiſh, and ſhaped ſomwhat like the faſhion of a kidney, whereby it comes neerer to the *Lychnides*, than to the *Caryophylli* or Pinkes. The root is long, blacke, and much ſpreading, whereby this little plant couers the ground a good ſpace together like as a moſſe, and makes a curious ſhew when the floures are blowne, which is commonly in Iune. It

10 *Caryophyllus montanus albus.*
White mountaine Pinke.



‡ 11 *Caryophyllus pratenſis.*
Deptford Pinke.

12 *Caryophyllus Virgineus.*
Maidenly Pinkes.

‡ 13 *Caryophyllus montanus humilis latifolius.*
Small mountaine broad leaued Pink.

‡ 14 *Caryophyllus montanus albus.*
White mountaine Pinke.

15 *Caryophyllus Holoſtius.*
Wilde Sea Pinke.

16 *Caryophyllus Holoſtius arvenſis.*
Broad leafed wilde Pinke.

‡ 17 *Caryophyl. humilis flor. cand. amœno.*
White Campion Pinke.

It growes naturally on diuers places of the Alpes. *Geſner* called it *Muſcus floridus: Pona, Ocimoides Muſcoſus:* and *Cluſius, Caryophyllus pumilio Alpinus 9.* ‡

9 This leafe-leſſe Pinke (as the Greeke word doth ſeeme to import) hath many ſmall rushy or benty leaues riſing immediately from a tough rushy root: among which riſe vp ſtalkes like vnto ruſhes, of a ſpan high, without any ioynt at all, but ſmooth and plaine; on the top whereof groweth a ſmall floure of a blewiſh or sky colour, conſiſting of foure little leaues ſomewhat iagged in the edges, not vnlike thoſe of wilde flax. The whole plant is very bitter, and of a hot taſte.

10 The white mountaine Pinke hath a great thicke and wooddy root; from the which immediately riſe vp very many ſmall and narrow leaues, finer and leſſer than graſſe, not vnlike to the ſmalleſt ruſh: among which riſe vp little tender ſtalkes, ioynted or kneed by certaine diſtances, ſet with the like leaues euen to the top by couples, one oppoſite againſt another: at the top whereof grow pretty ſweet ſmelling floures compoſed of fiue little white leaues. The ſeed is ſmall and blackiſh.

11 There is a wilde creeping Pinke which groweth in our paſtures neere about London, and in other places, but eſpecially in the great field next to Detford, by the path ſide as you goe from Redriffe to Greenwich; which hath many ſmall tender leaues ſhorter than any of the other wilde Pinkes, ſet vpon little tender ſtalkes which lie flat vpon the ground, taking hold of the ſame in ſundry places, whereby it greatly encreaſeth; whereupon grow little reddiſh floures. The root is ſmall, tough, and long laſting.

12 This Virgin-like Pinke is like vnto the reſt of the garden Pinkes in ſtalkes, leaues, and roots. The floures are of a bluſh colour, whereof it tooke his name, which ſheweth the difference from the other.

‡ This whoſe figure I giue you for that ſmall leaued one that was formerly in this place, hath ſlender ſtalkes ſome ſpanne high, ſet with two long narrow hard ſharpe pointed leaues at each ioynt. The floures (which grow commonly but one on a ſtalke) conſiſt of fiue little ſnipt leaues of a light purple colour, rough, and deeper coloured about their middles, with two little crooked threds or hornes: the ſeed is chaffie and blacke: the root long, and creeping: it floures in Aprill and May, and is the *Flos caryophylleus ſylueſtris* [illegible] of *Cluſius*. ‡

13 *Cluſius* mentions alſo another whoſe ſtalkes are ſome three inches high: the leaues broader, ſofter, and greener than the former: the floures alſo that grow vpon the top of the ſtalkes are larger than the former, and alſo conſiſt of fiue leaues of a deeper purple than the former, with longer haires finely intermixt with purple and white.

‡ 14 This from a hard wooddy root ſends vp ſuch ſtalks as the former, which are ſet at the ioynts with ſhort narrower and darker greene leaues: the floures are white, ſweet-ſmelling, conſiſting of fiue much diuided leaues, hauing two threds or hornes in their middle. It floures in May, and it is the *Caryophyllus ſylueſtris quintus* of *Cluſius*. ‡

15 This wilde ſea Pinke hath diuers ſmall tender weake branches trailing vpon the ground, whereupon are ſet leaues like thoſe of our ſmalleſt garden Pinke, but of an old hoary colour tending to whiteneſſe, as are moſt of the ſea Plants. The floures grow at the top of the ſtalks in ſhape like thoſe of Stitch-wort, and of a whitiſh colour. Neither the ſeeds nor ſeed-veſſels haue I as yet obſerued: the root is tough and ſingle.

16 There is another of theſe wilde Pinkes which is found growing in ploughed fields, yet in ſuch as are neere vnto the ſea: it hath very many leaues ſpred vpon the ground of a freſh green colour; amongſt which riſe vp tender ſtalkes of the height of a foot, ſet with the like leaues by couples at certaine diſtances. The floures grow at the top many together, in manner of the Sweet-William, of a white, or ſometimes a light red colour. The root is ſmall, tough, and long laſting. ‡ This is a kinde of *Gramen Leucanthemum*, or *Holoſteum Ruellij*, deſcribed in the 38. Chapter of the firſt booke.

17 *Cluſius* makes this a *Lychnis:* and *Lobel* (whom I here follow) a Pinke, calling it *Caryophyllus minimus humilis alter exoticus flore candido amæno.* This from creeping roots ſendeth vp euery yeare many branches ſome handfull and better high, ſet with two long narrow greene leaues at each ioynt: the floures which grow on the tops of the branches are of a pleaſing white colour, compoſed of fiue iagged leaues without ſmell. After the floures are gone there ſucceed round blunt pointed veſſels, containing a ſmall blackiſh flat ſeed like to that of the other Pinks. This hath a viſcous or clammy iuyce like as that of the *Muſcipula's* or Catch-flies. *Cluſius* makes this his *Lychnis ſylueſtris decima.* ‡

¶ *The Place.*

Theſe kindes of Pinkes do grow for the moſt part in gardens, and likewiſe many other ſorts, the which were ouer long to write of particularly. Thoſe that be wilde doe grow vpon mountaines, ſtony rockes, and deſart places. The reſt are ſpecified in their deſcriptions.

¶ *The*

¶ *The Time.*

They floure with the Cloue Gilloflourc, and often after.

¶ *The Names.*

The Pinke is called of *Pliny* and *Turner*, *Cantabrica* and *Stactice*: of *Fuchſius* and *Dodonæus*, *Vetonica altera*, and *Vetonica altilis*: of *Lobelius* and *Fuchſius*, *Superba*: in French, *Gyrofflees*, *Oeillets*, and *Violettes herbues*: in Italian, *Garofoli*, and *Garoni*: in Spaniſh, *Clauis*: in Engliſh, Pinkes, and Small Honeſties.

¶ *The Temperature.*

The temperature of the Pinkes is referred vnto the Cloue Gilloflours.

¶ *The Vertues.*

Theſe are not vſed in Phyſicke, but eſteemed for their vſe in Garlands and Noſegaies. They are good to be put into Vineger, to giue it a pleaſant taſte and gallant colour, as *Ruellius* writeth. *Fuchſius* ſaith, that the roots are commended againſt the infection of the plague; and that the iuice thereof is profitable to waſte away the ſtone, and to driue it forth: and likewiſe to cure them that haue the falling ſickneſſe. A

Chap. 184. *Of Sweet Saint Johns and Sweet Williams.*

1 *Armeria alba.*
White Iohns.

2 *Armeria alba & rubra multiplex.*
Double white and red Iohns.

¶ *The Deſcription.*

1 Sweet Iohns haue round ſtalkes as haue the Gilloflours, (whereof they are a kinde) a cubit high, whereupon do grow long leaues broader than thoſe of the Gilloflour, of a greene graſſie colour: the floures grow at the top of the ſtalkes, very like vnto Pinks, of a perfect white colour.

2 The ſecond differeth not from the other but in that, that this plant hath red floures, and the other white.

We haue in our London gardens a kinde hereof bearing moſt fine and pleaſant white floures, ſpotted very confuſedly with reddiſh ſpots, which ſetteth forth the beauty thereof; and hath bin taken of ſome (but not rightly) to be the plant called of the later Writers *Superba Auſtriaca*, or the Pride of Auſtria. ‡ It is now commonly in moſt places called London-Pride. ‡

† Wee haue likewiſe of the ſame kinde bringing forth moſt double floures, and theſe either very white, or elſe of a deepe purple colour.

3 *Armeria rubra latifolia.*
Broad leaued Sweet-Williams.

4 *Armeria ſuaue rubens.*
Narrow leaued Sweet-Williams.

3 The great Sweet-William hath round ioynted ſtalkes thicke and fat, ſomewhat reddiſh about the lower ioynts, a cubit high, with long broad and ribbed leaues like as thoſe of the Plantaine, of a greene graſſie colour. The floures at the top of the ſtalkes are very like to the ſmall Pinkes, many ioyned together in one tuft or ſpoky vmbel, of a deepe red colour: the root is thick and wooddy.

4 The narrow leaued Sweet-William groweth vp to the height of two cubits, very wel reſembling the former, but leſſer, and the leaues narrower: the floures are of a bright red colour, with many ſmall ſharpe pointed graſſie leaues ſtanding vp amongſt them, wherein eſpecially conſiſteth the difference.

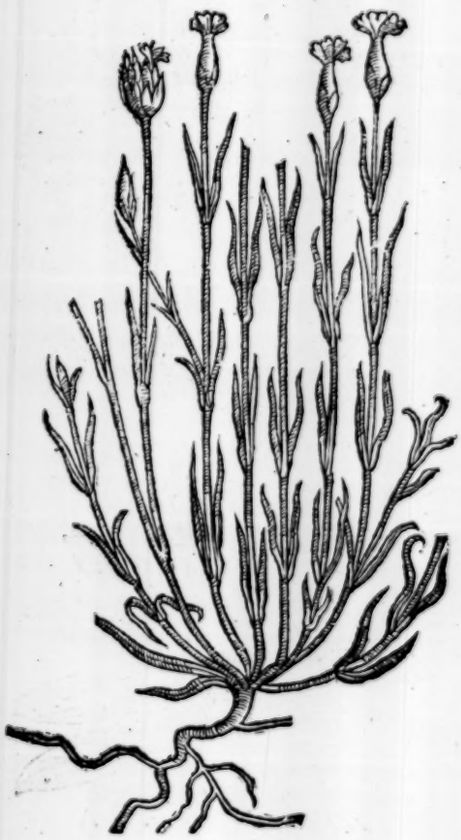
‡ 5 This little fruitfull Pinke (whoſe figure our Author formerly gaue in the firſt place of the next chapter ſaue one) hath a ſmall whitiſh wooddy root, which ſends forth little ſtalks ſome handfull and better high; and theſe at each ioynt are ſet with two thinne narrow little leaues: at the top of each of theſe ſtalkes growes a ſingle skinny ſmooth ſhining huske, out of which (as in other Pinkes) growes not one onely floure, but many, one ſtill comming out as another withers; ſo that oft times out of one head come ſeuen, eight, or nine floures one after another, which as they fade leaue behinde them a little pod containing ſmall blacke flattiſh ſeed. The floure is of a light red, and very ſmall, ſtanding with the head ſomewhat far out of the hoſe or huske. ‡

¶ *The Place.*

Theſe plants are kept and maintained in gardens more for to pleaſe the eye, than either the noſe or belly.

¶ *The*

‡ 5 *Armeria prolifera, Lob.*
Childing ſweet Williams.



¶ *The Time.*

They flouriſh and bring forth their floures in April and May, ſomewhat before the Gilloſloures, and after beare their floures the whole Sommer.

¶ *The Names.*

The ſweet Iohn, and alſo the ſweet William are both comprehended vnder one title, that is to ſay, *Armeria*: of ſome, *Superba*, and *Caryophyllus ſylueſtris*: of ſome Herbariſts, *Vetonica agreſtis*, or *Sylueſtris*: of ſome, *Herba tunica*: but it doth no more agree herewith than the Cloue Gilloſloure doth with *Vetonica altera*, or *Polemonium*. in French, *Armoires*: hereupon *Ruellius* nameth them *Armerij Flores*: in Dutch, **Keykens**: as though you ſhould ſay, a bundell or cluſter, for in their vulgar tongue bundles of floures or noſe gaies they call **Keykens**: doubtleſſe they are wild kindes of Gilloſloures: In Engliſh the firſt two are called Sweet Iohns; and the two laſt, Sweet Williams, Tolmeiners, and London Tufts.

¶ *The Temperature and Vertues.*

Theſe plants are not vſed either in meat or medicine, but eſteemed for their beauty to decke vp gardens, the boſomes of the beautifull, garlands and crownes for pleaſure.

Chap. 185. *Of Crow floures, or Wilde Williams.*

¶ *The Deſcription.*

1 BEſides theſe kindes of Pinkes before deſcribed, there is a certaine other kinde, either of the Gilloſloures or elſe of the Sweete Williams, altogether and euery where wilde, which of ſome hath beene inſerted amongſt the wilde Campions; of others taken to be the true *Flos Cuculi*. Notwithſtanding I am not of any of their mindes, but doe hold it for neither: but rather a degenerate kinde of wilde Gilloſloure. The Cuckow floure I haue comprehended vnder the title of *Siſimbrium*: Engliſhed, Ladies ſmocks; which plant hath been generally taken for *Flos Cuculi*. It hath ſtalks of a ſpan or a foot high, wherupon the leaues do ſtand by couples out of euery ioint; they are ſmall and bluntly pointed, very rough and hairy. The floures are placed on the tops of the ſtalkes, many in one tuft, finely and curiouſly ſnipt in the edges, leſſer than thoſe of Gilloſloures, very well reſembling the Sweet VVilliam (whereof no doubt it is a kinde) of a light red or Scarlet colour.

2 This female Crow-floure differeth not from the male, ſauing that this plant is leſſer, and the floures more finely iagged like the feathered Pinke, whereof it is a kinde.

3 Of theſe Crow-floures we haue in our gardens one that doth not differ from the former of the field, ſauing that the plant of the garden hath many faire red double floures, and thoſe of the field ſingle.

¶ *The Place.*

Theſe grow all about in Medowes and paſtures, and dankiſh places.

¶ The

1 *Armoraria pratenſis mas.*
The male Crow floure.

‡ 3 *Armoraria pratenſis flore pleno.*
The double Crow-floure.

¶ *The Time.*

They begin to floure in May, and end in Iune.

¶ *The Names.*

The Crow floure is called in Latine *Armoraria ſylueſtris*, and *Armoracia:* of ſome, *Flos Cuculi*, but not properly; it is alſo called *Tunix:* of ſome, *Armeria*, *Armerius flos primus* of *Dodon.* and likewiſe *Caryophillus minor ſylueſtris folijs latioribus*: in Dutch, **Craeynbloemkens:** that is to ſay, *Cornicis flores:* in French, *Cuydrelles*. In Engliſh, Crow floures, wilde Williams, marſh Gillofloures, and Cockow Gillofloures.

The Temperatures and Vertues.

Theſe are not vſed either in medicine or in nouriſhment: but they ſerue for garlands & crowns, and to decke vp gardens.

Chap. 186. *Of Catch-Flie, or Limewoort.*

¶ *The Deſcription.*

1 THis plant, called *Viſcaria*, or Lymewoort, is likewiſe of the ſtocke and kindred of the wilde Gillofloures: notwithſtanding *Cluſius* hath ioined it with the wilde Campions, making it a kinde thereof, but not properly. *Lobel* among the Sweet Williams, wherof doubtleſſe it is a kinde. It hath many leaues riſing immediately from the root like thoſe of the Crowfloure, or wilde ſweet VVilliam: among which riſe vp many reddiſh ſtalkes iointed or kneed at certaine ſpaces, ſet with leaues by couples one againſt another: at the top whereof come foorth prettie red floures; which being paſt there commeth in place ſmall blackiſh ſeed. The root is large with many fibres. The whole plant, as well leaues and ſtalkes, as alſo the floures, are here and there couered ouer with a moſt thick and clammie matter like vnto Bird-lime, which if you take in your hands,

† 1 *Viſcaria, ſiue Muſcipula.*
Limewoort.

2 *Muſcipula Lobelij.*
Catch Flie.

‡ 3 *Muſcipula anguſtifolia.*
Narrow leaued Catch-flie.

hands, the ſlimineſſe is ſuch, that your fingers will ſtick and cleaue together, as if your hand touched Bird-lime: and furthermore, if flies do light vpon the ſame, they will be ſo intangled with the limineſſe, that they cannot flie away; inſomuch that in ſome hot day or other you ſhal ſee many flies caught by that means. VVhereupon I haue called it Catch Flie, or Limewoort. ‡ This is *Lychnis ſyl.* 3. of *Cluſius*; *Viſcago* of *Camerarius*; and *Muſcipula ſiue Viſcaria* of *Lobel.* ‡

2 This plant hath many broad leaues like the great ſweet VVilliam, but ſhorter (whereof it is likewiſe a kinde) ſet vpon a ſtiffe and brittle ſtalk; from the boſom of which leaues, ſpring forth ſmaller branches, clothed with the like leaues, but much leſſer. The floures grow at the top of the ſtalkes many together tuft faſhion, of a bright red colour. The whole plant is alſo poſſeſſed with the like limineſſe as the other is, but leſſe in quantitie. ‡ This is *Lychnis ſyl.* 1. of *Cluſius*; and *Muſcipula ſive Armoraria altera* of *Lobel*: *Dodonæus* calls it *Armerius flos* 3. in his firſt Edition: but makes it his fourth in the laſt Edition in *Folio.* ‡

‡ 3. There is alſo belonging vnto this kindred another plant which *Cluſius* makes his *Lychnis ſyl.* 4. It comes vp commonly with one ſtalke a foot or more high, of a green purpliſh

pliſh colour, with two long ſharpe pointed thicke greene leaues, ſet at each ioint: from the middle to the top of the ſtalke grow little branches, which vpon pretty long ſtalkes carry floures conſiſting of fiue little round leaues, yet diuided at the tops; they are of a faire incarnate colour, with a deepe purple ring in their middles, without ſmell: after the floures are paſt ſucceede skinny and hard heads, ſmaller towards the ſtalkes, and thicker aboue; and in theſe are contained verie ſmall darke red ſeeds. The root is thicke and blacke, with many fibers, putting vp new ſhootes and ſtalks after the firſt yeare, and not dying euery yeare like as the two laſt deſcribed.

¶ *The Place.*

Theſe plants do grow wilde in the fields in the VVeſt parts of England, among the corne: wee haue them in our London gardens rather for toyes of pleaſure, than any vertues they are poſſeſſed with, that hath as yet been knowne.

¶ *The Time.*

They floure and flouriſh moſt part of the Sommer.

¶ *The Names.*

Catch Flies hath beene taken for *Behen*, commonly ſo called, for the likeneſſe that it hath with *Behen rubente flore:* or with *Behen* that hath the red floure, called of ſome *Valeriana rubra*, or red Valerian; for it is ſomething like vnto it in iointed ſtalkes and leaues, but more like in colour: of *Lobel*, *Muſcipula* and *Viſcaria:* of *Dodon.* *Armerius flos tertius:* of *Cluſius*, *Lychnis ſylueſtris*, *Silene Theophraſti*, and *Behen rubrum Salamanticum:* in Engliſh, Catch Flie, and Limewoort.

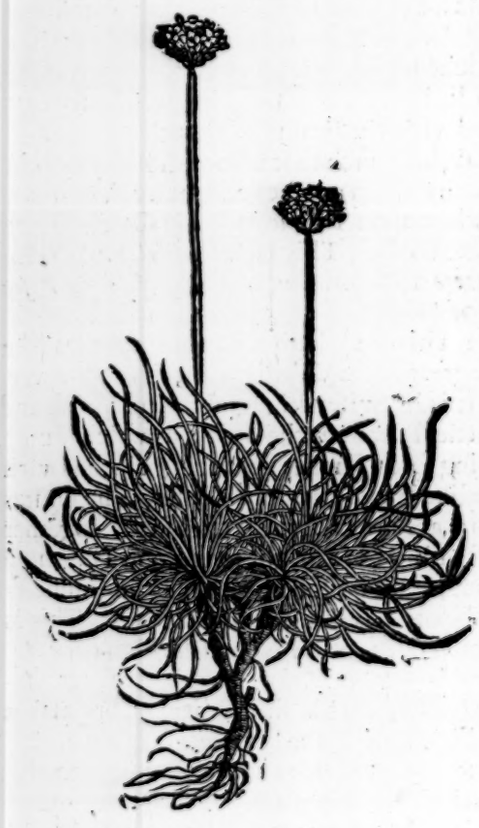
¶ *The Nature and Vertues.*

The nature and vertues of theſe wilde VVilliams are referred to the Wilde Pinkes and Gilloſloures.

† Our Authour certainly intended in this firſt place to figure and deſcribe the *Muſcipula* or *Viſcaria* of *Lobel*, but the figure he here gaue in the firſt place was of that plant which I haue giuen you in the laſt Chapter ſaue one by the name of *Armeria prolifera Lobelii*. The figure which belonged to this place was in the Chapter of wilde Campions, vnder the title of *Lychnis ſylueſtris incana*.

Chap. 187. *Of Thrift, or our Ladies Cuſhion.*

1 *Caryophyllus marinus minimus Lobelij.*
Thrift or Sea Gilloſloure.



2 *Caryophyllus Mediterraneus.*
Leuant Thrift, or Sea Gilloſloure.

The

¶ *The Description.*

1 THrift is also a kind of Gilloflowre, by *Dodonæus* reckoned among grasses, which brings forth leaues in great tufts, thick thrust together, smaller, slenderer, & shorter than grasse: among which rise vp small tender stalkes of a spanne high, naked and without leaues; on the tops wherupon stand little floures in a spokie tuft, of a white colour tending to purple. The root is long and threddie.

The other kinde of Thrift, found vpon the mountaines neere vnto the Leuant or Mediterranean sea, differeth not from the precedent in leaues, stalkes, or floures, but yet is altogether greater, and the leaues are broader.

¶ *The Place.*

2 The first is found in the most salt marshes in England, as also in Gardens, for the bordering vp of beds and bankes, for the which it serueth very fitly. The other is a stranger in these Northerne Regions.

¶ *The Time.*

They floure from May, till Sommer be far spent.

¶ *The Names:*

Thrift is called in Latine *Gramen Polyanthemum*, of the multitude of the floures: of some, *Gramen marinum*: of *Lobel*, *Caryophyllus Marinus*: In English, Thrift, Sea-grasse, and our Ladies Cushion.

¶ *The Temperature and Vertues.*

Their vse in Physicke as yet is not knowne, neither doth any seeke into the Nature thereof, but esteeme them onely for their beautie and pleasure.

Chap. 188. *Of the Saxifrage of the Antients, and of that great one of Matthiolus, with that of Pena and Lobel.*

‡ THis name *Saxifraga* or Saxifrage, hath of late been imposed vpon sundry plants farre different in their shapes, places of growing, & temperature, but all agreeing in this one facultie of expelling or driuing the stone out of the Kidneies, though not all by one meane or manner of operation. But because almost all of them are described in their fit places by our Authour, I will not insist vpon them: yet I thinke it not amisse a little to enquire, whether any *Saxifraga* were knowne to the Antients; and if knowne, to what kinde it may probably be referred. Of the Antients, *Dioscorides*, *Paulus Ægineta*, and *Apuleius*, seeme to mention one *Saxifraga*, but *Pliny lib. 22. cap. 21.* by the way, shewes that some called *Adianthum* by the name of *Saxifragum*: but this is nothing to the former; wherefore I will not insist vpon it, but returne to examine that the other three haue written thereof. *Dioſc. lib. 4.* betweene the Chapters of *Tribulus* and *Limonium*, to wit, in the seuenteenth place hath deliuered the Historie of this plant, both in the Greeke Edition of *Aldus Manutius*, as also in that of *Marcellus Virgilius*, yet the whole Chapter in the Paris Edition, 1549, is reiected and put amongst the *Notha*. The beginning thereof (against which they chiefely except) is thus: Σαξίφραγος, ὁ δὲ σαξίφραγος, ἢ δίθυμος, ἰσμὸς ἢ σαξιφρακτής, (1) *Sarxiphagon, alij vero Sarxifrangon, alij vero Empetron, Romani, Sarxifranga.* The first exception of *Marcellus Virgilius* against this Chapter is *Peregrina Græcis & aliena vox Saxifraga est, &c.* The second is, *Quod multo feliciores in componendis ad certiorem rei alicuius significationem vocibus Græci, quam Latini, &c.* The third is, *Solam in toto hoc opere primam, & a principio propositam audiri Romanam vocem, tamque inopes in appellanda hac herba fuisse Græcos, vt nisi Romana voce eam indicassent, nulla sibi futura esset.* These are the arguments which he vses against this Chapter; yet reiects it not, but by this means hath occasioned others without shewing any reason, to doe it: Now I will set downe what my opinion is concerning this matter, and so leaue it to the iudgement of the Learned. I grant *Marcellus*, that *Saxifraga* is a strange and no Greeke word; but the name in the title, and first in the Chapter both in his owne Edition and all the Greeke Editions that I haue yet seene is Σαξίφαγον, which none, no not he himselfe can denie to haue a Greeke originall ἀπὸ τοῦ σαρκοφαγεῖν: of eating the flesh: yet because there is no such facultie as this denomination imports attributed thereto by the Authour, therefore hee will not allow it to be so. But you must note that many names are imposed by the vulgar, and the reason of the name not alwais explained by those that haue written of them, as in this same Author may be

seene

ſeene in the Chapters of *Catanance*, *Cynosbatos*, *Hemerocallis*, *Crataogonon*, and diuers others, which are or ſeeme to be ſignificant, and to import ſomething by their name; yet he ſaith nothing thereof. It may be that which they would expreſſe by the name, was, that the hearbe had ſo piercing a facultie that it would eat into the very fleſh. The ſecond and third Argument both are anſwered, if this firſt word be Greeke, as I haue aireadie ſhewed it to be, and there are not many words in Greeke that more frequently enter into ſuch compoſition than φαγω: as *Pamphagos*, *Polyphagos*, *Opſiphagos*, and many other may ſhew. Moreouer, it hath beene obſurd from *Dioſcorides*, or any elſe how ſimple ſoeuer they were, if they had knowne the firſt word to haue beene Latine and *Saxifraga*, to ſay againe preſently after that the Romanes called it *Saxifranga*, or *Saxifraga*, for ſo it ſhould be, and not *Sarxifranga*: but I feare that the affinitie of ſounds more than of ſignification hath cauſed this confuſion, eſpecially in the middle times betweene vs and *Dioſcorides*, when learning was at a very low ebbe. The chiefe reaſons that induce mee to thinke this Chapter worthie to keepe his former place in *Dioſcorides*, are theſe: Firſt, the generall conſent of all both Greeke and Latine copies (as *Marcellus* ſaith) how antient ſoeuer they be. Secondly, the mention of this herbe for the ſame effect in ſome Greeke Authours of a reaſonable good antiquitie; for *Paulus Ægineta* teſtifieth that Σαξιφραγος διυρητικον τε ἐξ αἱσθ δρυπτικον. Then *Trallianus* amongſt other things in a *Conditum Nephriticum* mentions Σαξιφραγη: but *Nonus* a later Greeke calls it Σαξιφραγε: ſo that it is euident they knew and vſed ſome ſimple medicine that had both the names of *Sarxiphagon* and *Saxiphragos*, which is the Latine *Saxifraga*. Now ſeeing they had, and knew ſuch a ſimple medicine, it remaines we enquire after the ſhape and figure thereof. *Dioſcorides* deſcribes it to be a ſhrubby plant, growing vpon rockes and craggie places, like vnto *Epithymum*: boiled in wine and drunke, it hath the faculty to helpe the Strangurſe and Hicket; it alſo breakes the ſtone in the bladder and prouokes vrine. This word *Epithymum* is not found in moſt copies, but a ſpace left for ſome word or words that were wanting: But *Marcellus* ſaith, he found it expreſt in a booke which was *Omnium vetuſtiſſimus & probatiſſimus*: and *Hermolaus Barbarus* ſaith, *Veterem in* Dioſcoride *picturam huius herbæ vidi, non plus foliis quam cirris minutis per ramos ex intervallo conditis, nec frequentibus, in cacumine ſurculorum flocci ſeu arentes potius quam floſculi, ſubrubida radice non ſine fibris.* A figure reaſonable well agreeing with this deſcription of *Hermolaus*, I lately receiued from my friend M^r. *Goodyer*, who writ to me that he had ſought to know what *Saxifraga* (to wit, of the Antients) ſhould be; and finding no antient Authour that had deſcribed it to any purpoſe, he ſought *Apuleius*; which word *Apuleius* (ſaith he) is the printed title: my Manuſcript acknowledgeth no Authour but *Apolienſis Plato*; there is no deſcription neither, but the Manuſcript hath a figure which I haue drawne and ſent you, and all that *verbatim* that hee hath written of it, I ſhould be glad to haue this figure cut and added to your worke, together with his words, becauſe there hath beene ſo little written thereof by the Antients. This his requeſt I thought fit to performe, and haue (for the better ſatisfaction of the Reader) as you ſee made a further enquirie thereof: wherefore I will onely adde this, that the plants here deſcribed, and the *Alſine Saxifraga* of *Colum.* together with the two Chickweed *Saxifrages* formerly deſcribed Chap. 171. come neereſt of any that I know to the figure and deliniation of this of the Antients.

Nomen iſtius herbæ, Saxifraga.

Icon & deſcriptio ex Manuſcripto vetuſtiſſimo.

Quidam dicunt eam Scolopendriam, alij Scoliomos, alij Vitis canum, quidam vero Brucos. Itali Saxifragam. Egyptij Peperem, alij Lamprocam eam nominant. Naſcitur enim in Montibus & locis ſaxoſis.

Vna cura ipſius ad calculos expellendos.

Herbam iſtam Saxifragam contuſam calculoſo potum dabis in vino. Ipſe vero ſi febricitauerit cum aqua calida, tam preſens effectum ab expertis traditum, vt eodem die perfectis ictiſque calculis ad ſanitatem vſque producit.

1 This firſt little herb, ſaith *Camerarius*, hath been called *Saxifraga magna*, not from the greatneſſe of his growth, but of his faculties: The ſtalke is wooddie, writhen

writhen,and below ſometimes as thicke as ones little finger,from which grow many ſmall & hard branches, and thoſe ſlender ones ; the leaues are little, long and ſharpe pointed : the floures are white and ſmall,and grow in cups,which are finely ſnipt at the top in manner of a coronet,wherein is contained a ſmall red ſeed ; the rootes grow ſo faſt impact in the Rockes,that it cannot by any meanes be got out. It grows vpon diuers rocks in Italy and Germany ; and it is the *Saxifraga magna* of *Matthiolus*, and the Italians.

‡ 1 *Saxifraga magna Matthioli.*
Matthiolus his great Saxifrage.

‡ 2 *Saxifraga Antiquorum, Lob.*
Saxifrage of the Antients,according to *Lob.*

2 *Pena* and *Lobel* ſay, this growes in great plenty in Italie,in Dolphonie in Fran e, and England, hauing many ſmall ſlender branches a foot high,intricately wrapped within one another, where they are ſet with many graſſie ioynts : the roote is ſmall and white with ſome few fibers : the leaues ſtand by couples at the ioynts, beeing long and narrow ; of the bigneſſe and ſimilitude of thoſe of the wilde Pinks, or Rocke Sauorie : vpon each wooddie, ſmall, capillarie, ſtraight, and creeping little branch, growes one little floure ſomewhat like a Pinke, beeing finely ſnipt about the edges : and in the head is contained a round ſmall reddiſh ſeed. The foreſaid Authours call this *Saxifragra, ſive Saxifraga Antiquorum.*

The Vertues.

1 *Matthiolus* ſaith,that *Calceolarius* of Verona mightily commended this plant to him,for the A
ſingular qualitie it had to expell or driue forth the ſtone of the Kidneies,and that I might in verie deed beleeue it, he ſent me abundance of ſtones, whereof diuers exceeded the bigneſſe of a beane, which were voided by drinking of this plant by one onely Citizen of Verona, called *Hieronymo de Tortis* ; but this made me moſt to wonder,for that there were ſome ſtones amongſt them, that ſeemed rather to come out of the Bladder,than forth of the Kidneies.

2 This (ſay the Authours of the *Aduerſ.*) as it is the lateſt receiued in vſe and name for Saxi- B
frage,ſo is it the better & truer,eſpecially ſo thought by the Italians,both for the highly commended facultie,as alſo for the neere affinitie which it ſeemes to haue with *Epithymum*, &c. ‡

Chap. 189. *Of Sneeſewoort.*

¶ *The Deſcription.*

1 THe ſmall Sneeſe-woort hath many round and brittle branches, beſet with long and narrow leaues, hackt about the edges like a ſaw; at the tops of the ſtalks do grow ſmall ſingle floures like the wilde field Daiſie. The root is tender and full of ſtrings, creeping far abroad in the earth, and in ſhort time occupieth very much ground: the whole plant is ſharpe, biting the tongue and mouth like Pellitorie of Spaine, for which cauſe ſome haue called it wilde Pellitorie. The ſmell of this plant procureth ſneeſing, whereof it tooke the name *Sternutamentoria*, that is the herbe which doth procure ſneeſing, or Neeſewoort.

2 Double floured Sneeſewoort, or *Ptarmica*, is like vnto the former in leaues, ſtalks, and roots, ſo that vnleſſe you behold the floure, you cannot diſcerne the one from the other, and it is exceeding white, and double like vnto double Fetherfew. This plant is of great beautie, and if it be cut downe in the time of his flouring, there will come within a month after a ſupplie or crop of floures fairer than the reſt.

1 *Ptarmica.*
Sneeſewoort.

2 *Ptarmica duplici flore.*
Double floured Sneeſwoort.

3 There is alſo another kind hereof, of exceeding great beauty, hauing long leaues ſomewhat narrow like thoſe of Oliue tree: the ſtalks are of a cubit high, on the top whereof doe growe verie beautifull floures of the bignes of a ſmall ſingle Marygold, conſiſting of fifteene or ſixteene large leaues, of a bright ſhining red colour tending to purple; ſet about a ball of thrummie ſubſtance, ſuch as is in the middle of the Daiſie, in manner of a pale; which floures ſtand in ſcalie knops like thoſe of Knapweed, or Matfellon. The root is ſtraight, and thruſteth deepe into the ground.

‡ *Ptarmica Imperati; an Ptarmicæ Auſtriacæ ſpecies Cluſ. Cur. poſt. p.* 32.

4 This riſeth vp with a ſmall hard tough cornered whitiſh woolly ſtalke, diuided into many branches,

3 *Ptarmica Auſtriaca.*
Sneeſewoort of Auſtrich.

branches, and thoſe againe diuided into other branches like thoſe of *Cyanus* about two foot high, wherein grow long narrow whitiſh Cottonie leaues out of order, of a bitter taſte, whiter below than aboue, of the colour of the leaues of Wormwood, hauing but one rib or ſinew & that in the middle of the leafe, and commonly turne downewards: on the top of each ſlender branch groweth one ſmall ſcalie head or knap, like that of *Cyanus*, which bringeth forth a pale purple floure without ſmell, containing ſixe, ſeuen, eight, or more, ſmal hard drie ſharp pointed leaues: in the middle whereof groweth many ſtiffe chiues, their tops being of the colour of the floures: theſe floures fall not away till the whole hearbe periſheth, but change into a ruſtie colour: amongſt thoſe chiues grow long flat blackiſh ſeed, with a little beard at the top. The root is ſmall, whitiſh, hard and threddie, and periſheth when the ſeed is ripe, and ſoone ſpringeth vp by the fall of the ſeede, and remaineth greene all the Winter, and at the Spring ſendeth foorth a ſtalke as aforeſaid. The herbe touched or rubbed ſendeth forth a pleaſant aromaticall ſmell. Iuly 26. 1620. *Iohn Goodyer.* ‡

¶ *The Place.*

The firſt kinde of Sneeſewoort grows wilde in drie and barren paſtures in many places, and in the three great fieldes next adioyning to a Village neere London called Kentiſh towne, and in ſundry fields in Kent about Southfleet.

† The reſt grow onely in gardens.

¶ *The Time.*

They floure from May to the end of September.

¶ *The Names.*

Sneeſewoort is called of ſome *Ptarmica*, and *Pyrethrum ſylueſtre*, and alſo *Draco ſylueſtris*, or *Tarcon ſylueſtris*: of moſt, *Sternutamentoria*, taken from his effect, becauſe it procureth sneeſing: of *Tragus* & *Tabern. Tanacetum acutum album*: in Engliſh, wilde Pellitorie, taking that name from his ſharp and biting taſte; but it is altogether vnlike in proportion to the true Pellitorie of Spaine.

¶ *The Nature.*

They are hot and drie in the third degree.

¶ *The Vertues.*

The iuice mixed with Vineger and holden in the mouth eaſeth much the paine of the Tooth- A
ache.

The herbe chewed and holden in the mouth, bringeth mightily from the braine ſlimie flegme, B
like Pellitorie of Spaine, and therefore from time to time it hath beene taken for a wilde kinde thereof.

Chap. 190. *Of Hares Eares.*

¶ *The Deſcription.*

1 NArrow leafed Hares Eares is called in Greeke [illegible], and is reputed of the late writers to be *Bupleurum Plinij*, from which the name or figure diſagreeth not: it hath the long narrow and graſſie leaues of *Lachryma Iob*, or *Gladiolus*, ſtreaked or balked as it were with ſundry ſtiffe ſtreakes or ribbes running along euery leafe, as *Plinie* ſpeaketh of his

his *Heptapleurum*. The ſtalkes are a cubite and a halfe long, full of knots or knees, very rough or ſtiffe, ſpreading themſelues into many branches: at the tops whereof grow yellow floures in round tufts or heads like Dill. The root is as big as a finger, and blacke like *Peucedanum*, whereunto it is like in taſte, ſmell, and reſemblance of ſeede, which doth the more perſuade me that it is the true *Bupleurum*, whereof I now ſpeake, and by the authoritie of *Nicander* and *Pliny* confirmed.

1 *Bupleurum anguſtifolium Monſpelienſe.*
Narrow leafed Hares Eare.

2 *Bupleurum latifolium Monſpelienſe.*
Broad leafed Hares Eare.

2 The ſecond kinde called broad leafed Hares Eares, in figure, tuftes, and floures, is the very ſame with the former kinde, ſaue that the leaues are broader and ſtiffer, and more hollow in the midſt: which hath cauſed me to call it Hares Eares, hauing in the middle of the leafe ſome hollowneſſe reſembling the ſame. The root is greater and of a wooddie ſubſtance.

¶ *The Place.*

They grow among Oken woods in ſtony and hard grounds in Narbon. I haue found them growing naturally among the buſhes vpon Bieſton caſtle in Cheſhire.

¶ *The Time.*

They floure and bring forth their ſeed in Iuly and Auguſt.

¶ *The Names.*

Hares Eare is called in Latine *Bupleurum*: in Greeke, βουπλευρον: the Apothecaries of Montpelier in France do call it *Auricula leporis*, and therefore I terme it in Engliſh Hares-Eare: *Valerius Cordus* nameth it *Iſophyllon*, but whence he had that name, it is not knowne.

¶ *The Temperature.*

They are temperate in heat and drineſſe.

¶ *The Vertues.*

Hippocrates hath commended it in meats, for ſallads and Pot-hearbs: but by the authoritie of *Glaucon* and *Nicander*, it is effectuall in medicine, hauing the taſte and ſauour of *Hypericon*, ſeruing in the place thereof for wounds, and is taken by *Tragus* for *Panax Chironium*, who doth reckon it *inter Herbas vulnerarias*.

A

The

The leaues ſtamped with ſalt and wine,and applied, doe conſume and driue away the ſwelling of the neck,called the Kings euill,and are vſed againſt the ſtone and Grauell. B

Chap. 191. *Of Gromell.*

¶ *The Deſcription.*

1 THe great Gromell hath long,ſlender and hairie ſtalkes,beſet with long,browne & hoarie leaues; among which grow certaine bearded huskes, bearing at the firſt ſmall blew floures;which being paſt, there ſucceedeth a gray ſtonie ſeed ſomewhat ſhining. The root is hard, and of a wooddie ſubſtance.

2 The ſecond kinde of Gromell hath ſtraight, round, wooddie ſtalks,full of branches: The leaues long,ſmall,and ſharpe,of a darke greene colour;ſmaller than the leaues of great Gromell: among which come forth little white floures; which being paſt,there doth follow ſuch ſeed as the former hath,but ſmaller.

† 3 There is another kinde of Gromell,which hath leaues and ſtalkes like the ſmall kinde: the ſeed is not ſo white,neither ſo ſmooth and plaine,but ſomewhat ſhriueled or wrinckled. The leaues are ſomewhat rough like vnto the common Gromell, but the floures are of a purple colour, and in ſhape like thoſe of that wilde kinde of Bugloſſe, called *Anchuſa*,for which cauſe it carrieth that additament *Anchuſæ facie*.

4 There is alſo a degenerate kinde hereof called *Anchuſa degener*, being either a kinde of wilde Bugloſſe,or a kinde of wilde Gromell,or elſe a kinde of neither of both, but a plant participating of both kindes: it hath the ſeeds and ſtalkes of *Milium ſolis*,or Gromell: the leaues and rootes of *Anchuſa*,which is Alkanet, and is altogether of a red colour like the ſame.

1 *Lithoſpermum maius.*
Great Gromell.

2 *Lithoſpermum minus.*
Small Gromell.

‡ 3 *Lithoſpermum Anchuſæ facie.*
Purple floured Gromell.

‡ 4 *Anchuſa degener facie Milij ſolis.*
Baſtard Gromell.

¶ *The Place.*

The two firſt kindes do grow in vntoiled places, as by the high waies ſides, and barren places, in the ſtreet at Southfleet in Kent, as you goe from the church vnto an houſe belonging to a gentleman of worſhip, called M^r. *William Swan*, and in ſundry other places.

The two laſt kindes grow vpon the ſands and Bach of the Sea, in the iſle of Thanet neere Reculvers, among the kindes of wilde Bugloſſe there growing.

¶ *The Time.*

They floure from the Sommer Solſtice, or from the twelfth day of Iune euen vnto Autumne, and in the meane ſeaſon the ſeed is ripe.

¶ *The Names.*

Gromell is called in Greeke λιθόσπερμον, of the hardneſſe of the ſeed: of diuers, *Gorgonium*: of others, *Aegonychon*, *Leontion*, or *Dioſporon*, or *Dioſpyron*, as *Plinie* readeth it, and alſo *Heracleos*: of the Arabians, *Milium ſoler*: in ſhops, and among the Italians, *Milium ſolis*: in Spaniſh, *Mijo del ſol*: in French, *Gremill*, and *Herbe aux perles*: in Engliſh, Gromell: of ſome, Pearle plant; and of others, Lichwale.

¶ *The Temperature.*

The ſeed of Gromell is hot and drie in the ſecond degree.

¶ *The Vertues.*

A The ſeed of Gromell pound, and drunke in White wine, breaketh, diſſolueth, and driueth forth the ſtone, and prouoketh vrine, and eſpecially breaketh the ſtone in the bladder.

Chap. 192 *Of Chickeweed.*

¶ *The Deſcription.*

1 THe great Chickeweede riſeth vp with ſtalkes a cubit high, and ſometime higher, a great many from one roote, long and round, ſlender, full of ioints, with a couple of leaues

growing out of euery knot or ioynt aboue an inch broad, and longer than the leaues of Pellitorie of the wall, whereunto they are very like in ſhape, but ſmooth without haires or downe, and of a light greene colour: the ſtalkes are ſomthing cleere, and as it were tranſparent or thorow-ſhining, and about the ioynts they be oftentimes of a very light red colour, as be thoſe of Pellitorie of the wall: the floures be whitiſh on the top of the branches, like the floures of Stitchwort, but yet leſſer: in whoſe places ſucceed long knops, but not great, wherein the ſeed is contained. The root conſiſteth of fine little ſtrings like haires.

2 The ſecond Chickweed for the moſt part lyeth vpon the ground: the ſtalkes are ſmall, ſlender, long, and round, and alſo ioynted: from which ſlender branches do ſpring leaues reſembling the precedent, but much leſſer, as is likewiſe the whole herbe, which in no reſpect attaineth to the greatnes of the ſame: the floures are in like ſort little and white: the knops or ſeed-heads are like the former: the root is alſo full of little ſtrings.

1 *Alſine maior.*
Great Chickweed.

2 *Alſine minor, ſiue media.*
Middle or ſmall Chickweed.

3 The third is like the ſecond, but farre leſſer: the ſtalkes be moſt tender and fine: the leaues are very ſmall, the floures very little, the root maruellous ſlender.

4 Alſo there is a fourth kinde which groweth by the ſea: this is like to the ſecond, but the ſtemmes are thicker, ſhorter, and fuller of ioynts: the leaues in like ſort be thicker: the knops or ſeed-heads be not long and round, but ſomewhat broad, in which are three or foure ſeeds contained.

5 The vpright Chickweed hath a very ſmall ſingle threddy root, from which riſeth vp a ſlender ſtemme, diuiding it ſelfe into diuers branches euen from the bottome to the top; whereon do grow ſmall leaues, thicke and fat in reſpect of the others, in ſhape like thoſe of Rue or Herbe-Grace. The floures grow at the top of the branches, conſiſting of foure ſmall leaues of a blew colour.

6 The ſtone Chickweed is one of the common Chickweeds, hauing very threddy branches couering the ground farre abroad where it groweth: the leaues be ſet together by couples: the floures be ſmall and very white: the root is tough and very ſlender.

7 Speedwell

3 *Alſine minima.*
Fine Chickweed.

4 *Alſine marina.*
Sea Chickweed.

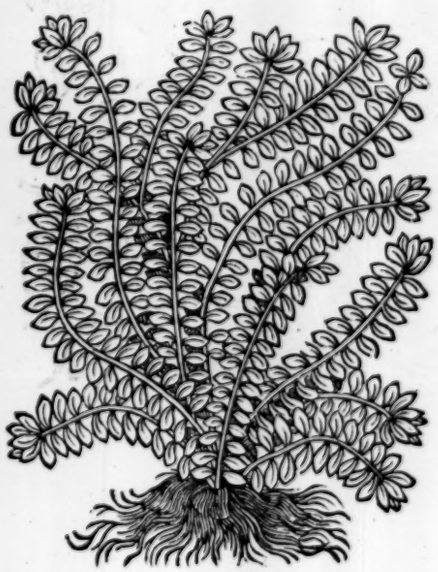
5 *Alſine recta.*
Right Chickweed.

6 *Alſine Petræa.*
Stone Chickweed.

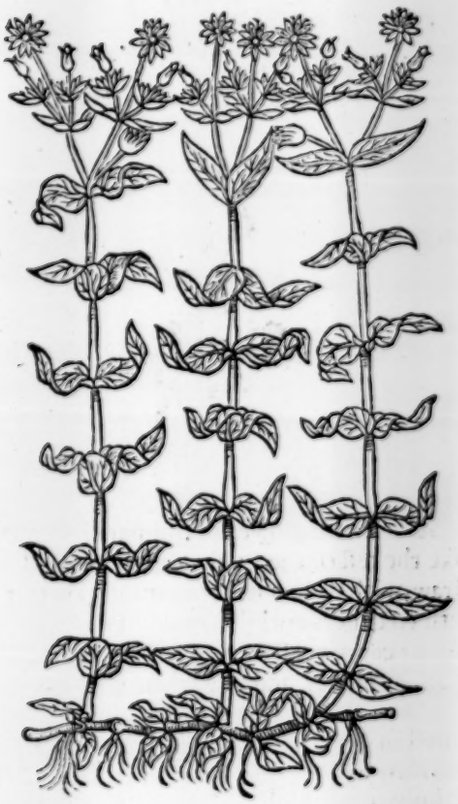
7 *Alſine folijs Veronicæ.*
Speed-well Chickweed.

8 *Alſine fontana.*
Fountaine Chickweed.

9 *Alſine fluviatilis.*
Riuer Chickweed.



10 *Alſine paluſtris.*
Mariſh Chickweed.



7 Speedwel Chickweed hath a little tender ſtalk, from which come diuers ſmall armes or branches as it were wings, ſet together by couples; whereon do grow leaues ſet likewiſe by couples, like thoſe of *Veronica*, or herbe Fluellen, whereof it tooke his name. The floures grow along the branches of a blew colour; after which come little pouches wherein is the ſeed: the root is ſmall, and likewiſe threddy. This in the *Hiſt. Lugd.* is called *Elatine polyſchides*: and *Fabius Columna* iudgeth it to be the *Alyſſon* of *Dioſcorides*. ‡

8 There is a kind of Chickweed growing in the brinks and borders of Wels, Fountains, & ſhallow Springs, hauing many threddy roots from which riſe vp diuers tender ſtalks, whereupon doe grow long narrow leaues; from the boſomes of which come forth diuers ſmaller leaues of a bright greene colour. The floures grow at the top of the ſtalkes, ſmall, and white of colour.

9 There is likewiſe another water Chickweed ſmaller than the laſt deſcribed, hauing for his root a thicke haſſocke or tuft of threddy ſtrings: from which riſe vp very many tender ſtems, ſtretching or trailing along the ſtreame; whereon do grow long leaues ſet vpon a middle rib, like thoſe of Lentils or wilde Fetch: the floures and ſeeds are like the precedent, but much ſmaller.

‡ 11 *Alſine rotundifolia, ſiue Portulaca aquatica.*
Water Purſlane.

‡ 12 *Alſine paluſtris ſerpillifolia.*
Creeping water Chickweed.

13 *Alſine baccifera.*
Berry-bearing Chickweed.

10 There growes in the mariſh or wateriſh grounds another ſort of Chickweed, not much vnlike the reſt of the ſtocke or kindred of Chickweeds. It hath a long root of the bigneſſe of a wheat ſtraw, with diuers ſtrings hanging thereat, very like the root of Couch-graſſe: from the which riſeth vp diuers vpright ſlender ſtalkes, ſet with pretty large ſharpe pointed leaues ſtanding by couples at certaine diſtances: on the top of the ſtalkes grow ſmall white floures like thoſe of Stitchwort, but leſſer, and of a white colour.

‡ 11 To theſe water Chickweeds may fitly be added thoſe two which I mentioned and figured in my laſt iournall: the former of which, that I haue there called *Alſine aquatica foliis rotundioribus, ſiue Portulaca aquatica*, (that is) Round leaued Chickweed, or water Purſlane, hath a ſmall ſtringy root which ſends forth diuers creeping ſquare branches, which here and there at the ioynts

put

put out ſmall fibres, and take root againe: the leaues grow at the ioynts by couples, ſomwhat longiſh, and round at the points, reſembling thoſe of Purſlane, but much ſmaller, and of a yellowiſh greene colour: at the boſomes of the leaues come forth little floures, which are ſucceeded by little round ſeed-veſſels containing a ſmall round ſeed. *Bauhine* hath ſet this forth by the name of *Alſine paluſtris minor foliis oblongis*.

12 The other water Chickweed, which *Iohn Bauhine* hath mentioned by the name of *Serpilli-folia*; and *Caſper Bauhine* by the title of *Alſine paluſtris minor Serpillifolia*, hath alſo weake and tender creeping branches lying ſpred vpon the ground; ſet with two narrow ſharp pointed leaues at each ioynt, greene aboue, and of a whitiſh colour below: at the ſetting on of theſe leaues grow ſmall veſſels parted as it were into two, with a little creſt on each ſide, and in theſe is contained a verie ſmall ſeed. Both theſe may be found in waterie places in Iuly and Auguſt, as betweene Clapham heath and Touting, and betweene Kentiſh towne and Hampſtead.

13 This Plant that *Cluſius* and others haue called *Alſine repens major*, and ſome haue thought the *Ciclaminus altera* of *Dioſcorides*; and *Cucubalus* of *Pliny*, may fitly be put in this ranke; for it ſendeth vp many long weake branches like the great Chickweed, ſet with two leaues at a ioynt, bigger than thoſe of the greateſt Chickweed, yet like them in ſhape and colour: at the tops of the branches, out of pretty large cups come whitiſh greene floures, which are ſucceeded by berries as big as thoſe of Iuniper, at firſt greene, but afterwards blacke: the ſeed is ſmall and ſmooth: the root white, very fibrous, long and wooddy, and it endures for many yeares. It floures moſt part of Sommer, and growes wilde in ſundry places of Spaine and Germany, as alſo in Flanders and England, according to *Pena* and *Lobel*: yet I haue not ſeene it growing but in the garden of my friend M^r. *Pemble* at Marribone. The Authors laſt mentioned affirme the berries hereof to haue a poyſonous facultie like as thoſe of Dwale or deadly Nightſhade. ‡

¶ *The Place.*

Chickweeds, ſome grow among buſhes and briers, old walls, gutters of houſes, and ſhadowie places. The places where the reſt grow are ſet forth in their ſeuerall deſcriptions.

¶ *The Time.*

The Chickweeds are greene in Winter, they floure and ſeed in the Spring.

¶ *The Names.*

Chickweed or Chickenweed is called in Greeke Ἀλσίνη: in Latine it retaineth the ſame name *Alſine*: of ſome of the Antients it is called *Hippia*. The reſt of the plants are diſtinguiſhed in their ſeuerall titles, with proper names which likewiſe ſetteth forth the place of their growings.

¶ *The Temperature.*

Chickweed is cold and moiſt, and of a wateriſh ſubſtance; and therefore it cooleth without aſtriction or binding, as *Galen* ſaith.

¶ *The Vertues.*

The leaues of Chickweed boyled in water very ſoft, adding thereto ſome hogs greaſe, the pouder of Fenugreeke and Lineſeed, and a few roots of marſh Mallowes, and ſtamped to the forme of cataplaſme or pulteſſe, taketh away the ſwellings of the legs or any other part; bringeth to ſuppuration or matter hot apoſtumes; diſſolueth ſwellings that wil not willingly yeeld to ſuppuration; eaſeth members that are ſhrunke vp; comforteth wounds in ſinewie parts; defendeth foule maligne and virulent vlcers from inflammation during the cure: in a word, it comforteth, digeſteth, defendeth, and ſuppurateth very notably. A

The leaues boyled in Vineger and ſalt are good againſt mangines of the hands and legs, if they be bathed therewith. B

Little birds in cadges (eſpecially Linnets) are refreſhed with the leſſer Chickweed when they loath their meat; whereupon it was called of ſome *Paſſerina*. C

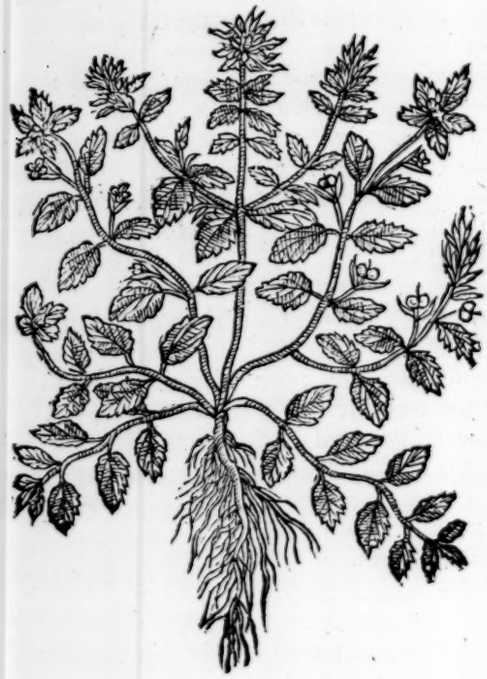
Chap. 193. *Of the baſtard Chickweeds.*

¶ *The Deſcription.*

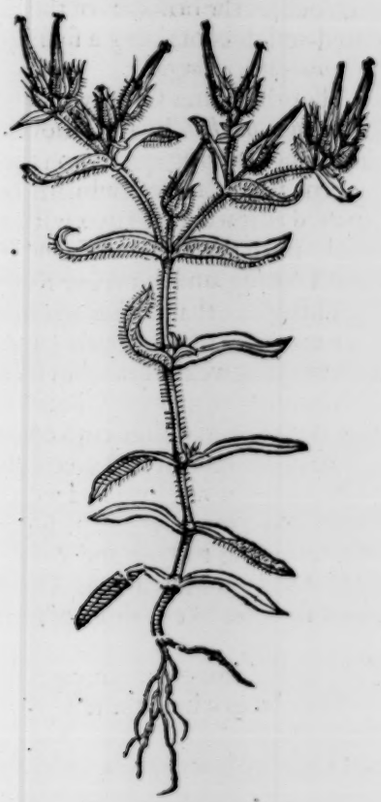
1 Germander Chickweed hath ſmall tender branches trailing vpon the ground, beſet with leaues like vnto thoſe of *Scordium*, or VVater Germander. Among which come forth little blew floures: which being faded, there appeare ſmall flat husks or pouches, wherein lieth the ſeed.. The root is ſmall and threddy; which being once gotten into a garden ground is hard to be deſtroyed, but naturally commeth vp from yeare to yeare as a noiſome weed.

2 *Cluſius*

1 *Aſine foliȝs triſſaginis.*
Germander Chickweed.



2 *Alſine corniculata Cluſij.*
Horned Chickweed.



3 *Alſine Hederacea.*
Iuy Chickweed.

4 *Alſine Hederula altera.*
Great Henne-bit.

2 *Cluſius*, a man ſingular in the knowledge of plants, hath ſet downe this herbe for one of the Chickweeds, which doth very well reſemble the Storks bill, and might haue been there inſerted. But the matter being of ſmall moment I let it paſſe; for doubtleſſe it participateth of both, that is, the head or beake of Storkes bill, and the leaues of Chickweed, which are long and hairy, like thoſe of Scorpion Mouſe-eare. The floures are ſmall, and of an herby colour; after which come long horned cods or ſeed-veſſels, like vnto thoſe of the Storks bill. The root is ſmall and ſingle, with ſtrings faſtened thereto.

3 Iuie Chickeweed or ſmall Henbit, hath thin hairy leaues ſomewhat broad, with two cuts or gaſhes in the ſides, after the maner of thoſe of ground Iuie, whereof it tooke his name, reſembling the backe of a Bee when ſhe flieth. The ſtalkes are ſmall, tender, hairy, and lying flat vpon the ground. The floures are ſlender, and of a blew colour. The root is little and threddy.

4 The great Henbit hath feeble ſtalkes leaning toward the ground, whereupon doe grow at certaine diſtances leaues like thoſe of the dead Nettell; from the boſome whereof come forth ſlender blew floures tending to purple; in ſhape like thoſe of the ſmall dead Nettle. The root is tough, ſingle, and a few ſtrings hanging thereat.

¶ *The Place.*

Theſe Chickweeds are ſowne in gardens among potherbes, in darke ſhadowie places, and in the fields after the corne is reaped.

¶ *The Time.*

They flouriſh and are greene when the other Chickweedes are.

¶ *The Names.*

The firſt and third is called *Morſus Gallinæ*, Hens bit, *Alſine Hederula*, and *Hederacea*: *Lobell* alſo calls the fourth *Morſus Galinæ folio Hederulæ alter*: in high Dutch **Hunerbiſz**: in French, *Morſgelin*, and *Morgeline*: in low Dutch, **Hoenderebeet**: in Engliſh, Henbit the greater and the leſſer.

¶ *The Temperature and Vertues.*

Theſe are thought alſo to be could and moiſt, and like to the other Chickweeds in vertue and operation.

Chap. 194. *Of Pimpernell.*

1 *Anagallis mas.*
Male Pimpernell.

2 *Anagallis fœmina.*
Female Pimpernell.

¶ *The Deſcription.*

1 PImpernell is like vnto Chickeweed; the ſtalkes are foure ſquare, trailing here and there vpon the ground, whereupon do grow broad leaues, and ſharpe pointed, ſet together by couples: from the boſome whereof come forth ſlender tendrells, whereupon doe grow ſmall purple floures tending to redneſſe: which being paſt there ſucceed fine round bullets, like vnto the ſeed of Corianders, wherein is conteined ſmall duſtie ſeed. The root conſiſteth of ſlender ſtrings.

2 The female Pimpernell differeth not from the male in any one point, but in the colour of the floures; for like as the former hath reddiſh floures, this plant bringeth forth floures of a moſt perfect blew colour, wherein is the difference.

‡ 3 Of this there is another variety ſet forth by *Cluſius* by the name of *Anagallis tenuifolia Monelli*, becauſe he receiued the figure and Hiſtory thereof from *Iohn Monell* of Tournay in France; it differs thus from the laſt mentioned, the leaues are longer and narrower, ſomewhat like thoſe of *Gratiola*, and they now and then grow three at a joint, and out of the boſomes of the leaues come commonly as many little footſtalkes as there are leaues, which carry floures of a blew colour with the middle purpliſh, and theſe are ſomewhat larger than them of the former, otherwiſe like. ‡

‡ 3 *Anagallis tenuifolia.*
Narrow leaued Pimpernell.

4 *Anagallis lutea.*
Yellow Pimpernell.

4 The yellow Pimpernell hath many weake and feeble branches trailing vpon the ground, beſet with leaues one againſt another like the great Chickweed, not vnlike to *Nummularia*, or Money woort; betweene which and the ſtalkes, come forth two ſingle and ſmall tender foote-ſtalkes, each bearing at their top one yellow floure and no more. The root is ſmall and threddy.

¶ *The Place.*

They grow in plowed fields neere pathwaies, in gardens and vineyardes, almoſt euery where. I found the female with blew floures in a chalkie corne field in the way from Mr. *William Swaines* houſe of Southfleet to Long field downs, but neuer any where elſe. ‡ I alſo being in Eſſex in the company of my kind friend Mr. *Nathaniel Wright* found this among the corne at Wrightsbridge, being the ſeate of Mr. *Iohn Wright* his brother. ‡ The yellow Pimpernell growes in the woods betweene High-gate and Hampſtead, and in many other woods.

¶ *The Time.*

They floure in Summer, and eſpecially in the moneth of Auguſt, at what time the husbandmen hauing occaſion to go vnto their harueſt worke, will firſt behold the floures of Pimpernell, whereby they know the weather that ſhall follow the next day after: as for example, if the floures be ſhut cloſe vp, it betokeneth raine and foule weather; contrariwiſe, if they be ſpread abroad, faire weather.

¶ *The*

¶ *The Names.*

It is called in Greeke Κυνόσβατος: in Latine also *Anagallis*: of diuers, (as *Pliny* reporteth) *Corchorus*, but vntruly: of *Marcellus* an old Writer, *Macia*; the word is extant in *Dioscorides* among the bastard names. That with the crimson floure, being the male, is named *Phœnicion*, and *Corallion*: of this is made the composition or receit called *Diacorallion*, that is vsed against the gout; which composition *Paulus Ægineta* setteth downe in his seuenth booke. Among the bastard names it hath beene called *Aëtitis*, *Ægitis*, and *Sauritis*: in English, Red Pimpernell, and blew Pimpernel.

¶ *The Temperature.*

Both the sorts of Pimpernell are of a drying facultie without biting, and somewhat hot, with a certaine drawing quality, insomuch that it doth draw forth splinters and things fixed in the flesh, as *Galen* writeth.

¶ *The Vertues.*

Dioscorides writes, That they are of power to mitigate paine, to cure inflammations or hot swellings, to draw out of the body and flesh thornes, splinters, or shiuers of wood, and to helpe the Kings Euill. A

The iuyce purgeth the head by gargarising or washing the throat therewith; it cures the tooth-ache being snist vp into the nosethrils, especially into the contrary nosethrill. B

It helpeth those that be dim sighted: the iuyce mixed with honey cleanses the vlcers of the eye called in Latine *Argema*. C

Moreouer he affirmeth, That it is good against the stinging of Vipers, and other venomous beasts. D

It preuaileth against the infirmities of the liuer and kidneyes, if the iuyce be drunk with wine. E He addeth further, how it is reported, That Pimpernel with the blew floure helpeth vp the fundament that is fallen downe; and that red Pimpernell applied, contrariwise bringeth it downe.

CHAP. 195. *Of Brooke-lime, or water Pimpernell.*

¶ *The Description.*

1 BRooke-lime or Brooklem hath fat thicke stalkes, round, and parted into diuers branches: the leaues be thicke, smooth, broad, and of a deepe greene colour. The floures grow vpon small tender foot-stalkes, which thrust forth of the bosome of the leaues, of a perfect blew colour, not vnlike to the floures of land Pimpernell: the root is white, low creeping, with fine strings fastned thereto: out of the root spring many other stalkes, whereby it greatly encreaseth.

‡ There is a lesser varietie of this, which our Author set forth in the fourth place, differing not from this but onely in that it is lesse in all the parts thereof; wherefore I haue omitted the historie and figure, to make roome for more conspicuous differences. ‡

2 The great water Pimpernell is like vnto the precedent, sauing that this plant hath sharper pointed or larger leaues, and the floures are of a more whitish or a paler blew colour, wherein consisteth the difference.

‡ There is also a lesser varietie of this, whose figure and description our Authour gaue in the next place; but because the difference is in nothing but the magnitude I haue made bold to omit it also.

3 Now that I haue briefely giuen you the history of the foure formerly described by our Author, I will acquaint you with two or three more plants which may fitly be here inserted: The first of these *Lobel* calls *Anagallis aquatica tertia*; and therefore I haue thought fit to giue you it in the same place here. It hath a white and fibrous root; from which ariseth a round smooth stalke a foot and more high, (yet I haue sometimes found it not aboue three or foure inches high:) vpon the stalkes grow leaues round, greene, and shining, standing not by couples, but one aboue another on all sides of the stalkes. The leaues that lie on the ground are longer than the rest, and are in shape somewhat like those of the common Daisie, but that they are not snipped about the edges: the floures are white, consisting of one leafe diuided into fiue parts; and they grow at the first as it were in an vmbel, but afterwards more spike fashioned. It floures in Iune and Iuly, and groweth in many waterie places, as in the marishes of Dartford in Kent, also betweene Sandwich and Sandowne castle, and in the ditches on this side Sandwich. *Bauhine* saith, That *Guillandinus* called it sometimes *Alisma*, and otherwhiles *Cochlearia*: and others would haue it to be *Samolum* of *Pliny*, *lib.* 25. *cap.* 11. *Bauhine* himselfe fitly calls it *Anagallis aquatica folio rotundo non crenato.*

1 *Anagallis ſeu Becabunga.*
Brooke-lime.

2 *Anagallis aquatica maior.*
Great long leaued Brook-lime.

‡ 3 *Anagallis aquatica rotundifolia.*
Round leaued water Pimpernel.

4 I coniecture this figure which we here giue you with the Authors title to be onely the leſſer variety of that which our Author deſcribes in the ſecond place; but becauſe I haue no certaintie hereof (for that *Lobel* hath giuen vs no deſcription thereof in any of his Latine Workes, and alſo *Bauhinus* hath diſtinguiſhed them) I am forced to giue you onely the figure thereof; not intending to deceiue my reader by giuing deſcriptions from my fancie and the figure, as our Author ſomtimes made bold to do.

5 This which is ſet forth by moſt writers for *Cepæa*, and which ſome may obiect to be more fit to be put next the Purſlanes, I will here giue you, hauing forgot to doe it there; and I thinke this place not vnfit, becauſe our Author in the Names in this Chapter takes occaſion in *Dodonæus* his words to make mention thereof. It hath a ſmall vnprofitable root, ſending vp a ſtalke ſome foot high, diuided into many weake branches, which are here and there ſet with thicke leaues like thoſe of Purſlane, but much leſſe, and narrower, and ſharper pointed: the floures which grow in good plenty vpon the tops of the branches are compoſed of fiue ſmall white leaues; whereto ſucceeds ſmall heads, wherein is contained a ſeed like that of Orpine. This by *Matthiolus* and others is called *Cepæa*: but *Cluſius* doubts that it is not the true *Cepæa* of the Antients. ‡ ¶ *The*

‡ 4 *Anagallis aquatica quarta, Lob.*
Lobels fourth water Pimpernel.

‡ 5 *Cepæa.*
Garden Brook-lime.

¶ *The Place.*

They grow by riuers ſides, ſmall running brookes, and waterie ditches. The yellow Pimpernell I found growing in Hampſted wood neere London, and in many other woods and copſes.

¶ *The Time.*

They bring forth their floures and ſeed in Iune, Iuly, and Auguſt.

¶ *The Names.*

Water Pimpernel is called *Anagallis aquatica*: of moſt, *Becabunga*, which is borrowed of the Germane word **Bachpunghen:** in low-Dutch, **Beeckpunghen:** in French, *Berle*; whereupon ſome do call it *Berula*: notwithſtanding *Marcellus* reporteth, That *Berula* is that which the Grecians call καρδαμον, or rather Creſſes: it is thought to be *Cepæa*; that is to ſay, of the garden; which *Dioſcorides* writeth to be like vnto Purſlane, whereunto this Brook-lime doth very well agree. But if it be therefore ſaid to be καρδαμον, becauſe it groweth either onely or for the moſt part in gardens, this Pimpernel or Brook-lime ſhall not be like vnto it, which groweth no where leſſe than in gardens, being altogether of his owne nature wilde, deſiring to grow in waterie places, and ſuch as be continually ouerflowne: in Engliſh the firſt is called Brooklime, and the reſt by no particular names; but we may call them water Pimpernels, or Brook-limes.

¶ *The Temperature.*

Brook-lime is of temperature hot and dry like water Creſſes, yet not ſo much.

¶ *The Vertues.*

Brooke-lime is eaten in ſallads as Water-Creſſes are, and is good againſt that ὀφθαλμικὸν *malum* of ſuch as dwell neere the Germane ſeas, which they call **Scuerbuycke:** or as we terme it, the Scuruie, or Skirby, being vſed after the ſame manner that Water Creſſes and Scuruy graſſe is vſed, yet is it not of ſo great operation and vertue. A

The herbe boyled maketh a good fomentation for ſwollen legs and the dropſie.

The leaues boyled, ſtrained, and ſtamped in a ſtone morter with the pouder of Fenugreek, Lineſeeds, the roots of mariſh Mallowes, and ſome hogs greaſe, vnto the forme of a cataplaſme or pulteſſe, taketh away any ſwelling in leg or arme; wounds alſo that are ready to fall into apoſtumation it mightily defendeth, that no humor or accident ſhall happen thereunto. B C

D The leaues of Brooke-lime ſtamped, ſtrained, and giuen to drinke in wine, helpeth the ſtrangurie, and griefes of the bladder.

E The leaues of Brook-lime, and the tendrels of *Aſparagus*, eaten with oyle, vineger, and Pepper, helpeth the ſtrangurie and ſtone.

Chap. 196. *Of ſtinking Ground-Pine.*

¶ *The Kindes.*

‡ *Dioſcorides* hath antiently mentioned two ſorts of *Anthyllis*: one with leaues like to the Lentill, & the other like to *Chamæpitys*. To the firſt, ſome late writers haue referred diuers plants, as the two firſt deſcribed in this Chapter; The *Anthyllis Leguminoſa Belgarum* hereafter to be deſcribed; the *Anthyllis Valentina Cluſij* formerly ſet forth Chap. 171. To the ſecond are referred the *Iua Moſchata Monſpeliaca*, deſcribed in the fourth place of the 150. Chap. of this booke; the *Linaria adulterina* deſcribed formerly chap. 165. in the 14. place, and that which is here deſcribed in the third place of this chapter, by the name of *Anthyllis altera Italorum*. ‡

¶ *The Deſcription.*

1 THere hath beene much adoe among Writers about the certaine knowledge of the true *Anthyllis* of *Dioſcorides*: I will therefore ſet downe that plant which of all others is found moſt agreeable thereunto. It hath many ſmall branches full ioynts, not aboue an handfull high, creeping ſundry wayes, beſet with ſmall thicke leaues of a pale colour, reſembling *Lenticula*, or rather *Alſine minor*, the leſſer Chickweed. The floures grow at the top of the ſtalke, ſtarre-faſhion, of an herby colour like boxe, or *Sedum minus*: it foſtereth his ſmall ſeeds in a three cornered huske. The root is ſomewhat long, ſlender, ioynted, and deepely thruſt into the ground like *Soldanella*: all the whole plant is ſaltiſh, bitter in taſte, and ſomewhat heating.

‡ 1 *Anthyllis lentifolia, ſiue Alſine cruciata marina.*
Sea Pimpernell.

‡ 2 *Anthyllis Marina incana Alſinefolia.*
Many floured Ground-Pine.

‡ This deſcription was taken out of the *Aduerſaria, pag.* 195. where it is called *Anthyllis prior lentifolia Peplios effigie maritima*: alſo *Cluſius* hath deſcribed it by the name of *Alſines genus pelagicum*: I haue called it in my laſt iournall by the name of *Alſine cruciata marina*, becauſe the leaues which grow thicke together by couples croſſe each other, as it happens in moſt plants which haue ſquare ſtalkes with two leaues at each ioynt. I haue Engliſhed it Sea Pimpernell, becauſe the leaues in ſhape are as like thoſe of Pimpernel as of any other Plant; and alſo for that our Author hath called another plant by the name of Sea Chickeweed. The figure of the *Aduerſaria* was not good, and *Cluſius* hath none; which hath cauſed ſome to reckon this *Anthyllis* of *Lobel*, and *Alſine* of *Cluſius* for two ſeuerall plants, which indeed are not ſo. I haue giuen you a figure hereof which I tooke from the growing plant, and which well expreſſeth the growing thereof. ‡

2 There

3 *Anthyllis altera Italorum.*
Stinking ground Pine.

2 There is likewiſe another ſort of *Anthyllis* or Sea Ground Pine, but in truth nothing els than a kinde of Sea Chickeweed, hauing ſmall branches trailing vpon the ground of two hands high, whereupon do grow little leaues like thoſe of Chickweed, not vnlike thoſe of *Lenticula marina*, or Sea Lentils: on the top of the ſtalks ſtand many ſmall moſſie floures of a white colour. The whole plant is of a bitter and ſaltiſh taſte. ‡ This is the *Marina incana Anthyllis Alſine folia Narbonenſium* of *Lobel*: it is the *Paronychia altera* of *Matthiolus*. ‡

‡ 3 To this figure (which formerly was giuen for the firſt of theſe by our Authour) I will now giue you a briefe deſcription. This in the branches, leaues, and whole face thereof is very like the French Herbe-Iuie, or Ground Pine, but that it is much leſſe in all the parts thereof, but chiefely in the leaues which alſo are not ſnipt like thoſe of the French Ground Pine, but ſharp pointed: the tops of the branches are downie or woolly, and ſet with little pale yellow floures. ‡

¶ *The Place.*

Theſe do grow in the South Iſles belonging to England, eſpecially in Portland in the grauelly and ſandy foords, which lie low and againſt the ſea; and likewiſe in the iſle of Shepey neere the water ſide. ‡ I haue onely found the firſt deſcribed, and that both in Shepey, as alſo in Weſt-gate bay by Margate in the Iſle of Thanet. ‡

¶ *The Time.*

They floure and flouriſh in Iune and Iuly.

¶ *The Names.*

Their titles and deſcriptions ſufficiently ſet forth their ſeuerall names.

¶ *The Temperature.*

Theſe ſea herbes are of a temperate facultie betweene hot and cold.

The Vertues.

Halfe an ounce of the dried leaues drunke, preuaileth greatly againſt the hot piſſe, the ſtrangurie, or difficultie of making water, and purgeth the reines. A

The ſame taken with Oxymell or honied water is good for the falling ſickneſſe, giuen firſt at morning, and laſt at night. B

† There was formerly three deſcriptions, yet but one figure in this chapter, and that was marked with the figure 1. and called *Anthyllis lentiſolia*, but vainly: wherefore I haue giuen you the title which *Lobel* the firſt Author thereof puts vpon it, with a deſcription thereto, that it may not ſtand as a cipher, as it formerly did. That deſcription which formerly held the ſecond place was of the *Anthyllis Valentina* of *Cluſius*, deſcribed formerly chap. 171. and therefore I haue omitted it here.

Chap. 197. *Of Whiteblow, or Whitelow Graſſe.*

¶ *The Kindes.*

1 THe firſt is a very ſlender plant hauing a fewe ſmall leaues like the leaſt Chickeweede, growing in little tufts, from the midſt whereof riſeth vp a ſmall ſtalke, three or foure inches long; on whoſe top do grow very little white floures; which being paſt, there come in place ſmall flat pouches compoſed of three filmes; which being ripe, the two outſides fall away, leauing the middle part ſtanding long time after which is like white Sattin, as is that of *Bolbonac*, which our women call white Sattin, but much ſmaller: the taſte is ſomewhat ſharpe.

2 This kinde of *Paronychia*, hath ſmall thicke and fat leaues, cut into three or more diuiſions, much reſembling the leaues of Rue, but a great deale ſmaller. The ſtalks are like the former, & the

leaues

leaues alſo; but the caſes wherein the ſeede is contained, are like vnto the ſeed veſſels of *Myoſitis Scorpioides*, or Mouſeare Scorpion graſſe. The floures are ſmall and white.

There is another ſort of Whitlow graſſe or Nailewoort, that is likewiſe a low or baſe herbe, hauing a ſmall tough roote, with ſome threddie ſtrings annexed thereto: from which riſe vp diuers ſlender tough ſtalkes, ſet with little narrow leaues confuſedly like thoſe of the ſmalleſt Chickweed whereof doubtleſſe theſe be kindes: alongſt the ſtalks do grow very little white floures, after which come the ſeeds in ſmall buttons, of the bigneſſe of a pins head. ‡ Our Author ſeemes here to deſcribe the *Paronychia* 2. of *Tabern.* ‡

1 *Paronychia vulgaris.*
Common Whitlow graſſe.

2 *Paronychia Rutacco folio.*
Rew leafed or iagged Whitlow graſſe.

¶ *The Place.*

Theſe ſmall, baſe and low herbs grow vpon bricke and ſtone wals, vpon old tiled houſes, which are growne to haue much moſſe vpon them, and vpon ſome ſhadowie, and dry muddy wals. It groweth plentifully vpon the bricke wall in Chancerie Lane, belonging to the Earle of Southampton, in the Suburbs of London, and ſundry other places.

¶ *The Time.*

Theſe floure many times in Ianuary and February, and when hot weather approcheth, they are no more to be ſeen all the yeare after.

¶ *The Names.*

The Græcians haue called theſe plants ναπυξία: which *Cicero* calleth *Reduvia*: There be many kindes of plants, called by the ſaid name of *Paronychia*, which hath cauſed many writers to doubt of the true kinde: but you may very boldly take theſe plants for the ſame, vntill time hath reuealed or raiſed vp ſome new plant, approching neerer vnto the truth: which I thinke will neuer be, ſo that we may call them in Engliſh, Naile-woort, and Whitelow graſſe.

¶ *The Temperatures and Vertues.*

A As touching the qualitie hereof, we haue nothing to ſet downe: onely it hath beene taken to heale the diſeaſe of the nailes called a Whitlow, whereof it took his name.

† Our Authour he elgaue vs two figures, and as many deſcriptions of both theſe plants, wherefore I haue omitted 2. of the figures, and the more vnperfect Deſcriptions.

Chap.

Chap. 198. *Of the female Fluellen, or Speedwell.*

¶ *The Deſcription.*

1 THe firſt kinde of *Elatine*, beeing of *Fuchſius* and *Matthiolus*, called *Veronica fœmina*, or the female Fluellen, ſhooteth from a ſmall and fibrous root many flexible and tender branches, diſperſed flat vpon the ground, ramping & creeping with leaues like *Nummularia*, but that the leaues of *Elatine* are of an hoarie, hairie, and ouerworne greene colour; among which come forth many ſmall floures, of a yellow colour mixed with a little purple, like vnto the ſmall Snapdragon, hauing a certaine taile or Spur faſtened vnto euery ſuch floure, like the herbe called Larkes ſpurre. The lower iaw or chap of the floure is of a purple colour, and the vpper iawe of a faire yellowe; which beeing paſt, there ſucceedes a ſmall blacke ſeede contained in round husks.

2 The ſecond kinde of *Elatine* hath ſtalkes, branches, floures, and roots, like the firſt: but the leaues are faſhioned like the former, but that they haue two little ears at the lower end, ſomewhat reſembling an arrow head, broad at the ſetting on: but the ſpur or taile of the floure is longer, and more purple mixed with the yellow in the floure.

1 *Veronica fœmina Fuchſij, ſive Elatine.*
The Female Fluellen.

2 *Elatine altera.*
Sharpe pointed Fluellen.

¶ *The Place.*

Both theſe plants I haue found in ſundry places where corne hath growne, eſpecially barley, as in the fields about Southfleet in Kent, where within ſix miles compaſſe there is not a field wherein it doth not grow.

Alſo it groweth in a field next vnto the houſe ſometime belonging to that honourable gentleman Sir *Frances Walſingham*, at Barn-elmes, and in ſundry places of Eſſex; and in the next field vnto the Churchyard at Chiſwicke neere London, towards the midſt of the field.

¶ *The Time.*

They floure in Auguſt and September.

¶ *The*

¶ *The Names.*

Their ſeuerall titles ſet forth their names as well in Latine as Engliſh.

¶ *The Nature and Vertues.*

A Theſe plants are not onely of a ſingular aſtringent facultie, and thereby helpe them that bee grieued with the Dyſenterie and hot ſwelling; but of ſuch ſingular efficacy to heale ſpreading and eating cankers, and coroſiue vlcers, that their vertue in a manner paſſeth all credit in theſe fretting ſores, vpon ſure proofe done vnto ſundry perſons, and eſpecially vpon a man whom *Pena* reporteth to haue his noſe eaten moſt grieuouſly with a canker or eating ſore, who ſent for the Phyſitions & Chirurgions that were famouſly knowne to be the beſt, and they with one conſent concluded to cut the ſaid noſe off, to preſerue the reſt of his face: among theſe Surgeons and Phyſitions came a poore ſorie Barbar, who had no more skill than he had learned by tradition, and yet vndertooke to cure the patient. This foreſaid Barbar ſtanding in the companie and hearing their determination, deſired that he might make triall of an herbe which he had ſeene his maſter vſe for the ſame purpoſe, which herbe *Elatine*, though he were ignorant of the name whereby it was called, yet hee knew where to fetch it. To be ſhort, this herbe he ſtamped, and gaue the iuice of it vnto the patient to drinke, and outwardly applied the ſame plaiſterwiſe, and in very ſhort ſpace perfectly cured the man, and ſtaied the reſt of his body from further corruption, which was ready to fall into a leproſie, *Aduerſar. pag.* 197.

B *Elatine* helpeth the inflammation of the eies, and defendeth humours flowing vnto them, beeing boiled, and as a pultus applied thereto.

C The leaues ſodden in the broth of a hen, or Veale, ſtaieth the dyſenterie.

D The new writers affirme, that the female Fluellen openeth the obſtructions or ſtoppings of the liuer and ſpleen, prouoketh vrine, driueth forth ſtones, and clenſeth the kidneies and bladder, according to *Paulus*.

E The weight of a dram or of a French crowne, of the pouder of the herbe, with the like waight of treacle, is commended againſt peſtilent Feuers.

Chap. 192. *Of Fluellen the male, or Paul's Betonie.*

1 *Veronica vera & maior.*
Fluellen, or Speedwell.

† 2 *Veronica recta mas.*
The male Speedwell.

¶ *The*

¶ *The Deſcription.*

1 THe firſt kinde of *Veronica* is a ſmall herbe, and creepeth by the ground, with little reddiſh and hairy branches. The leafe is ſomething round and hairy, indented or ſnipped round about the edges. The floures are of a light blew colour, declining to purple: the ſeed is contained in little flat pouches: the root is fibrous and hairy.

† 2 The ſecond doth alſo creepe vpon the ground, hauing long ſlender ſtemmes, ſome foot high, and ſomewhat large leaues a little hairy, and pleaſantly ſoft. The floures be blew like as thoſe of the former, but ſomewhat bigger, and of a brighter colour; and they are alſo ſucceeded by round ſeed veſſels.

3 The third kinde of *Veronica* creepeth with branches and leaues like vnto *Serpillum*, for which cauſe it hath beene called *Veronica Serpillifolia*. The floures grow along the ſmall and tender branches, of a whitiſh colour declining to blewneſſe. The root is ſmall and threddie, taking hold vpon the vpper face of the earth, where it ſpreadeth. The ſeed is contained in ſmall pouches like the former.

4 The fourth hath a root ſomewhat wooddie, from the which riſe vp leaues like vnto the former. The ſmall vpright ſtalke is beſet with the like leaues, but leſſer; at the top whereof commeth forth a ſlender ſpike cloſely thruſt together, and full of blewiſh floures, which are ſucceeded by many horned ſeed veſſels.

‡ 5 This hath many wooddie round ſmooth branches, ſome handfull and halfe high or better: the leaues are like thoſe of wilde Tyme, but longer, and of a blacker colour, ſometimes lightly ſnipt: at the tops of the branches grow floures of a whitiſh blew colour, conſiſting of foure, fiue, or elſe ſixe little leaues a piece; which falling, there follow round ſeede veſſels, containing a round ſmall and blacke ſeed. It floures in Auguſt, and growes vpon cold and high mountaines, as the Alpes. *Pona* calls this *Veronica Alpina minima Serpillifolio*: and *Cluſius* hath it by the name of *Veronica 3. fruticans*. ‡

3 *Veronica minor.*
Little Fluellen.

4 *Veronica recta minima.*
The ſmalleſt Fluellen.

‡ 5 *Veronica*

‡ 5 *Veronica fruticans Serpillifolia.*
Shrubbie Fluellen.

6 *Veronica aſſurgens, ſive Spicata.*
Tree Fluellen.

† 7 *Veronica ſpicata latifolia.*
Vpright Fluellen.

‡ 8 *Veronica ſupina.*
Leaning Fluellen.

6 The ſixt kinde of *Veronica* hath many vpright branches a foote high and ſometimes more, diuiding themſelues into ſundry other ſmall twigs; at the top whereof do grow faire ſpikie tufts, bearing bright and ſhining blew floures. The leaues are ſomewhat long, indented about the edges like a ſaw: the root is compact of many threds, or ſtrings.

‡ 7 This hath ſtalkes ſome cubit high and ſometimes more, and theſe not very full of branches, yet hauing diuers joints, at each whereof do grow forth two leaues, two or three inches long, and one broad, and theſe leaues are alſo thicke, ſmooth, and ſhining, lightly ſnipt or cut about the edges, and of a very aſtringent and drying taſte, and at laſt ſomewhat biting. At the top of the ſtalkes grow ſpokie tufts or blew floures like thoſe of the laſt mentioned, but of ſomewhat a lighter colour, and they begin firſt to floure or ſhew themſelues below, and ſo go vpwards; the ſeed, which is ſmall and blacke, is conteyned in flat ſeed veſſels: the roote is thicke with many fibres, euery yeere thruſting vp new ſhoots. There is a variety of this with the leaues not ſo blacke and ſhining, but hauing more branches; and another which hath a longer ſpike or tuft of floures. *Cluſius* calls this *Veronica erectior latifolia*. ‡

8 The eighth hauing his ſtalkes leaning vpon the ground looketh with his face vpright, hauing ſundry flexible branches, ſet with leaues like vnto wilde Germander by couples, one right againſt another, deeply jagged about the edges, in reſpect of the other before mentioned. The floures are of a blew colour: the root is long, with ſome threds appendant thereto.

¶ *The Place.*

Veronica groweth vpon bankes, borders of fields, and graſsie mole-hils, in ſandy grounds, and in woods, almoſt euery where.

The fourth kinde, my good friend M^r. *Stephen Bredwell*, practitioner in phyſicke found and ſhewed it me in the cloſe next adjoining to the houſe of M^r. *Bele*, chiefe of the clerkes of her Maieſties Counſell, dwelling at Barnes neere London. The ſixth is a ſtranger in England, but I haue it growing in my garden.

¶ *The Time.*

Theſe floure from May to September.

¶ *The Names.*

† Theſe plants are comprehended vnder this generall name *Veronica*; and *Dodonæus* would haue the firſt of them to be the *Betonica* of *Paulus Ægineta*; and *Turner* and *Geſner* the third: we do call them in Engliſh, Pauls Betony, or Speedwell: in Welch it is called Fluellen, and the Welch people do attribute great vertues to the ſame: in high Dutch, **Gzowndheill**: in low Dutch, **Er eu prijs**, that is to ſay, Honor and praiſe.

¶ *The Nature.*

Theſe are of a meane temperature, betweene heate and drineſſe.

¶ *The Vertues.*

The decoction of *Veronica* drunke, ſodereth and healeth all freſh and old wounds, clenſeth the bloud from all corruption, and is good to be drunke for the kidnies, and againſt ſcuruineſſe and foule ſpredding tetters, and conſuming and fretting ſores, the ſmall pox and meaſels. A

The water of *Veronica* diſtilled with wine, and re-diſtilled ſo often vntill the liquor wax of a reddiſh colour, preuaileth againſt the old cough, the drineſſe of the lungs, and all vlcers and inflammation of the ſame. B

† The ſecond and third were both figures of that deſcribed in the third place: and thoſe that were formerly in the fifth and ſixth places, were alſo of the ſame plant, to wit that which is here deſcribed in the ſixth place and which was formerly in the fifth.

Chap. 198. *Of herbe Two pence.*

¶ *The Deſcription.*

1 Herbe Two pence hath a ſmall and tender root, ſpreding and diſperſing it ſelfe farre within the ground; from which riſe vp many little, tender, flexible ſtalkes trailing vpon the ground, ſet by couples at certaine ſpaces, with ſmooth greene leaues ſomewhat round, whereof it tooke his name; from the boſome of which leaues ſhoote forth ſmall tender foot-ſtalkes, whereon do grow little yellow floures, like thoſe of Cinkefoile or Tormentill.

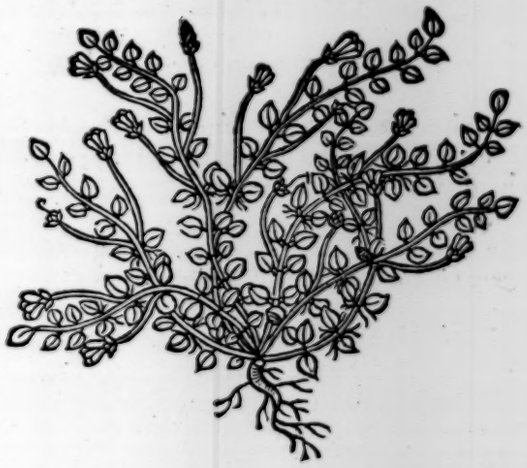
2 There is a kinde of Money woort or herbe Two pence, like the other of his kinde in each reſpect, ſauing it is altogether leſſer, wherein they differ.

‡ 3 There is another kinde of Money-woort which hath many very ſlender creeping branches which here and there put forth fibres, and take root againe: the leaues are ſmall and round, ſtanding by couples one againſt another; and out of the boſomes come ſlender foote-ſtalkes

bearing prety little whitiſh purple floures conſiſting of fiue little leaues ſtanding together in manner of a little bell-floure, and ſeldome otherwiſe: the ſeed is ſmall, and conteined in round heads. This growes in many wet rotten grounds and vpon bogges: I firſt found it *Anno 1626*, in the Biſhopricke of Durham, and in two or three places of Yorkſhire, and not thinking any had taken notice thereof, I drew a figure of it & called it *Nummularia puſilla flore ex albo purpuraſcente*; but ſince I haue found that *Bauhine* had formerly ſet it forth in his *Prodromus* by the name of *Nummularia flore purpuraſcente*. It growes alſo on the bogges vpon the heath, neare Burnt wood in Eſſex: it floures in Iuly and Auguſt. ‡

1 *Nummularia.*
Herbe Two pence.

‡ 3 *Nummularia flore purpuraſcente.*
Purple floured Money-woort.



¶ *The Place.*

It groweth neere vnto ditches and ſtreames, and other watery places, and is ſometimes found in moiſt woods: I found it vpon the banke of the riuer of Thames, right againſt the Queenes pallace of White hall; and almoſt in euery countrey where I haue trauelled.

¶ *The Time.*

It floureth from May till Summer be well ſpent.

¶ *The Names.*

Herbe Two pence is called in Latine *Nummularia*, and *Centummorbia*: and of diuers *Serpentaria*. It is reported that if ſerpents be hurt or wounded, they do heale themſelues with this herbe, whereupon came the name *Serpentaria*: it is thought to be called *Centummorbia*, of the wonderfull effect which it hath in curing diſeaſes; and it is called *Nummularia* of the forme of money, whereunto the leaues are like: in Dutch, **Penninckcruyt**: in Engliſh, Money woort, Herbe Two pence, and Two penny graſſe.

¶ *The Temperature.*

That this herbe is dry, the binding taſte thereof doth ſhew: it is alſo moderate colde.

¶ *The Vertues.*

A The floures and leaues ſtamped and laid vpon wounds and vlcers doth cure them: but it worketh moſt effectually being ſtamped and boiled in oile oliue, with ſome roſen, wax, and turpentine added thereto.

The

The iuice drunke in wine, is good for the bloudie flix, and all other issues in bloud of man or woman; the weakenesse and loosenesse of the belly and laske; it helpeth those that vomite bloud, and the Whites in such as haue them. B

Boiled with wine and honie it cureth the wounds of the inward parts, and vlcers of the lungs, & in a word, there is not a better wound herbe, no not Tabaco it selfe, nor any other whatsoeuer. C

The herbe boiled in wine with a little honie, or meade, preuaileth much against the cough in children, called the Chinne cough. D

Chap. 200. *Of Bugle or Middle Comfrey.*

¶ *The Description.*

1 *Bugula* spreadeth and creepeth alongst the ground like Monie woort; the leaues be long, fat, & oleous, and of a brown colour for the most part. The floures grow about the stalks in rundles, compassing the stalke, leauing betweene euery rundle bare or naked spaces; and are of a faire blew colour, and often white. I found many plants of it in a moist ground vpon Blacke Heath neere London, fast by a village called Charleton, but the leaues were green, and not browne at all like the other.

1 *Bugula.*
Middle Consound.

2 *Bugula flore albo, siue carneo.*
White or carnation floured Bugle.

2 Bugle with the white floure differeth not from the precedent, in roots, leaues, and stalks: the onely difference is, that this plant bringeth forth faire milk white floures, and the other those that are blew. ‡ It is also found with a flesh coloured floure, and the leaues are lesse snipt than those of the former. *Bauhine* makes mention of one much lesse than those, with round snipt leaues and a yellow floure, which he saith he had out of England, but I haue not as yet seene it; nor found any other mention thereof. ‡

¶ *The Place.*

Bugula groweth almost in euery wood and copse, and such like shadowie and moist places, and is much planted in gardens: the other varieties are seldome to be met withall.

¶ *The Time.*

Bugula floureth in Aprill and May.

¶ *The Names.*

Bugle is reckoned among the Conſounds or wound herbes: and it is called of ſome *Conſolida media*, *Bugula*, and *Buglum*: in High Dutch, **Guntzel:** in Low Dutch **Senegroen:** of *Matthiolus*, *Herba Laurentina*: in Engliſh, Browne Bugle: of ſome, Sicklewoort, and herbe Carpenter, but not truly.

¶ *The Nature.*

Bugle is of a meane temperature, betweene heat and drineſſe.

¶ *The Vertues.*

A It is commended againſt inward burſtings, and members torne, rent, and bruiſed: and therefore it is put into potions that ſerue for nodes, in which it is of ſuch vertue, that it can diſſolue & waſte away congealed and clotted bloud. *Ruellius* writeth that they commonly ſay in France, how he needeth neither Phyſition nor Surgeon that hath Bugle and Sanickle, for it doth not only cure rotten wounds being inwardly taken, but alſo applied to them outwardly; it is good for the infirmities of the Liuer; it taketh away the obſtructions, and ſtrengthneth it.

B The decoction of Bugle drunken, diſſolueth clotted or congealed bloud within the bodie, healeth and maketh ſound all wounds of the bodie, both inward and outward.

C The ſame openeth the ſtoppings of the Liuer and gall, and is good againſt the iaundiſe and feuers of long continuance.

D The ſame decoction cureth the rotten vlcers and ſores of the mouth and gums.

E *Bugula* is excellent in curing wounds and ſcratches, and the iuice cureth the wounds, vlcers and ſores of the ſecret parts, or the herbe bruiſed and laid thereon.

Chap. 201 *Of Selfe-heale.*

1 *Prunella.*
Selfe-heale.

2 *Prunella Lobelij.*
The ſecond Selfe-heale.

¶ *The*

3 *Prunella flore albo.*
White floured Selfe-heale.

¶ *The Deſcription.*

1 PRunell or Brunel hath ſquare hairy ſtalks of a foot high, beſet with long, hairy and ſharpe pointed leaues, & at the top of the ſtalks grow floures thicke ſet together, like an eare or ſpiky knap, of a browne colour mixed with blew floures, and ſometimes white, of which kinde I found ſome plants in Eſſex neere Henningham caſtle. The root is ſmall and very threddie.

† 2 *Prunella altera*, or after *Lobel* and *Pena*, *Symphytum petræum*, hath leaues like the laſt deſcribed, but ſomewhat narrower, and the leaues that grow commonly towards the tops of the ſtalks, are deeply diuided or cut in, after the manner of the leaues of the ſmall Valerian, and ſometimes the lower leaues are alſo diuided, but that is more ſeldom; the heads and floures are like thoſe of the former, and the colour of the floures is commonly purple yet ſomtimes it is found with fleſh coloured, and otherwhiles with white or aſhe coloured floures.

3 The third ſort of Selfe-heale is like vnto the laſt deſcribed in root, ſtalke, & leaues, & in euery other point, ſauing that the floures hereof are of a perfect white colour, and the others not ſo, which maketh the difference.

‡ The figure which our Authour gaue in this third place, was of the *Prunella ſecunda* of *Tabern.* which I iudge to be all one with the *Prunella* 1. *non vulgaris* of *Cluſius*, and that becauſe the floures in that of *Tabernamontanus* are expreſſed *Ventre laxiore*, which *Cluſius* complaines his drawer did not obſerue; the other parts alſo agree: now this of *Cluſius* hath much larger floures than the ordinary, and thoſe commonly of a deeper purple colour, yet they are ſometimes whitiſh, and otherwhiles of an aſhe colour: the leaues alſo are ſomewhat more hairie, long and ſharpe pointed, than the ordinary, and herein conſiſts the greateſt difference. ‡

¶ *The Place.*

The firſt kinde of Prunell or Brunell groweth verie commonly in all our fieldes throughout England.

The ſecond Brunel or *Symphytum petræum* groweth naturally vpon rocks, ſtonie mountaines, and grauelly grounds.

‡ The third for any thing that I know is a ſtranger with vs: but the firſt common kinde I haue found with white floures. ‡

¶ *The Time.*

Theſe plants floure for the moſt part all Sommer long.

¶ *The Names.*

Brunel is called in Engliſh Prunell, Carpenters herbe, Selfe-heale, and Hooke-heale, and Sicklewoort. It is called of the later Herbariſts *Brunella*: and *Prunella*, of *Matthiolus*, *Conſolida minor*, and *Solidago minor*; but ſaith *Ruellius*, the Daiſie is the right *Conſolida minor*, and alſo the *Solidago minor*.

¶ *The Nature.*

Theſe herbes are of the temperature of *Bugula*, that is to ſay, moderately hot and drie, and ſomething binding.

¶ *The Vertues.*

The decoction of Prunell made with wine or water, doth ioine together and make whole and found all wounds, both inward and outward, euen as Bugle doth. A

Prunell bruiſed with oile of Roſes and Vineger, and laied to the forepart of the head, ſwageth and helpeth the paine and aking thereof. B

To bee ſhort, it ſerueth for the ſame that Bugle doth, and in the world there are not two better wound herbs, as hath been often proued. C

D It is commended againſt the infirmities of the mouth, and eſpecially the ruggedneſſe, blackeneſſe, and drineſſe of the tongue, with a kinde of ſwelling in the ſame. It is an infirmitie amongſt ſouldiers that lie in campe. The Germans call it **de Braun**, which happeneth not without a continuall ague and frenſie. The remedie hereof is the decoction of Selfe-heale, with common water, after bloud letting out of the veins of the tongue: and the mouth and tongue muſt be often waſhed with the ſame decoction, and ſometimes a little vineger mixed therewith. This diſeaſe is thought to be vnknowne to the old writers: but notwithſtanding if it be conferred with that which *Paulus Aegineta* calleth *Eryſipelas Cerebri*, an inflammation of the braine, then will it not be thought to bee much differing, if it be not the very ſame.

Chap. 202. *Of the great Daiſie, or Maudelen woort.*

1 *Bellis maior.*
The great Daiſie.

¶ *The Deſcription.*

1 THe great Daiſie hath very many broad leaues ſpred vpon the ground, ſomewhat indented about the edges, of the breadth of a finger, not vnlike thoſe of ground ſwell: among which riſe vp ſtalkes of the height of a cubit, ſet with the like leaues, but leſſer, in the top whereof do grow large white floures with yellow thrums in the middle like thoſe of the ſingle field Daiſy or Mayweed, without any ſmell at all. The root is full of ſtrings.

¶ *The Place.*

It groweth in Medowes and in the borders of fields almoſt euery where.

¶ *The Time.*

It floureth and flouriſheth in May and Iune.

¶ *The Names.*

It is called (as we haue ſaid) *Bellis maior*, and alſo *Conſolida media vulnerariorum*, to make a difrence betweene it and *Bugula*, which is the true *Conſolida media*: notwithſtanding this is holden of all to bee *Conſolida mediȳ generis*, or a kinde of middle Conſound: in High Dutch, as *Fuchſius* reporteth, **Genszblume**: in Engliſh, the Great Daiſie and Maudelen woort.

¶ *The Temperature.*

This great Daiſie is moiſt in the end of the ſecond degree, and cold in the beginning of the ſame.

¶ *The Vertues.*

A The leaues of the great Maudleine woort are good againſt all burning vlcers and apoſtemes, againſt the inflammation and running of the eies, being applied thereto.

B The ſame made vp in an vnguent or ſalue with wax, oile, and turpentine, is moſt excellent for wounds, eſpecially thoſe wherein is any inflammation, and will not come to digeſtion or maturation, as are thoſe weeping wounds made in the knees, elbowes, and other ioints.

C The iuice, decoction, or diſtilled water, is drunk to very good purpoſe againſt the rupture or any inward burſtings.

D The herbe is good to be put into Vulnerarie drinks or potions, as one ſimple belonging thereto moſt neceſſarie, to the which effect, the beſt practiſed do vſe it as a ſimple in ſuch caſes of great effect.

E It likewiſe aſſwageth the cruell torments of the gout, vſed with a few Mallows and butter boiled and made to the forme of a pultis.

F The ſame receipt aforeſaid vſed in Clyſters, profiteth much againſt the vehement heat in agues, and ceaſeth the torments or wringing of the guts or bowels.

Chap.

CHAP. 203. *Of little Daiſies.*

¶ *The Deſcription.*

1 THe Daiſie bringeth forth many leaues from a threddy root, ſmooth, fat, long, and ſomwhat round withall, very ſleightly indented about the edges, for the moſt part lying vpon the ground: among which riſe vp the floures, euery one with his owne ſlender ſtem, almoſt like thoſe of Camomill, but leſſer, of a perfect white colour, and very double.

2 The double red Daiſie is like vnto the precedent in euery reſpect, ſauing in the colour of the floures: for this plant bringeth forth floures of a red colour, and the other white as aforeſaid.

‡ Theſe double Daiſies are of two ſorts, that is either ſmaller or larger; and theſe againe either white or red, or of both mixed together: wherefore I haue giuen you in the firſt place the figure of the ſmall, and in the ſecond that of the larger.

3 Furthermore, there is another pretty double daiſie which differs from the firſt deſcribed only in the floure, which at the ſides thereof puts forth many foot-ſtalkes carrying alſo little double floures, being commonly of a red colour; ſo that each ſtalke carries as it were an old one and the brood thereof: whence they haue fitly termed it the childing Daiſie. ‡

1 *Bellis minor multiplex flore albo vel rubro.*
The leſſer double red or white Daiſie.

2 *Bellis media multiplex flore albo vel rubro.*
The larger double white or red Daiſie.

4 The wilde field Daiſie hath many leaues ſpred vpon the ground like thoſe of the garden Daiſie: among which riſe vp ſlender ſtems; on the top whereof do grow ſmall ſingle floures like thoſe of Camomill, ſet about a bunch of yellow thrums, with a pale of white leaues, ſometimes white, now and then red, and often of both mixed together. The root is threddy.

5 There doth likewiſe grow in the fields another ſort of wilde Daiſie, agreeing with the former in each reſpect, ſauing that it is ſomewhat greater than the other, and the leaues are ſomwhat more cut in the edges, and larger.

6 The blew Italian Daiſie hath many ſmall threddy roots, from the which riſe vp leaues like thoſe

‡ 3 *Bellis minor prolifera.*
Childing Daiſie.

4 *Bellis minor ſylueſtris.*
The ſmall wilde Daiſie.

5 *Bellis media ſylueſtris.*
The middle wilde Daiſie.

thoſe of the common Daiſie, of a darke greene colour: among which commeth vp a fat ſtemme ſet round about with the like leaues, but leſſer. The floures grow at the top globe-faſhion, that is, round like a ball, of a perfect blew colour, verie like vnto the floures of Mountaine Scabious.

7 The French blew Daiſie is like vnto the other blew Daiſies in each reſpect, ſauing it is altogether leſſer, wherein conſiſteth the difference.

‡ There were formerly three figures and deſcriptions of this blew Daiſie, but one of them might haue ſerued; for they differ but in the tallneſſe of their growth, and in the bredth and narrowneſſe of their leaues. ‡

¶ *The Place.*

The double Daiſies are planted in gardens: the others grow wilde euery where.

The

The blew Daiſies are ſtrangers in England; their naturall place of abode is ſet forth in their ſeuerall titles.

6 *Bellis cærulea ſiue Globularia Apula.*
The blew Italian Daiſie.

7 *Bellis cærulea Monſpeliaca.*
Blew French Daiſies.

¶ *The Time.*

The Daiſies do floure moſt part of the Sommer.

¶ *The Names.*

The Daiſie is called in high-Dutch **Maſzlieben:** in low Dutch, **Margrieten:** in Latine, *Bellis minor*, and *Conſolida minor*, or the middle Conſound: of *Tragus*, *Primula veris*; but that name is more proper vnto Primroſe: of ſome, *Herba Margarita*, or Margarites herbe: in French, *Margueri-tes*, and *Caſſaudes*: in Italian, *Fiori di prima veri gentili*. In Engliſh, Daiſies, and Bruiſewort.

The blew Daiſie is called *Bellis cærulea*: of ſome, *Globularia*, of the round forme of the floure: it is alſo called *Aphyllanthes*, and *Frondiſlora*: in Italian, *Botanaria*: in Engliſh, blew Daiſies, and Globe Daiſie.

¶ *The Temperature.*

The leſſer Daiſies are cold and moiſt, being moiſt in the end of the ſecond degree, and cold in the beginning of the ſame.

¶ *The Vertues.*

The Daiſies doe mitigate all kinde of paines, but eſpecially of the ioynts, and gout proceeding from an hot and dry humor, if they be ſtamped with new butter vnſalted, and applied vpon the pained place; but they worke more effectually if Mallowes be added thereto. A

The leaues of Daiſies vſed amongſt other Pot-herbes doe make the belly ſoluble; and they are alſo put into Clyſters with good ſucceſſe, in hot burning feuers, and againſt inflammations of the inteſtines. B

The iuyce of the leaues and roots ſniſt vp into the noſthrils, purgeth the head mightily of foule and filthy ſlimie humors, and helpeth the megrim. C

The ſame giuen to little dogs with milke keepeth them from growing great. D

The leaues ſtamped taketh away bruiſes and ſwellings proceeding of ſome ſtroke, if they be ſtamped and laid thereon; whereupon it was called in old time Bruiſewort. E

The iuyce put into the eyes cleareth them, and taketh away the watering. F

The decoction of the field Daiſie (which is the beſt for phyſicks vſe) made in water and drunke, is good againſt agues, inflammation of the liuer, and all other the inward parts. G

Chap. 204. *Of Mouſe-eare.*

¶ *The Deſcription.*

1 THe great Mouſe-eare hath great and large leaues greater than our common *Pyloſella*, or Mouſe-eare, thicke, and full of ſubſtance: the ſtalkes and leaues be hoarie and white, with a ſilken moſſineſſe in handling like ſilke, pleaſant and faire in view: it beareth three or foure quadrangled ſtalkes, ſomewhat knotty, a foot long: the roots are hard, wooddy, and full of ſtrings: the floures come forth at the top of the ſtalke, like vnto the ſmall Piſſeabed, or Dandelion, of a bright yellow colour.

2 The ſecond kinde of *Pyloſella* is that which we call *Auricula muris*, or Mouſe-eare, being a very common herb, but few more worthy of conſideration becauſe of his good effect, and yet clean vnremembred of the old Writers. It is called *Pyloſella* of the rough hairy and whitiſh ſubſtance growing on the leaues, which are ſomewhat long like the little Daiſie, but that they haue a ſmall hollowneſſe in them reſembling the eare of a Mouſe: vpon the which conſideration ſome haue called it *Myoſotis*; wherein they were greatly deceiued, for it is nothing like vnto the *Myoſotis* of *Dioſcorides*: his ſmall ſtalkes are likewiſe hairy, ſlender, and creeping vpon the ground; his floures are double, and of a pale yellow colour, much like vnto *Sonchus*, or *Hieracium*, or Hawkeweed.

1 *Pyloſella major.*
Great Mouſe-eare.

2 *Pyloſella repens.*
Creeping Mouſe-eare.

3 The ſmall Mouſe-eare with broad leaues hath a ſmall tough root, from which riſe vp many hairy and hoarie broad leaues ſpred vpon the ground; among which growes vp a ſlender ſtem, at the top whereof ſtand two or three ſmall yellow floures, which being ripe turne vnto downe that is caried away with the winde.

¶ *The Place.*

Theſe plants do grow vpon ſandy bankes and vntoiled places that lie open to the aire.

¶ *The Time.*

They floure in May and Iune.

¶ *The*

¶ *The Names.*

Great Mouſe-eare is called of the later herbariſts *Pyloſella:* the ſmaller likewiſe *Pyloſella*, and *Auricula muris*: in Dutch, **Nagelcruiſt**, and **Muyſoor**: *Lacuna* thinkes it *Holoſtium*: in French, *Oreille de rat, ou ſouris*: in Italian, *Peloſella:* in Engliſh, Mouſe-eare.

¶ *The Temperature.*

They are hot and dry of temperature, of an excellent aſtringent facultie, with a certaine hot tenuitie admixed.

¶ *The Vertues.*

The decoction of *Pyloſella* drunke doth cure and heale all wounds, both inward and outward: it A
cureth hernies, ruptures, or burſtings.

The leaues dried and made into pouder, do profit much in healing of wounds, being ſtrewed B
thereupon.

The decoction of the iuyce is of ſuch excellencie, that if ſteele-edged tooles red hot be drenched and cooled therein oftentimes, it maketh them ſo hard, that they will cut ſtone or iron, be C
they neuer ſo hard, without turning the edge or waxing dull.

This herbe being vſed in gargariſmes cureth the looſeneſſe of the Vuula. D

Being taken in drinke it healeth the fluxes of the wombe, as alſo the diſeaſes called *Dyſenteria* E
and *Enterocele*: it glueth and conſoundeth wounds, ſtayeth the ſwelling of the ſpleene, and the bloudy excrements procured thereby.

The Apothecaries of the Low-countries make a ſyrrup of the iuyce of this herb, which they vſe F
for the cough, conſumption, and ptiſicke.

† I haue in this chapter omitted two figures and one deſcription: the firſt of the two omitted figures, which ſhould haue beene the third, differs little from the firſt but in the ſmallneſſe of the ſtalke, and fewneſſe of the floures at the top thereof: the other, which was in the fourth place, was figured and deſcribed by me formerly in the fourth place of the 54 chapter of this booke.

Chap. 205. *Of Cotton-weed or Cud-weed.*

1 *Gnaphalium Anglicum.*
Engliſh Cudweed.

2 *Gnaphalium vulgare.*
Common Cudweed.

¶ *The*

¶ *The Deſcription.*

1 ENgliſh Cudweed hath ſundry ſlender and vpright ſtalkes diuided into many branches, and groweth as high as common Wormwood, whoſe colour and ſhape it doth much reſemble. The leaues ſhoot from the bottome of the turfe ful of haires, in ſhape ſomewhat like a Willow leafe below, but aboue they be narrower, and like the leaues of *Pſyllium* or Flea-wort: among which do grow ſmall pale coloured floures like thoſe of the ſmall *Coniza* or Flea-bane. The whole plant is of a bitter taſte.

2 The ſecond being our common *Gnaphalium* or Cudweed is a baſe or low herbe, nine or ten inches long, hauing many ſmall ſtalks or tender branches, and little leaues, couered all ouer with a certain white cotton or fine wooll, and very thick: the floures be yellow, and grow like buttons at the top of the ſtalkes.

3 The third kinde of Cudweed or Cotton-weed, being of the ſea, is like vnto the other Cudweed laſt deſcribed, but is altogether ſmaller and lower, ſeldome growing much aboue a handfull high: the leaues grow thicke vpon the ſtalkes, and are ſhort, flat, and very white, ſoft and woolly. The floures grow at the top of the ſtalkes in ſmall round buttons, of colour and faſhion like the other Cudweed.

4 The fourth being the Cotton-weed of the hills and ſtony mountains, is ſo exceeding white and hoary, that one would thinke it to be a plant made of wooll, which may very eaſily be known by his picture, without other deſcription.

3 *Gnaphalium marinum.*
Sea Cudweed.

4. 5. *Gnaphalium montanum purpureum & album.*
White and purple mountaine Cotton-weed.

5 The fifth kinde of Cotton-weed hath leaues and ſtalkes like the other of his kinde, and differeth in that, that this plant beareth a buſh or tuft of purple floures, otherwiſe it is very like.

6 The ſixth is like vnto the laſt recited, but greater: the floures are of an exceeding bright red colour, and of an aromaticall ſweet ſmell.

7 The ſeuenth kinde of *Gnaphalium* or Cotton-weed of *Cluſius* his deſcription, growes nine or ten inches high, hauing little long leaues like the ſmall Mouſ-eare, woolly within, and of a hoarie colour on the outſide: the ſtalkes in like manner are very woolly, at the top whereof commeth forth a faire floure and a ſtrange, hauing ſuch woolly leaues bordering the floure about, that a man would thinke it to be nothing elſe but wooll it ſelfe: and in the middeſt of the floure come forth

ſundry

6 *Gnaphalium montanum ſuaue rubens.*
Bright red mountaine Cotton-weed.

† 7 *Gnaphalium Alpinum.*
Rocke Cotton-weed.

‡ 8 *Gnaphalium Americanum.*
Liue for euer.

9 *Filago minor.*
Small Cud-weed.

ſundry ſmall heads of a pale yellow colour, like vnto the other of this kinde. The root is blacke and ſomewhat fibrous.

8 There is a kinde of Cotton-weed, being of greater beauty than the reſt, that hath ſtrait and vpright ſtalks 3 foot high or more, couered with a moſt ſoft and fine wooll, and in ſuch plentifull manner, that a man may with his hands take it from the ſtalke in great quantitie: which ſtalke is beſet with many ſmall long and narrow leaues, greene vpon the inner ſide, and hoary on the other ſide, faſhioned ſomewhat like the leaues of Roſemary, but greater. The floures do grow at the top of the ſtalkes in bundles or tufts, conſiſting of many ſmall floures of a white colour, and very double, compact, or as it were conſiſting of little ſiluer ſcales thruſt cloſe together, which doe make the ſame very double. When the floure hath long flouriſhed, and is waxen old, then comes there in the middeſt of the floure a certaine browne yellow thrumme, ſuch as is in the midſt of the Daiſie: which floure being gathered when it is young, may be kept in ſuch manner as it was gathered (I meane in ſuch freſhneſſe and well liking) by the ſpace of a whole yeare after, in your cheſt or elſewhere: wherefore our Engliſh women haue called it Liue-long, or Liue for euer, which name doth aptly anſwer his effects. ‡ *Cluſius* receiued this plant out of England, and firſt ſet it forth by the name of *Gnaphalium Americanum*, or *Argyrocome*. ‡

9 This plant hath three or foure ſmall grayiſh cottony or woolly ſtalkes, growing ſtrait from the roor, and commonly diuided into many little branches: the leaues be long, narrow, whitiſh, ſoft, and woolly, like the other of his kinde: the floures be round like buttons, growing very many together at the top of the ſtalkes, but nothing ſo yellow as Mouſe-eare, which turne into downe, and are caried away with the winde.

10 *Filago, ſiue Herba impia.*
Herbe impious, or wicked Cudweed.

11 *Leontopodium, ſiue Pes Leoninus.*
Lions Cudweed.

10 The tenth is like vnto the laſt before mentioned, in ſtalkes, leaues, and floures, but much larger, and for the moſt part thoſe floures which appeare firſt are the loweſt and baſeſt, and they are ouertopt by other floures which come on younger branches, and grow higher, as children ſeeking to ouergrow or ouertop their parents, (as many wicked children do) for which cauſe it hath beene called *Herba impia*, that is, the wicked Herbe, or Herbe Impious.

11 The eleuenth plant comprehended vnder the title of *Gnaphalium*, (being without doubt a kinde thereof, as may appeare by the ſhape of his floures and ſtalks, couered ouer with a ſoft wool like vnto the other kindes of Cotton-weed) is an handfull high or thereabouts, beſet with leaues like

‡ 12 *Leontopodium parvum.*
Small Lyons Cudweed.

‡ 13 *Gnaphalium oblongo folio.*
Long leaued Cudweed.

‡ 14 *Gnaphalium minus latiore folio.*
Small broad leaued Cudweed.

like *Gnaphalium Anglicum*, but ſomewhat broader. At the top of the ſtalke groweth a floure of a blackiſh brown violet colour, beſet about with rough and woolly hairie leaues, which make the whole floure to reſemble the rough haired foot of a Lyon, of a Hare, or a Beare, or rather in mine opinionof a rough footed Doue. The heads of theſe floures when they are ſpred abroad carry a greater circumference than is required in ſo ſmall a plant; and when the floure is faded, the ſeed is wrapped in ſuch a deale of wooll that it is ſcarſely to be found out.

12 This ſmall kinde of *Leontopodium* being likewiſe a kind of Cotton-weed, neither by *Dioſcorides* or any other antient writer once remembred, hath one ſingle ſtalke nine inches in height, and the leaues of *Gnaphalium montanum*; which leaues and ſtalkes are white, with a thicke hoary woollineſſe, bearing at the top pale yellow floures like *Gnaphalium montanum*: the root is ſlender and wooddy.

‡ 13 This, which *Cluſius* calls *Gnaphalium Plateau* 2. hath ſmall ſtalkes ſome handfull high or ſomewhat more, of which

ſome ſtand vpright, others lie along vpon the ground, being round, hairy, and vnorderly ſet with ſoft hoary leaues ingirting their ſtalkes at their ſetting on, and ſharpe pointed at their vpper ends. The tops of the ſtalkes carry many whitiſh heads full of a yellowiſh downe: the root is thicke and blackiſh, with ſome fibres.

14 This ſends vp one ſtalke parted into ſeuerall branches ſet here and there with broad ſoft and hoarie leaues, and at the diuiſion of the branches and amongſt the leaues grow ſeuen or eight little heads thicke thruſt together, being of a grayiſh yellow colour, and full of much downe: the root is vnprofitable, and periſhes as ſoone as it hath perfected his ſeed. *Cluſius* calls this *Gnaphalium Plateau* 3. he hauing as it ſeemes receiued them both from his friend *Iaques Plateau*. ‡

¶ *The Place.*

The firſt groweth in the darke woods of Hampſted, and in the woods neere vnto Deptford by London. The ſecond groweth vpon dry ſandy bankes. The third groweth at a place called Merezey, ſix miles from Colcheſter, neere vnto the ſea ſide. ‡ I alſo had it ſent me from my worſhipfull friend Mr. *Thomas Glynn*, who gathered it vpon the ſea coaſt of Wales. ‡

The reſt grow vpon mountaines, hilly grounds, and barren paſtures.

The kinde of *Gnaphalium* newly ſet forth (to wit *Americanum*) groweth naturally neere vnto the Mediterranean ſea, from whence it hath beene brought and planted in our Engliſh gardens. ‡ If this be true which our Author here affirmes, it might haue haue had a fitter (at leaſt a neerer) denomination than from America: yet *Bauhine* affirmes that it growes frequently in Braſill, and it is not improbable that both their aſſertions be true. ‡

¶ *The Time.*

They floure for the moſt part from Iune to the end of Auguſt.

¶ *The Names.*

Cotton-weed is called in Greeke *Gnaphalion*; and it is called *Gnaphalion*, becauſe men vſe the tender leaues of it in ſtead of bombaſte or Cotton, as *Paulus Ægineta* writeth. *Pliny* ſaith it is called *Chamæxylon*, as though he ſhould ſay Dwarfe Cotton; for it hath a ſoft and white cotton like vnto bombaſte: whereupon alſo it was called of diuers *Tomentitia*, and *Cotonaria*: of others, *Centunculus*, *Centuncularis*, and *Albinum*; which word is found among the baſtard names: but the later word, by reaſon of the white colour, doth reaſonably well agree with it. It is alſo called *Bombax*, *Humilis filago*, and *Herba Impia*, becauſe the yonger, or thoſe floures that ſpring vp later, are higher, and ouertop thoſe that come firſt, as many wicked children do vnto their parents, as before touched in the deſcription: in Engliſh, Cotton-weed, Cud-weed, Chaffe-weed, and petty Cotton.

¶ *The Nature.*

Theſe herbes be of an aſtringent or binding and drying qualitie.

¶ *The Vertues.*

A *Gnaphalium* boyled in ſtrong lee cleanſeth the haire from nits and lice: alſo the herbe being laid in ward-robes and preſſes keepeth apparell from moths.

B The ſame boyled in wine and drunken, killeth wormes and bringeth them forth, and preuaileth againſt the bitings and ſtingings of venomous beaſts.

C The fume or ſmoke of the herbe dried, and taken with a funnell, being burned therein, and receiued in ſuch manner as we vſe to take the fume of Tabaco, that is, with a crooked pipe made for the ſame purpoſe by the Potter, preuaileth againſt the cough of the lungs, the great ache or paine of the head, and clenſeth the breſt and inward parts.

† The figure that was formerly in the ſeuenth place ſhould haue beene in the eleuenth; and that in the eleuenth in the ſeuenth.

Chap. 206.

Of Golden Moth-wort, or Cudweed.

¶ *The Deſcription.*

1 Golden Moth-wort bringeth forth ſlender ſtalkes ſomewhat hard and wooddy, diuided into diuers ſmall branches; whereupon do grow leaues ſomewhat rough, and of a white colour, very much iagged like Southernwood. The floures ſtand on the tops of the ſtalkes, ioyned together in tufts, of a yellow colour glittering like gold, in forme reſembling the ſcaly floures of Tanſie, or the middle button of the floures of Camomil; which being gathred before they be ripe or withered, remaine beautifull long time after, as my ſelfe did ſee in the hands of Mr. *Wade*, one of the Clerks of her Maieſties Counſell, which were ſent him among other things from

from Padua in Italy. For which cauſe of long laſting, the images and carued gods were wont to weare garlands thereof: whereupon ſome haue called it Gods floure. For which purpoſe *Ptolomy* King of Egypt did moſt diligently obſerue them, as *Pliny* writeth.

1 *Elyochryſon, ſiue Coma aurea.*
Golden Moth-wort.

¶ *The Place.*

It growes in moſt vntilled places of Italy and Spaine, in medowes where the ſoile is barren, and about the banks of riuers; it is a ſtranger in England.

¶ *The Time.*

It floures in Auguſt and September: notwithſtanding *Theophraſtus* and *Pliny* reckon it among the floures of the Spring.

¶ *The Names.*

Golden Moth-wort is called of *Dioſcorides Elichryſon*: *Pliny* and *Theophraſtus* call it *Helichryſon*: *Gaza* tranſlates it *Aurelia*: in Engliſh, Gold-floure, Golden Moth-wort.

¶ *The Temperature.*

It is (ſaith *Galen*) of power to cut and make thinne.

¶ *The Vertues.*

Dioſcorides teacheth, that the tops thereof A
drunke in wine are good for them that can hardly make water; againſt ſtingings of Serpents, paines of the huckle bones: and taken in ſweet wine it diſſolueth congealed bloud.

The branches and leaues laid amongſt B
cloathes keepeth them from moths, whereupon it hath beene called of ſome Moth-weed, or Mothwort.

† Here formerly were two figures and deſcriptions of the ſame Plant.

CHAP. 207. *Of Golden Floure-Gentle.*

¶ *The Deſcription.*

1 THis yellow Euerlaſting or Floure-Gentle, called of the later Herbariſts Yellow Stœcas, is a plant that hath ſtalkes of a ſpan long, and ſlender, whereupon do grow narrow leaues white and downie, as are alſo the ſtalks. The floures ſtand on the tops of the ſtalks, conſiſting of a ſcattered or diſordered ſcaly tuft, of a reaſonable good ſmell, of a bright yellow colour; which being gathered before they be ripe, do keep their colour and beauty a long time without withering, as do moſt of the Cottonweeds or Cudweeds, whereof this is a kinde. The root is blacke and ſlender. ‡ There is ſome varietie in the heads of this plant, for they are ſometimes very large and longiſh, as *Camerarius* notes in his Epitome of *Matthiolus*; otherwhiles they are very compact and round, and of the bigneſſe of the ordinarie.

2 This growes to ſome foot or more high, and hath rough downie leaues like the former, but broader: the floures are longer, but of the ſame yellow colour and long continuance as thoſe of the laſt deſcribed. This varies ſomthing in the bredth and length of the leaues, whence *Tabernamontanus* gaue three figures thereof, and therein was followed by our Author, as you ſhall finde more particularly ſpecified at the end of the chapter. ‡

3 About Nemauſium and Montpelier there growes another kinde of *Chryſocome*, or as *Lobel* termes it, *Stœchas Citrina altera*, but that as this plant is in all points like, ſo in all points it is leſſer and ſlenderer, blacker, and not of ſuch beauty as the former, growing more neere vnto an aſh colour, conſiſting of many ſmall twigs a foot long. The root is leſſer, and hath fewer ſtrings annexed thereto; and it is ſeldome found but in the cliffes and crags, among rubbiſh, and on walls of cities. This plant is browne, without ſent or ſauor like the other: euery branch hath his own bunch of floures comming forth of a ſcaly or round head, but not a number heaped together, as in the firſt kinde. It proſpereth well in our London Gardens.

† 1 *Stœchas Citrina, ſiue Amaranthus luteus.*
Golden Stœchas, or Goldilockes.

† 2 *Amaranthus luteus latifolius.*
Broad leaued Goldilockes.

† 3 *Chryſocome capitulis conglobatis.*
Round headed Goldilockes.

† 4 *Amaranthus luteus flore oblongo.*
Golden Cudweed.

4 There is a kinde hereof beeing a very rare plant, and as rare to be found where it naturally groweth, which is in the woods among the Scarlet-Okes betweene Sommieres and Mountpellier. It is a fine and beautifull plant, in ſhew paſſing the laſt deſcribed *Stœchas Citrina altera*: but the leaues of this kinde are broad, and ſomewhat hoarie, as is all the reſt of the whole plant; the ſtalke a foot long, and beareth the very floures of *Stœchas Citrina altera*, but bigger and longer, and ſomewhat like the floures of *Lactuca agreſtis*: the root is like the former, without any manifeſt ſmel, little knowne, hard to finde, whoſe faculties be yet vnknowne.

† 5 This

† 5 *Heliochryſos ſylueſtris.*
Wilde Goldylockes.

† 5 This is a wilde kinde (which *Lobel* ſetteth forth) that here may be inſerted, called *Eliochryſos ſylueſtris*. The woolly or ſlockey leafe of this plant reſembleth *Gnaphalium vulgare*, but that it is ſomewhat broader in the middle: the floures grow cluſtering together vpon the tops of the branches, of a yellow colour, and almoſt like thoſe of Maudline: the roots are blacke and wooddie.

¶ *The Place.*

The firſt mentioned growes in Italy, and other hot countries: and the ſecond growes in rough and grauelly places almoſt euery where neere vnto the Rhene, eſpecially between Spires and Wormes.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

Golden floure is called in Latine *Coma aurea*, of his golden locks or beautifull buſh, and alſo *Tineraria*: in ſhops, *Stœchas citrina, Amaranthus luteus, Fuchſij, & Tragi*: of ſome, *Linaria aurea*, but not truely: in Greeke, *Chryſocome*: in Dutch, **Reynbloemen**, and **Motten crupt**: in Italian, *Amaranthо Giallo*: in Engliſh, Gold-floure, Gods floure, Goldilockes, and Golden *Stœchas*.

¶ *The Temperature and Vertues.*

The floures of Golden Stœchados A boiled in wine and drunke, expell worms out of the bellie; and being boiled in Lee made of ſtrong aſhes doth kill lice and nits, if they bee bathed therewith. The other faculties are refered to the former plants mentioned in the laſt chapter.

† There were formerly the ſame number of figures as are now in this Chapter, but no way agreeing with the deſcriptions; the firſt was of *Millefolium Luteum* being the *Helichryſum Italicum* of *Matthiolus*: The ſecond was of the *Amaranthus primus* of *Tragus*, which ſtil keeps the 2 place: and the 4. & 5. were onely varieties of this, according to *Bauhine*: but if they be not varieties, but made to expreſſe the 2. figures of the *Aduerſar.* which we here giue, as I conſture they were, then ſhould the fourth haue beene put in the third place, and the fift in the fourth, & the third ſhould haue been put in the fifth, as you may ſee now it is.

CHAP. 208. *Of Coſtmarie and Maudelein.*

¶ *The Deſcription.*

1 COſtmary groweth vp with round hard ſtalkes two foot high, bearing long broad leaues finely nicked in the edges, of an ouerworn whitiſh green colour. The tuft or bundle is of a golden colour, conſiſting of many little floures like cluſters, ioyned together in a rundle after the manner of golden Stœchados. The root is of a wooddy ſubſtance, by nature verie durable, not without a multitude of little ſtrings hanging thereat. The whole plant is of a pleaſant ſmell, ſauour, or taſte.

2 Maudleine is ſomewhat like to Coſtmary (whereof it is a kinde) in colour, ſmell, taſte, and in the golden floures, ſet vpon the tops of the ſtalks in round cluſters. It bringeth forth a number of ſtalkes, ſlender, and round. The leaues are narrow, long, indented, and deepely cut about the edges. The cluſter of floures is leſſer than that of Coſtmarie, but of a better ſmell, and yellower colour. The roots are long laſting and many.

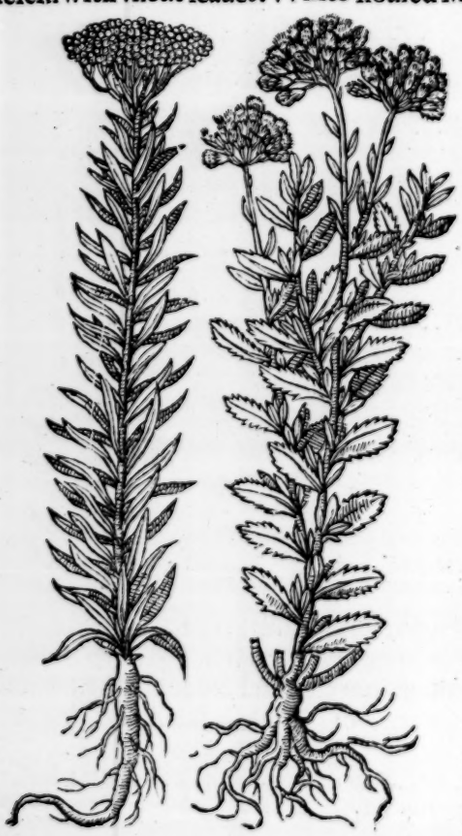
‡ 3 There is another kinde of *Balſamita minor*, or *Ageratum*, which hath leaues leſſer and narrower than the former, and thoſe not ſnipt about the edges: the vmbel or tuft of floures is yellow

1 *Balſamita mas.*
Coſtmarie.

2 *Balſamita fœmina, ſive Ageratum,*
Maudelein.

‡ 3 *Ageratum folijs non ſerratis.* Maudelein with vncut leaues.

4 *Ageratum floribus albis.* White floured Maudlein.



yellow like as the former, and you may call each of theſe laſt deſcribed at your pleaſure, either *Ageratum*, or *Balſamita:* the Græcians call it Ἀγήρατος, which is in Latine *Ageratum, vel non ſeneſcens*, called in ſhops (though vntruly) *Eupatorium Meſuæ*. The floures are of a beautifull and ſeemely ſhew, which will not loſe their excellencie of grace in growing, vntill they be very old, and therefore called *Ageratum*, or *Non ſeneſcens*, as before; and are like in tuft to *Eliochryſon*, but of a white colour; and this is thought to be the true and right *Ageratum* of *Dioſcorides*, although therehath been great, controuerſie which ſhould be the true plant.

‡ 4 This differeth not from the common Maudelein, but in the colour of the floures, which are white, when as thoſe of the ordinarie ſort are yellow. ‡

¶ *The Place.*

They grow euery where in gardens, and are cheriſhed for their ſweet floures and leaues.

¶ *The Time.*

They bring forth their tufts of yellow floures in the Sommer moneths.

¶ *The*

¶ *The Names.*

Coſtmarie is called in Latine *Balſamita maior* or *mas*: of ſome, *Coſtus hortorum*: it is alſo called *Mentha Græca*: and *Saracenica Officinarum*: of *Tragus*, *Aliſma*: of *Matthiolus*, *Herba Græca*: of others, *Saluia Romana*, and *Herba laſſulata*: of ſome, *Herba D. Mariæ*: in Engliſh, Coſtmarie, and Ale-coaſt: in High Dutch, **Frauwenkraut**: in low Dutch, **Heydniſch windkraut**: in French, *Coq*.

Maudlein is without doubt a kinde of Coſtmarie, called of the Italians *Herba Giulia*: of *Valerius Cordus*, *Mentha Corymbifera minor*: and *Eupatorium Meſue*: It is iudged to be *Dioſcorides* his *Ageratum*, and it is the *Coſtus minor hortenſis* of *Geſner*: we call it in Engliſh Maudlein.

¶ *The Nature.*

They are hot and drie in the ſecond degree.

¶ *The Vertues.*

Theſe plants are very effectuall, eſpecially Maudlein, taken either inwardly or elſe outwardly to prouoke vrine, and the fume thereof doth the ſame, and mollifieth the hardneſſe of the Matrix. A

Coſtmarie is put into Ale to ſteepe, as alſo into the barrels and Stands amongſt thoſe herbes wherewith they doe make Sage Ale; which drinke is very profitable for the diſeaſes before ſpoken of. B

The leaues of Maudleine and Adders tongue ſtamped and boiled in Oile Oliue, adding thereto a little wax, roſin, and a little turpentine, maketh an excellent healing vnguent, or incarnatiue ſalue to raiſe or bring vp fleſh from a deepe and hollow wound or vlcer, whereof I haue had long experience. C

The Conſerue made with the leaues of Coſtmarie and Sugar, doth warme and drie the braine, and openeth the ſtoppings of the ſame: ſtoppeth all Catarrhes, rheumes and diſtillations, taken in the quantitie of a beane. D

The leaues of Coſtmarie boiled in wine and drunken, cureth the griping paine of the bellie, the guts and bowels, and cureth the bloudie flix. E

It is good for them that haue the greene ſickneſſe, or the dropſie, eſpecially in the beginning; and it helpeth all that haue a weake and cold liuer. F

The ſeed expelleth all manner of wormes out of the belly, as wormſeed doth. G

Chap. 209. *Of Tanſie.*

¶ *The Deſcription.*

1 Tanſie groweth vp with many ſtalkes, bearing on the tops of them certaine cluſtered tufts, with floures like the round buttons of yellow Romane Cammomill, or Feuerfew (without any leaues paled about them) as yellow as gold. The leaues be long, made as it were of a great many ſet together vpon one ſtalke, like thoſe of Agrimony, or rather wild Tanſie, very like to the female Ferne, but ſofter and leſſer, and euery one of them ſlaſhed in the edges as are the leaues of Ferne. The root is tough and of a wooddie ſubſtance. The whole plant is bitter in taſte, and of a ſtrong ſmell, but yet pleaſant.

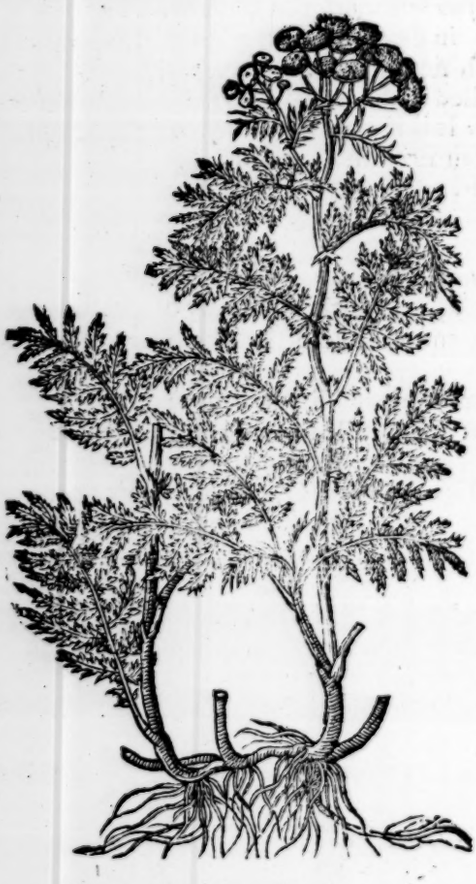
2 The double Engliſh Tanſie hath leaues infinitly iagged and nicked, and curled withall, like vnto a plume of feathers: it is altogether like vnto the other, both in ſmell and taſte, as alſo in floures, but more pleaſantly ſmelling by many degrees, wherein eſpecially conſiſteth the difference.

3 The third kinde of Tanſie hath leaues, roots, ſtalkes, and branches like the other, and differeth from them, in that this hath no ſmell or ſauour at all, and the floures are like the common ſingle Fetherfew.

‡ 4 *Cluſius* hath deſcribed another bigger kind of vnſauorie Tanſie, whoſe figure here we giue you; it grows ſome cubit and halfe high, with creſted ſtalks, hauing leaues ſet vpon ſomwhat longer ſtalks than thoſe of the laſt deſcribed, otherwiſe much like them: the floures are much larger, being of the bigneſſe of the great Daiſie, and of the ſame colour: the ſeede is long and blacke: The root is of the thicknes of ones finger, running vpon the ſurface of the ground, & putting forth ſome fibres, and it laſts diuers yeares, ſo that the plant may be encreaſed thereby. This floures in May and Iune, and grows wilde vpon diuers hills in Hungary and Auſtria. ‡

5 The

1 *Tanacetum.*
Tanſie.

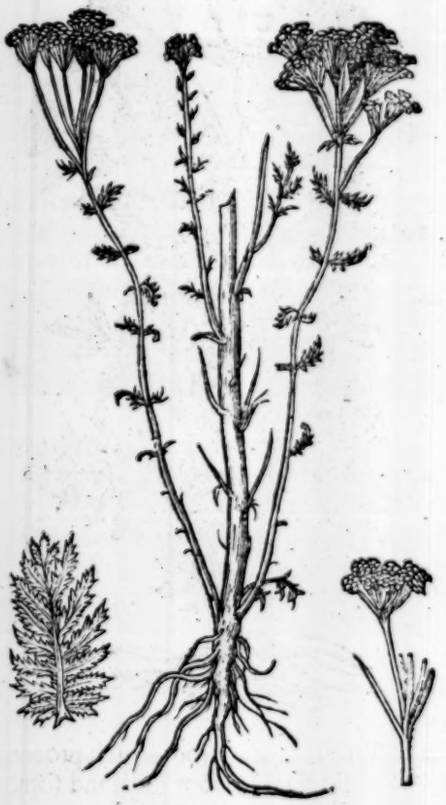


2 *Tanacetum criſpum Anglicum.*
Double Engliſh Tanſie.

3 *Tanacetum non odorum.*
Vnſauorie Tanſie.

‡ 4 *Tanacetum inodorum maius.*
Great vnſauorie Tanſie.

† 4 *Tanacetum minus album.*
Small white Tanſie.



5 The fifth kinde of Tanſie hath broad leaues, much iagged and wel cut, like the leaues of Fetherfew, but ſmaller, and more deeply cut. The ſtalke is ſmall, a foot long, whereupon doe grow little tufts of little white floures, like the tuft of Milfoile or Yarrow. The herbe is in ſmell and ſauour like the common Tanſie, but not altogether ſo ſtrong.

¶ *The Place.*

The firſt groweth wilde in fields as well as in gardens: the others grow in my garden.

¶ *The Time.*

They floure in Iuly and Auguſt.

¶ *The Names.*

The firſt is called Tanſie; the ſecond double Tanſie, the third vnſauory Tanſie, the laſt white Tanſie: in Latine, *Tanacetum*, and *Athanaſia*, as though it were immortall: becauſe the floures do not ſpeedily wither: of ſome, *Artemiſia*, but vntruly.

¶ *The Nature.*

The Tanſies which ſmel ſweet are hot in the ſecond degree, and dry in the third. That without ſmell is hot and drie, and of a meane temperature.

¶ *The Vertues.*

In the Spring time are made with the leaues hereof newly ſprung vp, and with egs, cakes or tanſies, which be pleaſant in taſte, and good for the ſtomacke. For if any bad humours cleaue thereunto, it doth perfectly concoct them, and ſcowre them downewards. The root preſerued with hony or ſugar, is an eſpecial thing againſt the gout, if euery day for a certaine ſpace, a reaſonable quantitie thereof be eaten faſting. A

The ſeed of Tanſie is a ſingular and approoued medicine againſt Wormes, for in what ſort ſoeuer it be taken, it killeth and driueth them forth. B

The ſame pound, and mixed with oile Oliue, is very good againſt the paine and ſhrinking of the ſinewes. C

Alſo being drunke with wine, it is good againſt the paine of the bladder, and when a man cannot piſſe but by drops. D

† The figure that was formerly in the fourth place was onely the varietie of the ordinary Tanſie, hauing a white floure, but that which agreed with the deſcription was pag. 915. vnder the title of *Achillea, ſiue Milleſolium nobile.*

CHAP. 210. *Of Fetherfew.*

¶ *The Deſcription.*

1 FEuerfew bringeth forth many little round ſtalkes, diuided into certaine branches. The leaues are tender, diuerſly torne and iagged, and nickt on the edges like the firſt and nethermoſt leaues of Coriander, but greater. The floures ſtand on the tops of the branches, with a ſmall pale of white leaues, ſet round about a yellow ball or button, like the wilde field Daiſie. The root is hard and tough: the whole plant is of a light whitiſh greene colour, of a ſtrong ſmell and bitter taſte

2 The ſecond kinde of Feuerfew, *Matricaria*, or *Parthenium*, differeth from the former, in that it hath double floures; otherwiſe in ſmell, leaues, and branches, it is all one with the common Feuerfew.

3 There is a third ſort called Mountaine Feuerfew, of *Carolus Cluſius* his deſcription, that hath ſmall

1 *Matricaria.*
Feuerfew.

2 *Matricaria duplici flore.*
Double Feuerfew.

‡ 3 *Matricaria Alpina Cluſij.*
Mountaine Feuerfew.

ſmall and fibrous roots; from which proceed ſlender woodie ſtalks, a foot high and ſomewhat more, beſet or garniſhed about with leaues like Camomill, deepely iagged or cut, of the ſauour or ſmell of Feuerfew, but not ſo ſtrong; in taſte hot, but not vnpleaſant. At the top of the ſtalks there come forth ſmal white floures not like vnto the firſt, but rather like vnto *Abſynthium album*, or White Wormewood.

4 I haue growing in my Garden another ſort, like vnto the firſt kinde, but of a moſt pleaſant ſweet ſauour, in reſpect of any of the reſt. ‡ This ſeemes to be the *Matricaria altera ex Ilua*, mentioned by *Camerarius* in his *Hortus medicus*. ‡

¶ *The Place.*

The common ſingle Feuerfew groweth in hedges, gardens, and about old wals; it ioyeth to grow among rubbiſh. There is oftentimes found when it is digged vp a little cole vnder the ſtrings of the root, and neuer without it, whereof *Cardane* in his booke of Subtilties ſetteth down diuers vaine and trifling things.

¶ *The Time.*

They floure for the moſt part all the Sommer long.

¶ *The Names.*

Feuerfew is called in Greeke of *Dioſcorides* μητρόπυρος: of *Galen*, and *Paulus* one of his ſect, ἀγριόπυρος: in Latine, *Parthenium*, *Matricaria*, and *Febrifu-*

Febrifuga, of *Fuchſius*, *Artemiſia Tenuifolia*: in Italian, *Amarella*: in Dutch, Moedercruyt: in French, *Eſpargoute*: in Engliſh, Fedderfew and Feuerfew, taken from his force of driuing away Agues.

¶ *The Temperature.*

Feuerfew doth manifeſtly heat, it is hot in the third degree, and drie in the ſecond; it cleanſeth, purgeth, or ſcoureth, openeth and fully performeth all that bitter things can do.

¶ *The Vertues.*

It is a great remedie againſt the diſeaſes of the matrix; it procureth womens ſicknes with ſpeed; A
it bringeth forth the after birth and the dead childe, whether it bee drunke in a decoction, or boiled in a bath and the woman ſit ouer it; or the herbes ſodden and applied to the priuie part, in manner of a cataplaſme or pultis.

Dioſcorides alſo teacheth, that it is profitably applied to Saint Anthonies fire, to all hot inflam- B
mations, and hot ſwellings, if it be laid vnto, both leaues and floures.

The ſame Author affirmeth, that the pouder of Feuerfew drunke with Oxymell, or ſyrup of Vi- C
neger, or wine for want of the others, draweth away flegme and melancholy, and is good for them that are purſie, and haue their lungs ſtuffed with flegme; and is profitable likewiſe to be drunke againſt the ſtone, as the ſame Author ſaith.

Feuerfew dried and made into pouder, and two drams of it taken with honie or ſweet wine, pur- D
geth by ſiege melancholy and flegme; wherefore it is very good for them that are giddie in the head, or which haue the turning called *Vertigo*, that is a ſwimming and turning in the head. Alſo it is good for ſuch as be melancholike, ſad, penſiue, and without ſpeech.

The herbe is good againſt the ſuffocation of the mother, that is, the hardneſſe and ſtopping of E
the ſame, being boiled in wine, and applied to the place.

The decoction of the ſame is good for women to ſit ouer, for the purpoſes aforeſaid. F

It is vſed both in drinks, and bound to the wreſts with bay ſalt, and the pouder of glaſſe ſtamped G
together, as a moſt ſingular experiment againſt the ague.

CHAP. 211. *Of Poley, or Pellamountaine.*

1 *Polium montanum album.*
White Poley mountaine.

2 *Polium montanum luteum.*
Yellow Poley mountaine.

¶ *The Deſcription.*

1 THe firſt kinde of *Polium*, or in Engliſh Poley of the mountain, is a little tender and ſweet ſmelling herbe, verie hoarie, whereupon it tooke his name: for it is not onely hoary in part, but his hoarie flockineſſe poſſeſſeth the whole plant, tufts and all, being no leſſe hoarie than *Gnaphalium*, eſpecially where it groweth neere the Sea at the bending of the hils, or neere the ſandie ſhores of the Mediterranean Sea: from his wooddie and ſomewhat threddie root ſhooteth forth ſtraight from the earth a number of ſmall round ſtalkes nine inches long, and by certaine diſtances from the ſtalke proceed ſomewhat long leaues like *Gnaphalium*, which haue light nickes about the edges, that ſtand one againſt another, incloſing the ſtalke: in the toppe of the ſtalkes ſtand ſpokie tufts of floures, white of colour like *Serpillum*. This plant is ſtronger of ſent or ſauour than any of the reſt following, which ſent is ſomewhat ſharp, and affecting the noſe with his ſweetneſſe.

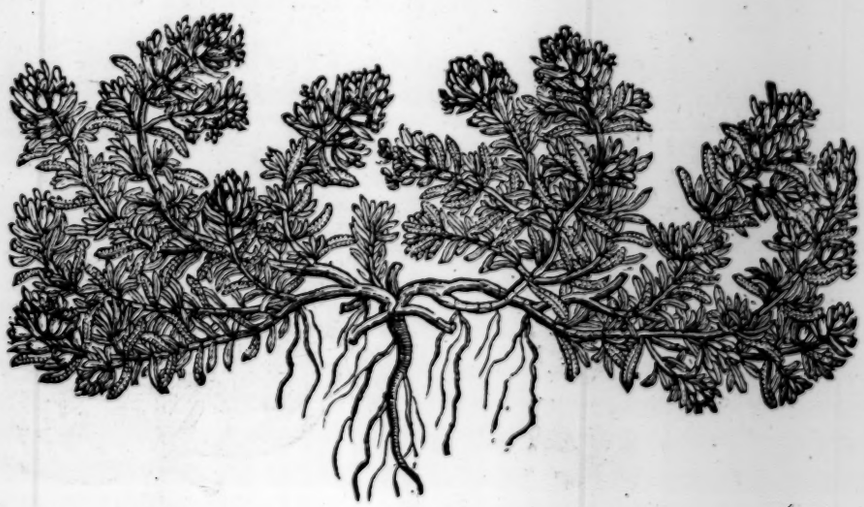
2 The tuftes of the ſecond kinde of *Polium* are longer than the tufres or floures of the laſt beforementioned, and they are of a yellow colour; the leaues alſo are broader, otherwiſe they are very like.

3 From the wooddie rootes of this third kinde of *Polium* proceed a great number of ſhootes like vnto the laſt rehearſed, lying flat vpright vpon the ground, whoſe ſlender branches take hold vpon the vpper part of the earth where they creepe. The floures are like the other, but of a purple colour.

4 The laſt kinde of *Polium*, and of all the reſt the ſmalleſt, is of an indifferent good ſmell, in all points like vnto the common *Polium*, but that it is foure times leſſer, hauing the leaues not ſnipt, & the floures white.

‡ 5 This ſends vp many branches from one root like to thoſe of the firſt deſcribed, but ſhorter and more ſhrubbie, lying partly vpon the ground; the leaues grow by couples at certain ſpaces, ſomewhat like, but leſſer than thoſe of Roſemarie or Lauander, greene aboue, and whitiſh beneath, not ſnipt about their edges; their taſte is bitter, and ſmell ſomewhat pleaſant: the floures grow plentifully vpon the tops of the branches, white of colour, and in ſhape not vnlike thoſe of the other Poleyes: they grow on a bunch together, and not Spike faſhion: the ſeed is blackiſh and contained in ſmall veſſels: the root is hard and wooddie, with many fibres. *Cluſius* calls this *Polium* 7. *albo flore*. It is the *Polium alterum* of *Matthiolus*, and *Polium recentiorum fœmina Lavandulæ folio* of *Lobel*. I here giue you (as *Cluſius* alſo hath done) two figures to make one good one: the former ſhews the floures and their manner of growing; the other, the ſeede veſſels, and the leaues growing by couples, together with a little better expreſſion of the root. ‡

3 *Polium montanum purpureum.* Purple Poley.



¶ *The Place.*

Theſe plants do grow naturally vpon the mountaines of France, Italie, Spaine, and other hot regions. They are ſtrangers in England, notwithſtanding I haue plants of that Poley with yellow floures by the gift of *Lobel*.

¶ *The Time.*

They floure from the end of May, to the beginning of Auguſt.

¶ *The*

4 *Polium montanum minimum.*
Creeping Poley.

‡ 5 *Polium Lavandulæfolio, flore albo.*
Lavander leaued Poley.

Another figure of the Lauander leaued Poley.

¶ *The Names.*

Poley mountaine is called in Greeke πόλιον, of his hoarineſſe, and in Latine alſo *Polium*. Diuers ſuſpect that *Polium* is *Leucas*, and that *Dioſcorides* hath twiſe intreated of that herbe, vnder diuers names; the kindes, the occaſion of the name, and likewiſe the faculties do agree. There bee two of the *Leucades*, one ὀρεινὸν: that is of the mountaine: the other, πεδινὸν, which is that with the broader leafe: it is called *Leucas* of the whitiſh colour, and *Polion* of the hoarineſſe, becauſe it ſeemeth like to a mans hoarie head; for whatſoeuer waxeth hoarie, is ſaid to be white.

¶ *The Temperature.*

Poley is of temperature drie in the third degree, and hot in the end of the ſecond.

¶ *The Vertues.*

Dioſcorides ſaith, it is a remedie for them that haue the dropſie, the yellow iaundice, and that are troubled with the ſpleene. A

It prouoketh vrine, & is put into Mithridate, treacle, and counterpoiſons. B

It profiteth much againſt the bitings of venomous beaſts, and driueth away all venomous beaſts from the place where it is ſtrewed or burnt. C

The ſame drunke with vineger, is good for the D

the diſeaſes of the milt and ſpleene; it troubleth the ſtomacke, and afflicteth the head, and prouoketh the looſeneſſe of the bellie.

Chap. 212. *Of Germander.*

¶ *The Kindes.*

THe old writers haue ſet downe no certaine kinds of Germander, yet we haue thought it good, and not without cauſe, to intreat of mo ſorts than haue been obſerued of all, diuiding thoſe vnder the title of *Teucrium* from *Chamædryes*: although they are both of one kind, but yet differing very notably.

¶ *The Deſcription.*

3 THe firſt Germander groweth lowe, with very many branches lying vpon the ground, tough, hard, and wooddie, ſpreading it ſelfe here and there: whereupon are placed ſmall leaues ſnipt about the edges like the teeth of a ſaw, reſembling the ſhape of an oken leafe. The floures are of a purple colour, very ſmall, ſtanding cloſe to the leaues toward the top of the branches. The ſeed is little and blacke. The root ſlender and full of ſtrings, creeping, and alwaies ſpreading within the ground, whereby it greatly increaſeth. ‡ This is ſometimes found with bigger leaues, otherwhiles with leſſe; alſo the floure is ſometimes white, and otherwhiles red in the ſame plant, whence *Tabernam.* gaue two figures, and our Authour two figures and deſcriptions, whereof I haue omitted the later, and put the two titles into one. ‡

2 The ſecond Germander riſeth vp with a little ſtraight ſtalk a ſpan long, and ſometimes longer, wooddie and hard like vnto a little ſhrub: it is afterwards diuided into very many little ſmall branches. The leaues are indented and nicked about the edges, leſſer than the leaues of the former, great creeping Germander: the floures likewiſe ſtand neere to the leaues, and on the vpper parts of the ſprigs, of colour ſometimes purple, and oftentimes tending to blewneſſe: the roote is diuerſly diſperſed with many ſtrings.

1 *Chamædrys maior latifolia.*
Great broad leaued Germander.

2 *Chamædrys minor.*
Small Germander.

3 Wilde

3 *Chamædrys ſylueſtris.*
Wilde Germander.

3 Wilde Germander hath little ſtalkes, weake and feeble, edged or cornered, ſomewhat hairie, and ſet as it were with ioints; about the which by certaine diſtances there come forth at each ioint two leaues ſomething broad, nicked in the edges, and ſomething greater than the leaues of creeping Germander, and ſofter. The floures be of a gallant blew colour, made of foure ſmall leaues a peece, ſtanding orderly on the tops of the tender ſpriggie ſpraies; after which come in place little huskes or ſeede veſſels. The root is ſmall and threddie.

¶ *The Place.*

Theſe plants do grow in rocky and rough grounds, and in gardens they do eaſily proſper.

The wilde Germander groweth in manie places about London in Medowes and fertil fields, and in euery place whereſoeuer I haue trauelled in England.

¶ *The Time.*

They floure and flouriſh from the end of May, to the later end of Auguſt.

¶ *The Names.*

Garden Germander is called in Greeke, χαμαίδρυς, *Chamædrys*: of ſome, *Triſſago*, & *Trixago*, and likewiſe *Quercula minor*; notwithſtanding moſt of theſe names do more properly belong to *Scordium*, or water Germander: in Italian, *Querciuola*: in Engliſh, Germander, or Engliſh Treacle: in French, *Germandre*. Before creeping Germander was knowne, this wilde kinde bare the name of Germander amongſt the Apothecaries, and was vſed for the right Germander in the compoſitions of Medicines: but after the former were brought to light, this began to be named *Sylueſtris*, and *Spuria Chamædrys*: that is wilde and baſtard Germander: of ſome, *Teucrium pratenſe*, and without errour; becauſe all the ſorts of plants comprehended vnder the title of *Teucrium*, are doubtleſſe kindes of Germander. Of ſome it hath been thought to be the plant that *Dioſcorides* called ἱερὰ βοτάνη, *Hierabotane*; that is to ſay, the Holie herbe, if ſo bee that the Holie herbe, and *Verbenaca*, or Veruaine, which is called in Greeke περιστερεών, be ſundrie herbes. *Dioſcorides* maketh them ſundrie herbes, deſcribing them apart, the one after the other: but other Authors, as *Paulus*, *Aetius*, and *Oribaſius*, make no mention of *Herba Sacra*, the Holie herbe, but onely of *Periſtereon*: and this ſame is found to be likewiſe called *Hierabotane*, or the Holie Herb, and therefore it is euident that it is one and the ſelfe ſame plant, called by diuers names: the which things conſidered, if they ſay ſo, and ſay truely, this wilde Germander cannot be *Hierabotane* at all, as diuers haue written and ſaid it to be.

¶ *The Temperature.*

Garden Germander is of thin parts, and hath a cutting facultie, it is hot and drie almoſt in the third degree, euen as *Galen* doth write of *Teucrium*, or wilde Germander.

The wilde Germander is likewiſe hot and drie, and is not altogether without force or power to open and clenſe: it may be counted among the number of them that do open the liuer and ſpleen.

¶ *The Vertues.*

Germander boiled in water and drunk, deliuereth the bodie from all obſtructions or ſtoppings, A diuideth and cutteth tough and clammie humors: being receiued as aforeſaid, it is good for them that haue the cough, and ſhortneſſe of breath, the ſtrangurie or ſtopping of vrine, and helpeth thoſe which are entring into a dropſie.

The leaues ſtamped with honie and ſtrained, and a drop at ſundrie times put into the eies, takes B away the web and hawe in the ſame, or any dimneſſe of ſight.

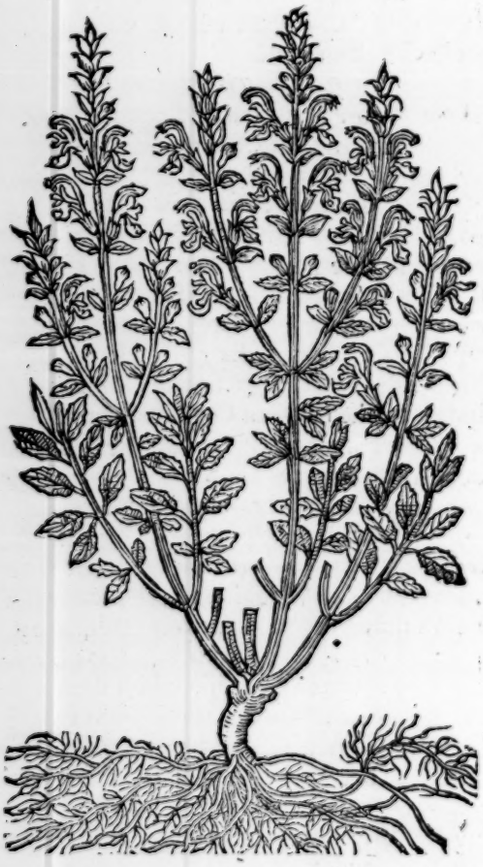
It prouoketh mightily the termes, being boiled in wine, and the decoction drunk; with a fomen- C tation or bath made alſo thereof, and the ſecret parts bathed therewith.

Chap. 213. *Of Tree Germander.*

¶ *The Deſcription.*

1 The firſt kinde of Tree Germander riſeth vp with a little ſtraight ſtalke a cubite high, wooddie and hard like vnto a ſmall wooddie ſhrubbe. The ſtalke diuideth it ſelfe from the bottome vnto the toppe into diuers branches, whereon are ſet indented leaues nicked about the edges, in ſhape not much vnlike the leafe of the common Germander. The floures grow among the leaues of a purple colour. The root is wooddie, as is all the reſt of the plant.

1 *Teucrium latifolium.*
Tree Germander with broad leaues.



2 *Teucrium Pannonicum.*
Hungarie Germander.

2 The Tree Germander of Hungarie hath many tough threddie roots, from which riſe vp diuers weake and feeble ſtalks, reeling this way and that way; whereupon are ſet together by couples, long leaues iagged in the edges, not vnlike thoſe of the vpright Fluellen: on the tops of the ſtalks ſtand the floures Spike faſhion, thicke thruſt together, of a purple colour tending towards blewneſſe.

‡ 3 This (which is the fourth of *Cluſius* deſcription) hath diuers ſtalkes ſome cubite high, foure ſquare, rough, and ſet at certaine ſpaces with leaues growing by couples like thoſe of the wilde Germander: the tops of the ſtalkes are diuided into ſundry branches, carrying long ſpokes of blew floures, conſiſting of foure leaues, whereof the vppermoſt leafe is the largeſt, and diſtinguiſhed with veines: after the floures are paſt follow ſuch flat ſeed veſſels as in Fluellen: the root is fibrous and liues long, ſending forth euery yeare new branches. ‡

4 This

‡ 3 *Teucrium maius Pannonicum.*
Great Auſtrian Germander.

‡ 4 *Teucrium petræum pumilum.*
Dwarfe Rocke Germander.

5 *Teucrium Bæticum.*
Spaniſh Tree Germander.

6 Teucrium Alpinum Ciſti flore.
Rough headed Tree Germander.

4 This Dwarfe Germander ſends vp ſtalkes ſome handfull high, round, not branched: the leaues grow vpon theſe ſtalkes by couples, thicke, ſhining, a little hairy and greene on their vpper ſides, and whitiſh below: the tops of the ſtalkes carry ſpoky tufts of floures, conſiſting of foure or fiue blewiſh leaues; which falling, there followes a ſeed-veſſell, as in the *Veronica's*. The root is knotty and fibrous, and growes ſo faſt amongſt the rockes that it cannot eaſily be got out. It floureth in Iuly. *Cuſius* deſcribes this by the name of *Teucrium 6. Pumilum*: and *Pona* ſets it forth by the name of *Veronica petræa ſemper virens*. ‡

5 This Spaniſh Germander riſeth vp oft times to the height of a man, in manner of a hedge buſh, with one ſtiffe ſtalke of the bigneſſe of a mans little finger, couered ouer with a whitiſh bark, diuided ſometimes into other branches, which are alwayes placed by couples one right againſt another, of an ouerworne hoarie colour; and vpon them are placed leaues not much vnlike the common Germander; the vpper parts whereof are of a grayiſh hoarie colour, and the lower of a deepe greene; of a bitter taſte, and ſomewhat crooked, turning and winding themſelues after the manner of a welt. The floures come forth from the boſome of the leaues, ſtanding vpon ſmall tender foot-ſtalkes of a white colour, without any helmet or hood on their tops, hauing in the middle many threddy ſtrings. The whole plant keepeth greene all the Winter long.

6 Among the reſt of the Tree Germanders this is not of leaſt beauty and account, hauing many weake and feeble branches trailing vpon the ground, of a darke reddiſh colour, hard and woody; at the bottome of which ſtalks come forth many long broad iagged leaues not vnlike the precedent, hoary vnderneath, and greene aboue, of a binding and drying taſte. The floures grow at the top of the ſtalkes, not vnlike to thoſe of *Ciſtus fœmina*, or Sage-roſe, and are white of colour, conſiſting of eight or nine leaues, in the middle whereof do grow many threddy chiues without ſmell or ſauour: which being paſt, there ſucceedeth a tuft of rough threddy or flocky matter, not vnlike to thoſe of the great Auens or *Pulſatilla*: the root is wooddy, and ſet with ſome few hairie ſtrings faſtned to the ſame.

¶ *The Place.*

Theſe plants do ioy in ſtony and rough mountaines and dry places, and ſuch as lie open to the Sunne and aire, and proſper well in gardens: and of the ſecond ſort I haue receiued one plant for my garden of M^r. *Garret* Apothecarie.

¶ *The Time.*

They floure, flouriſh, and ſeed when the other Germanders do.

¶ *The Names.*

Tree Germander is called in Greeke χαμαίδρυς, retaining the name of the former *Chamædrys*, and πίτυρον, according to the authoritie of *Dioſcorides* and *Pliny*: in Latine *Teucrium*: in Engliſh, Great Germander, vpright Germander, and Tree Germander.

¶ *The Temperature and Vertues.*

Their temperature and faculties are referred vnto the garden Germander, but they are not of ſuch force and working, wherefore they be not much vſed in phyſicke.

Chap. 214.

Of Water Germander, or Garlicke Germander.

¶ *The Deſcription.*

1 *Scordium* or water Germander hath ſquare hairie ſtalkes creeping by the ground, beſet with ſoft whitiſh crumpled leaues, nickt and ſnipt round about the edges like a Saw: among which grow ſmall purple floures like the floures of dead Nettle. The root is ſmall and threddy, creeping in the ground very deepely. The whole plant being bruiſed ſmelleth like Garlicke, whereof it tooke that name *Scordium*. ‡ This by reaſon of goodneſſe of ſoile varieth in the largeneſſe thereof, whence *Tabernamontanus* and our Author made a bigger and a leſſer thereof, but I haue omitted the later as ſuperfluous. ‡

¶ *The Place.*

Water Germander groweth neere to Oxenford, by Ruley, on both ſides of the water, and in a medow

medow by Abington called Nietford, by the relation of a learned Gentleman of S. *Iohns* in the ſaid towne of Oxenford, a diligent φιλοβοτανικὸς, my very good friend, called Mr. *Richard Slater*. Alſo it groweth in great plenty in the Iſle of Elie, and in a medow by Harwood in Lancaſhire, and diuers other places.

1 *Scordium.*
Water Germander.

¶ *The Time.*

The floures appeare in Iune and Iuly: it is beſt to gather the herbe in Auguſt: it periſheth not in Winter, but onely loſeth the ſtalkes, which come vp againe in Sommer: the root remaineth freſh all the yeare.

¶ *The Names.*

The Grecians call it σκόρδιον: the Latines do keepe that name *Scordium*: the Apothecaries haue no other name: It is called of ſome *Trixago Paluſtris*, *Quercula*, and alſo *Mithridatium*, of *Mithridates* the finder of it out. It tooke the name *Scordium* from the ſmel of Garlicke, which the Grecians call σκόροδον, and σκῶμον, of the ranckneſſe of the ſmell: in high-Dutch, **waſſer battenig**: in French, *Scordion*: in Italian, *Chalamandrina paluſtre*: in Engliſh, Scordium, Water Germander, and Garlicke Germander.

¶ *The Temperature.*

Water Germander is hot and dry: it hath a certaine bitter taſte, harſh and ſharpe, as *Galen* witneſſeth.

¶ *The Vertues.*

Water Germander cleanſeth the intrals, and likewiſe old vlcers, being mixed with honey according to art: it prouoketh vrine, and bringeth downe the monethly ſickeneſſe: it draweth out of the cheſt thicke flegme and rotten matter: it is good for an old cough, paine in the ſides which commeth of ſtopping and cold, and for burſtings and inward ruptures. A

The decoction made in wine and drunke, is good againſt the bitings of Serpents, and deadly poyſons; and is vſed in antidotes or counterpoyſons with good ſucceſſe. B

It is reported to mitigate the paine of the gout, being ſtamped and applied with a little vineger and water. C

Some affirme, that raw fleſh being laid among the leaues of Scordium, may be preſerued a long time from corruption. D

Being drunke with wine it openeth the ſtoppings of the liuer, the milt, kidnies, bladder, and matrix, prouoketh vrine, helpeth the ſtrangurie, that is, when a man cannot piſſe but by drops, and is a moſt ſingular cordiall to comfort and make merry the heart. E

The pouder of Scordion taken in the quantitie of two drams in meade or honied water, cureth and ſtoppeth the bloudy flix, and comforteth the ſtomacke. Of this Scordium is made a moſt ſingular medicine called *Diaſcordium*, which ſerueth very notably for all the purpoſes aforeſaid. F

The ſame medicine made with Scordium is giuen with very good ſucceſſe vnto children and aged people, that haue the ſmall pockes, meaſles, or the Purples, or any other peſtilent ſickneſſe whatſoeuer, euen the plague it ſelfe, giuen before the ſicknes haue vniuerſally poſſeſſed the whole body. G

CHAP.

Chap. 215. *Of Wood Sage, or Garlicke Sage.*

¶ *The Deſcription.*

THat which is called Wilde Sage hath ſtalkes foure ſquare, ſomewhat hairie, about which are leaues like thoſe of Sage, but ſhorter, broader, and ſofter: the floures grow vp all vpon one ſide of the ſtalke, open and forked as thoſe of dead Nettle, but leſſer, of a pale white colour: then grow the ſeeds foure together in one huske: the root is full of ſtrings. It is a plant that liueth but a yeare: it ſmelleth of garlicke when it is bruiſed, being a kinde of Garlicke Germander, as appeareth by the ſmell of garlicke wherewith it is poſſeſſed.

† *Scorodonia, ſiue Saluia agreſtis.*
Wood Sage, or Garlicke Sage.

¶ *The Place.*

It groweth vpon heaths and barren places: it is alſo found in Woods, and neere vnto hedgerowes, and about the borders of fields: it ſomewhat delighteth in a leane ſoile, and yet not altogether barren and dry.

¶ *The Time.*

It floureth and ſeedeth in Iune, Iuly, and Auguſt, and it is then to be gathered and laid vp.

¶ *The Names.*

It is called of the later Herbariſts *Saluia agreſtis*: of diuers alſo *Ambroſia*; but true *Ambroſia*, which is Oke of Cappadocia, differs from this. *Valerius Cordus* names it *Scordonia*, or *Scorodonia*, and *Scordium alterum*. *Ruellius* ſaith it is called *Boſciſaluia*, or *Saluia Boſci*: in high Dutch, **waldt ſalbey**: in Engliſh, wilde Sage, wood Sage, and Garlicke Sage.

It ſeemeth to be *Theophraſtus* his σφάκελον, *Sphacelus*, which is alſo taken for the ſmall Sage, but not rightly.

¶ *The Temperature.*

Wilde Sage is of temperature hot and drie, yet leſſe than common Sage; therefore it is hot and dry in the ſecond degree.

¶ *The Vertues.*

A It is commended againſt burſtings, dry beatings, and againſt wounds: the decoction thereof is giuen to them that fall, and are inwardly bruiſed: it alſo prouoketh vrine.

B Some likewiſe giue the decoction hereof to drinke, with good ſucceſſe, to them that are infected with the French Pox; for it cauſeth ſweat, drieth vp vlcers, digeſteth humors, waſteth away and conſumeth ſwellings, if it be taken thirtie or forty dayes together, or put into the decoction of *Guiacum*, in ſtead of *Epithymum* and other adiutories belonging to the ſaid decoction.

† The figure which was formerly here was of *Calamintha montana præſtantior* of *Lobel*.

Chap. 216. *Of Eye-bright.*

¶ *The Deſcription.*

EVphraſia or Eye-bright is a ſmall low herbe not aboue two handfuls high, full of branches, couered with little blackiſh leaues dented or ſnipt about the edges like a ſaw: the floures are ſmall

ſmall and white, ſprinkled and poudered on the inner ſide, with yellow and purple ſpeeks mixed therewith. The root is ſmall and hairie.

Euphraſia.
Eye-bright.

¶ *The Place.*

This plant growes in dry medows, in green and graſſie wayes and paſtures ſtanding againſt the Sunne.

¶ *The Time.*

Eye-bright beginneth to floure in Auguſt and continueth vnto September, and muſt be gathered while it floureth for phyſicks vſe.

¶ *The Names.*

It is commonly called *Euphraſia*, as alſo *Euphroſyne*; notwithſtanding there is another *Euphroſyne*, *viz.* Bugloſſe: it is called of ſome *Ocularis*, & *Ophthalmica* of the effect: in high-Dutch, **Augen troſt**: in low-Dutch, **Oogben trooſt**: in Italian, Spaniſh, and French, *Eufraſia*, after the Latine name: in Engliſh, Eye-bright.

¶ *The Nature.*

This herbe is hot and dry, but yet more hot than dry.

¶ *The Vertues.*

It is very much commended for the eyes. A
Being taken it ſelfe alone, or any way elſe, it preſerues the ſight, and being feeble and loſt it reſtores the ſame: it is giuen moſt fitly being beaten into pouder; oftentimes a like quantitie of Fennel ſeed is added thereto, and a little mace, to the which is put ſo much ſugar as the weight of them all commeth to.

Eye-bright ſtamped and layd vpon the eyes, or the iuyce thereof mixed with white Wine, and B
dropped into the eyes, or the diſtilled water, taketh away the darkneſſe and dimneſſe of the eyes, and cleareth the ſight.

Three parts of the pouder of Eye-bright, and one part of maces mixed therewith, taketh away C
all hurts from the eyes, comforteth the memorie, and cleareth the ſight, if halfe a ſpoonfull be taken euery morning faſting with a cup of white wine.

† That which was formerly here ſet forth in the ſecond place vnder the title of *Euphraſia cærulea Tabern.* was deſcribed by our Author amongſt the Scorpion graſſes, in the third place, Chap. 54. and the figure is pag. 338. vnder the title of *Myoſotis Scorpioides paluſtris.*

CHAP. 217. *Of Marierome.*

¶ *The Deſcription.*

1 SWeet Marjerome is a low and ſhrubby plant, of a whitiſh colour and maruellous ſweet ſmell, a foot or ſomewhat more high. The ſtalkes are ſlender, and parted into diuers branches; about which grow forth little leaues ſoft and hoarie: the floures grow at the top in ſcaly or chaffie ſpiked eares, of a white colour like vnto thoſe of Candy Organy. The root is compact of many ſmall threds. The whole plant and euerie part thereof is of a moſt pleaſant taſte, and aromaticall ſmell, and periſheth at the firſt approch of Winter.

2 Pot Marierome or Winter Maierome hath many threddy tough roots, from which riſe immediately diuers ſmall branches, whereon are placed ſuch leaues as the precedent, but not ſo hoarie, nor yet ſo ſweet of ſmell, bearing at the top of the branches tufts of white floures tending to purple. The whole plant is of long continuance, and keepeth greene all the Winter; whereupon our Engliſh women haue called it, and that very properly, Winter Marierome.

3 Marierome Gentle hath many branches riſing from a threddy root, whereupon do grow ſoft and ſweet ſmelling leaues of an ouerworne ruſſet colour. The floures ſtand at the top of the ſtalks,

compact

1 *Mariorana maior.*
Great ſweet Marierome.

2 *Mariorana maior Anglica.*
Pot Marierome.

3 *Mariorana tenuifolia.*
Marierome gentle.

compact of diuers ſmall chaffie ſcales, of a white colour tending to a bluſh. The whole plant is altogether like the great ſweet Marierome, ſauing that it is altogether leſſer, and far ſweeter, wherein eſpecially conſiſteth the difference.

4 *Epimaiorana* is likewiſe a kind of Marierome, differing not from the laſt deſcribed, ſauing in that, that this plant hath in his naturall country of Candy, and not elſewhere, ſome laces or threds faſtned vnto his branches, ſuch, and after the ſame manner as thoſe are that doe grow vpon Sauorie, wherein is the difference.

¶ *The Place.*

Theſe plants do grow in Spaine, Italy, Candy, and other Iſlands thereabout, wilde, and in the fields; from whence wee haue the ſeeds for the gardens of our cold countries.

¶ *The Time.*

They are ſowne in May, and bring forth their ſcaly or chaffie huskes or eares in Auguſt. They are to be watered in the middle of the day, when the Sunne ſhineth hotteſt, euen as Baſill ſhould be, and not in the euening nor morning, as moſt Plants are.

¶ *The Names.*

Marierome is called *Mariorana*, and *Amaracus*, and alſo *Marum* and *Sampſychum* of others: in high-Dutch, **Mayoran:** in Spaniſh, *Mayorana*, *Moradux*, and *Almoradux:* in French, *Mariolaine:* in Engliſh, Sweet Marierome, Fine Marierome, and Marierome

rome gentle; of the beſt ſort Marjerane. The pot Marjerome is alſo called Winter Marjerome. Some haue made a doubt whether *Maiorana* and *Sampſychum* be all one; which doubt, as I take it, is becauſe that *Galen* maketh a difference betweene them, intreating of them apart, and attributeth to either of them their operations. But *Amaracus Galeni* is *Parthenium*, or Feuerfew. *Dioſcorides* likewiſe witneſſeth, that ſome do call *Amaracus*, *Parthenium*; and *Galen* in his booke of the faculties of ſimple medicines, doth in no place make mention of *Parthenium*, but by the name of *Amaracus*. *Pliny* in his 21 booke, chap. 2. witneſſeth, that *Diocles* the phyſition, and they of Sicily did call that *Amaracus*, which the Ægyptians and the Syrians did call *Sampſychum*.

Virgill in the firſt booke of his *Æneidos* ſheweth, that *Amaracus* is a ſhrub bearing floures, writing thus:

Vbi mollis Amaracus illum
Floribus, & dulci aſpirans complectitur vmbra.

Likewiſe *Catullus* in his *Epithalamium*, or mariage ſong of *Iulia* and *Mallius* ſaith,

Cinge tempora floribus
Suaue olentis Amaraci.

Compaſſe the temples of the head with floures.
Of Amarac affording ſweete ſauours.

Notwithſtanding it may not ſeeme ſtrange, that Majorane is vſed in ſtead of *Sampſychum*, ſeeing that in *Galens* time alſo *Marum* was in the mixture of the ointment called *Amaracinum vnguentum*, in the place of *Sampſychum*, as he himſelfe witneſſeth in his firſt booke of counterpoiſons.

¶ *The Temperature.*

They are hot and dry in the ſecond degree; after ſome copies, hot and dry in the third.

¶ *The Vertues.*

Sweete Marjerome is a remedy againſt cold diſeaſes of the braine and head, being taken any way to your beſt liking; put vp into the noſthrils it prouoketh ſneeſing, and draweth forth much baggage flegme: it eaſeth the tooth-ache being chewed in the mouth; being drunke it prouoketh vrine, and draweth away wateriſh humors, and is vſed in medicines againſt poiſon. A

The leaues boiled in water, and the decoction drunke, helpeth them that are entering into the dropſie: it eaſeth them that are troubled with difficultie of making water, and ſuch as are giuen to ouermuch ſighing, and eaſeth the paines of the belly. B

The leaues dried and mingled with hony, and giuen, diſſolueth congealed or clotted blood, and putteth away blacke and blew markes after ſtripes and bruſes, being applied thereto. C

The leaues are excellent good to be put into all odoriferous ointments, waters, pouders, broths, and meates. D

The dried leaues poudered, and finely ſearched, are good to be put into Cerotes, or Cere-cloths and ointments, profitable againſt colde ſwellings, and members out of joint. E

There is an excellent oile to be drawne forth of theſe herbes, good againſt the ſhrinking of ſinewes, crampes, convulſions, and all aches proceeding of a colde cauſe. F

Chap. 218. *Of wilde Marjerome.*

¶ *The Deſcription.*

1 Baſtard Marjerome groweth ſtraight vp with little round ſtalkes of a reddiſh colour, full of branches, a foot high and ſometimes higher. The leaues be broad, more long than round, of a whitiſh greene colour: on the top of the branches ſtand long ſpikie ſcaled eares, out of which ſhoot forth little white floures like the flouring of wheate. The whole plant is of a ſweete ſmell, and ſharpe biting taſte.

2 The white Organy, or baſtard Marjerome with white floures, differing little from the precedent, but in colour and ſtature. This plant hath whiter and broader leaues, and alſo much higher, wherein conſiſteth the difference.

3 Baſtard Marjerome of Candy hath many threddy roots; from which riſe vp diuers weake and feeble branches trailing vpon the ground, ſet with faire greene leaues, not vnlike thoſe of Penny Royall, but broader and ſhorter: at the top of thoſe branches ſtand ſcalie or chaffie eares of a purple colour. The whole plant is of a moſt pleaſant ſweet ſmell. The root endured in my garden

1 *Origanum Heracleoticum.*
Baſtard Marjerome.

† 2 *Origanum album, Tabern.*
White baſtard Marjerome.

† 3 *Origanum Creticum.*
Wilde Marjerome of Candy.

4 *Origanum Anglicum.*
Engliſh wilde Marjerome.

and the leaues alſo greene all this winter long, 1597. although it hath been ſaid that it doth periſh at the firſt froſt, as ſweete Marjerome doth.

4 Engliſh wilde Marjerome is exceedingly well knowne to all, to haue long, ſtiffe, and hard ſtalkes of two cubits high, ſet with leaues like thoſe of ſweet Marjerome, but broader and greater, of a ruſſet greene colour, on the top of the branches ſtand tufts of purple floures, compoſed of many ſmall ones ſet together very cloſely vmbell faſhion. The root creepeth in the ground, and is long laſting.

¶ *The Place.*

Theſe plants do grow wilde in the kingdome of Spaine, Italy, and other of thoſe hot regions. The laſt of the foure doth grow wilde in the borders of fields, and low copſes, in moſt places of England.

¶ *The Time.*

They floure and flouriſh in the Sommer moneths, afterward the ſeed is perfected.

¶ *The Names.*

Baſtard Marjerome is called in Greeke, ἡδύοσμος, and that which is ſurnamed *Heracleoticum*, ἡδύοσμος ἡρακλεωτικὸς: of diuers it is called *Cunila*: in ſhops, *Origanum Hiſpanicum*, Spaniſh Organy: our Engliſh wilde Marjerome is called in Greeke of *Dioſcorides*, *Galen*, and *Plinie*, *Onitis*, of ſome, *Agrioriganum*, or *Sylveſtre Origanum*: in Italian, *Origano*: in Spaniſh *Oregano*: in French, *Mariolaine baſtarde*: in Engliſh, Organe, baſtard Marjerome: and that of ours, wilde Marjerome, and groue Marjerome.

¶ *The Temperature.*

All the Organies do cut, attenuate, or make thin, dry, and heate, and that in the third degree; and *Galen* teacheth that wilde Marjerome is more forceable and of greater ſtrength; notwithſtanding Organy of Candy which is brought dry out of Spaine (whereof I haue a plant in my garden) is more biting than any of the reſt, and of greateſt heate.

¶ *The Vertues.*

Organy giuen in wine is a remedy againſt the bitings, and ſtingings of venomous beaſts, and cureth them that haue drunke *Opium*, or the iuice of blacke poppy, or hemlockes, eſpecially if it be giuen with wine and raiſons of the ſunne. A

The decoction of Organy prouoketh vrine, bringeth downe the monethly courſe, and is giuen with good ſucceſſe to thoſe that haue the dropſie. B

It is profitably vſed in a looch, or a medicine to be licked, againſt an old cough and the ſtuffing of the lungs. C

It healeth ſcabs, itches, and ſcuruineſſe, being vſed in bathes, and it taketh away the bad colour which commeth of the yellow jaundice. D

The weight of a dram taken with meade or honied water, draweth forth by ſtoole blacke and filthy humors, as *Dioſcorides* and *Pliny* write. E

The iuice mixed with a little milke, being poured into the eares, mitigateth the paines thereof. F

The ſame mixed with the oile of *Ireos*, or the rootes of the white Florentine floure de luce, and drawne vp into the noſthrils, draweth downe water and flegme: the herbe ſtrowed vpon the ground driueth away ſerpents. G

The decoction looſeth the belly, and voideth choler; and drunke with vineger helpeth the infirmities of the ſpleene, and drunke in wine helpeth againſt all mortall poiſons, and for that cauſe it is put into mithridate and treacles prepared for that purpoſe. H

Theſe plants are eaſie to be taken in potions, and therefore to good purpoſe they may be vſed and miniſtred vnto ſuch as cannot brooke their meate, and to ſuch as haue a ſowre and ſqamiſh and watery ſtomacke, as alſo againſt the ſwouning of the heart. I

† The ſecond and third figures were formerly tranſpoſed.

Chap. 219. *Of Goates Marjerome, or Organy.*

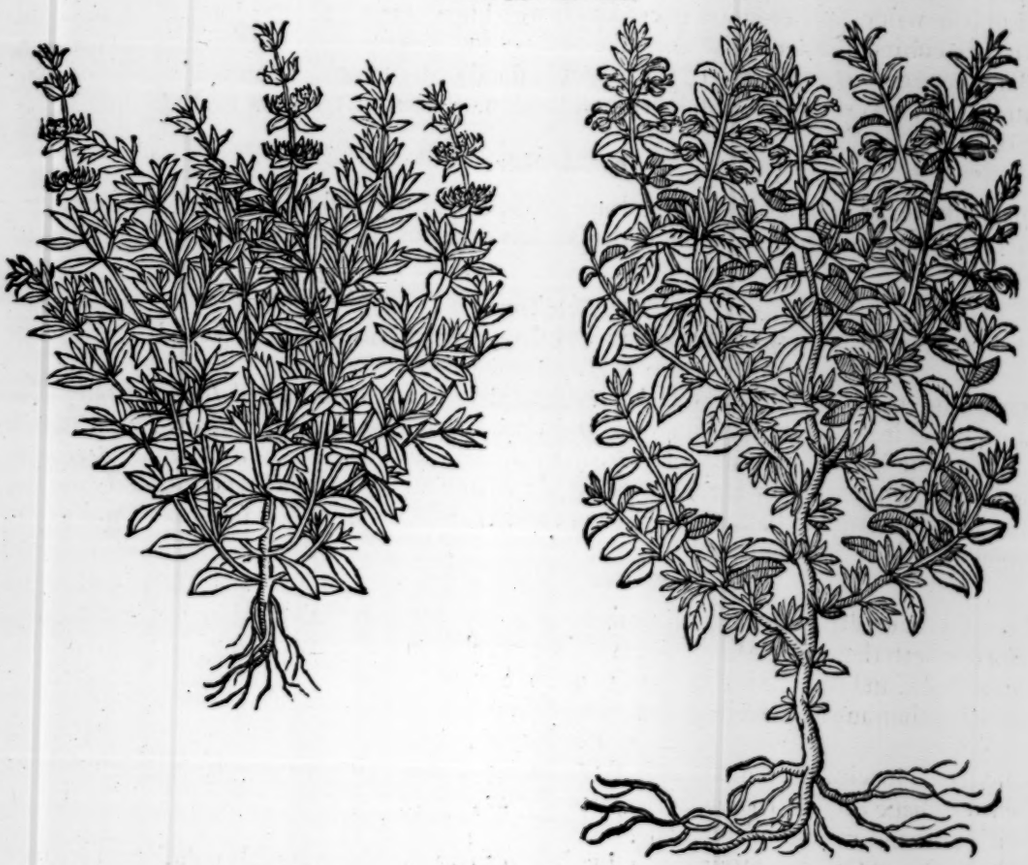
¶ *The Deſcription.*

1 The ſtalkes of Goates Organy are ſlender, hard and wooddy, of a blackiſh colour; whereon are ſet long leaues, greater than thoſe of the wilde Time, ſweete of ſmell, rough, and ſomewhat hairy. The floures be ſmall, and grow out of little crownes or wharles round about the top of the ſtalkes, tending to a purple colour. The root is ſmall and threddy.

† 1 *Tragoriganum Dod.*

† *Tragoriganum Lob.*

Goats Marierome.



† 2 *Tragoriganum Cluſij.*
Cluſius his Goats Marierome.

‡ 3 *Tragoriganum Cretenſe.*
Candy Goats Marierome.

2 *Carolus Clusius* hath set forth in his Spanish Obseruations another sort of Goats Marierome growing vp like a small shrub: the leaues are longer and more hoarie than wilde Marierome, and also narrower, of a hot biting taste, but of a sweet smell, though not very pleasant. The floures do stand at the top of the stalkes in spokie rundles, of a white colour. The root is thicke and wooddy.

‡ 3 This differs little in forme and magnitude from the last described, but the branches are of a blacker colour, with rougher and darker coloured leaues: the floures also are lesser, and of a purple colour. Both this and the last described continue alwaies greene, but this last is of a much more fragrant smell. This floures in March, and was found growing wilde by *Clusius* in the fields of Valentia: he calls it *Tragoriganum Hispanicum tertium*. *Pena* and *Lobel* call it *Tragoriganum Cretense apud Venetas*; that is, the Candy Goats Marierome of the Venetians. ‡

¶ *The Place.*

These plants grow wilde in Spaine, Italy, and other hot countries. The first of these I found growing in diuers barren and chalky fields and high-wayes neere vnto Sittingburne and Rochester in Kent, and also neere vnto Cobham house and Southfleet in the same county.

‡ I doubt our Author was mistaken, for I haue not heard of this growing wilde with vs. ‡

¶ *The Time.*

They floure in the moneth of August. I remember (saith *Dodonæus*) that I haue seene *Tragoriganum* in the Low-countries, in the gardens of those that apply their whole study to the knowledge of plants; or as we may say, in the gardens of cunning Herbarists.

¶ *The Names.*

Goats Organie is called in Greeke τραγορίγανον: in Latine likewise *Tragoriganum*: in English, goats Organie, and Goats Marierome.

¶ *The Temperature.*

Goats Organies are hot and dry in the third degree: They are (saith *Galen*) of a binding qualitie.

¶ *The Vertues.*

Tragoriganum or Goats Marierome is very good against the wamblings of the stomacke, and the foure belchings of the same, and stayeth the desire to vomit, especially at sea. A

These bastard kindes of Organie or wilde Marieromes haue the same force and faculties that the other Organies haue for the diseases mentioned in the same chapter. B

† There were formerly two figures in this chapter; the first whereof was of that which is described in the second place: the second was of *Tragoriganum* of *Matthiolus*, whereof here is no mention made. The figure of the *Tragoriganum alterum* of *Lobel* (which as I haue formerly said, *Bauhine* would haue all one with that of *Dodonæus*) was formerly vnder the name of *Thymum Creticum*, pag. 459. of the former edition.

CHAP. 220. *Of Herbe Masticke.*

¶ *The Description.*

1 THe English and French herbarists at this day do in their vulgar tongues call this herb Masticke or Mastich, taking this name *Marum* of *Maro* King of Thrace; though some rather suppose the name corruptly to be deriued from this word *Amaracus*, the one plant being so like the other, that many learned haue taken them to be one and the selfe same plant: others haue taken *Marum* for *Sampsuchus*, which doubtlesse is a kinde of Marierome. Some (as *Dodonæus*) haue called this our *Marum* by the name of *Clinopodium*; which name rather belongs to another plant than to Masticke. ‡ This growes some foot high, with little longish leaues set by couples: at the tops of the stalkes amongst white downie heads come little white floures: the whole plant is of a very sweet and pleasing smell. ‡

2 If any be desirous to search for the true *Marum*, let them be assured that the plant last mentioned is the same: but if any do doubt thereof, for nouelties sake here is presented vnto your view a plant of the same kinde (which cannot be reiected) for a speciall kind thereof, which hath a most pleasant sent or smell, and in shew resembleth Marierome and *Origanum*, consisting of smal twigs a foot and more long; the heads tusted like the common Marierome; but the leaues are lesse, and like *Myrtus*: the root is of a wooddy substance, with many strings hanging thereat.

3 There is another kinde hereof set forth by *Lobel*, which I haue not as yet seen, nor himselfe hath well described, which I leaue to a better consideration. ‡ Though our Authour knew not how to describe this creeping *Marum* of *Lobel*, yet no question, if he had knowne so much, he would haue giuen vs the figure thereof as wel in this place, as in the third place of the next chapter

1 *Marum.*
Herbe Maſticke.

2 *Marum Syriacum.*
Aſſyrian Maſticke.

† 3 *Marum ſupinum Lobelij.*
Creeping Maſticke.

for a Penny-Royall; and might as well here as there, and much more fitly haue ventured at a deſcription. But that which is defectiue in him and *Lobel*, I will endeauour to ſupply out of *Cæſalpinus*. This plant hath many creeping branches like to thoſe of wilde Time, but ſet with whiter and ſhorter leaues like to thoſe of the ſmaller Marjerome, but ſomewhat narrower: the floures grow in rundles amongſt the leaues, as in Calamint, and are of a purple colour: the whole plant is of a ſtrong and ſweet ſmell, and of an hot and bitter taſte. *Cæſalpinus* thinkes this to be the *Sampſuchum* of *Dioſcorides*: and ſo alſo do the Authors of the *Aduerſaria*. *Tabernamontanus* calls it *Marum repens*. ‡

¶ *The Place.*

Theſe plants are ſet and ſowne in the gardens of England, and there maintained with great care and diligence from the iniurie of our cold clymate.

¶ *The*

¶ *The Time.*

They floure about Auguſt, and ſomewhat later in cold Sommers.

¶ *The Names.*

‡ Maſticke is called of the new writers *Marum*: and ſome, as *Lobel* and *Anguillara* thinke it the *Helenium odorum* of *Theophraſtus*. *Dodonæus* iudges it to be the *Clinopodium* of *Dioſcorides*. *Cluſius* makes it his *Tragoriganum* 1. and ſaith he receiued the ſeeds thereof by the name of *Ambra dulcis*. ‡

¶ *The Nature.*

Theſe plants are hot and drie in the third degree.

¶ *The Vertues.*

Dioſcorides writeth, that the herbe is drunke, and likewiſe the decoction thereof, againſt the bitings of venomous beaſts, crampes and convulſions, burſtings and the ſtrangurie. A

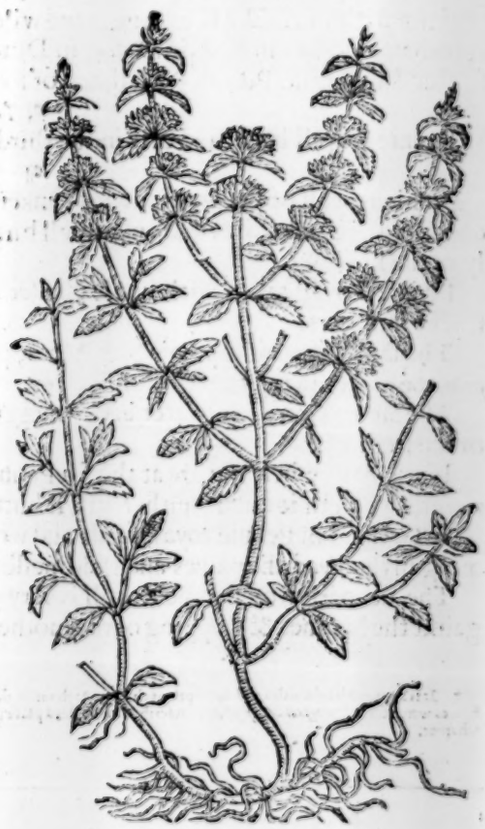
The decoction boiled in wine till the third part be conſumed, and drunke, ſtoppeth the laske in them that haue an ague, and vnto others in water. B

† That we here giue you in the third place was formerly vnfitly figured in the third place of the enſuing Chapter by the name of *Talegium Anguſtifolium*.

Chap. 221. *Of Pennie Royall, or pudding graſſe.*

† 1 *Pulegium regium.*
Pennie Royall.

† 2 *Pulegium mas.*
Vpright Pennie Royall.



¶ *The Deſcription.*

1 *Pulegium regium vulgatum* is ſo exceedingly well knowne to all our Engliſh Nation, that it needeth no deſcription, being our common Pennie Royall.

2 The ſecond being the male Pennie Royall is like vnto the former, in leaues, floures and ſmell, and differeth in that this male kinde groweth vpright of himſelfe without creeping, much like in ſhew vnto wilde Marierome.

3 The

† 3 *Pulegium anguſtifolium.*
Narrow leafed Pennie Royall.

3 The third kinde of Pennie Royall growes like vnto Tyme, and is of a wooddie ſubſtance, ſomewhat like vnto the thinne leafed Hyſſope, of the ſauour of common Pennie Royall, ‡ but much ſtronger and more pleaſant: the longiſh narrow leaues ſtand vpon the ſtalkes by couples, with little leaues comming forth of their boſomes: and towards the tops of the branches grow rundles of ſmall purple floures. This grows plentifully about Montpellier, and by the Authors of the *Aduerſaria*, who firſt ſet it forth, it is ſtiled *Pulegium, anguſtifol. ſive ceruinum Monſpelienſium.* ‡

¶ *The Place.*

The firſt and common Pennie Royall groweth naturally wilde in moiſt and ouerflown places, as in the Common neere London called Miles end, about the holes & ponds thereof in ſundry places, from whence poore women bring plentie to ſell in London markets; and it groweth in ſundrie other Commons neere London likewiſe.

The ſecond groweth in my garden: the third I haue not as yet ſeene.

¶ *The Time.*

They floure from the beginning of Iune to the end of Auguſt.

¶ *The Names.*

Pennie Royall is called in Greeke πολιον, and oftentimes βλιχων: in Latine, *Pulegium*, and *Pulegium regale*, for difference ſake betweene it and wilde Tyme, which of ſome is called *Pulegium montanum*: in Italian, *Pulegio*: in Spaniſh, *Poleo*: in Dutch, **Poley**: in French, *Pouliot*: in Engliſh, Pennie Royall, Pudding graſſe, Puliall Royall, and of ſome Organie.

¶ *The Nature.*

Pennie Royall is hot and drie in the third degree, and of ſubtill parts, as *Galen* ſaith.

¶ *The Vertues.*

A Pennie Royall boiled in wine and drunken, prouoketh the monthly termes, bringeth forth the ſecondine, the dead childe and vnnaturall birth: it prouoketh vrine, and breaketh the ſtone, eſpecially of the kidneies.

B Pennie Royall taken with honie clenſeth the lungs, and cleereth the breaſt from all groſſe and thicke humours.

C The ſame taken with honie and Aloes, purgeth by ſtoole melancholie humours; helpeth the crampe and drawing together of ſinewes.

D The ſame taken with water and Vineger aſſwageth the inordinate deſire to vomite, & the pains of the ſtomacke.

E If you haue when you are at the ſea Pennie Royal in great quantitie drie, and caſt it into corrupt water, it helpeth it much, neither will it hurt them that drinke thereof.

F A Garland of Pennie royall made and worne about the head is of great force againſt the ſwimming in the head, the paines and giddineſſe thereof.

G The decoction of Pennie Royall is very good againſt ventoſitie, windineſſe, or ſuch like, and againſt the hardnes & ſtopping of the mother being vſed in a bath or ſtew for the woman to ſit ouer.

† It is apparant by the titles and deſcriptions that our Author in this chapter followed *Lobel* but the figures were not agreeable to the hiſtorie, for the two firſt figures were of the *Pulegium Anguſtifolium* deſcribed in the third place; and the third figure was of the *Marum ſupinum* deſcribed in the laſt place of the foregoing Chapter.

Chap. 222. *Of Baſill.*

¶ *The Deſcription.*

1 Garden Baſill is of two ſorts, differing one from another in bigneſſe. The firſt hath broad, thicke, and fat leaues, of a pleaſant ſweet ſmell, and of which ſome one here and there are of a black reddiſh colour, ſomewhat ſnipped about the edges, not vnlike the leaues of French Mercurie. The ſtalke groweth to the height of halfe a cubite, diuiding it ſelf into diuers branches, whereupon doe ſtand ſmall and baſe floures ſometimes whitiſh, and often tending to a darke purple. The root is threddie, and dieth at the approch of Winter.

2

1 *Ocimum magnum.*
Great Baſill.

2 *Ocimum medium citratum.*
Citron Baſill.

3 *Ocimum minus Gariophyllatum.*
Buſh Baſill.

‡ 4 *Ocimum Indicum.*
Indian Baſill.

2 The middle Baſill is very like vnto the former, but it is altogether leſſer. The whole plant is of a moſt odoriferous ſmell, not vnlike the ſmell of a Limon, or Citron, whereof it tooke his ſurname.

3 Buſh Baſill, or fine Baſill, is a low and baſe plant, hauing a threddie root, from which riſe vp many ſmall and tender ſtalks, branched into diuers armes or boughes; whereupon are placed many little leaues, leſſer than thoſe of Pennie Royall. The whole plant is of a moſt pleaſing ſweete ſmell.

‡ 4 This which ſome call *Ocimum Indicum*, or rather (as *Camerarius* ſaith) *Hiſpanicum*, ſends vp a ſtalk a foot or more high, foure ſquare, and of a purple colour, ſet at each ioint with two leaues, and out of their boſomes come little branches: the largeſt leaues are ſome two inches broad, and ſome three long; growing vpon long ſtalks, and deepely cut in about their edges, being alſo thicke, fat and iuicie, and either of a darke purple colour, or elſe ſpotted with more or leſſe ſuch coloured ſpots. The tops of the branches end in ſpokie tufts of white floures with purple veines running alongſt them. The ſeede is contained in ſuch ſeed veſſels as that of the other Baſils, and is round, blacke and large. The plant periſhes euery yeare as ſoone as it hath perfected the ſeed. *Cluſius* calls this *Ocimum Indicum*. ‡

¶ *The Place.*

Baſil is ſowne in gardens, and in earthen pots. It commeth vp quickly, and loueth little moiſture except in the middle of the day; otherwiſe if it be ſowne in rainie weather, the ſeed will putrifie, and grow into a iellie or ſlime, and come to nothing.

¶ *The Time.*

Baſill floureth in Iune and Iuly, and that by little and little, whereby it is long a flouring, beginning firſt at the top.

¶ *The Names.*

Baſill is called in Greeke ὤκιμον, and more commonly with ο in the firſt ſyllable ὄκιμον: in Latine, *Ocimum*. It differeth from *Ocymum* which ſome haue called *Cereale* as we (ſaith *Dodonæus*) haue ſhewed in the Hiſtorie of Graine. The later Græcians haue called it βασιλικὸν: in ſhops likewiſe *Baſilicum*, and *Regium*: in Spaniſh, *Albahaca*: in French, *Baſilic*: in Engliſh, Baſill, garden Baſill, the greater Baſill Royall, the leſſer Baſill gentle, and buſh Baſill: of ſome, *Baſilicum Gariophyllatum*, or Cloue Baſill.

¶ *The Temperature.*

Baſill, as *Galen* teacheth, is hot in the ſecond degree, but it hath adioined with it a ſuperfluous moiſture, by reaſon whereof he doth not like that it ſhould be taken inwardly; but being applied outwardly, it is good to digeſt or diſtribute, and to concoct.

¶ *The Vertues.*

A *Dioſcorides* ſaith that if Baſil be much eaten, it dulleth the ſight, it mollifieth the belly, breedeth winde, prouoketh vrine, drieth vp milke, and is of a hard digeſtion.

B The iuice mixed with fine meale of parched Barly, oile of roſes and Vineger, is good againſt inflammations, and the ſtinging of venomous beaſts.

C The iuice drunke in wine of *Chios* or ſtrong Sacke, is good againſt head ache.

D The iuice clenſeth away the dimmeneſſe of the eyes, and drieth vp the humour that falleth into them.

E The ſeede drunke is a remedie for melancholicke people; for thoſe that are ſhort winded, and them that can hardly make water.

F If the ſame be ſnift vp in the noſe, it cauſeth often neeſing: alſo the herbe it ſelfe doth the ſame.

G There be that ſhunne Baſill and will not eat thereof, becauſe that if it be chewed and laid in the Sun, it ingendreth wormes.

H They of Africke do alſo affirme, that they who are ſtung of the Scorpion and haue eaten of it, ſhall feele no paine at all.

I The Later writers, among whom *Simeon Zethy* is one, doe teach, that the ſmell of Baſill is good for the heart and for the head. That the ſeede cureth the infirmities of the heart, taketh away ſorrowfulneſſe which commeth of melancholy, and maketh a man merry and glad.

Chap. 223. *Of wilde Baſill.*

¶ *The Deſcription.*

1 THe wilde Baſil or *Acynos*, called of *Pena*, *Clinopodium vulgare*, hath ſquare hairie ſtems, beſet with little leaues like vnto the ſmall Baſil, but much ſmaller, and more hairie, ſharp pointed, and a little ſnipt towards the end of the leafe, with ſmall floures of a purple colour, faſhioned like vnto the garden Baſill. The root is full of hairie threds, and creepeth along the ground, and ſpringeth vp yearely anew of it ſelfe without ſowing. ‡ This is the *Clinopodium alterum* of *Matthiolus*. ‡

2 This kinde of wilde Baſill called amongſt the Græcians ἄσπρον, which by interpretation is *Sine ſemine*, or *Sterilis*, hath cauſed ſundry opinions and great doubts concerning the words of *Plinie* and *Theophraſtus*, affirming that this herbe hath no floures nor ſeeds; which opinions I am ſure of mine owne knowledge to be without reaſon: but to omit controuerſies, this plant beareth purple floures, wharled about ſquare ſtalkes, rough leaues and hairie, verie like in ſhape vnto Baſil: ‡ The ſtalkes are ſome cubite and more high, parted into few branches, and ſet at certaine ſpaces with leaues growing by couples. This is the *Clinopodium vulgare* of *Matthiolus*, and that of *Cordus*, *Geſner*, and others; it is the *Acinos* of *Lobel*. ‡

3 *Scrapio* and others haue ſet forth another wilde Baſill vnder the title of *Molochia*; and *Lobel* after the minde of *Iohn Brancion*, calleth it *Corcoros*, which we haue Engliſhed, Fiſh Baſill, the ſeeds whereof the ſaid *Brancion* receiued from Spaine, ſaying that *Corcoros Plinij* hath the leaues of Baſil: the ſtalkes are two handfuls high, the floures yellow, growing cloſe to the ſtalkes, bearing his ſeed in ſmal long cods. The root is compact and made of an innumerable companie of ſtrings, creeping far abroad like running Time. ‡ This figure of *Lobels* which here we giue you is (as *Camerarius* hath obſerued) vnperfect, for it expreſſes not the long cods wherein the ſeed is contained, neither the two little ſtrings or beards that come forth at the ſetting on of each leafe to the ſtalke. ‡

1 *Ocymum ſylueſtre.*
Wilde Baſill.

2 *Acynos.*
Stone Baſill.

4 It

‡ 3 *Corchoros.*
Fiſh Baſill.

‡ 5 *Clinopodium Auſtriacum.*
Auſtrian field Baſill.

‡ 6 *Clinopodium Alpinum.*
Wilde Baſill of the Alpes.

‡ 4 It may be our Authour would haue deſcribed this in the firſt place, as I coniecture by thoſe words which he vſed in mentioning the place of their growing; and [*Clinopodium vulgare* groweth in great plentie vpon Longfield downs in Kent;] but to this neither figure nor deſcription did agree, wherefore I will giue you the Hiſtorie therof. It ſends vp many little ſquare ſtalks ſome handful and an halfe high, ſeldome diuided into branches: at each ioint ſtand two ſmal greeniſh leaues, little hairy, and not diuided or ſnipt about the edges, and much like thoſe of the next deſcribed, as you ſee them expreſt in the figure: the little hollow and ſomewhat hooded floures grow in roundles towards the tops of the ſtalkes, as in the firſt deſcribed, and they are of a blewiſh violet colour. The ſeeds I haue not yet obſerued: the root is fibrous and wooddie, and laſts for many yeares. The whole plant hath a pretty pleaſing but weake ſmell. It floures in Iuly and Auguſt. I firſt obſerued it *Anno* 1626, a little on this ſide Pomfret in Yorkſhire, and ſince by Datford in Kent, and in the Ile of Tenet. I haue ſometimes ſeene it brought to Cheapſide market, where the herbe women called it Poley mountaine, ſome it may bee that haue taken it for *Polium montanum* miſinforming them; *Cluſius* firſt tooke notice of this plant, and called it *Acinos Anglicum*, finding it growing in Kent, *Anno*, 1581. and he thinkes it to

be the *Acinos* of *Dioſcorides:* now the vertues attributed by *Dioſcorides* to his *Acinos* are ſet downe at the end of the chapter vnder the letter B.

5 This which *Cluſius* hath alſo ſet forth by the name of *Clinopodiũ*, or *Acinos Auſtriacum*, doth not much differ from the laſt deſcribed, for it hath tender ſquare hard ſtalkes like thoſe of the laſt deſcribed, ſet alſo with two leaues at each joint, heere and there a little ſnipt (which is omitted in the figure) the floures grow onely at the tops of the ſtalkes, and theſe pretty large, and of a violet colour (yet they are ſometimes found white:) they hang commonly forward, and as is were with there vpper parts turned downe. The ſeed veſſels are like thoſe of the firſt deſcribed, and containe each of them foure little blacke ſeeds: This floures in May, and the ſeed is ripe in Iune: It growes about the bathes of Badon and in diuers places of Auſtria.

6 *Pena* alſo hath giuen vs knowledge of another, that from a fibrous root ſends vp many quadrangular rough branches, of the height of the two former, ſet alſo with two leaues at each joint, and theſe rough and lightly ſnipt about the edges; the floures grow thicke together at the tops of the ſtalkes of a darke red colour, and in ſhape like thoſe of the mountaine Calaminte. It floures in the beginning of Iuly, and growes vpon mount Baldus in Italy; *Pona* ſets it forth by the name of *Clinopodium Alpinum*.

7 To theſe I thinke fit to adde another, whoſe deſcription was ſent me by Mr. *Goodyer*, and I queſtion whether it may not be the plant which *Fabius Columna Phytobaſani*, *pag.* 22. ſets forth by the name of *Acinos Dioſcoridis*; for he makes his to be endued *odore fragrantiſſimo:* but to the purpoſe.

Acinos odoratiſſimum.

This herbe hath foure, fiue, or more, foure ſquare hard wooddy ſtalkes growing from one root, diuided into many branches, couered with a ſoft white hairineſſe, two or three foot long or longer, not growing vpright, but trailing vpon the ground; the leaues grow on little ſhort footſtalkes by couples of a light greene colour, ſomewhat like the leaues of Baſill, very like the leaues of *Acinos Lobelij*, but ſmaller, about three quarters of an inch broad, and not fully an inch long, ſomewhat ſharpe pointed, lightly notched about the edges, alſo couered with a light ſoft hoary hairineſſe, of a very ſweete ſmell, little inferiour to Garden Marjerome, of a hot biting taſte: out of their boſomes grow other ſmaller leaues, or elſe branches; the floures alſo grow forth of the boſomes of the leaues toward the tops of the ſtalkes and branches, not in whorles like the ſaid *Acinos*, but hauing one little ſhort footſtalke growing forth of the boſome of each leafe, on which is placed three, foure, or more ſmall floures, gaping open, and diuided into foure vnequall parts at the top, like the floures of Baſill, and very neare of the likeneſſe and bigneſſe of the floures of Garden Marjerome, but of a pale blewiſh colour tending towards a purple. The ſeed I neuer obſerued by reaſon it floured late. This plant I firſt found growing in the Garden of Mr. *William Yalden* in Sheete neere Peterſfield in Hampſhire, *Anno* 1620. amongſt ſweete Marjerome, and which by chance they bought with the ſeedes thereof. It is to be conſidered whether the ſeedes of ſweete Marjerome degenerate and ſend forth this herbe or not. 11. October, 1621. *Iohn Goodyer.* ‡

¶ *The Place.*

The wilde kindes doe grow vpon grauelly grounds by water ſides, and eſpecially I found the three laſt in the barren plaine by an houſe in Kent two miles from Dartford, called Saint Iones, in a village called Sutton; and *Clinopodium vulgare* groweth in great plentie vpon Long field downes in Kent. ‡ One of the three laſt of our Authors deſcription is omitted, as you may finde noted at the end of the chapter: yet I cannot be perſuaded that euer he found any of the foure he deſcribed euer wilde in this kingdome, vnleſſe the ſecond, which growes plentifully in Autumne almoſt by euery hedge: alſo the fourth being of my deſcription growes neere Dartford and in many ſuch dry barren places in ſundry parts of the kingdome. ‡

¶ *The Time.*

Theſe herbes floure in Iune and Iuly.

¶ *The Names.*

Vnprofitable Baſil, or wilde Baſill is called by ſome *Clinopodium*.

¶ *The Nature.*

The ſeed of theſe herbes are of complexion hot and dry.

¶ *The Vertues.*

Wilde Baſill pound with wine appeaſeth the paine of the eyes, and the juice doth mundifie the A
ſame, and putteth away all obſcurity and dimneſſe, all catarrhes and flowing humors that fall into the eies, being often dropped into the ſame.

B † The ſtone Baſill howſoeuer it be taken ſtoppeth the laske, and courſes; and outwardly applied it helpes hot Tumors and inflammations.

‡ Theſe plants are good for all ſuch effects as require moderate heate and aſtriction. ‡

† The figure that was formerly in the third place of this chapter was of the *Calamintha Ocymoides* of *Tabernæmontanus*, and it was deſcribed by our Author in the fourth place of the next chapter ſaue one, and there you ſhall finde it: the deſcription ſeemes to be of the *Ocymoides reſpens Polygonifolia* of the *Lobeliaſtra*, formerly deſcribed by me in the fifth place of the 128. chapter of this booke; if that the place and flowres in the omitted deſcription of our Author did not ſeeme to vary: howeuer I iudge it the ſame and therefore haue heere excluded it.

Chap. 224. *Of Baſill Valerian.*

¶ *The Deſcription.*

1 THe firſt kinde of *Ocymaſtrum*, called of *Dodonæus*, *Valeriana rubra*, bringeth forth long and brittle ſtalkes two cubits high, full of knots or joints, in which place is ioined long leaues much like vnto great Baſill, but greater, broader, and larger, or rather like the leaues of Woade. At the top of the ſtalkes do grow very pleaſant and long red floures, of the faſhion of the floures of Valerian, which hath cauſed *Dodonæus* to call this plant red Valerian; which being paſt, the ſeedes are caried away with the winde being, few in number, and little in quantity, ſo that without great diligence the ſeed is not to be gathered or preſerued: for my ſelfe haue often indeuoured to ſee it, and yet haue loſt my labour. The roote is very thicke, and of an excellent ſweete ſauour.

1 *Valeriana rubra Dodonæi.*
Red Valerian.

2 *Behen album.*
Spatling poppy.

2 The ſecond is taken for *Spumeum papauer*, in reſpect of that kinde of frothy ſpattle, or ſpume, which we call Cuckow ſpittle, that more aboundeth in the boſomes of the leaues of theſe plants, than in any other plant that is knowne: for which cauſe *Pena* calleth it *Papaver ſpumeum*, that is, frothy, or ſpatling Poppy: his floure doth very little reſemble any kinde of Poppy, but onely the ſeede and cod, or bowle wherein the ſeede is contained, otherwiſe it is like the other *Ocymaſtrum*;

ſtrum: the floures grow at the top of the ſtalkes hanging downewards, of a white colour, and it is taken generally for *Behen album:* the roote is white, plaine, and long, and very tough and hard to breake.

¶ *The Place.*

The firſt groweth plentifully in my garden, being a great ornament to the ſame, and not common in England.

The ſecond groweth almoſt in euery paſture.

¶ *The Time.*

Theſe plants do floure from May to the end of Auguſt.

¶ *The Names.*

Red Valerian hath beene ſo called of the likeneſſe of the floures and ſpoked rundles with Valerian; by which name we had rather haue it called, than raſhly to lay vpon it an vnproper name. There are ſome alſo who would haue it to be a kinde of *Behen* of the later Herbariſts, naming the ſame *Behen rubrum*, for difference between it and the other *Behen album*, that of ſome is called *Ocymaſtrum*, and *Papauer ſpumeum:* which I haue Engliſhed, Spatling Poppie; and is in truth another plant, much differing from *Behen* of the Arabians: it is alſo called *Valerianthon*, *Saponaria altera*, *Struthium Aldroandi*, and *Condurdum:* in Engliſh, red Valerian, and red Cow Baſill.

Spatling Poppie is called *Behen album*, *Ocymaſtrum alterum*; of ſome, *Polemonium*, and *Papauer ſpumeum:* in Engliſh, Spatling Poppie, frothie Poppie, and white Ben.

¶ *The Nature.*

Theſe plants are drie in the ſecond degree.

¶ *The Vertues.*

The root of *Behen Album* drunke in wine, is good againſt the bloudie fluxe: and beeing pound leaues and floures, and laid to, cureth the ſtingings of Scorpions and ſuch like venomous beaſts; inſomuch that who ſo doth hold the ſame in his hand, can receiue no damage or hurt by any venomous beaſt. A

The decoction of the root made in water and drunke, prouoketh vrine, it helpeth the ſtrangurie, and paines about the backe and Huckle bone. B

† That which was formerly here ſet forth in the third place by the name of *Ocymaſtrum multiflorum*, is nothing elſe but the *Lychnis ſylueſtris alba multiplex*, which I haue deſcribed amongſt the reſt of the ſame kinde in the 128. Chapter of this booke.

CHAP. 225. *Of Mints.*

¶ *The Kindes.*

THere be diuers ſorts of Mints; ſome of the garden; other wilde, or of the field; and alſo ſome of the water.

¶ *The Deſcription.*

1 THe firſt tame or garden Mint commeth vp with ſtalkes foure ſquare, of an obſcure red colour ſomewhat hairie, which are couered with round leaues nicked in the edges like a ſaw, of a deepe greene colour: the floures are little and red, and grow about the ſtalkes circle-wiſe, as thoſe of Pennie Royall: the roote creepeth aſlope in the ground, hauing ſome ſtrings on it, and now and then in ſundry places it buddeth out afreſh: the whole herbe is of a pleaſant ſmell, and it rather lieth downe than ſtandeth vp.

2 The ſecond is like to the firſt in hairie ſtalkes ſomething round, in blackiſh leaues, in creeping roots, and alſo in ſmell, but the floures do not at all compaſſe the ſtalke about, but ſtand vp in the tops of the branches being orderly placed in little eares, or rather catkines or aglets.

3 The leaues of Speare-Mint are long like thoſe of the Willow tree, but whiter, ſofter, and more hairie: the floures are orderly placed in the tops of the ſtalks, and in ears like thoſe of the ſecond. The root hereof doth alſo creepe no otherwiſe than doth that of the firſt, vnto which it is like.

4 There is another ſort of Mint which hath long leaues like to the third in ſtalks, yet in leaues and in roots leſſer; but the floures hereof ſtand not in the tops of the branches, but compaſſe the ſtalks about circle-wiſe as do thoſe of the firſt, which be of a light purple colour.

‡ 5 This hath round leaues broader than the common Mint, rounder alſo, and as criſp or curled as thoſe deſcribed in the ſecond place (of which it ſeemes but a larger varietie:) the ſtalkes are

† 1 *Mentha ſativa rubra.*
Red Garden Mints.

† 2 *Mentha cruciata, ſive criſpa.*
Croſſe Mint, or curled Mint.

† 3 *Mentha Romana.*
Speare Mint.

‡ 4 *Mentha Cardiaca.*
Heart Mint.

‡ 5 *Mentha ſpicata altera*, Balſam Mint.

foure ſquare, and the floures grow in eares or ſpokie tufts, like thoſe of the ſecond. ‡

¶ *The Place.*

Moſt vſe to ſet Mints in Gardens almoſt euery where.

¶ *The Time.*

Mints do floure and flouriſh in Sommer, in Winter the roots onely remaine: being once ſet they continue long, and remaine ſure and faſt in the ground.

¶ *The Names.*

Mint is called in Greeke ἡδύοσμον and μυδὶ: the ſweet ſmell ſaith *Pliny* in his 19. booke *cap.* 8. hath changed the name among the Græcians when as otherwiſe it ſhould be called *Mintha*, from whence our old writers haue deriued the name: for ἡδὺ ſignifieth ſweet, and ὀσμὴ ſmel: The Apothecaries, Italians, and French men, do keepe the Latine name *Mentha*. the Spaniards do call it *Yerua buena*, and *Ortelana*: in High Dutch, **Muntz**: in Low Dutch, **Munte**: in Engliſh, Mint.

The firſt Mint is called in High Dutch, **Diement**: in Low Dutch, **Bzuyn heylighe**: he that would tranſlate it into Latin, muſt call it *Sacra nigricans*, or the holy blackiſh mint: in Engliſh, browne Mint, or red Mint.

The ſecond is alſo called in High Dutch **krauſz diement**, **krauſz muntz**, and **krauſz balſam**: that is to ſay, *Mentha cruciata*: in French, *Beaume creſpu*: in Engliſh, Croſſe-Mint, or curled Mint.

The third is called of diuers *Mentha Sarracenica*, *Mentha Romana*: it is called in High Dutch **Balſam muntz**, **Onſer krawen muntz**, **Spitzer muntz**, **Spitzer balſam**: it may be called *Mentha anguſtifolia*: that is to ſay, Mint with the narrow leafe: and in Engliſh, Speare Mint, common garden Mint, our Ladies Mint, browne Mint, and Macrell Mint.

The fourth is called in High Dutch **Hertzkraut**, as though it were to bee named *Cardiaca*, or *Cardiaca Mentha*: in Engliſh, Hart-woort, or Heart-mint ‡ This is the *Siſymbrium ſatiuum* of *Matthiolus*, and *Mentha hortenſis altera* of *Geſner*: the Italians call it *Siſembrio domeſtico*, and *Balſamita*; the Germanes, **Katzenbalſam**. ‡

¶ *The Temperature.*

Mint is hot and drie in the third degree. It is ſaith *Galen*, ſomewhat bitter and harſh, and it is inferiour to Calamint. The ſmell of Mint, ſaith *Pliny* doth ſtir vp the minde, and the taſte to a greedy deſire to meat.

¶ *The Vertues.*

Mint is maruellous wholeſome for the ſtomacke, it ſtaieth the Hicket, parbraking, vomiting & A
ſcowring in the Cholerike paſſion, if it be taken with the iuice of a ſoure pomegranate.

It ſtoppeth the caſting vp of bloud, being giuen with water and vineger, as *Galen* teacheth. B

And in broth ſaith *Pliny*, it ſtaieth the floures, and is ſingular good againſt the whites, that is to C
ſay, that Mint which is deſcribed in the firſt place. For it is found by experience, that many haue had this kinde of flux ſtaied by the continuall vſe of this onely Mint: the ſame being applied to the forehead, or to the temples, as *Pliny* teacheth, doth take away the headache.

It is good againſt watering eies, and all manner of breakings out in the head, and againſt the in- D
firmities of the fundament, it is a ſure remedie for childrens ſore heads.

It is poured into the eares with honie water. It is taken inwardly againſt Scolopenders, Beare- E
wormes, Sea-ſcorpions and ſerpents.

It is applied with ſalt to the bitings of mad dogs. It will not ſuffer milke to cruddle in the ſto- F
macke (*Pliny* addeth to wax ſoure.) therefore it is put in Milke that is drunke for feare that thoſe who haue drunke thereof ſhould be ſtrangled.

It is thought, that by the ſame vertue it is an enemy to generation, by ouerthickning the ſeed. G

H *Dioſcorides* teacheth, that being applied to the ſecret part of a woman before the act, it hindreth conception.

I Garden Mint taken in meat or drinke warmeth and ſtrengtheneth the ſtomacke, and drieth vp all ſuperfluous humours gathered in the ſame, and cauſeth good digeſtion.

K Mints mingled with the leaues of parched Barly, conſumeth tumors and hard ſwellings.

L The water of Mints is of like operation in diuers medicines, it cureth the trenching and griping paines of the belly and bowels, it appeaſeth headach, ſtaieth yexing and vomiting.

M It is ſingular againſt the grauell and ſtone in the kidneies, and againſt the ſtrangurie, being boiled in wine and drunke.

N They lay it to the ſtinging of waſpes and bees with good ſucceſſe.

† The figures which were formerly in this Chapter were no way agreeable to the deſcriptions and names taken forth of *Dodonæus*. The firſt was of the *Calamintha montana vulgaris* of *Lobel* & *Tab.* The 2. was of that which is deſcribed in the third place, the third was of the *Mentha Cattaria angustifolia* deſcribed in the third place of the next Chapter. The figure agreeing to the 4. deſcription was in the chapter next ſaue one afore by the title of *Ocymoides repens*.

Chap. 226. *Of Nep, or Cat Mint.*

¶ *The Deſcription.*

1 CAt Mint or Nep groweth high; it bringeth forth ſtalks aboue a cubit long, cornered, chamfered, and full of branches: the leaues are broad, nicked in the edges like thoſe of Bawme, or of Horehound, but longer. The floures are of a whitiſh colour, they partly compaſſe about the vppermoſt ſprigs, and partly grow on the very top, they are ſet in a manner like an eare or catkin: the root is diuerſly parted, and ful of ſtrings, and endureth a long time. The whole herbe together with the leaues and ſtalks is ſoft, and couered with a white downe, but leſſer than Horſe-mint; it is of a ſharpe ſmel, and pearceth into the head: it hath a hot taſte with a certaine bitternesse.

‡ 2 Our Authour figured this and deſcribed the next in the ſecond place of this Chapter. This hath pretty large ſquare ſtalks, ſet at each ioint with two leaues like thoſe of Coſtmary, but of a gray or ouerworn colour: the floures grow at the tops of the ſtalks in long ſpokie tufts like thoſe of the laſt deſcribed, and of a whitiſh colour, the ſmel is pleaſanter than that of the laſt deſcribed. ‡

1 *Mentha Felina, ſeu Cattaria.*
Nep, or Cat-mint.

2 *Mentha Cattaria altera.*
Great Cat-mint.

3 There

3 There is alſo another kind hereof that hath a longer and narrower leafe, and not of ſo white a colour: the ſtalkes hereof are foure ſquare: the floures be more plentifull, of a red light purple colour inclining to blew, ſprinkled with little fine purple ſpecks: the ſmell hereof is ſtronger, but the taſte is more biting. ‡ The figure of this was formerly in the third place of the laſt chapter. ‡

† 3 *Mentha Cattaria anguſtifolia.*
Small Cat-Mint.

¶ *The Place.*

The firſt growes about the borders of gardens and fields, neere to rough bankes, ditches, and common wayes: it is delighted with moiſt and waterie places: it is brought into gardens.

‡ The other two commonly grow in gardens with vs. ‡

¶ *The Time.*

The Cat-Mints flouriſh by and by after the Spring: they floure in Iuly and Auguſt.

¶ *The Names.*

The later Herbariſts do cal it *Herba Cattaria*, and *Herba Catti*, becauſe the Cats are very much delighted herewith; for the ſmel of it is ſo pleaſant to them, that they rub themſelues vpon it, and wallow or tumble in it, and alſo feed on the branches and leaues very greedily. It is named of the Apothecaries *Nepeta*: but *Nepeta* is properly called (as we haue ſaid) wilde Penny-royall: in high-Dutch, **Katzen Muntz**: in Low-Dutch, **Catte cruijt**: in Italian, *Gattaria*, or *herba Gatta*: in Spaniſh, *Yerua Gatera*: in Engliſh, Cat Mint and Nep. ‡ The true *Nepeta* is *Calamintha Pulegij odore*. ‡

¶ *The Temperature.*

Nep is of temperature hot and dry, and hath the faculties of the Calamints.

¶ *The Vertues.*

It is commended againſt cold paines of the head, ſtomacke, and matrix, and thoſe diſeaſes that grow of flegme and raw humors, and of winde. It is a preſent helpe for them that be burſten inwardly by meanes of ſome fall receiued from an high place, and that are very much bruiſed, if the iuyce be giuen with wine or mede. A

It is vſed in baths and decoctions for women to ſit ouer, to bring downe their ſickneſſe, and to make them fruitfull. B

‡ It is alſo good againſt thoſe diſeaſes for which the ordinarie Mints do ſerue and are vſed. ‡ C

CHAP. 227. *Of Horſe-Mint or Water-Mint.*

¶ *The Deſcription.*

1 WAter Mint is a kinde of wilde Mint, it is like to the firſt Garden Mint, the leaues thereof are round, the ſtalkes cornered, both the leaues and ſtalkes are of a darke red colour: the roots creepe far abroad, but euery part is greater, and the herbe it ſelfe is of a ſtronger ſmell: the floures in the tops of the branches are gathered together into a round eare, of a purple colour.

† 2 The ſecond kinde of water Mint in each reſpect is like the others, ſauing that the ſame hath a more odoriferous ſauor being lightly touched with the hand: otherwiſe being hardly touched, the ſauour is ouer hot to ſmell vnto: it beareth his floures in ſundry tufts or roundles ingirting the ſtalkes in many places; and they are of a light purple colour: the leaues are alſo leſſe than thoſe of the former, and of an hoary gray colour.

‡ 3 This common Horſe-Mint hath creeping roots like as the other Mints, from which proceed ſtalkes partly leaning, and partly growing vpright: the leaues are pretty large, thicke, wrinkled,

† 1 *Mentha aquatica, ſiue Siſymbrium.*
Water Mint.

† 2 *Calamintha aquatica.*
Water Calamint.

‡ 3 *Mentaſtrum.*
Horſe-Mint.

‡ 4 *Mentaſtrum niueum Anglicum.*
Party coloured Horſe-Mint.

‡ 5 *Mentaſtrum minus.*
Small Horſe-Mint.

‡ 6 *Mentaſtrum montanum* 1. *Cluſij.*
Mountaine Horſe-Mint.

‡ 7 *Mentaſtrum tuberoſa radice Cluſij.*
Turnep-rooted Horſe-Mint.

wrinkled, hoary and rough both aboue and be low, and lightly ſnipped about the edges; the floures grow in thicke compact eares at the tops of the ſtalks, and are like thoſe of common Mint. The whole plant is of a more vnpleaſant ſent than any of the other Mints. It growes in diuers wet and moiſt grounds, and floures in Iune and Iuly. This by moſt writers is called only *Mentaſtrum*, without any other attribute.

4 In ſome of our Engliſh gardens (as *Penn* and *Lobel* obſerued) growes another Horſe-mint, much leſſe, and better ſmelling than the laſt mentioned, hauing the leaues partly greene, and partly milke white; yet ſometimes the leaues are ſome of them wholly white, but more, and more commonly all greene: the ſtalkes, floures, and other parts are like thoſe of the former, but leſſe. This is the *Mentaſtrum niueum Anglicum*, of *Lobel*; and *Mentaſtrum alterum* of *Dodonæus*.

5 This growes in waterie places, hauing a ſtalke of a cubit or cubit and halfe high, ſet with longiſh hoary leaues like thoſe of Horſe-mint: the floures grow in ſpokie tufts at the tops of the ſtalkes, of a duskie purple colour, and in ſhape like thoſe of the common Mint: the ſmell of this comes neere to that of the water Mint. This is the *Mentaſtrifolia aquatica hirſuta, ſiue Calamintha* 3. *Dioſcoridis*, of *Lobel*: in the *hiſt. Lugd.* it is called *Mentaſtrum minus ſpicatum.*

6 The

6 ¶ The ſtalke of this is ſome cubit and halfe high, ſquare, and full of pith: the leaues are like in ſhape to thoſe of Cat-Mint, but not hoarie, but rather greene: the tops of the branches are ſet with roundles of ſuch white floures as thoſe of the Cats-mint: the ſmell of this plant is like to that of the Horſe-Mint; whence *Cluſius* calls it *Mentaſtrum montanum primum*. It floures in Auguſt, and growes in the mountainous places of Auſtria.

7 The ſame Author hath alſo ſet forth another by the name of *Mentaſtrum tuberoſa radice*. It hath roughiſh ſtalkes like the former, and longiſh crumpled leaues ſomewhat ſnipt about the edges like thoſe of the laſt deſcribed: the floures grow in roundles alongſt the tops of the branches, and are white of colour, and like thoſe of Cat-Mint. The root of this (which, as alſo the leaues, is not well expreſt in the figure) is like a Radiſh, and blackiſh on the out ſide, ſending forth many ſuccours like to little Turneps, and alſo diuers fibres: theſe ſuccours taken from the maine root will alſo take root and grow. It floures in Iune. *Cluſius* receiued the ſeed of it from Spaine. ‡

¶ *The Place.*

They grow in moiſt and waterie places, as in medowes neere vnto ditches that haue water in them, and by riuers.

¶ *The Time.*

They floure when the other Mints do, and reuiue in the Spring.

¶ *The Names.*

It is called in Greeke Σισύμβριον: in Latine, *Siſymbrium*: in high-Dutch, **Roſzmuntz, waſſer-muntz**: in French, *Menthe ſauuage*: in Engliſh, Water Mint, Fiſh-Mint, Brooke-Mint, and Horſe-mint.

¶ *The Temperature.*

Water Mint is hot and dry as is the Garden Mint, and is of a ſtronger ſmell and operation.

¶ *The Vertues.*

A It is commended to haue the like vertues that the garden Mint hath; and alſo to be good againſt the ſtinging of Bees and Waſpes, if the place be rubbed therewith.

B The ſauour or ſmell of the Water-Mint reioyceth the heart of man; for which cauſe they vſe to ſtrew it in chambers and places of recreation, pleaſure, and repoſe, and where feaſts and banquets are made.

C There is no vſe hereof in phyſicke whileſt we haue the garden Mint, which is ſweeter, and more agreeing to the nature of man.

† The figure that was in the firſt place was of the Horſe-Mint, and that in the ſecond place ſhould haue beene in the firſt, as now it is.

Chap. 228. *Of Mountaine Mint or Calamint.*

¶ *The Deſcription.*

1 Mountaine Calamint is a low herbe, ſeldome aboue a foot high, parted into many branches: the ſtalkes are foure ſquare, and haue ioynts as it were, out of euery one whereof grow forth leaues ſomething round, leſſer than thoſe of Baſill, couered with a very thinne hairy downe, as are alſo the ſtalkes, ſomwhat whitiſh, and of a ſweet ſmell: the tops of the branches are gallantly deckt with floures, ſomewhat of a purple colour; then groweth the ſeed which is blacke: the roots are full of ſtrings, and continue.

2 This moſt excellent kinde of Calamint hath vpright ſtalkes a cubit high, couered ouer with a woolly moſſineſſe, beſet with rough leaues like a Nettle, ſomewhat notched about the edges; among the leaues come forth blewiſh or sky-coloured floures: the root is wooddy, and the whole plant is of a very good ſmell.

3 There is another kinde of Calamint which hath hard ſquare ſtalks, couered in like manner as the other with a certaine hoary or fine cotton. The leaues be in ſhape like Baſill, but that they are rough; and the floures grow in roundles toward the tops of the branches, ſometimes three or foure vpon a ſtemme, of a purpliſh colour. The root is threddy, and long laſting.

† 4 There is a kinde of ſtrong ſmelling Calamint that hath alſo ſquare ſtalks couered with ſoft cotton, and almoſt creeping by the ground, hauing euermore two leaues ſtanding one againſt another, ſmall and ſoft, not much vnlike the leaues of Penny-Royall, ſauing that they are larger and whiter: the floures grow about the ſtalks like wharles or garlands, of a blewiſh purple colour; the root is ſmall and threddy: the whole plant hath the ſmell of Penny-Royal; whence it hath the addition of *Pulegij odore*.

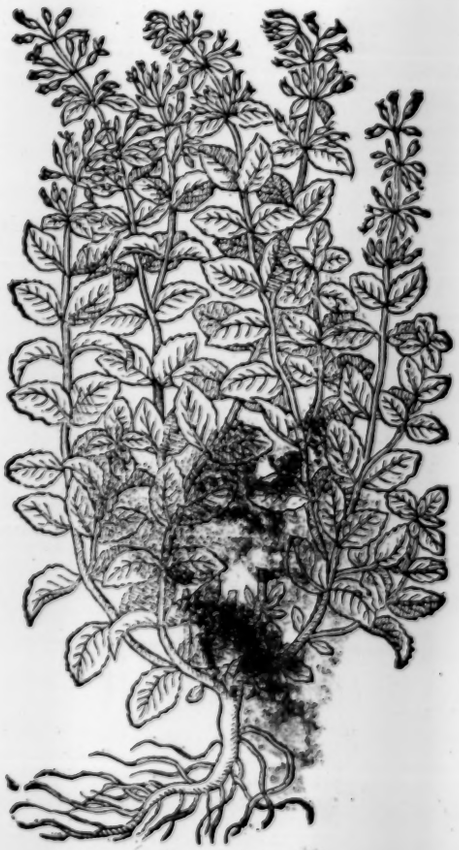
¶ The

1 *Calamintha montana vulgaris.*
Calamint, or Mountaine Mint.

† 2 *Calamintha montana præſtantior.*
The more excellent Calamint.

† 3 *Calamintha vulgaris Officinarum.*
Common Calamint.

† 3 *Calamintha odore Pulegij.*
Field Calamint.



¶ *The Place.*

It delighteth to grow in mountaines, and in the ſhadowy and grauelly ſides thereof: it is found in many places of Italy and France, and in other countries: it is brought into gardens, where it proſpereth maruellous well, and very eaſily ſoweth it ſelfe. I haue found theſe plants growing vpon the chalkie grounds and highwayes leading from Grauesend vnto Canturbury, in moſt places, or almoſt euery where. ‡ I haue onely obſerued the third and fourth to grow wilde with vs in England. ‡

¶ *The Time.*

It flouriſheth in Sommer, and almoſt all the yeare thorow: it bringeth forth floures and ſeed from Iune to Autumne.

¶ *The Names.*

It is called in Greeke Καλαμίνθη, as though you ſhould ſay, *Elegans aut vtilis Mentha*, a gallant or profitable Mint: the Latines keepe the name *Calamintha*: *Apuleius* alſo nameth it amiſſe, *Mentaſtrum*, and confoundeth the names one with another: the Apothecaries call it *Montana Calamintha*, *Calamentum*, and ſometime *Calamentum montanum*: in French, *Calament*: in Engliſh, Mountain Calamint. ‡ The fourth is certainly the ſecond Calamint of *Dioſcorides*, and the true *Nepeta* of the Antients. ‡

¶ *The Temperature.*

This Calamint which groweth in mountaines is of a feruent taſte, and biting, hot, and of a thin ſubſtance, and dry after a ſort in the third degree, as *Galen* ſaith: it digeſteth or waſteth away thin humors, it cutteth, and maketh thicke humors thin.

¶ *The Vertues.*

A Therefore being inwardly taken by it ſelfe, and alſo with meade, or honied water, it doth manifeſtly heate, prouoketh ſweat, and conſumeth ſuperfluous humors of the body; it taketh away the ſhiuerings of Agues that come by fits.

B The ſame alſo is performed by the ſallet oyle in which it is boyled, if the body be anointed and well rubbed and chafed therewith.

C The decoction thereof drunke prouoketh vrine, bringeth downe the monethly ſickneſſe, and expelleth the childe, which alſo it doth being but onely applied.

D It helpeth thoſe that are bruiſed, ſuch as are troubled with crampes and conuulſions, and that cannot breathe vnleſſe they hold their necks vpright (that haue the wheeſing of the lungs, ſaith *Galen*) and it is a remedie ſaith *Dioſcorides* for a cholericke paſſion, otherwiſe called the Felony.

E It is good for them that haue the yellow jaundice, for that it remoueth the ſtoppings of the liuer and gall, and withall clenſeth: being taken afore-hand in Wine, it keepeth a man from being poyſoned: being inwardly taken, or outwardly applied it cureth them that are bitten of Serpents: being burned or ſtrewed it driues ſerpents away: it takes away black and blew ſpots that come by blowes or dry beatings, making the skin faire and white; but for ſuch things (ſaith *Galen*) it is better to be laid to greene than dry.

F It killeth all manner of wormes of the belly, if it be drunk with ſalt and honey: the iuyce dropped into the eares doth in like manner kill the wormes thereof.

G *Pliny* ſaith, that if the iuyce be conueyed vp into the noſthrils it ſtancheth the bleeding at the noſe; and the root (which *Dioſcorides* writeth to be good for nothing) helpeth the Squincie, if it be gargariſed, or the throat waſhed therewith, being vſed in Cute, and Myrtle ſeed withall.

H It is applied to thoſe that haue the Sciatica or ache in the huckle bone, for it drawes the humor from the very bottome, and bringeth a comfortable heat to the whole ioynt: *Paulus Ægineta* ſaith, that for the paine of the haunches or huckle bones it is to be vſed in Clyſters.

I Being much eaten it is good for them that haue the leproſie, ſo that the patient drinke whay after it, as *Dioſcorides* witneſſeth.

K *Apuleius* affirmeth, that if the leaues be often eaten, they are a ſure and certaine remedy againſt the leproſie.

L There is made of this an Antidote or compoſition, which *Galen* in his fourth booke of the Gouernment of health deſcribes by the name of *Diacalaminthos*, that doth not onely notably digeſt or waſte away crudities, but alſo is maruellous good for young maidens that want their courſes, if their bodies be firſt well purged; for in continuance of time it bringeth them downe very gently without force.

† The figure which formerly was in the ſecond place belonged to the fourth deſcription; and the figure that belonged thereto was before falſly put for the *Scorodonia* or Wood-Sage. As alſo that which ſhould haue beene put in the fourth place was put in the firſt place of the laſt chapter ſaue two, for the Red Garden Mint.

Chap.

CHAP. 229. *Of Bawme.*

¶ *The Deſcription.*

1 *Piaſtrum*, or *Meliſſa*, is our common beſt knowne Balme or Bawme, hauing many ſquare ſtalkes and blackiſh leaues like to *Ballote*, or blacke Hore-hound, but larger, of a pleaſant ſmell, drawing neere in ſmell and ſauour vnto a Citron: the floures are of a Carnation colour; the root of a wooddy ſubſtance.

2 The ſecond kinde of Bawme was brought into my garden and others, by his ſeed from the parts of Turky, wherefore we haue called it Turky Balme: it excelleth the reſt of the kinds, if you reſpect the ſweet ſauour and goodly beauty thereof, and deſerueth a more liuely deſcription than my rude pen can deliuer. This rare plant hath ſundry ſmall weake and brittle ſquare ſtalkes and branches, mounting to the height of a cubit and ſomewhat more, beſet with leaues like to Germander or *Scordium*, indented or toothed very bluntly about the edges, but ſomewhat ſharpe pointed at the top. The floures grow in ſmall coronets, of a purpliſh blew colour: the root is ſmall and threddy, and dieth at the firſt approch of Winter, and muſt be ſowne anew in the beginning of May, in good and fertill ground.

1 *Meliſſa.*
Bawme.

2 *Meliſſa Turcica.*
Turky Bawme.

3 *Fuchſius* ſetteth forth a kinde of Bawme hauing a ſquare ſtalke, with leaues like vnto common Bawme, but larger and blacker, and of an euill ſauour; the floures white, and much greater than thoſe of the common Bawme; the root hard, and of a wooddy ſubſtance. ‡ This varies with the leaues ſometimes broader and otherwhiles narrower: alſo the floures are commonly purple, yet ſometimes white, and otherwhiles of diuers colours: the leaues are alſo ſometimes broader, otherwhiles narrower: wherefore I haue giuen you one of the figures of *Cluſius*, and that of *Lobel*, that you may ſee the ſeuerall expreſſions of this plant. *Cluſius*, and after him *Bauhine*, referre it to the *Lamium*, or Arch-angell: and the former calls it *Lamium Pannonicum*: and the later, *Lamium montanum Meliſſæ folio*. ‡

4 There is a kinde of Bawme called *Herba Iudaica*, which *Lobel* calles *Tetrahit*, that hath many weake

‡ 3 *Meliſſa Fuchſij flore albo.*
Baſtard Bawme with white floures.

‡ 3 *Meliſſa Fuchſij flore purpureo.*
Baſtard Bawme with purple floures.

‡ 4 *Herba Iudaica Lobelij.*
Smiths Bawme, or Iewes All-heale.

weake and tender ſquare hairie branches; ſome leaning backward, and others turning inward, diuiding themſelues into ſundry other ſmall armes or twigs, which are beſet with long rough leaues dented about, and ſmaller than the leaues of Sage. And growing in another ſoile or clymat, you ſhal ſee the leaues like the oken leaf; in other places like *Marrubium Creticum*, very hoary, which cauſed *Dioſcorides* to deſcribe it with ſo many ſhapes, and alſo the floures, which are ſometimes blew and purple, and oftentimes white: the root is ſmall and crooked, with ſome hairie ſtrings faſtned thereto. All the whole plant draweth to the ſauour of Balme, called *Meliſſa*. ‡ This might much more fitly haue beene put to the reſt of the *Siderites*, but that our Authour had thruſt it as by force into this Chapter. ‡

5 There be alſo two other plants comprehended vnder the kindes of Balme, the one very like vnto the other, although not knowne to many Herbariſts, and haue been of ſome called by the title of *Cardiaca*: the firſt kinde *Pena* calleth *Cardiaca Melica*, or *Molucca Syriaca*, ſo called for that it was firſt brought out of Syria: it groweth three cubits

cubits high, and yeeldeth many shoots from a wooddy root, full of many whitish strings; the stalkes be round, somewhat thicke, and of a reddish colour, which are hollow within, with certain obscure prints or small furrowes along the stalkes, with equall spaces halfe kneed or knotted, and at euery such knee or ioynt stand two leaues one against another, tufted like *Melissa*, but more rough and deeply indented, yet not so deepely as our common *Cardiaca*, called Mother-wort, nor so sharpe pointed: about the knees there come forth small little prickles, with six or eight small open wide bells, hauing many corners thinne like parchment, and of the same colour, somewhat stiffe and long; and at the top of the edge of the bell it is cornered and pointed with sharpe prickles; and out of the middle of this prickly bell riseth a floure somewhat purple tending to whitenesse, not vnlike our *Lamium* or *Cardiaca*, which bringeth forth a cornered seed, the bottome flat, and smaller toward the top like a steeple: the sauour of the plant draweth toward the sent of *Lamium*.

6 The other kinde of *Melica*, otherwise called *Molucca asperior* (whereof *Pena* writeth) differeth from the last before mentioned, in that the cups or bells wherein the floures grow are more prickly than the first, and much sharper, longer, and more in number: the stalke of this is foure square, lightly hollowed or furrowed; the seed three cornered, sharpe vpward like a wedge; the tunnels of the floures browniſh, and not so white as the first.

5 *Melissa molucca lævis.*
Smooth Molucca Bawme.

6 *Molucca spinosa.*
Thorny Molucca Bawme.

¶ *The Place.*

Bawme is much sowen and set in gardens, and oftentimes it groweth of it selfe in Woods and mountaines, and other wilde places: it is profitably planted in gardens, as *Pliny* writeth, *lib.* 21. *cap.* 12. about places where Bees are kept, because they are delighted with this herbe aboue others, whereupon it hath beene called *Apiastrum*: for, saith he, when they are strayed away, they do finde their way home againe by it, as *Virgil* writeth in his Georgicks:

Huc tu iussos asperge liquores,
Trita Meliphylla, & Cerinthe nobile gramen.
Vse here such helpe as husbandry doth vsually prescribe,
Bawme bruised in a mortar, and base Hony-wort beside.
All these I haue in my garden from yeare to yeare.

¶ *The Time.*

Bawme floureth in Iune, Iuly, and Auguſt: it withereth in the Winter; but the root remaineth, which in the beginning of the Spring bringeth forth freſh leaues and ſtalkes.

The other ſorts do likewiſe flouriſh in Iune, Iuly, and Auguſt; but they doe periſh when they haue perfected their ſeed.

¶ *The Names.*

Bawme is called in Greeke μελισσόφυλλον: by *Pliny*, *Melitis*: in Latine, *Meliſſa*, *Apiaſtrum*, and *Citrago*: of ſome, *Meliſſophyllon*, and *Meliphyllon*: in Dutch, **Conſille de greyn**: in French, *Poucyrade*, *ou Meliſſe*: in Italian, *Cedronella*, and *Arantiata*: in Spaniſh, *Torongil*: in Engliſh, Balme, or Bawme.

¶ *The Temperature.*

Bawme is of temperature hot and dry in the ſecond degree, as *Auicen* ſaith: *Galen* ſaith it is like Horehound in facultie.

¶ *The Vertues.*

A Bawme drunke in wine is good againſt the bitings of venomous beaſts, comforts the heart, and driueth away all melancholy and ſadneſſe.

B Common Bawme is good for women which haue the ſtrangling of the mother, either being eaten or ſmelled vnto.

C The iuyce thereof glueth together greene wounds, being put into oyle, vnguent, or Balme, for that purpoſe, and maketh it of greater efficacie.

D The herbe ſtamped, and infuſed in *Aqua vitæ*, may be vſed vnto the purpoſes aforeſaid (I meane the liquour and not the herbe) and is a moſt cordiall liquour againſt all the diſeaſes before ſpoken of.

E The hiues of Bees being rubbed with the leaues of Bawme, cauſeth the Bees to keep together, and cauſeth others to come vnto them.

F The later age, together with the Arabians and Mauritanians, affirme Balme to be ſingular good for the heart, and to be a remedie againſt the infirmities thereof; for *Auicen* in his booke written of the infirmities of the heart, teacheth that Bawme makes the heart merry and ioyfull, and ſtrengtheneth the vitall ſpirits.

G *Serapio* affirmeth it to be comfortable for a moiſt and cold ſtomacke, to ſtir vp concoction, to open the ſtopping of the braine, and to driue away ſorrow and care of the minde.

H *Dioſcorides* writeth, That the leaues drunke with wine, or applied outwardly, are good againſt the ſtingings of venomous beaſts, and the bitings of mad dogs: alſo it helpeth the tooth-ache, the mouth being waſhed with the decoction, and is likewiſe good for thoſe that canot take breath vnleſſe they hold their necks vpright.

I The leaues being mixed with ſalt (ſaith the ſame Author) helpeth the Kings Euil, or any other hard ſwellings and kernels, and mitigateth the paine of the Gout.

K Smiths Bawme or Carpenters Bawme is moſt ſingular to heale vp greene wounds that are cut with iron; it cureth the rupture in ſhort time; it ſtayeth the whites. *Dioſcorides* and *Pliny* haue attributed like vertues vnto this kinde of Bawme, which they call Iron-wort. The leaues (ſay they) being applied, cloſe vp wounds without any perill of inflammation. *Pliny* ſaith that it is of ſo great vertue, that though it be but tied to his ſword that hath giuen the wound, it ſtancheth the bloud.

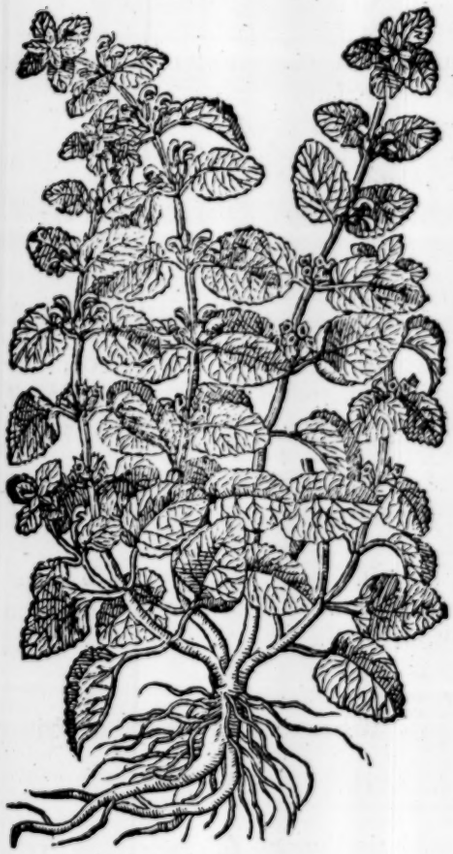
Chap. 230. *Of Horehound.*

¶ *The Deſcription.*

1 White Horehound bringeth forth very many ſtalkes foure ſquare, a cubit high, couered ouer with a thin whitiſh downineſſe: whereupon are placed by couples at certaine diſtances, thicke whitiſh leaues ſomewhat round, wrinkled and nicked on the edges, and couered ouer with the like downineſſe; from the boſomes of which leaues come forth ſmall floures of a feint purpliſh colour, ſet round about the ſtalke in round wharles, which turne into ſharpe prickly husks after the floures be paſt. The whole plant is of a ſtrong ſauor, but not vnpleaſant: the root is threddy.

2 The ſecond kinde of Horehound hath ſundry crooked ſlender ſtalkes, diuided into many ſmall branches couered ouer with a white hoarineſſe or cottony downe. The leaues are likewiſe hoarie and cottony, longer and narrower than the precedent, lightly indented about the edges, and ſharply pointed like the Turky Bawme, and of the ſame bigneſſe, hauing ſmall wharles of white floures,

1 *Marrubium album.*
White Horehound.



2 *Marrubium candidum.*
Snow white Horehound.

3 *Marrubium Hiſpanicum.*
Spaniſh Horehound.

4 *Marrubium Creticum.*
Candy Horehound.

floures, and prickly rundles or ſeed-veſſels ſet about the ſtalks by certaine diſtances. The root is likewiſe threddy.

3 Spaniſh Horehound hath a ſtiffe hoarie and hairy ſtalke, diuiding it ſelfe at the bottome into two wings or more armes, and likewiſe toward the top into two others; whereupon are placed by couples at certaine ſpaces faire broad leaues, more round than any of the reſt, and likewiſe more woolly and hairy. The floures grow at the top of the ſtalkes, ſpike faſhion, compoſed of ſmall gaping floures of a purple colour. The whole plant hath the ſauor of Stœchados.

4 Candy Horehound hath a thicke and hard root, with many hairy threds faſtned thereunto; from which riſe vp immediately rough ſquare ſtalkes, ſet confuſedly with long leaues of a hoarie colour, of a moſt pleaſant ſtrong ſmell. The floures grow toward the top of the ſtalkes in chaffie rundles, of a whitiſh colour.

¶ *The Place.*

The firſt of theſe Horehounds, being the common kinde, groweth plentifully in all places of England, neere vnto old walls, highwayes, and beaten paths, in vntilled places. It groweth in all other countries likewiſe, where it altereth according to the ſcituation and nature of the countries; for commonly that which growes in Candy and in Hungary is much whiter, and of a ſweeter ſmel, and the leaues oftentimes narrower and leſſer than that which groweth in England and theſe Northerne Regions.

¶ *The Time.*

They floure in Iuly and Auguſt, and that in the ſecond yeare after the ſowing of them.

¶ *The Names.*

Horehound is called in Greeke πράσιον: in Latine, *Marrubium*: in ſhops, *Praſium*, and alſo *Marrubium*. There be certaine baſtard names found in *Apuleius*, as *Melittena*, *Labeonia*, and *Vlceraria*: in Italian, *Marrubio*: in Spaniſh, *Marruuio*: in Dutch, **Malroue**: in French, *Marubin*: in Engliſh, Horehound. ‡ *Cluſius* calls the third *Ocimaſtrum Valentinum*.‡

¶ *The Temperature.*

Horehound (as *Galen* teacheth) is hot in the ſecond degree, and dry in the third, and of a bitter taſte.

¶ *The Vertues.*

A Common Horehound boyled in water and drunke, openeth the liuer and ſpleene, cleanſeth the breſt and lungs, and preuailes greatly againſt an old cough, the paine of the ſide, ſpitting of bloud, the ptyſicke, and vlcerations of the lungs.

B The ſame boyled in wine and drunke, bringeth downe the termes, expelleth the ſecondine, after birth, or dead childe, and alſo eaſeth thoſe that haue ſore and hard labour in childe-bearing.

C Syrrup made of the greene freſh leaues and ſugar, is a moſt ſingular remedie againſt the cough and wheeſing of the lungs.

D The ſame ſyrrup doth wonderfully and aboue credit eaſe ſuch as haue lien long ſicke of any conſumption of the lungs, as hath beene often proued by the learned Phyſitions of our London Colledge.

E It is likewiſe good for them that haue drunke poyſon, or that haue beene bitten of Serpents. The leaues are applied with honey to cleanſe foule and filthy vlcers. It ſtayeth and keepeth back the pearle or web in the eyes.

F The iuyce preſſed forth of the leaues, and hardned in the Sun, is very good for the ſame things, eſpecially if it be mixed with a little wine and honey; and dropped into the eyes, it helps them, and cleereth the ſight.

G Being drawne vp into the noſthrils it cleanſeth the yellowneſſe of the eyes, and ſtayeth the running and watering of them.

Chap. 231. *Of wilde Horehound.*

¶ *The Deſcription.*

1 WIld Horehound is alſo like to common Horehound: there riſeth from the root hereof a great number of ſtalkes high and ioynted, and out of euery ioynt a couple of leaues oppoſite, or ſet one againſt another, ſomewhat hard, a little longer than thoſe of common Horehound, and whiter, as alſo the ſtalkes are ſet with ſoft haires, and of a ſweet ſmell: the floures do compaſſe the ſtalke about as thoſe doe of common Horehound, but they are yellow, and the wharles be narrower: the root is wooddy and durable.

2 Beſides

1 *Stachys.*
Wilde Hore-hound.

2 *Stachys Fuchſij.*
Wilde ſtinking Horehound.

‡ 3 *Stachys ſpinoſa Cretica.*
Thorny Horehound.

‡ 4 *Stachys Luſitanica.*
Portugall Wilde Horehound.

‡ 5 *Sideritis Scordioides.*
Germander Ironwoort.

‡ 6 *Sideritis Alpina Hyſſopifolia.*
Hyſſop-leaued Iron-wort.

2 Beſides this there is alſo another deſcribed by *Fuchſius*: the ſtalkes hereof are thicke, foure ſquare, now and then two or three foot long: the leaues be broad, long, hoarie, nicked in the edges, hairie as are alſo the ſtalks, and much broader than thoſe of the common Horehound: the floures in the whorles which compaſſe the ſtalke about, are of a purple colour; the ſeede is round and blackiſh: the root hard & ſomthing yellow.

‡ 3 This thorny *Stachys* hath leaues before it comes to ſend forth the ſtalk, like thoſe of the leſſer Sage, but more white & hairie, thoſe that grow vpon the ſtalkes are much narrower: the ſtalks are ſquare ſome foot high: and at the parting of them into branches grow alwaies two leaues one oppoſit againſt another: the tops of the branches end in long ſharpe thornie prickles: the floures grow about the toppes of the branches like thoſe of Sage, but of ſomewhat a lighter colour. This grows naturally in Candy, about a Towne called Larda, where *Honorius Bellus* firſt obſerued it, there it is called *Guidarothymo*, or Aſſes Tyme, though it agree with Tyme in nothing but the place of growth. *Cluſius* ſets it forth by the name of *Stachys ſpinoſa*.

4 *Lobel* hath giuen vs the figure and firſt deſcription of this by the name of *Stachys Luſitanica*. It hath creeping and downie ſtalkes ſome handfull and halfe high, ſet with little leaues: amongſt which in rundles grow ſmal floures like thoſe of the other wilde Horehounds; the whole plant is of ſomewhat a gratefull ſmell. ‡

5 There is another wilde Horehound of Mountpelier, called *Sideritis Monſpelliaca Scordioides, ſiue Scordij folio*: being that kind of *Sideritis* or wilde Horehound which is like vnto *Scordium*, or water Germander, which groweth to the height of a handfull and a halfe, with many ſmall branches riſing vpright, of a wooddie ſubſtance, hauing the tops and ſpokie coronets of Hyſſop, but the leaues do reſemble *Dioſcorides* his *Scordium*, ſaue that they be ſomewhat leſſer, ſtiffer, more wrinckled or curled and hairie, than *Tetrahit*, or the Iudaicall herb: the floures do reſemble thoſe of the common Sauorie, in taſte bitter, and of an aromaticall ſmell.

6 Mountaine *Sideritis* beeing alſo of the kindes of Horehound, was firſt found by *Valerandus Donraz*, in the mountains of Sauoy, reſembling very wel the laſt deſcribed, but the leaues are much narrower, and like thoſe of Hyſſope: the floures grow in ſmall rough rundlets or tufts, pale of colour like *Marrubium* or *Tetrahit*; the root long and bending, of a wooddie ſubſtance, and purple colour, bitter in taſte, but not vnpleaſant, whoſe vertue is yet vnknowne.

¶ *The Place.*

Theſe herbes are forreiners, they grow in rough and barren places, notwithſtanding I haue them growing in my garden. ‡ My kinde friend Mr. *Buckner* an Apothecary of London the laſt yeare, beeing

being 1632, found the ſecond of theſe growing wilde in Oxfordſhire in the field ioyning to Witney Parke a mile from the Towne. ‡

¶ *The Time.*

They floure in the Sommer moneths, and wither towards winter: the root remaineth alive a certaine time.

¶ *The Names.*

The former is taken for the right *Stachys*, which is called in Greeke [illegible]: it is knowne in ſhoppes and euery where: we name it in Engliſh yellow Horehound, and wilde Horehoond. ‡ *Lobel* calls it *Stachys Lychnites ſpuria Flandrorum.* ‡

The other wilde Horehound, ſeeing it hath no name, is to be called *Stachys ſpuria*: for it is not the right, neither is it *Sphacelus* (as moſt haue ſuſpected) of which *Theophraſtus* hath made mention: it is called in Engliſh purple Horehound, baſtard wild Horehound, & *Fuchſius* his wild Horehound. ‡ *Fabius Columna* proues the ſecond to be the *Sideritis Heraclia* of *Dioſcorides* and the Antients. ‡

¶ *The Temperature.*

Theſe herbes are of a biting and bitter taſte, and are hot in the third degree according to *Galen*.

‡ The *Stachys Fuchſij* and *Sideritides* ſeem to be hot and drie in the firſt degree. ‡

¶ *The Vertues.*

The decoction of the leaues drunk doth draw downe the menſes and the ſecondine, as *Dioſcorides* teacheth. A

‡ 2 This is of ſingular vſe (as moſt of the herbes of this kinde are) to keep wounds from inflammation, and ſpeedily to heale them vp, as alſo to ſtay all fluxes and defluctions, hauing a drying and moderate aſtrictiue facultie. B

Aetius and *Ægineta* commend the vſe of it in medicines vſed in the cure of the biting of a mad Dog. ‡ C

‡ Chap. 232. *Of the Ironwoorts or Alheales.*

‡ 1 *Sideritis vulgaris.*
Ironwoort, or Alheale.

‡ 2 *Sideritis Angustifolia.*
Narrow leaued Alheale.

¶ The

¶ *The Kindes.*

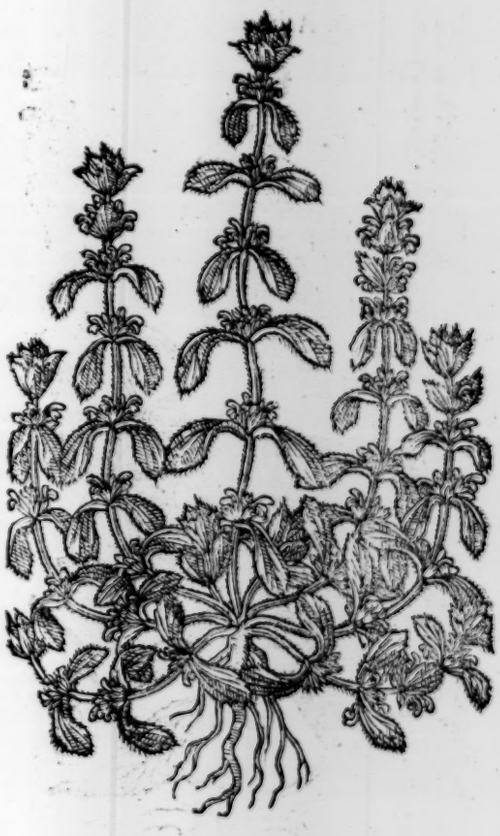
‡ THere are many plants that belong to this kindred of the *Sideritides*, or Ironwoorts, and ſome of them are already treated of, though in ſeuerall places, & that not verie fitly by our Authour; and one of them is alſo ſet forth hereafter by the name of Clownes Alheale: theſe that are formerly handled, and properly belong to this Chapter, are firſt the *Herba Iudaica Lobelij*, being in the fourth place of the 229. Chapter. Secondly, the *Stachys Fuchſij* (being the firſt *Sideritis* of *Dioſcorides*) deſcribed in the ſecond place of the laſt chapter. Thirdly, the *Sideritis Scordioides* ſet forth in the fift place, and fourthly the *Sideritis Alpina Hyſſopifolia* ſet forth in the ſixt place of the laſt chapter. Now beſides all theſe, I will in this Chapter giue you the Deſcriptions of ſome others like to them in face and Vertues, and all of them may be referred to the firſt *Sideritis* of *Dioſcorides* his deſcription.

¶ *The Deſcription.*

1 THis hath ſquare ſtalkes ſome cubite high, rough, and iointed with two leaues at each ioint which are wrinkled and hairie, of an indifferent bigneſſe, ſnipt about the edges, of a ſtrong ſmell, and of a bitteriſh and ſomewhat hottiſh taſte: almoſt forth of euery ioint grow branches, ſet with leſſer leaues: the floures which in roundles incompaſſe the toppes of the ſtalks end in a ſpike, being ſomewhat hooded, whitiſh, well ſmelling, and marked on the inſide with ſanguine ſpots. The ſeed is rough and blacke, being contained in fiue cornered ſeed veſſels. The root is hard and wooddie, ſending forth many ſtalkes. This is the *Sideritis prima* of *Fuchſius*, *Cordus*, *Cluſius*, and others; it hath a very great affinitie with the *Panax Coloni*, or Clownes Alheale of our Authour, and the difference betweene them certainly is very ſmall.

‡ 3 *Sideritis procumbens ramoſa.*
Creeping branched Ironwoort.

‡ 3 *Sideritis procumbens non ramoſa.*
Not branched Creeping Ironwoort.



2 The foure ſquare ſtalke of this plant is not aboue a foot high, and it is preſently from the root diuided into diuers branches; the leaues are long and narrow with ſome nerues or veines running

‡ 6 *Sideritis latifolia glabra.*
Smooth broad leaued Alheale.

ning alongſt them, being alſo very hairie, but not ſnipt about the edges: the floures grow alongſt the branches, and vpon the main ſtalk in roundles like thoſe of the firſt mentioned, but leſſer, and of a darke colour, with a yellowiſh ſpot on their inſides: the ſeed is alſo contained in fiue cornered veſſels like as the former. It floures in Iune and Iuly, and growes amongſt the corne in Hungarie and Auſtria. This is onely ſet forth by *Cluſius*, and that vnder the name of *Sideritis 6. Pannonica.*

3 This hath ſome branches lying along vpon the ground, ſlender, quadrangular & hairie, which at certain ſpaces are ſet with leaues growing by couples, almoſt like thoſe of the firſt, but much leſſe, and ſnipt onely from the middle to the end: the floures grow after the manner of the former, and (as *Cluſius* thinkes) are like them, as is alſo the ſeed. *Cluſius* hath this by the name of *Sideritis* 4.

4 The ſame Authour hath alſo giuen vs another, which from the top of the root ſends foorth many branches, partly lying ſpred on the ground, and partly ſtanding vpright, being hairy, iointed, and ſquare like thoſe of the former, and ſuch alſo are the leaues, but that they are leſſe ſnipt about the edges: and in their boſomes from the bottome of the ſtalkes to the top grow roundles of whitiſh floures ſhaped like others of this kinde. *Cluſius* calls this *Sideritis* 5. He had onely the figures of theſe elegantly drawne by the hand of *Iaques Plateau*, and ſo ſent him.

5 This from a ſmall wooddie root ſends forth a ſquare hairie ſtalke ſome halfe foot high, and ſometimes higher, and this ſtalke moſt commonly ſends forth ſome foure branches, which ſubdiuide themſelues into ſmaller ones, all of them ſometimes lying vpon the ground, and the ſtalke ſtanding vpright; the leaues grow by couples at each ioint, from a broader bottome, ending in an obtuſe point, the lower leaues being ſome inch long, and not much leſſe in breadth: the floures are whitiſh, or light purple, ſmall and hooded, engirting the ſtalkes in roundles, which falling, foure longiſh blacke ſeeds are contained in fiue cornered veſſels. I firſt found it Auguſt 1626 in floure and ſeed amongſt the corne in a field ioining to a wood ſide not far from Greene-hiue in Kent, and I at that time, not finding it to be written of by any, called it *Sideritis humilis lato obtuſo folio*, but ſince I finde that *Bauhine* hath ſet it forth in his *Prodromus* by the name of *Sideritis Alſine Triſſaginis folio.*

6 This (which *Tabernamontanus* calls *Alyſſum Germanicum*, and whoſe figure was formerly giuen with the ſame title by our Authour in the 118 Chapter of the former Edition, with a Deſcription no waies agreeing therewith) grows vp with ſquare ſtalkes ſome cubite high, ſet with pretty large and greene ſmooth leaues ſnipt about the edges: the floures grow in roundles at the tops of the branches, being hooded, and of a pale yellow colour. This grows in the Corne fields in ſome places of Germany and Italy: and it is the *Sideritis* 2. of *Matthiolus* in *Bauhines* opinion, who cals it *Sideritis aruenſis latifolia glabra.*

7 There is another plant that growes frequently in the Corne fields of Kent, and by Purfleet in Eſſex which may fitly be ioined to theſe, for *Camerarius* calls it *Sideritis arvenſis flore rubro*, and in the *Hiſtoria Lugd.* it is named *Tetrahit anguſtifolium*, and thought to be *Ladanum ſegetum* of *Pliny*, mentioned *lib.* 29. *cap.* 8. and *lib.* 26. *cap.* 11. It hath a ſtalke ſome foot or better high, ſet with ſharp pointed longiſh leaues, hauing two or three nickes on their ſides, and growing by couples; at the top of the branches, and alſo the maine ſtalke it ſelfe, ſtand in one or two roundles faire red hooded floures: the root is ſmall and fibrous, dying euery yeare when it hath perfected the ſeed. It floures in Iuly and Auguſt. This is alſo ſometimes found with a white floure.

¶ *The Time, Place, &c.*

All theſe are ſufficiently deliuered in the deſcriptions.

¶ *The*

¶ *The Temperatures and Vertues.*

A Theſe plants are drie with little or no heat, and are endued with an aſtrictiue faculty. They conduce much to the healing of greene wounds being beaten and applied, or put in vnguents or plaiſters made for that purpoſe.

B They are alſo good for thoſe things that are mentioned in the laſt chapter, in B, and C.

C *Cluſius* ſaith, the firſt and ſecond are vſed in Stiria in fomentations, to bathe the head againſt the paines or aches thereof, as alſo againſt the ſtiffeneſſe and wearineſſe of the limbs or ioints.

D And the ſame Author affirmes that he hath knowne the decoction vſed with very good ſucceſſe in curing the inflammations and vlcerations of the legs. ‡

Chap. 233. *Of Water Horehound.*

‡ 1 *Marubium aquaticum.*
Water Horehound.

¶ *The Deſcription.*

1 Water Horehound is very like to blacke and ſtinking Horehound in ſtalke and floured cups, which are rough, pricking, & compaſſing the ſtalks round about like garlands: the leaues thereof be alſo blacke, but longer, harder, more deeply gaſhed in the edges than thoſe of ſtinking Horehound, yet not hairie at all, but wrinkled: the floures be ſmall and whitiſh: the root is faſtened with many blacke ſtrings.

¶ *The Place.*

It growes in Brooks on the brinks of water ditches and neere vnto motes, for it requireth ſtore of water, and groweth not in drie places.

¶ *The Time.*

It flouriſhes and floures in the Sommer moneths, in Iuly and Auguſt.

¶ *The Names.*

It is called *Aquatile*, and *Paluſtre Marubium*: In Engliſh, water Horehound. *Matthiolus* taketh it to be *Species prima Sideritidis*; or a kind of Ironwoort, which *Dioſcorides* hath deſcribed in the firſt place; but with this doth better agree that which is called *Herba Iudaica*, or Glid woort; it much leſſe agreeth with *Sideritis ſecunda*, or the ſecond Ironwoort, which opinion alſo hath his fauourers, for it is like in leafe to none of the Fernes. Some alſo thinke good to cal it *Herba Ægyptia*, becauſe they that feine themſelues Egyptians (ſuch as many times wander like vagabonds from citie to citie in Germanie and other places) do vſe with this herbe to giue themſelues a ſwart colour, ſuch as the Egyptians and the people of Africke are of; for the iuice of this herbe doth die euery thing with this kinde of colour, which alſo holdeth ſo faſt, as that it cannot be wiped or waſhed away: inſomuch as linnen cloth being died herewith, doth alwaies keepe that colour.

¶ *The Temperature.*

It ſeemeth to be cold, and withall very aſtringent or binding.

¶ *The Vertues.*

There is little vſe of the water Horehound in Phyſicke.

† The figure that heretofore was in the firſt place was of the *Marrubium nigrum* deſcribed in the next chapter; and the figure and deſcription that were in the ſecond place by the name of *Marrubium aquaticum acutum*, were of the ſo much magnified *Paeax Colon* or Clowns Al-heale of our Author, and therefore here omitted to auoid Tautologie.

Chap.

Chap. 234. *Of blacke or ſtinking Horehound.*

¶ *The Deſcription.*

1 BLacke Horehound is ſomewhat like vnto the white kinde. The ſtalkes be alſo ſquare and hairie. The leaues ſomewhat larger, of a darke ſwart or blackiſh colour, ſomewhat like the leaues of Nettles, ſnipt about the edges, of an vnpleaſant and ſtinking ſauour. The floures grow about the ſtalks in certain ſpaces, of a purple colour, in ſhape like thoſe of Archangell or dead Nettle. The roote is ſmall and threddie. ‡ I haue found this alſo with white floures.

‡ 2 To this may fitly be referred that plant which ſome haue called *Parietaria, Sideritis*, and *Herba venti*, with the additament of *Monſpelienſium* to each of theſe denominations: but *Bauhine*, who I herein follow, calls it *Marrubium nigrum longifolium*. It is thus deſcribed: the root is thicke and very fibrous, ſending vp many ſquare rough ſtalkes ſome cubite high, ſet at certaine ſpaces with leaues longer and broader than Sage, rough alſo and ſnipt about the edges: and out of their boſomes come floures, hooded, and purple of colour, engirting the ſtalkes as in other plants of this kinde. Some haue thought this to be *Othonna* of the Antients, becauſe the leaues not falling off in Winter, are either eaten by the Wormes, or waſted by the iniurie of the weather to the very nerues or veines that runne ouer them; ſo that by this meanes they are all perforated, and eaſily blowne thorow by each blaſt of winde: which cauſed ſome to giue it alſo the name of *Herba venti*. It grows in the corne fields about Montpelier.‡

† 1 *Marrubium nigrum.*
Stinking Horehound.

‡ 2 *Marrubium nigrum Longifolium.*
Long leaued Horehound.

¶ *The Place.*

It is found in gardens amongſt pot herbes, and oftentimes amongſt ſtones and rubbiſh in drie ſoiles.

¶ *The Time.*

It floureth and flouriſheth when the others do.

¶ *The Names.*

It is called in Greeke βαλλωτὸς, and μέλας πεφόνιον, as *Pliny* teſtifieth in his 27. booke, 8. chapter: of ſome, *Marrubiaſtrum*, or *Marrubium ſpurium*, or baſtard Horehound: in ſhops, *Praſium fœtidum*, and *Ballote*: in Italian, *Marrubiaſtro*: in Spaniſh, *Marrauio negro*: in French, *Marubin noir & putant*: in Engliſh ſtinking Horehound.

¶ *The Temperature.*

Stinking Horehound is hot and dry, and as *Paulus Ægineta* teacheth, of a ſharpe and clenſing faculty.

¶ *The Vertues.*

A Being ſtamped with ſalt and applied, it cureth the biting of a mad dogge, againſt which it is of
B great efficacy, as *Dioſcorides* writeth.

The leaues roſted in hot embers do waſte and conſume away hard lumpes or knots in or about the fundament. It alſo clenſeth foule and filthy vlcers, as the ſame Author teacheth.

† The figure was of *Lamium album*, or Archangell with the white floure; and the figure that ſhould haue beene here was in the former Chapter.

Chap. 235. *Of Archangell, or dead Nettle.*

† 1 *Lamium album.*
White Archangell.

2 *Lamium luteum.*
Yellow Archangell.

¶ *The Deſcription.*

1 WHite Archangell hath foure ſquare ſtalkes, a cubit high, leaning this way and that way, by reaſon of the great weight of his ponderous leaues, which are in ſhape like thoſe of Nettles, nicked round about the edges, yet not ſtinging at all, but

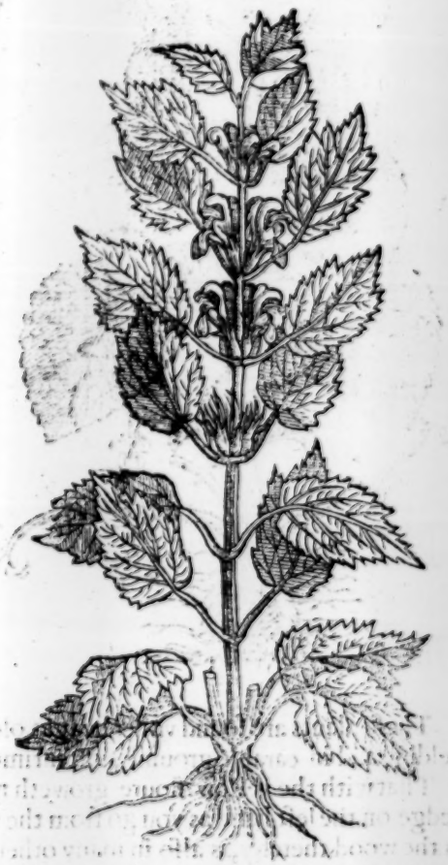
but ſoft, and as it were downy. The floures compaſſe the ſtalkes round about at certaine diſtances, euen as thoſe of Horehound doe, whereof doubtleſſe this is a kinde, and not of Nettles, as hath been generally holden: which floures are white of colour, faſhioned like to litrle gaping hoods or helmets. The root is very threddy. ‡ There is alſo a variety of this hauing red or purple floures. ‡

2 Yellow Archangell hath ſquare ſtalkes riſing from a threddy root, ſet with leaues by couples, very much cut or hackt about the edges, and ſharpe pointed. The vppermoſt whereof are oftentimes of a faire purple colour. The floures grow among the ſame leaues, of a gold yellow colour, faſhioned like thoſe of the white Archangell, but greater, and more wider gaping open.

3 Red Archangell being called *Vrtica non mordax*, or dead Nettle, hath many leaues ſpred vpon the ground, among which riſe vp ſtalkes hollow, and ſquare, whereupon do grow rough leaues of an ouer worne colour, among which come forth purple floures, ſet about in round wharles, or rundles. The root is ſmall, and periſheth at the firſt approach of winter.

† 3 *Lamium rubrum.*
Red Archangell.

‡ 4 *Lamium Pannonicum, ſiue Galeopſis.*
Hungary dead Nettle.

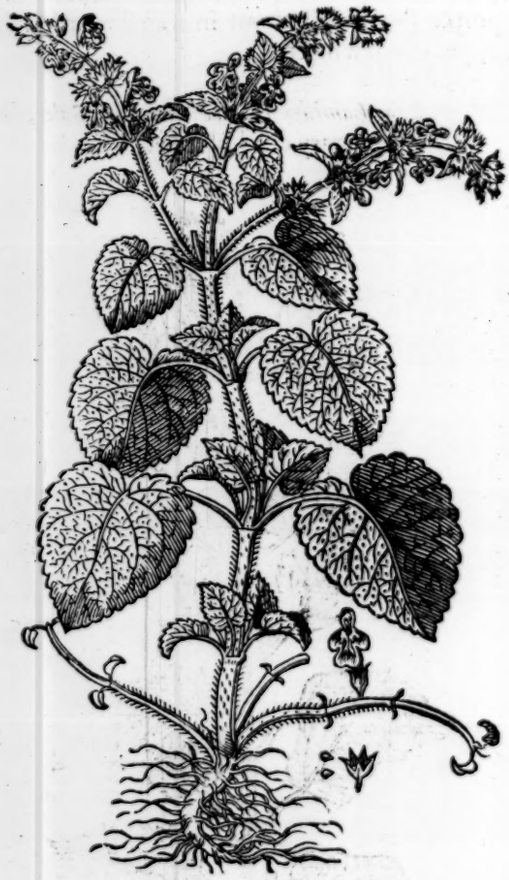


4 Dead Nettle of Hungary hath many large rough leaues very much curled or crumpled like thoſe of the ſtinging nettle, of a darke greene colour, ſnipt about the edges like the teeth of a ſawe, ſet vpon a foure ſquare ſtalke by couples; from the boſome of which leaues come forth the floures cloſe to the ſtalkes, of a perfect purple colour, in ſhape like thoſe of the white Archangell, gaping like a dragons mouth, the lower chap whereof is of a bright purple ſpotted with white, which being paſt, there doth follow ſeed incloſed in rough huskes, with fine ſharpe points ſticking out. The root is thicke, tough, conſiſting of many threds and long ſtrings.

‡ 5 To this of *Cluſius*, we may fitly refer 2. other plants: the firſt of which *Tragus* and others call *Vrtica Heraclea*, or *Herculea*, and *Cluſius* iudges it to be the true *Galeopſis* of *Dioſcorides*, as *Tragus* alſo thought before him. The root hereof is fibrous and creeping, ſending forth many foure ſquare ſtalkes, vpon which at each joint grow two leaues vpon long ſtalkes very like thoſe of Nettles, but more ſoft and hairy, not ſtinging: the tops of the branches end as it were in a ſpike made of ſeuerall roundles of floures like thoſe of Archangell but leſſe, and of a purple colour ſpotted with white on their inſides; the ſeedes are contained foure in a veſſell, and are blacke when they come to be ripe; It growes about hedges in very many places, and floures in Iune and Iuly.

‡ 6 This hath roots like thoſe of the laſt deſcribed, ſending vp alſo ſquare ſtalkes a foot high, ſet at each ioint with leaues growing vpon long ſtalkes like thoſe of the ſmall dead Nettle, or rather like thoſe of Alehoofe: out of the boſoms of thoſe come three or foure ſtalks carrying floures like thoſe of Alehoof, gaping, but without a hood, but with a lip turned vp, which is variegated with blew, white, and purple. This hiſtorie *Cluſius* (who did not ſee the plant, but an exact figure thereof in colours) giues vs, and he names it as you finde expreſt in the title. ‡

‡ 5 *Galeopſis vera.*
Hedge Nettle.



6 Lamium Pannonicum 3. Cluſij.
Hungary Nettle with the variegated floure.

¶ *The Place.*

Theſe plants are found vnder hedges, old wals, common waies, among rubbiſh, in the borders of fieldes, and in earable grounds, oftentimes in gardens ill husbanded.

That with the yellow floure groweth not ſo common as the others. I haue found it vnder the hedge on the left hand as you go from the village of Hampſted neere London to the Church, and in the wood thereby, as alſo in many other copſes about Lee in Eſſex, neere Watford and Buſhie in Middleſex, and in the woods belonging to the Lord Cobham in Kent.

¶ *The Time.*

They floure for the moſt part all Sommer long, but chiefely in the beginning of May.

¶ *The Names.*

Archangell is called of ſome *Vrtica iners*, and *Mortua:* of ſome, *Lamium*: in Engliſh, Archangell, blinde Nettle, and dead Nettle.

¶ *The Temperature.*

They are hotter and drier than Nettle, approching to the temperature of Horehound.

¶ *The Vertues.*

A Archangel [or rather the hedge Nettle] ſtamped with vineger, and applied in manner of a pultis taketh away Wens and hard ſwellings, the Kings euill, inflammation of the kernels vnder the eares and iawes, and alſo hot fierie inflammations of the kernels of the necke, arme-holes and flanks.

B It is good to bathe thoſe parts with the decoction of it, as *Dioſcorides* and *Pliny* ſay.

C The later Phyſitions thinke that the white floures of Archangell doe ſtaie the whites, and for the ſame purpoſe diuers do make of them a Conſerue, as they call it of the floures and ſugar, which they appoint to be taken for certaine daies together.

Th

The floures are baked with ſugar as roſes are, which is called ſugar Roſet: as alſo the diſtilled water of them, which is vſed to make the heart merry; to make a good colour in the face, and to make the vitall ſpirits more freſh and liuely. D

† The firſt figure that was formerly in this Chapter, was of the *Galioſis* 1. of *Tabern* being a kinde of dead Nettle that hath the leaues ſpotted with white, & ſomewhat ſmaller than the ordinary one: the figure that ſhould haue been here was in the laſt Chapter; the third was the ſame with the firſt (that ſhould haue bin) differing onely in colour of floures, and that which ſhould haue beene in the third place was in the fourth.

CHAP. 236. *Of Mother woort.*

Cardiaca.
Mother-woort.

¶ *The Deſcription.*

MOther woort bringeth forth ſtalks foure ſquare, thick, hard, two cubites high, of an obſcure or ouerworn red colour: the leaues are ſomewhat black, like thoſe of Nettles, but greater and broader than the leaues of Horehound, deeply indented or cut on the edges. The husks are hard & pricking, which do compaſſe the ſtalks about like wharles, or little crownets, out of which do growpurpliſh floures, not vnlike to thoſe of dead Nettle, but leſſer: The roote is compact of many ſmall ſtrings, the whole plant is of a very ranke ſmel and bitter taſte.

¶ *The Place.*

It ioieth among rubbiſh, in ſtony and other barren and rough places, eſpecially about Oxford; it profiteth well in gardens.

¶ *The Time.*

It flouriſheth, floureth, and ſeedeth from Iune to September: the leaues and ſtalks periſh in winter, but the root indureth.

¶ *The Names.*

It is called in our age *Cardiaca*: in High Dutch, **Hertzgeſpoꝛt**: in Low Dutch, **Hertegeſpan**: in French, *Agripaulme*: in Engliſh, Motherwoort. Some there be that make it a kinde of Bawme, it ſeemes that it may be alſo referred to *Sideritis Herculana*, or Hercules Ironwoort.

¶ *The Temperature.*

Motherwoort is hot and dry in the ſecond degree, by reaſon of the clenſing aud binding quality that it hath.

¶ *The Vertues.*

Diuers commend it againſt the infirmities of the heart: it is iudged to be ſo forceable, that it is thought it tooke his name *Cardiaca* of the effect. A

It is alſo reported to cure conuulſions and cramps, and likewiſe the palſie: to open the obſtructions or ſtoppings of the intrails: to kill all kindes of Wormes of the bellie. B

The pouder of the herbe giuen in wine, prouoketh not onely vrine, or the monthly courſe, but alſo is good for them that are in hard trauell with childe. C

Moreouer, the ſame is commended for greene wounds: it is alſo a remedie againſt certain diſeaſes in cattell, as the cough and murreine, and for that cauſe diuers husbandmen oftentimes much deſire it. D

Chap. 237. *Of ſtinging Nettle.*

¶ *The Deſcription.*

1 THe ſtalkes of the firſt be now and then halfe a yard high, round, and hollow within: the leaues are broad, ſharp pointed, cut round about like a ſaw, they be rough on both ſides, and couered with a ſtinging downe, which with a light touch onely cauſeth a great burning, and raiſeth hard knots in the skin like bliſters, and ſometimes maketh it red. The ſeed commeth from the roots of the leaues in round pellets bigger than Peaſe; it is ſlippery, glittering like Line-ſeed, but yet leſſer and rounder. The roote is ſet with ſtrings.

1 *Vrtica Romana.*
Romane Nettle.

2 *Vrtica vrens.*
Common ſtinging Nettle.

2 The ſecond Nettle beeing our common Nettle is like to the former in leaues and ſtalkes, but yet now and then higher and more full of branches: it is alſo couered with a downe that ſtingeth and burneth as well as the other: the ſeed hereof is ſmall, and groweth not in round bullets, but on long ſlender ſtrings, as it were in cluſters, as thoſe of the female Mercury, which grow along the ſtalkes and branches aboue the leaues, very many. The root is full of ſtrings; of colour ſomething yellow, and creepeth all about. ‡ This hath the ſtalkes and rootes ſometimes a little reddiſh, whence *Tabernamontanus* and our Authour gaue another figure thereof by the name of *Vrtica rubra*, Red Nettle. ‡

3 The third is like to the ſecond in ſtalkes, leaues and ſeed, that groweth by cluſters, but leſſer, and commonly more full of branches, of a light greene, more burning and ſtinging; the root is ſmall and not without ſtrings.

¶ *The*

3 *Vrtica minor.*
Small Nettle.

¶ *The Place.*

Nettles grow in vntilled places, and the firſt in thicke woods, and is a ſtranger in England, notwithſtanding it groweth in my garden.

The ſecond is more common, and groweth of it ſelfe neere vnto hedges, buſhes, brambles, and old walls, almoſt euery where.

The third alſo commeth vp in the ſame places, which notwithſtanding groweth in gardens and moiſt earable grounds.

¶ *The Time.*

They all flouriſh in Sommer: the ſecond ſuffereth the winters cold: the ſeed is ripe, and may be gathered in Iuly and Auguſt.

¶ *The Names.*

It is called in Greeke Ἀκαλήφη: in Latine, *Vrtica, ab vrendo*, of his burning and ſtinging qualitie: whereupon *Macer* ſaith,

— nec immerito nomen ſumpſiſſe videtur,
Tacta quod exurat digitos vrtica tenentis.

Neither without deſert his name hee ſeemes to git,
As that which quickly burnes the fingers touching it.

And of diuers alſo with, becauſe it ſtingeth with hurtfull downe: in high-Dutch, **Neſſel**: in Italian, *Ortica*: in Spaniſh, *Hortiga*: in French, *Ortie*: in Engliſh, Nettle. The firſt is called in low Dutch **Roomſche Netelen**, that is, *Romana vrtica*, or Roman Nettle: and likewiſe in high-Dutch **Walſche Neſſelen**, that is, *Italica vrtica*, Italian Nettle, becauſe it is rare, and groweth but in few places, and the ſeed is ſent from other countries, and ſowne in gardens for his vertues: it is alſo called of diuers *Vrtica mas*: and of *Dioſcorides, Vrtica ſylueſtris*, or wilde Nettle, which he ſaith is more rough, with broader and longer leaues, and with the ſeed of Flax, but leſſer. *Pliny* maketh the wilde Nettle the male, and in his 21 booke, chap. 15. ſaith that it is milder and gentler: it is called in Engliſh Romane Nettle, Greeke Nettle, Male Nettle. The ſecond is called *Vrtica fœmina*, and oftentimes *Vrtica maior*, that it may differ from the third Nettle: in Engliſh, Female Nettle, Great Nettle, or common Nettle. The third is named in high-Dutch **Heyter Neſſel**: in the Brabanders ſpeech, **Heute Netelen**, ſo called of the ſtinging qualitie: in Engliſh, Small Nettle, Small burning Nettle: but whether this be that or no which *Pliny* calleth *Cania*, or rather the firſt, let the Students conſider. There is in the wilde Nettle a more ſtinging qualitie, which, ſaith he, is called *Cania*, with a ſtalke more ſtinging, hauing nicked leaues.

¶ *The Temperature.*

Nettle is of temperature dry, a little hot, ſcarſe in the firſt degree: it is of thin and ſubtil parts; for it doth not therefore burne and ſting by reaſon it is extreme hot, but becauſe the downe of it is ſtiffe and hard, piercing like fine little prickles or ſtings, and entring into the skin: for if it be withered or boyled it ſtingeth not at all, by reaſon that the ſtiffeneſſe of the downe is fallen away.

¶ *The Vertues.*

Being eaten, as *Dioſcorides* ſaith, boyled with Perywinkles, it maketh the body ſoluble, doing it by a kinde of cleanſing qualitie: it alſo prouoketh vrine, and expelleth ſtones out of the kidneyes: being boyled with barley creame it bringeth vp tough humours that ſticke in the cheſt, as it is thought. A

Being ſtamped, and the iuyce put vp into the noſthrils, it ſtoppeth the bleeding of the noſe: the iuyce is good againſt the inflammation of the Vuula. B

The ſeed of Nettle ſtirreth vp luſt, eſpecially drunke with Cute: for (as *Galen* ſaith) it hath in it a certaine windineſſe. C

It

D It concocteth and draweth out of the cheſt raw humors.

E It is good for them that cannot breathe vnleſſe they hold their necks vpright, and for thoſe that haue the pleuriſie, and for ſuch as be ſick of the inflammation of the lungs, if it be taken in a looch or licking medicine, and alſo againſt the troubleſome cough that children haue, called the Chincough.

F *Nicander* affirmeth that it is a remedie againſt the venomous qualitie of Hemlocke, Muſhroms, and Quick-ſiluer.

G And *Apollodoris* ſaith that it is a counterpoyſon for Henbane, Serpents, and Scorpions.

H As *Pliny* witneſſeth, the ſame Author writeth, that the oyle of it takes away the ſtinging which the Nettle it ſelfe maketh.

I The ſame groſſely powned, and drunke in white wine, is a moſt ſingular medicine againſt the ſtone either in the bladder or in the reines, as hath beene often proued, to the great eaſe and comfort of thoſe that haue been grieuouſly tormented with that maladie.

K It expelleth grauell, and cauſeth to make water.

L The leaues of any kinde of Nettle, or the ſeeds, do worke the like effect, but not with that good ſpeed and ſo aſſuredly as the Romane Nettle.

Chap. 238. *Of Hempe.*

1 *Cannabis mas.*
Male or Steele Hempe.

‡ 2 *Cannabis fœmina.*
Femeline, or Female Hempe.

¶ *The Deſcription.*

1 HEmpe bringeth forth round ſtalkes, ſtraight, hollow, fiue or ſix foot high, full of branches when it groweth wilde of it ſelfe; but when it is ſowne in fields it hath very few or no branches at all. The leaues thereof be hard, tough, ſomewhat blacke, and if they be bruiſed they be of a ranke ſmell, made vp of diuers little leaues ioyned together, euery particular leafe whereof is narrow, long, ſharpe pointed, and nicked in the edges: the ſeeds come forth from the bottomes of the wings and leaues, being round, ſomewhat hard, full of white ſubſtance. The roots haue many ſtrings.

2 There is another, being the female Hempe, yet barren and without ſeed, contrarie vnto the nature

nature of that ſex; which is very like to the other being the male, and one muſt be gathered before the other be ripe, elſe it will wither away, and come to no good purpoſe.

¶ *The Place.*

Hempe, as *Columella* writeth, delighteth to grow in a fat dunged and waterie ſoile, or plaine and moiſt, and deepely digged.

¶ *The Time.*

Hempe is ſowne in March and Aprill; the firſt is ripe in the end of Auguſt, the other in Iuly.

¶ *The Names.*

This is named of the Grecians κάνναβις: alſo of the Latines *Cannabis*: the Apothecaries keep that name: in high-Dutch, **Zamer hanff**: of the Italians *Canape*: of the Spaniards, *Canamo*: in French, *Chanure*: of the Brabanders, **Kemp**: in Engliſh, Hempe. The male is called Charle Hempe, and Winter Hempe: the female, Barren Hempe, and Sommer Hempe.

¶ *The Temperature and Vertues.*

The ſeed of Hempe, as *Galen* writeth in his bookes of the faculties of ſimple medicines, is hard of digeſtion, hurtfull to the ſtomacke and head, and containeth in it an ill iuyce: notwithſtanding ſome do vſe to eate the ſame parched, *cum alijs tragematis*, with other junkets. A

It conſumeth winde, as the ſaid Author ſaith in his booke of the faculties of medicines, and is ſo great a drier, as that it drieth vp the ſeed if too much be eaten of it. B

Dioſcorides ſaith, That the iuyce of the herbe dropped into the eares aſſwageth the paine thereof proceeding (as I take it) of obſtruction or ſtopping, as *Galen* addeth. C.

The inner ſubſtance or pulpe of the ſeed preſſed out in ſome kinde of liquor, is giuen to thoſe that haue the yellow jaundice, when the diſeaſe firſt appeares, and oftentimes with good ſucceſſe, if the diſeaſe come of obſtruction without an ague; for it openeth the paſſage of the gall, and diſperſeth and concocteth the choler through the whole body. D

Matthiolus ſaith, that the ſeed giuen to hens cauſeth them to lay egges more plentifully. E

CHAP. 239. *Of wilde Hempe.*

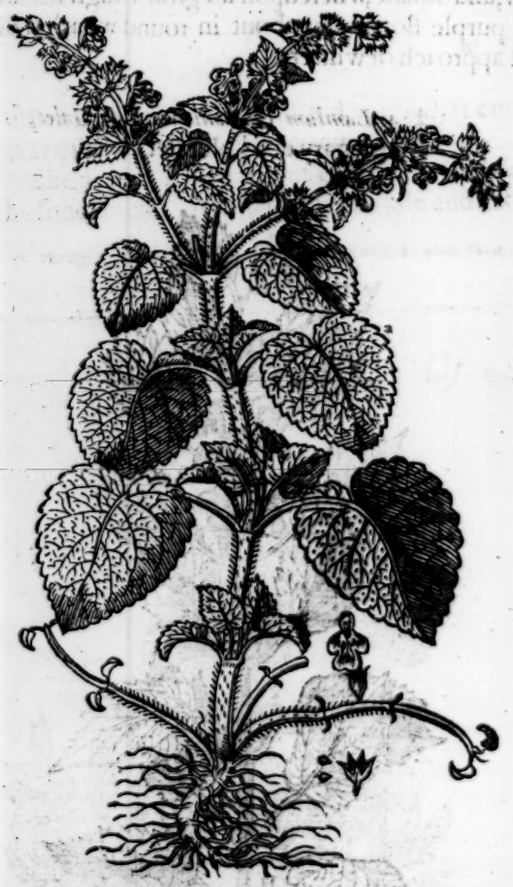
1 *Cannabis Spuria.*
Wilde Hempe.

‡ 2 *Cannabis Spuria altera.*
Baſtard Hempe.

¶ *The*

‡ 6 This hath roots like thoſe of the laſt deſcribed, ſending vp alſo ſquare ſtalkes a foot high, ſet at each ioint with leaues growing vpon long ſtalkes like thoſe of the ſmall dead Nettle, or rather like thoſe of Alehoofe: out of the boſoms of thoſe come three or foure ſtalks carrying floures like thoſe of Alehoof, gaping, but without a hood, but with a lip turned vp, which is variegated with blew, white, and purple. This hiſtorie *Cluſius* (who did not ſee the plant, but an exact figure thereof in colours) giues vs, and he names it as you finde expreſt in the title. ‡

‡ 5 *Galeopſis vera.*
Hedge Nettle.



6 *Lamium Pannonicum 3. Cluſij.*
Hungary Nettle with the variegated floure.

¶ *The Place.*

Theſe plants are found vnder hedges, old wals, common waies, among rubbiſh, in the borders of fieldes, and in earable grounds, oftentimes in gardens ill husbanded.

That with the yellow floure groweth not ſo common as the others. I haue found it vnder the hedge on the left hand as you go from the village of Hampſted neere London to the Church, and in the wood thereby, as alſo in many other copſes about Lee in Eſſex, neere Watford and Buſhie in Middleſex, and in the woods belonging to the Lord Cobham in Kent.

¶ *The Time.*

They floure for the moſt part all Sommer long, but chiefely in the beginning of May.

¶ *The Names.*

Archangell is called of ſome *Vrtica iners*, and *Mortua:* of ſome, *Lamium*: in Engliſh, Archangell, blinde Nettle, and dead Nettle.

¶ *The Temperature.*

They are hotter and drier than Nettle, approching to the temperature of Horehound.

¶ *The Vertues.*

A Archangel [or rather the hedge Nettle] ſtamped with vineger, and applied in manner of a pultis taketh away Wens and hard ſwellings, the Kings euill, inflammation of the kernels vnder the eares and iawes, and alſo hot fierie inflammations of the kernels of the necke, arme-holes and flanks.

B It is good to bathe thoſe parts with the decoction of it, as *Dioſcorides* and *Pliny* ſay.

C The later Phyſitions thinke that the white floures of Archangell doe ſtaie the whites, and for the ſame purpoſe diuers do make of them a Conſerue, as they call it of the floures and ſugar, which they appoint to be taken for certaine daies together.

Th

The floures are baked with ſugar as roſes are, which is called ſugar Roſet: as alſo the diſtilled water of them, which is vſed to make the heart merry; to make a good colour in the face, and to make the vitall ſpirits more freſh and liuely. D

† The firſt figure that was formerly in this Chapter, was of the *Galeopſis* 1. of *Tabern* being a kinde of dead Nettle that hath the leaues ſpotted with white, & ſomewhat ſmaller than the ordinary one: the figure that ſhould haue been here was in the laſt Chapter; the third was the ſame with the firſt (that ſhould haue bin) differing onely in colour of floures, and that which ſhould haue beene in the third place was in the fourth.

Chap. 236. *Of Mother woort.*

Cardiaca.
Mother-woort.

¶ *The Deſcription.*

MOther woort bringeth forth ſtalks foure ſquare, thick, hard, two cubites high, of an obſcure or ouerworn red colour: the leaues are ſomewhat black, like thoſe of Nettles, but greater and broader than the leaues of Horehound, deeply indented or cut on the edges. The husks are hard & pricking, which do compaſſe the ſtalks about like wharles, or little crownets, out of which do grow purpliſh floures, not vnlike to thoſe of dead Nettle, but leſſer: The roote is compact of many ſmall ſtrings, the whole plant is of a very ranke ſmel and bitter taſte.

¶ *The Place.*

It ioieth among rubbiſh, in ſtony and other barren and rough places, eſpecially about Oxford; it profiteth well in gardens.

¶ *The Time.*

It flouriſheth, floureth, and ſeedeth from Iune to September: the leaues and ſtalks periſh in winter, but the root indureth.

¶ *The Names.*

It is called in our age *Cardiaca*: in High Dutch, **Hertzgeſpoꝛt**: in Low Dutch, **Hertegeſpan**: in French, *Agripaulme*: in Engliſh, Motherwoort. Some there be that make it a kinde of Bawme, it ſeemes that it may be alſo referred to *Sideritis Herculana*, or Hercules Ironwoort.

¶ *The Temperature.*

Motherwoort is hot and dry in the ſecond degree, by reaſon of the clenſing aud binding quality that it hath.

¶ *The Vertues.*

Diuers commend it againſt the infirmities of the heart: it is iudged to be ſo forceable, that it is thought it tooke his name *Cardiaca* of the effect. A

It is alſo reported to cure conuulſions and cramps, and likewiſe the palſie: to open the obſtructions or ſtoppings of the intrails: to kill all kindes of Wormes of the bellie. B

The pouder of the herbe giuen in wine, prouoketh not onely vrine, or the monthly courſe, but alſo is good for them that are in hard trauell with childe. C

Moreouer, the ſame is commended for greene wounds: it is alſo a remedie againſt certain diſeaſes in cattell, as the cough and murreine, and for that cauſe diuers husbandmen oftentimes much deſire it. D

Chap. 237. *Of ſtinging Nettle.*

¶ *The Deſcription.*

1 THe ſtalkes of the firſt be now and then halfe a yard high, round, and hollow wirhin: the leaues are broad, ſharp pointed, cut round about like a ſaw, they be rough on both ſides, and couered with a ſtinging downe, which with a light touch onely cauſeth a great burning, and raiſeth hard knots in the skin like bliſters, and ſometimes maketh it red. The ſeed commeth from the roots of the leaues in round pellets bigger than Peaſe; it is ſlippery, glittering like Line-ſeed, but yet leſſer and rounder. The roote is ſet with ſtrings.

1 *Vrtica Romana.*
Romane Nettle.

2 *Vrtica vrens.*
Common ſtinging Nettle.

2 The ſecond Nettle beeing our common Nettle is like to the former in leaues and ſtalkes, but yet now and then higher and more full of branches: it is alſo couered with a downe that ſtingeth and burneth as well as the other: the ſeed hereof is ſmall, and groweth not in round bullets, but on long ſlender ſtrings, as it were in cluſters, as thoſe of the female Mercury, which grow along the ſtalkes and branches aboue the leaues, very many. The root is full of ſtrings; of colour ſomething yellow, and creepeth all about. ‡ This hath the ſtalkes and rootes ſometimes a little reddiſh, whence *Tabernamontanus* and our Authour gaue another figure thereof by the name of *Vrtica rubra*, Red Nettle. ‡

3 The third is like to the ſecond in ſtalkes, leaues and ſeed, that groweth by cluſters, but leſſer, and commonly more full of branches, of a light greene, more burning and ſtinging; the root is ſmall and not without ſtrings.

¶ *The*

3 *Vrtica minor.*
Small Nettle.

¶ *The Place.*

Nettles grow in vntilled places, and the firſt in thicke woods, and is a ſtranger in England, notwithſtanding it groweth in my garden.

The ſecond is more common, and groweth of it ſelfe neere vnto hedges, buſhes, brambles, and old walls, almoſt euery where.

The third alſo commeth vp in the ſame places, which notwithſtanding groweth in gardens and moiſt earable grounds.

¶ *The Time.*

They all flouriſh in Sommer: the ſecond ſuffereth the winters cold: the ſeed is ripe, and may be gathered in Iuly and Auguſt.

¶ *The Names.*

It is called in Greeke ἀκαλήφη: in Latine, *Vrtica, ab vrendo*, of his burning and ſtinging qualitie: whereupon *Macer* ſaith,

— nec immerito nomen ſumpſiſſe videtur,
Tacta quod exurat digitos vrtica tenentis.

Neither without deſert his name hee ſeemes to git,
As that which quickly burnes the fingers touching it.

And of diuers alſo with, becauſe it ſtingeth with hurtfull downe: in high-Dutch, **Neſſel**: in Italian, *Ortica*: in Spaniſh, *Hortiga*: in French, *Ortie*: in Engliſh, Nettle. The firſt is called in low Dutch **Roomſche Netelen**, that is, *Romana vrtica*, or Roman Nettle: and likewiſe in high-Dutch **Walſche Neſſelen**, that is, *Italica vrtica*, Italian Nettle, becauſe it is rare, and groweth but in few places, and the ſeed is ſent from other countries, and ſowne in gardens for his vertues: it is alſo called of diuers *Vrtica mas*: and of *Dioſcorides*, *Vrtica ſylueſtris*, or wilde Nettle, which he ſaith is more rough, with broader and longer leaues, and with the ſeed of Flax, but leſſer. *Pliny* maketh the wilde Nettle the male, and in his 21 booke, chap. 15. ſaith that it is milder and gentler: it is called in Engliſh Romane Nettle, Greeke Nettle, Male Nettle. The ſecond is called *Vrtica fœmina*, and oftentimes *Vrtica maior*, that it may differ from the third Nettle: in Engliſh, Female Nettle, Great Nettle, or common Nettle. The third is named in high-Dutch **Heyter Neſſel**: in the Brabanders ſpeech, **Heiſte Netelen**, ſo called of the ſtinging qualitie: in Engliſh, Small Nettle, Small burning Nettle: but whether this be that or no which *Pliny* calleth *Cania*, or rather the firſt, let the Students conſider. There is in the wilde Nettle a more ſtinging qualitie, which, ſaith he, is called *Cania*, with a ſtalke more ſtinging, hauing nicked leaues.

¶ *The Temperature.*

Nettle is of temperature dry, a little hot, ſcarſe in the firſt degree: it is of thin and ſubtil parts; for it doth not therefore burne and ſting by reaſon it is extreme hot, but becauſe the downe of it is ſtiffe and hard, piercing like fine little prickles or ſtings, and entring into the skin: for if it be withered or boyled it ſtingeth not at all, by reaſon that the ſtiffeneſſe of the downe is fallen away.

¶ *The Vertues.*

Being eaten, as *Dioſcorides* ſaith, boyled with Perywinkles, it maketh the body ſoluble, doing it by a kinde of cleanſing qualitie: it alſo prouoketh vrine, and expelleth ſtones out of the kidneyes: being boyled with barley creame it bringeth vp tough humours that ſticke in the cheſt, as it is thought. A

Being ſtamped, and the iuyce put vp into the noſthrils, it ſtoppeth the bleeding of the noſe: the iuyce is good againſt the inflammation of the Vuula. B

The ſeed of Nettle ſtirreth vp luſt, eſpecially drunke with Cute: for (as *Galen* ſaith) it hath in it a certaine windineſſe. C

It

It concocteth and draweth out of the cheſt raw humors.

It is good for them that cannot breathe vnleſſe they hold their necks vpright, and for thoſe that haue the pleuriſie, and for ſuch as be ſick of the inflammation of the lungs, if it be taken in a looch or licking medicine, and alſo againſt the troubleſome cough that children haue, called the Chincough.

Nicander affirmeth that it is a remedie againſt the venomous qualitie of Hemlocke, Muſhroms, and Quick-ſilver.

And *Apollodoris* ſaith that it is a counterpoyſon for Henbane, Serpents, and Scorpions.

As *Pliny* witneſſeth, the ſame Author writeth, that the oyle of it takes away the ſtinging which the Nettle it ſelfe maketh.

The ſame groſſely powned, and drunke in white wine, is a moſt ſingular medicine againſt the ſtone either in the bladder or in the reines, as hath beene often proued, to the great eaſe and comfort of thoſe that haue been grieuouſly tormented with that maladie.

It expelleth grauell, and cauſeth to make water.

The leaues of any kinde of Nettle, or the ſeeds, do worke the like effect, but not with that good ſpeed and ſo aſſuredly as the Romane Nettle.

Chap. 238. *Of Hempe.*

1 *Cannabis mas.*
Male or Steele Hempe.

‡ 2 *Cannabis fœmina.*
Femeline, or Female Hempe.

¶ *The Deſcription.*

1 Hempe bringeth forth round ſtalkes, ſtraight, hollow, fiue or ſix foot high, full of branches when it groweth wilde of it ſelfe; but when it is ſowne in fields it hath very few or no branches at all. The leaues thereof be hard, tough, ſomewhat blacke, and if they be bruiſed they be of a ranke ſmell, made vp of diuers little leaues ioyned together, euery particular leafe whereof is narrow, long, ſharpe pointed, and nicked in the edges: the ſeeds come forth from the bottomes of the wings and leaues, being round, ſomewhat hard, full of white ſubſtance. The roots haue many ſtrings.

2 There is another, being the female Hempe, yet barren and without ſeed, contrarie vnto the nature

nature of that ſex; which is very like to the other being the male, and one muſt be gathered before the other be ripe, elſe it will wither away, and come to no good purpoſe.

¶ *The Place.*

Hempe, as *Columella* writeth, delighteth to grow in a fat dunged and waterie ſoile, or plaine and moiſt, and deepely digged.

¶ *The Time.*

Hempe is ſowne in March and Aprill; the firſt is ripe in the end of Auguſt, the other in Iuly.

¶ *The Names.*

This is named of the Grecians κάνναβις: alſo of the Latines *Cannabis*: the Apothecaries keep that name: in high-Dutch, **Zamer hanff**: of the Italians *Canape*: of the Spaniards, *Canamo*: in French, *Chanure*: of the Brabanders, **Kemp**: in Engliſh, Hempe. The male is called Charle Hempe, and Winter Hempe: the female, Barren Hempe, and Sommer Hempe.

¶ *The Temperature and Vertues.*

The ſeed of Hempe, as *Galen* writeth in his bookes of the faculties of ſimple medicines, is hard of digeſtion, hurtfull to the ſtomacke and head, and containeth in it an ill iuyce: notwithſtanding ſome do vſe to eate the ſame parched, *cum alijs tragematis*, with other junkets. A

It conſumeth winde, as the ſaid Author ſaith in his booke of the faculties of medicines, and is ſo great a drier, as that it drieth vp the ſeed if too much be eaten of it. B

Dioſcorides ſaith, That the iuyce of the herbe dropped into the eares aſſwageth the paine thereof proceeding (as I take it) of obſtruction or ſtopping, as *Galen* addeth. C.

The inner ſubſtance or pulpe of the ſeed preſſed out in ſome kinde of liquor, is giuen to thoſe that haue the yellow iaundice, when the diſeaſe firſt appeares, and oftentimes with good ſucceſſe, if the diſeaſe come of obſtruction without an ague; for it openeth the paſſage of the gall, and diſperſeth and concocteth the choler through the whole body. D

Matthiolus ſaith, that the ſeed giuen to hens cauſeth them to lay egges more plentifully. E

CHAP. 239. *Of wilde Hempe.*

1 *Cannabis Spuria.*
Wilde Hempe.

‡ 2 *Cannabis Spuria altera.*
Baſtard Hempe.

¶ *The*

‡ 3 *Cannabis Spuria tertia.*
Small Baſtard Hempe.

¶ *The Deſcription.*

1 THis wilde Hempe, called *Cannabis Spuria*, or Baſtard Hempe, hath ſmal ſlender hoary and hairie ſtalkes a foot high, beſet at euery ioynt with two leaues, ſmally indented about the edges ſomewhat like a Nettle. The floures grow in rundles about the ſtalkes, of a purple colour, and ſometimes alſo white: the root is little and threddy.

2 There is likewiſe another kind of wild Hempe which hath hairie ſtalkes and leaues like the former, but the floures are greater, gaping wide open like the floures of *Lamium*, or dead Nettle, whereof this hath been taken for a kinde: but hee that knoweth any thing may eaſily diſcerne the ſauor of hempe from the ſmell of dead Nettle. The floures are of a cleare and light carnation colour, declining to purple.

3 There is alſo another kinde of wilde Hempe like vnto the laſt before mentioned, ſauing that it is ſmaller in each reſpect, and not ſo hairy. The leafe is ſomewhat rounder: the root ſmall and threddy: the floure is larger, being purple or white, with a yellow ſpot in the inſide.

¶ *The Place.*

Theſe kinds of wild or baſtard Hempe do grow vpon hills and mountaines, and barren hilly grounds, eſpecially in earable land, as I haue often ſeene in the corne fields of Kent, as about Grauеſend, Southfleet, and in all the tract from thence to Canturbury, and in many places about London.

¶ *The Time.*

Theſe herbes do floure from Iuly to the end of Auguſt.

¶ *The Names.*

It ſhall ſuffice what hath been ſet downe in the titles for the Latine names: in Engliſh, Wilde Hempe, Nettle Hempe, and Baſtard Hempe.

¶ *The Temperature and Vertues.*

The temperature and faculties are referred to the manured Hempe, notwithſtanding they are not vſed in phyſicke where the other may be had.

Chap. 240. *Of Water-Hempe.*

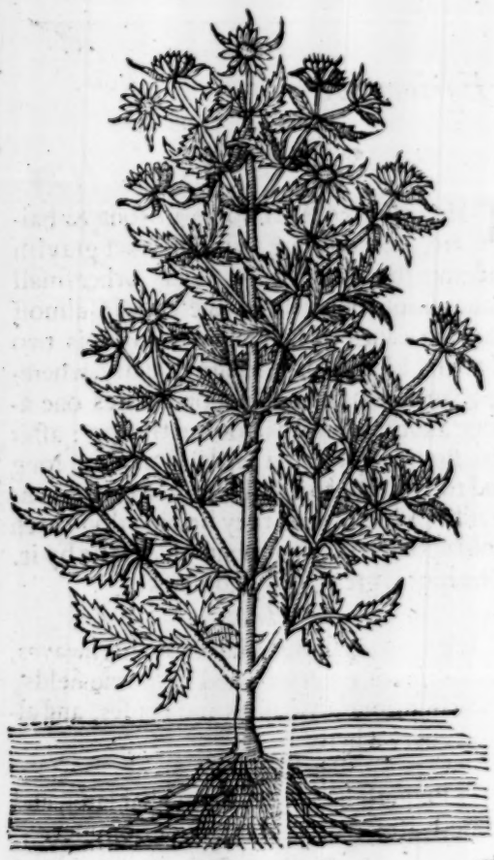
¶ *The Deſcription.*

1 WAter-Hempe or Water-Agrimony is ſeldome found in hot regions, for which cauſe it is called *Eupatorium Cannabinum fœmina Septentrionalium*, and groweth in the cold Northerne countries in moiſt places, and in the midſt of ponds, ſlow running riuers, and ditches. The root continueth long, hauing many long and ſlender ſtrings, after the nature of water herbes: the ſtalkes grow a cubit and a halfe high, of a darke purple colour, with many branches ſtanding by diſtances one from another. The leaues are more indented and leſſe hairy than the male kind: the floures grow at the top, of a browne yellow colour, ſpotted with blacke ſpots like *Aſter atticus*; which conſiſteth of ſuch a ſubſtance as is in the midſt of the Daiſie, or the Tanſie floure, and is ſet about with ſmall and ſharpe leaues, ſuch as are about the Roſe, which cauſeth the whole floure to reſemble a ſtar, and it ſauoreth like gum *Elemni*, *Roſine*, or Cedar wood when it is burned. The ſeed is long like *Pyrethrum*, cloſely thruſt together, and lightly cleaueth to any woollen garment, that it toucheth

toucheth by reaſon of his roughneſſe. ‡ This is found with the leaues whole, and alſo with them parted into three parts: the firſt varietie was expreſt by our Authors figure; and the ſecond is expreſt by this we giue you in the place thereof. ‡

2 There is another wilde Hempe growing in the water, whereof there be two ſorts more, delighting to grow in the like ground, in ſhew differing very little. This ſprings vp with long round ſtalkes, and ſomewhat reddiſh, about two cubits high, or ſomething higher: they are beſet with long greene leaues indented about the edges, whereof you ſhal ſee commonly fiue or ſeuen of thoſe leaues hanging vpon one ſtem like the leaues of Hempe, but yet ſofter. The floures are little, of a pale reddiſh colour, conſiſting of ſoft round tufts, and ſtand perting vpon the top of the ſprigges, which at length vaniſh away into downe: the root vnderneath is full of threddy ſtrings of a mean bigneſſe.

1 *Eupatorium Cannabinum fœmina.*
Water Hempe, or Water Agrimony.



‡ 2 *Eupatorium Cannabinum mas.*
Common Dutch Agrimonie.

¶ *The Place.*

They grow about the brinks of ditches, running waters, and ſtanding pooles, and in watery places almoſt euery where.

¶ *The Time.*

They floure and flouriſh in Iuly and Auguſt: the root continues, but the ſtalkes and leaues wither away in Winter.

¶ *The Names.*

The baſtard or wilde Hempes, eſpecially thoſe of the water, are commonly called *Hepatorium Cannabinum*: of diuers alſo *Eupatorium*, *Leonhar. Fuchſius* nameth it *Eupatorium Adulterinum*: of moſt, *Cannabina*, of the likeneſſe it hath with the leaues of *Cannabis*, Hempe, and *Eupatorium Auicennæ*. It is thought alſo to be that which *Baptiſta Sardus* doth terme *Terzola*: in high-Dutch, **S. Kunigund kraut**; that is to ſay in Latine, *Sanctæ Cunigundæ herba*, S. Cunigunds herbe: in Low-Dutch, **Boelkens kruit**: in Engliſh, Water Hempe, Baſtard and water Agrimonie. It is called *Hepatorium*, of the facultie, being good for *Hepar*, the liuer. ‡ I haue named the ſecond Common Dutch Agrimonie, becauſe it is commonly vſed for Agrimonie in the ſhops of that countrey. ‡

¶ *The Temperature.*

The leaues and roots of theſe herbes are bitter, alſo hot and dry in the ſecond degree: they haue vertue to ſcoure and open, to attenuate or make thinne thicke and groſſe humours, and to expell or driue them forth by vrine: they clenſe and purifie the bloud.

¶ *The*

¶ *The Vertues, which chiefely belong to the laſt deſcribed.*

A The decoction hereof is profitably giuen to thoſe that be ſcabbed and haue filthy skinnes; and likewiſe to ſuch as haue their ſpleen and liuer ſtopped or ſwolne: for it taketh away the ſtoppings of both thoſe intrals, and alſo of the gall: wherefore it is good for them that haue the jaundice, eſpecially ſomewhat after the beginning.

B The herbe boyled in wine or water is ſingular good againſt tertian Feuers.

C The decoction drunke, and the leaues outwardly applied, do heale all wounds both inward and outward.

D ‡ *Fuchſius* ſaith that the ſecond is very effectuall againſt poyſon. And *Geſner* in his Epiſtles affirmeth, that he boyled about a *pugil* of the fibres of the root of this plant in wine, and drunke it, which an houre after gaue him one ſtoole, and afterwards twelue vomits, whereby he caſt vp much flegme: ſo that it workes (ſaith he) like white Hellebor, but much more eaſily and ſafely, and it did me very much good. ‡

Chap. 241. *Of Egrimonie.*

Agrimonia.
Agrimonie.

¶ *The Deſcription.*

THe leaues of Agrimonie are long & hairie, greene aboue, and ſomewhat grayiſh vnderneath, parted into diuers other ſmall leaues ſnipt round about the edges, almoſt like the leaues of hempe: the ſtalke is two foot and a halfe long, rough & hairy, whereupon grow many ſmall yellow floures one aboue another vpwards toward the top: after the floures come the ſeeds ſomewhat long and rough, like to ſmall burs hanging downwards; which when they be ripe doe catch hold vpon peoples garments that paſſe by it. The root is great, long, and blacke.

¶ *The Place.*

It growes in barren places by highwayes, incloſures of medowes, and of corne fields, and oftentimes in woods and copſes, and almoſt euery where.

¶ *The Time.*

It floureth in Iune and ſomwhat later, and ſeedeth after that a great part of Sommer.

¶ *The Names.*

The Grecians call it ἐυπατόριον: and the Latines alſo *Eupatorium*: *Pliny*, *Eupatoria*: yet there is another *Eupatorium* in *Apuleius*, and that is *Marrubium*, Horehound. In like maner the Apothecaries of Germany haue another *Hepatorium* that is there commonly vſed, being deſcribed in the laſt chapter, and may be named *Hepatorium adulterinum*. Agrimonie is named *Lappa inuerſa*: and it is ſo called, becauſe the ſeeds which are rough like burres do hang downwards: of ſome, *Philanthropos*, of the cleauing qualitie of the ſeeds hanging to mens garments: the Italians and Spaniards call it *Agramonia*: in high Dutch, **Odermeng, Bzuckwurtz**: in low-Dutch, in French, and in Engliſh, *Agrimonie*, and *Egrimonie*: *Eupatorium* taketh the name of *Eupator*, the finder of it out: and (ſaith *Pliny*) it hath a royall and princely authoritie.

¶ *The Temperature.*

It is hot, and doth moderately binde, and is of a temperate drineſſe. *Galen* ſaith that Agrimonie is of fine and ſubtill parts, that it cutteth and ſcoureth; therefore, ſaith he, it remoues obſtructions or ſtoppings out of the liuer, and doth likewiſe ſtrengthen it by reaſon of the binding quality that is in it.

¶ *The*

¶ *The Vertues.*

The decoction of the leaues of Egrimony is good for them that haue naughty liuers; and for ſuch as piſſe bloud vpon the diſeaſes of the kidnies. A

The ſeed being drunke in wine (as *Pliny* affirmeth) doth helpe the bloudy flixe. B

Dioſcorides addeth, that it is a remedy for them that haue bad liuers, and for ſuch as are bitten with ſerpents. C

The leaues being ſtamped with old ſwines greaſe, and applied, cloſeth vp vlcers that be hardly healed, as *Dioſcorides* ſaith. D

‡ Agrimony boiled in wine and drunke, helpes inueterate hepaticke fluxes in old people. ‡ E

CHAP. 242. *Of Sawewoort.*

1. 2. *Serratula purpurea, ſiue alba.*
Saw-woort with purple, or white floures.

¶ *The Deſcription.*

1 THe plant which the new writers haue called *Serratula* differeth from *Betonica*, although the Antients haue ſo called Betony; It hath large leaues ſomewhat ſnipt about the edges like a ſaw (whereof it tooke his name) riſing immediately from the root: among which come vp ſtalkes of a cubite high, beſet with leaues very deepely cut or jagged euen to the middle of the rib, not much vnlike the male Scabious. The ſtalkes towards the top diuide themſelues into other ſmall branches, at the top whereof they beare floures ſomewhat ſcaly, like the Knapweed, but not ſo great nor hard: at the top of the knap commeth forth a buſhie or thrummy floure, of a purple colour. The root is threddy, and thereby increaſeth and becommeth of a great quantity.

2 Sawewoort with white floures differeth not from the precedent, but in the colour of the floures: for as the other bringeth forth a buſh of purple floures; in a manner this plant bringeth forth floures of the ſame faſhion, but of a ſnow white colour, wherein conſiſteth the difference.

‡ Our Authour out of *Tabernamontanus* gaue three figures, with as many deſcriptions of this plant, yet made it onely to vary in the colour of the floures, being either purple, white, or red; but he did not touch the difference which *Tabernamontanus* by his figures expreſt, which was, the firſt had all the leaues whole, being only ſnipt about the edges; the lower leaues of the ſecond were moſt of them whole, and thoſe vpon the ſtalkes deepely cut in, or diuided, and the third had the leaues both below and aboue all cut in or deepely diuided. The figure which we here giue you expreſſes the firſt and third varieties, and if you pleaſe, the one may be with white, and the other with red or purple floures. ‡

¶ *The Place.*

Sawe-woort groweth in woods and ſhadowie places, and ſometimes in medowes. They grow in Hampſted wood: likewiſe I haue ſeene it growing in great abundance in the wood adjoining to Iſlington, within halfe a mile from the further end of the towne, and in ſundry places of Eſſex and Suffolke.

¶ *The Time.*

They floure in Iuly and Auguſt.

¶ *The Names.*

The later age doe call them *Serratula*, and *Serratula tinctoria*, it differeth as we haue ſaid from Betony, which is alſo called *Serratula*: other names if it haue any we know not: it is called in Engliſh Sawewoort. ‡ *Cæſalpinus* calls it *Cerretta* and *Serretta*, and *Thalius*, *Centauroides*, or *Centaurium maius ſylueſtre Germanicum*. ‡

¶ *The Temperature and Vertues.*

A *Serratula* is wonderfully commended to be moſt ſingular for wounds, ruptures, burſtings, and ſuch like: and is referred vnto the temperature of Sanicle.

Chap. 243. *Of Betony.*

¶ *The Deſcription.*

1 Betony groweth vp with long leaues and broad, of a darke greene colour, ſlightly indented about the edges like a ſaw. The ſtalke is ſlender, foure ſquare, ſomewhat rough, a foote high more or leſſe. It beareth eared floures, of a purpliſh colour, and ſometimes reddiſh; after the floures, commeth in place long cornered ſeed. The root conſiſteth of many ſtrings.

1 *Betonica.*
Betony.

2 Betony with white floures is like the precedent in each reſpect, ſauing that the flours of this plant are white, and of greater beautie, and the others purple or red, as aforeſaid.

¶ *The Place.*

Betony loues ſhadowie woods, hedge-rowes, and copſes, the borders of paſtures, and ſuch like places.

Betony with white floures is ſeldome ſeene. I found it in a wood by a village called Hampſtead, neere vnto a worſhipfull Gentlemans houſe, one of the Clerkes of the Queenes counſell called Mr. *Wade*, from whence I brought plants for my garden, where they flouriſh as in their naturall place of growing.

¶ *The Time.*

They floure and flouriſh for the moſt part in Iune and Iuly.

¶ *The Names.*

Betony is called in Greeke βετονικη: in Latine, *Betonica*: of diuers *Vetonica*: but vnproperly. There is likewiſe another *Betonica*, which *Paulus Ægineta* deſcribed; and *Galen* in his firſt booke of the gouernment of health ſheweth that it is called βετονη, that is to ſay, *Betonica*, Betonie, and alſo *Sarxiphagon*: *Dioſcorides* notwithſtanding doth deſcribe another *Sarxiphagon*.

¶ *The Temperature.*

Betony is hot and dry in the ſecond degree: it hath force to cut, as *Galen* ſaith.

¶ *The Vertues.*

A Betony is good for them that be ſubject to the falling ſickeneſſe, and for thoſe alſo that haue ill heads vpon a cold cauſe.

B It clenſeth the lungs and cheſt, it taketh away obſtructions or ſtoppings of the liuer, milt, and gall: it is good againſt the yellow jaundiſe.

C It maketh a man to haue a good ſtomack and appetite to his meate: it preuaileth againſt ſower belchings:

belchings: it maketh a man to piſſe well: it mitigateth paine in the kidnies and bladder: it breaketh ſtones in the kidnies, and driueth them forth.

It is alſo good for ruptures, cramps, and conuulſions: it is a remedie againſt the bitings of mad dogs and venomous ſerpents, being drunke, and alſo applied to the hurts, and is moſt ſingular againſt poyſon. D

It is commended againſt the paine of the Sciatica, or ache of the huckle bone. E

There is a Conſerue made of the floures and ſugar good for many things, and eſpecially for the head-ache. A dram weight of the root of Betonie dried, and taken with meade or honied water, procureth vomit, and bringeth forth groſſe and tough humors, as diuers of our age do report. F

The pouder of the dried leaues drunke in wine is good for them that ſpit or piſſe bloud, and cureth all inward wounds, eſpecially the greene leaues boyled in wine and giuen. G

The pouder taken with meate looſeth the belly very gently, and helpeth them that haue the falling ſickneſſe with madneſſe and head-ache. H

It is ſingular againſt all paines of the head: it killeth wormes in the belly; helpeth the Ague: it cleanſeth the mother, and hath great vertue to heale the body, being hurt within by bruiſing or ſuch like. I

Chap. 244. *Of Water-Betony.*

¶ *The Deſcription.*

WAter Betony hath great ſquare hollow and brown ſtalks, whereon are ſet very broad leaues notched about the edges like vnto thoſe of Nettles, of a ſwart greene colour, growing for the moſt part by two and two as it were from one ioynt, oppoſite, or ſtanding one right againſt an other. The floures grow at the top of the branches, of a darke purple colour, in ſhape like to little helmets. The ſeed is ſmall, contained in round bullets or buttons. The root is compact of many and infinite ſtrings.

Betonica aquatica.
Water Betony.

¶ *The Place.*

It groweth by brookes and running waters, by ditch ſides, and by the brinks of riuers, and is ſeldome found in dry places.

¶ *The Time.*

It floureth in Iuly and Auguſt, and from that time the ſeed waxeth ripe.

¶ *The Names.*

Water Betonie is called in Latine *Betonica aquatica*: ſome haue thought it *Dioſcorides* his *Clymenum*: others, his *Galeopſis*: it is *Scrophularia altera* of *Dodonæus*: of *Turner*, *Clymenon*: of ſome, *Seſamoides minus*, but not properly: of others, *Serpentaria*: in Dutch, **S. Antonies cruyd**: in Engliſh, Water Betonie: and by ſome, Browne-wort: in Yorke-ſhire, Biſhops leaues.

¶ *The Temperature.*

Water Betony is hot and dry.

¶ *The Vertues.*

The leaues of Water Betony are of a ſcouring or cleanſing qualitie, and is very good to mundifie foule and ſtinking vlcers, eſpecially the iuyce boyled with honey. A

It is reported, if the face be waſhed with the iuyce thereof, it taketh away the redneſſe and deformitie of it. B

Chap. 245.

Of Great Figge-wort, or Brownewort.

¶ *The Deſcription.*

1 THe great Fig-wort ſpringeth vp with ſtalkes foure ſquare, two cubits high, of a darke purple colour, and hollow within: the leaues grow alwayes by couples, as it were from one ioynt, oppoſite, or ſtanding one right againſt another, broad, ſharpe pointed, ſnipped round about the edges like the leaues of the greater Nettle, but bigger, blacker, and nothing at all ſtinging when they be touched: the floures in the tops of the branches are of a darke purple colour, very like in forme to little helmets: then commeth vp little ſmal ſeed in pretty round buttons, but ſharpe at the end: the root is whitiſh, beſet with little knobs and bunches as it were knots and kernels.

2 There is another Figge-wort called *Scrophularia Indica*, that hath many and great branches trailing here and there vpon the ground, full of leaues, in faſhion like the wilde or common Thiſtle, but altogether without prickes: among the leaues appeare the floures in faſhion like a hood, on the out ſide of a ſeint colour, and within intermixt with purple; which being fallen and withered, there come in place ſmall knops very hard to breake, and ſharpe at the point as a bodkin: which containeth a ſmall ſeed like vnto Time. The whole plant periſheth at the firſt approch of Winter, and muſt be ſowen againe in Aprill, in good and fertile ground. ‡ This is the *Scrophularia Cretica* 1. of *Cluſius*. ‡

1 *Scrophularia maior.*
Great Fig-wort.

‡ 2 *Scrophularia Indica.*
Indian Fig-wort.

‡ 3 The ſtalke of this is alſo ſquare, and ſome yard high, ſet with leaues like thoſe of the hedge Nettle, but ſomewhat larger and thicker, and a little deeper cut in: out of the boſomes of theſe leaues come little rough foot-ſtalkes ſome inch or two long, carrying ſome foure or fiue hollow round floures of a greeniſh yellow colour, with ſome threds in them, being open at the top, and cut in with fiue little gaſhes: the ſeeds are blacke, and contained in veſſels like thoſe of the firſt

firſt deſcribed: the root is like that of the Nettle, and liues many yeares: it floures in May, and the ſeeds are ripe in Iune. I haue not found nor heard of this wilde with vs, but ſeen it flouriſhing in the garden of my kinde friend Mr. *Iohn Parkinſon*. *Cluſius* calls it *Lamium* 2. *Pannonicum exoticum*: and *Bauhine* hath ſet it forth by the name of *Scrophularia flore luteo*: whom in this I follow. ‡

‡ 3 *Scrophularia flore luteo.*
Yellow floured Fig-wort.

¶ *The Place.*

The great *Scrophularia* groweth plentifully in ſhadowie Woods, and ſometimes in moiſt medowes, eſpecially in greateſt aboundance in a wood as you go from London to Harneſey, and alſo in Stow wood and Shotouer neere Oxford.

The ſtrange Indian figure was ſent me from Paris by *Iohn Robin* the Kings Herbariſt, and it now groweth in my garden.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

Fig-wort or Kernel-wort is called in Latine *Scrophularia maior*, that it might differ from the leſſer Celandine, which is likewiſe called *Scrophularia*, with this addition *minor*, the leſſer: it is called of ſome *Millemorbia*, and *Caſtrangula*: in Engliſh, great Fig-wort, or Kernel-wort, but moſt vſually Brown-wort.

¶ *The Vertues.*

Fig-wort is good againſt the hard kernells A
which the Grecians call χοιράδες: the Latines, *Strumas*, and commonly *Scrophulas*, that is, the Kings Euill: and it is reported to be a remedy againſt thoſe diſeaſes whereof it tooke his name, as alſo the painefull piles and ſwelling of the hæmorrhoides.

Diuers do raſhly teach, that if it be hanged B
about the necke, or elſe carried about one, it keepeth a man in health.

Some do ſtampe the root with butter, and ſet it in a moiſt ſhadowie place fifteene dayes toge- C
ther: then they do boyle it, ſtraine it, and keepe it, wherewith they anoint the hard kernels, and the hæmorrhoide veines, or the piles which are in the fundament, and that with good ſucceſſe.

CHAP. 246. *Of Veruaine.*

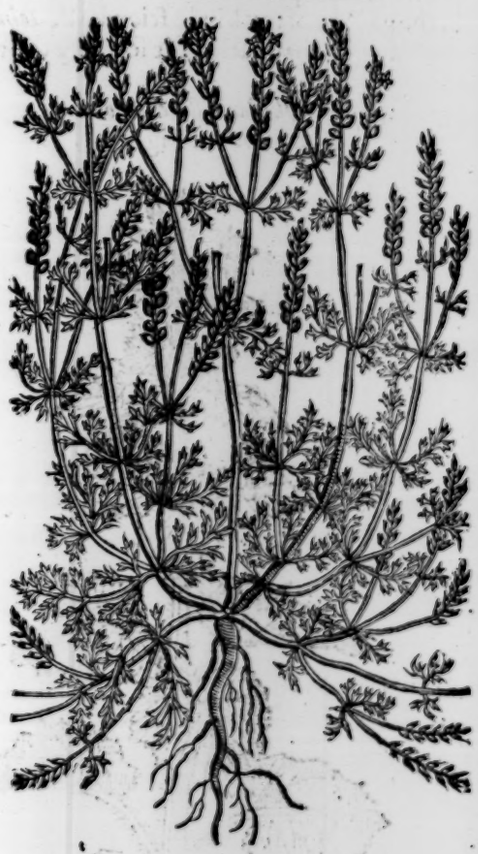
¶ *The Deſcription.*

1 THe ſtalke of vpright Veruaine riſeth from the root ſingle, cornered, a foot high, ſeldome aboue a cubite, and afterwards diuided into many branches. The leaues are long, greater than thoſe of the Oke, but with bigger cuts and deeper: the floures along the ſprigs are little, blew, or white, orderly placed: the root is long, with ſtrings growing on it.

2 Creeping Veruaine ſendeth forth ſtalkes like vnto the former, now and then a cubit long, cornered, more ſlender, for the moſt part lying vpon the ground. The leaues are like the former, but with deeper cuts, and more in number. The floures at the tops of the ſprigs are blew, and purple withall, very ſmall as thoſe of the laſt deſcribed, and placed after the ſame manner and order. The root groweth ſtraight downe, being ſlender and long; as is alſo the root of the former.

1 *Verbena communis.*
Common Veruaine.

2 *Verbena ſacra.*
Common Veruaine.



¶ *The Place.*

Both of them grow in vntilled places neere vnto hedges, high-wayes, and commonly by ditches almoſt euery where. ‡ I haue not ſeene the ſecond, and doubt it is not to be found wilde in England. ‡

¶ *The Time.*

The Veruaines floure in Iuly and Auguſt.

¶ *The Names.*

Veruaine is called in Greeke ἱερὰ βοτάνη: in Latine, *Verbena*, and *Verbenaca, Herculania, Ferraria*, and *Exupera*: of ſome, *Matricalis*, and *Hiera botane*: of others, *Veruena*, and *Sacra herba*: *Verbenæ* are herbes that were taken from the Altar, or from ſome holy place, which becauſe the Conſull or Pretor did cut vp, they were likewiſe called *Sagmina*, which oftentimes are mentioned in *Liuy* to be graſſie herbes cut vp in the Capitoll. *Pliny* alſo in his two and twentieth booke, and eleuenth Chapter witneſſeth, That *Verbenæ* and *Sagmina* be all one: and this is manifeſt by that which wee reade in *Andræa* in *Terence*: *Ex ara verbenas hinc ſume*; Take herbes here from the Altar: in which place *Terence* did not meane Veruaine to be taken from the Altar, but ſome certaine herbes: for in *Menander*, out of whom this Comedie was tranſlated, is read μυρσίνη, or Myrtle, as *Donatus* ſaith. In Spaniſh it is called *Vrgebaom*: in Italian, *Verminacula*: in Dutch, **Iſer cruijt**: in French, *Veruaine*: in Engliſh, Iuno's teares, Mercuries moiſt bloud, Holy-herbe; and of ſome, Pigeons graſſe, or Columbine, becauſe Pigeons are delighted to be amongſt it, as alſo to eat thereof, as *Apuleius* writeth.

¶ *The Temperature.*

Both the Veruaines are of temperature very dry, and do meanly binde and coole.

¶ *The Vertues.*

A The leaues of Veruaine pownd with oile of Roſes or hogs greaſe, doth mitigate and appeaſe the paines of the mother, being applied thereto.

B The leaues of Veruaine and Roſes ſtamped with a little new hogs greaſe, and emplaiſtered after the manner of a pulteſſe, doth ceaſe the inflammation and grieuous paines of wounds, and ſuffereth them not to come to corruption: and the greene leaues ſtamped with hogs greaſe takes away the ſwelling and paine of hot impoſtumes and tumors, and cleanſeth corrupt and rotten vlcers.

C It is reported to be of ſingular force againſt the Tertian and Quartane Feuers: but you muſt obſerue

obſerue mother *Bombies* rules, to take iuſt ſo many knots or ſprigs, and no more, leſt it fall out ſo that it do you no good, if you catch no harm by it. Many odde old wiues fables are written of Veruaine tending to witchcraft and ſorcerie, which you may read elſewhere, for I am not willing to trouble your eares with reporting ſuch trifles, as honeſt eares abhorre to heare.

Archigenes maketh a garland of Veruaine for the head-ache, when the cauſe of the infirmitie proceedeth of heat. D

The herbe ſtamped with oile of roſes and Vineger, or the decoction of it made in oile of roſes, keepeth the haires from falling, being bathed or annointed therewith. E

It is a remedie againſt putrified vlcers, it healeth vp wounds, and perfectly cureth Fiſtulaes, it waſteth away old ſwellings, and taketh away the heat of inflammations. F

The decoction of the roots and leaues ſwageth the tooth-ache, and faſteneth them, and healeth the vlcers of the mouth. G

They report ſaith *Pliny*, that if the dining roome be ſprinckled with water in which the herbe hath beene ſteeped, the gueſts will be the merrier, which alſo *Dioſcorides* mentioneth. H

Moſt of the latter Phyſitions do giue the iuice or decoction hereof to them that hath the plague but theſe men are deceiued, not only in that they looke for ſome truth from the father of falſhood and leaſings, but alſo becauſe in ſtead of a good and ſure remedie they miniſter no remedy at all for it is reported, that the Diuell did reueale it as a ſecret and diuine medicine. I

CHAP. 247. *Of Scabious.*

† 1 *Scabioſa maior vulgaris.*
Common Scabious.

† 2 *Scabioſa minor, ſiue Columbaria.*
The ſmall common Scabious.

¶ *The Deſcription.*

1 THe firſt kinde of Scabious being the moſt common and beſt known, hath leaues long and broad, of a grayiſh, hoary, and hairy colour, ſpred abroad vpon the ground, among which riſe vp round and rough ſtems, beſet with hairy iagged leaues, in faſhion like great

great Valerian,which we call Setwall. At the top of the ſtalks grow blew floures in thicke tufts or buttons. The root is white and ſingle.

2 The ſecond is like vnto the former, ſauing that his leaues are much cut or iagged, and the whole plant is altogether leſſer,ſcarcely growing to the height of a foot.

3 The third kinde of Scabious is in all things like vnto the ſecond, ſauing that the knap or head doth not dilate it ſelfe ſo abroad,and is not ſo thicke or cloſely thruſt together, and the loweſt leaues are not ſo deepely cut or iagged, but the vpper are much ſmaller,and alſo the more diuided.

† 4 The fourth groweth with large ſtalkes,hauing two leaues one ſet right againſt another, very much iagged,almoſt like vnto common Ferne,or rather Aſh: and at the top of the ſtalks there grow larger floures,like vnto the firſt,but greater, and the roote is alſo like it,and it differs nowaie from the firſt deſcribed,but onely by reaſon of the ſoile.

5 Purple floured Scabious hath a rough hairie ſtalke, whereon doe grow broad leaues deepely cut in the edges,in forme like thoſe of Sowthiſtle,rough likewiſe and hairie; the floures grow at the top of the ſtalks, compoſed of an innumerable ſort of purple thrums: after which come ſcaly knaps like thoſe of *Iacea*,or Knapweed, wherein is the ſeed. The root is ſmall and threddie.

‡ 6 The ſixth ſort of Scabious hath ſtalks ſome cubite high,round, and ſet with leaues not cut and iagged almoſt to the middle rib,as in the former, yet ſomewhat rough and hairie, ſnipt about the edges,and of a light greene colour;amongſt which riſe vp rough ſtalkes,on the top whereof do grow faire red floures conſiſting of a bundle of thrummes. The root is long, tough,and fibrous. ‡

7 The ſeuenth kinde of Scabious hath ſundrie great, rough and round ſtemmes, as high as a tall man,beſet with leaues like the firſt Scabious,but far greater. The floures grow at the top of the ſtalkes like vnto the others, but of a faint yellow colour,which fall as ſoone as it is touched with the hand, whereby it mightily increaſeth, notwithſtanding the roote endureth for many yeares,and groweth to be wonderfull great:and in my garden it did grow to the bigneſſe of a mans body.

† 3 *Scabioſa media.*
Middle Scabious.

4 *Scabioſa campeſtris, ſive ſegetum.*
Corne Scabious.

‡ 8 The

5 *Scabioſa flore purpureo.*
Purple floured Scabious.

† 6 *Scabioſa rubra Auſtriaca.*
Red Scabious of Auſtrich.

† 7 *Scabioſa montana maxima.*
Mountaine Scabious.

‡ 8 *Scabioſa montana alba.*
White mountaine Scabious.

6 *Scabioſa maior Hiſpanica.*
Spaniſh Scabious.

10 *Scabioſa peregrina.*
Strange Scabious.

† 11 *Scabioſa omnium minima.*
Sheepes Scabious.

‡ 8 The white mountaine Scabious hath broad leaues ſpred vpon the ground, like thoſe of the field Primroſe, but greater. Amongſt which riſeth vp a great ſtiffe ſtalke ſmooth and plain, garniſhed with leaues not like thoſe next the ground, but leſſer, much more diuided, and of a greener colour & harder. The floures are like thoſe of the common Scabious, but white of colour: the root of this periſhes euery yeare after the perfecting of the ſeed. ‡

9 The ninth kinde of Scabious is like vnto the mountaine Scabious, but lower and ſmaller, hauing ſundry large and broad leaues next the ground, ſnipt confuſedly and out of order at the edges like the Oken leafe, among which riſeth vp a ſtem two cubites high, diuiding it ſelfe into ſundry other branches. The floures are ſet at the top of the naked ſtalkes, of a whitiſh colour; which being paſt, the ſeed appeareth like a tuft of ſmall bucklers, round, and ſomewhat hollow within, and made as it were of parchment, very ſtrange to behold: and within the bucklers there are ſundry ſmall croſſes of blacke faſtened to the bottome, as it were the needle in a diall, running vpon the point of a needle. The plant dieth at the beginning of winter, and muſt be ſowne in Aprill in good and fertile ground.

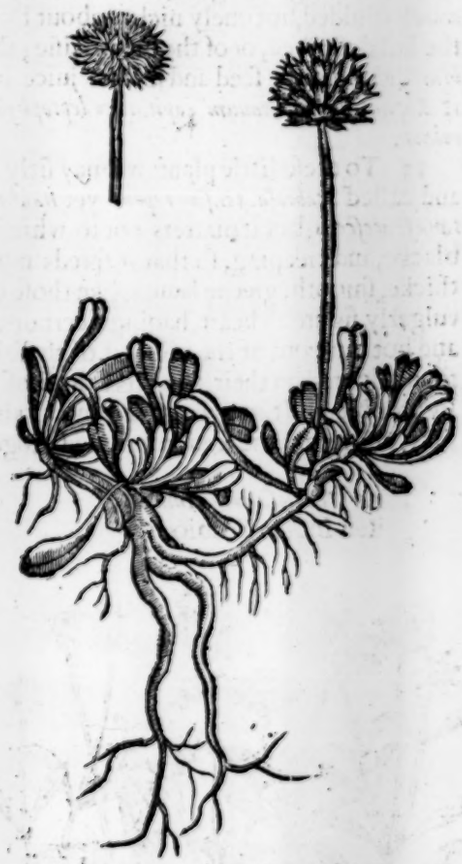
10 The tenth is like vnto the laſt before mentioned, in ſtalkes, root, and floures, and differeth that this plant hath leaues altogether without any cuts or iagges about the edges, but is ſmooth and plaine like the leaues of Marigolds, or Diuels bit, and the floures are like vnto thoſe of the laſt deſcribed.

11 Sheeps Scabious hath ſmall and tender branches trailing vpon the ground, whereupon do grow ſmall leaues very finely iagged or minced euen almoſt to the middle ribbe, of an ouerworne colour. The floures grow at the top of a blewiſh colour, conſiſting of much thrummie matter, hard thruſt together like a button: the root is ſmall, and creepeth in the ground.

12 The

12 *Scabioſa minima hirſuta.*
Hairie Sheepes Scabious

‡ 13 *Scabioſa minima Bellidis folio.*
Daiſie leaued Scabious.



‡ 14 *Scabioſa flore pallido.*
Yellow Scabious.

‡ 15 *Scabioſa prolifera.*
Childing Scabious.

‡ 12 The other Sheeps Scabious of our Author (according to the figure) is greater than the laſt deſcribed, growing ſome foot or better high, with ſlender rough branches ſet with leaues not ſo much diuided, but onely nicked about the edges: the floures are in colour and ſhape like thoſe of the laſt deſcribed, or of the blew daiſie; the root is ſingle, and like that of a Rampion, whence *Fabius Columna* (the ſeed and milkie juice inducing him) hath refer'd this to the Rampions, calling it *Rapuntium montanum capitatum leptophyllon*. *Lobell* calls it *Scabioſa media*: and *Dodonæus*, *Scabioſa minor*.

13 To theſe little plants we may fitly adde another ſmall one refer'd by *Cluſius* to this Claſſis, and called *Scabioſa*. 10. *ſiue repens*: yet *Bauhine* refers it to the Daiſies, and termes it *Bellis cærulea montana fruteſcens*; but it matters not to which we referre it: the deſcription is thus; The root is hard, blacke, and creeping, ſo that it ſpreds much vpon the ſurface of the ground, ſending forth many thicke, ſmooth, greene leaues, like thoſe of the blew Daiſie, not ſharpe pointed, but ending as we vulgarly figure an heart, hauing a certaine graſsie but not vnpleaſant ſmell, and ſomewhat a bitter and hot taſte: out of the middeſt of theſe leaues grow ſlender naked ſtalks ſome hand high, hauing round floures on their tops, like thoſe of Diuells bit, and of the ſame colour, yet ſometimes of a lighter blew. It growes in the mountaines of Hungary and Auſtria. It floures in Aprill and May, and ripens the ſeed in Iuly and Auguſt.

‡ 16 *Scabioſa rubra Indica.*
Red Indian Scabious.

‡ 17 *Scabioſa æſtivalis Cluſij.*
Sommer Scabious.

14 This (which is the ſeuenth Scabious of *Cluſius*, and which he termes *luteus*, of the whitiſh yellow colour of the floure) hath round, ſlender, ſtiffe, and greene ſtalkes ſet at each joint with two large and much diuided leaues of a whitiſh greene colour: thoſe leaues that come from the root before the ſtalke grow vp are broader, and leſſe diuided; vpon the tops of the branches and ſtalkes grow floures like thoſe of the common Scabious, being white or rather (before they be throughly open) of a whitiſh yellow colour; which fading, there follow ſeedes like as in the ordinary kinde. This floures in Iune and Iuly, and growes very plentifully in all the hilly grounds and dry Meades of Auſtria and Morauia.

15 There is alſo a kinde of Scabious hauing the leaues much cut and diuided, and the ſtalkes and floures like to the common ſort, of a blewiſh purple colour, but differing in this, that at the

the ſides of the floure it puts forth little ſtalkes, bearing ſmaller floures, as is ſeene in ſome other plants, as in Daiſies and Marigolds, which therefore are fitly termed in Latine *Prolifera* or Childing. This growes onely in Gardens, and floures at the ſame time with the former.

16 The ſtalkes of the red Scabious grow ſome cubit or more in height, and are diuided into many very ſlender branches, which at the tops carry floures compoſed after the manner of the other ſorts of Scabious, that is, of many little floures diuided into fiue parts at the top, and theſe are of a perfect red colour, and haue ſmall threds with pendants at them comming forth of the midſe of each of theſe little floures, which are of a whitiſh colour, and make a pretty ſhow. The leaues are greene, and very much diuided or cut in. The ſtarry ſeeds grow in long round hairy heads handſomely ſet together. This is an annuall, and periſhes as ſoone as it hath perfected the ſeed. *Cluſius* makes it his ſixt Scabious, and calls it *Scabioſa Indica*. It floures in Iuly, and growes in the Gardens of our prime Herbariſts.

17 The ſame Authour hath alſo giuen vs the figure and deſcription of another Scabious, which ſends vp a ſtalke ſome three cubits or more high, ſet at certaine ſpaces with leaues large, and ſnipt about their edges, and a little cut in neere their ſtalkes. The ſtalkes are diuided into others, which at there tops carry blewiſh floures in long ſcaly heads, which are ſucceeded by long whitiſh ſeed. The roote is whitiſh and fibrous, and dyes euery yeare. This is the *Scabioſa 9, ſiue æſtiualis* of *Cluſius*. ‡

¶ *The Place.*

Theſe kindes of Scabious do grow in paſtures, medowes, corne fields, and barren ſandy grounds almoſt euery where.

The ſtrange ſorts do grow in my garden, yet are they ſtrangers in England.

¶ *The Time.*

They floure and flouriſh in the Sommer moneths.

¶ *The Names.*

Scabious is commonly called *Scabioſa*; diuers thinke it is named [illegible], which ſignifieth a ſcabbe, and a certaine herbe ſo called by *Aëtius*: I do not know, ſaith *Hermolaus Barbarus*, whether it be Scabious which *Aëtius* doth call *Pſora*, the ſmoake of which being burnt doth kill cankers or little wormes. The Author of the Pandects doth interpret *Scabioſa* to be *Dioſcorides* his *Stæbe*. *Dioſcorides* deſcribeth *Stæbe* by no markes at all, being commonly knowne in his time; and *Galen* in his firſt booke of Antidotes ſaith thus: There is found amongſt vs a certaine ſhrubby herbe, hot, very ſharpe and biting, hauing a little kind of aromaticall or ſpicy ſmell, which the inhabitants do call *Colymbade*, and *Stæbe* ſingular good to keepe and preſerue wine: but it ſeemeth that this *Stæbe* doth differ from that of which he hath made mention in his booke of the faculties of medicines, which agreeth with that of *Dioſcorides*: for he writeth that this is of a binding quality without biting; ſo that it cannot be very ſharpe.

¶ *The Temperature.*

Scabious is hot and dry in the later end of the ſecond degree, or neere hand in the third, and of thin and ſubtile parts: it cutteth, attenuateth, or maketh thin, and throughly concocteth tough and groſſe humours.

¶ *The Vertues.*

Scabious ſcoureth the cheſt and lungs; it is good againſt an old cough, ſhortneſſe of breath, paine in the ſides, and ſuch like infirmities of the cheſt. A

The ſame prouoketh vrine, and purgeth now and then rotten matter by the bladder, which happeneth when an impoſtume hath ſomewhere lien within the body. B

It is reported that it cureth ſcabs, if the decoction thereof be drunke certain daies, and the juice vſed in ointments. C

The later Herbariſts doe alſo affirme that it is a remedy againſt the bitings of Serpents and ſtingings of venomous beaſts, being outwardly applied or inwardly taken. D

The juice being drunke procureth ſweat, eſpecially with Treacle; and it ſpeedily conſumeth plague ſores, if it be giuen in time, and forthwith at the beginning: but it muſt be vſed often. E F

It is thought to be forceable, and that againſt all peſtilent feuers.

† Formerly the 1. 2. 3. 11. figures were all nothing elſe than the varieties of one Plant, being of the 1. 2. 3. 4. *Scabioſa minor* of *Tabern.* they differ onely in the more or leſſe cutting or diuiding of the leaues: I haue of theſe onely reſerued the third, and in other places put ſuch figures as are agreeable to the titles. The figure that was in the ſixt place was of the ordinary firſt deſcribed Scabious; and the figure that ſhould haue beene there was in the eighth place; and that which was in the ſeuenth place belongs to the plant deſcribed by me in the fourteenth place.

Chap. 248. *Of Diuels bit.*

Morſus Diaboli.
Diuels bit.

¶ *The Deſcription.*

Diuels bit hath ſmall vpright round ſtalks of a cubite high, beſet with long leaues ſomewhat broad, very little or nothing ſnipt about the edges, ſomewhat hairie and euen. The floures alſo are of a darke purple colour, faſhioned like the floures of Scabious, which being ripe are carried away with the winde. The root is blacke, thicke, hard and ſhort, with many threddie ſtrings faſtened thereto. The great part of the root ſeemeth to be bitten away: old fantaſticke charmers report, that the diuell did bite it for enuie, becauſe it is an herbe that hath ſo many good vertues, and is ſo beneficiall to mankinde.

¶ *The Place.*

Diuels bit groweth in drie medows and woods, and about waies ſides. I haue found great ſtore of it growing in Hampſtead wood neere London, at Lee in Eſſex, and at Raleigh in Eſſex, in a wood called Hammerell, and ſundrie other places.

¶ *The Time.*

It floureth in Auguſt, and is hard to be knowne from Scabious, ſauing when it floureth.

¶ *The Names.*

It is commonly called *Morſus Diaboli*, or Diuels bit, of the root (as it ſeemeth) that is bitten off: for the ſuperſtitious people hold opinion, that the diuell for enuie that he beareth to mankinde bit it off, becauſe it would be otherwiſe good for many vſes: it is called of *Fuchſius*, *Succiſa*: in High Dutch **Teuffels abbiß**: in Low Dutch, **Duyuelles beet** in French *Mors du Diable*: in Engliſh, Diuels bit, and Forebit. ‡ *Fabius Columna* iudgeth it to bee the *Pycnocomon* of *Dioſcorides*, deſcribed by him *lib. 4. cap. 176.*‡

¶ *The Temperature.*

Diuels bit is ſomething bitter, and of a hot and drie temperature, and that in the later end of the ſecond degree.

¶ *The Vertues.*

A There is no better thing againſt old ſwellings of the Almonds, and vpper parts of the throat that be hardly ripened.

B It clenſeth away ſlimie flegme that ſticketh in the iawes, it digeſteth and conſumeth it: and it quickely taketh away the ſwellings in thoſe parts, if the decoction thereof be often held in the mouth and gargarized, eſpecially if a little quantitie of *Mel Roſarum*, or honie of Roſes be put into it.

C It is reported to be good for the infirmities that Scabious ſerueth for, and to be of no leſſe force againſt the ſtingings of venomous beaſts, poiſons, and peſtilent diſeaſes, and to conſume and waſte away plague ſores, being ſtamped and laid vpon them.

D And alſo to mitigate the paines of the matrix or mother, and to driue forth winde, if the decoction thereof be drunke.

Chap.

Chap. 249. *Of Matfellon or Knapweed.*

¶ *The Deſcription.*

1 MAtfellon or blacke Knapweed is doubtleſſe a kinde of Scabious, as all the others are, intituled with the name of *Iacea*; yet for diſtinction I haue thought good to ſet them downe in a ſeuerall Chapter, beginning with that kinde which is called in Engliſh Knapweed and Matfellon, or *Materſilon*. It hath long and narrow leaues, of a blackiſh green colour, in ſhape like Diuels bit, but longer, ſet vpon ſtalks two cubits high, ſomewhat bluntly cut or ſnipt about the edges: the floures do grow at the top of the ſtalks, being firſt ſmall ſcaly knops, like to the knops of Corne floure, or blew bottles, but greater; out of the midſt thereof groweth a purple thrummie or threddie floure. The root is thicke and ſhort.

2 The great Knapweed is very like vnto the former, but that the whole plant is much greater, the leaues bigger, and more deeply cut, euen to the middle rib: the floures come forth of ſuch like ſcaly heads, of an excellent faire purple colour, and much greater.

3 The third kinde of Matfellon, or Knapweed is very like vnto the former great Knapweed laſt before mentioned, ſauing that the floures of this plant are of an excellent faire yellow colour, proceeding forth of a ſcaly head or knop, beſet with moſt ſharppricks, not to be touched without hurt: the floure is of a pleaſing ſmel, and very ſweet; the root is long and laſting, and creepeth far abroad, by means whereof it greatly increaſeth.

1 *Iacea nigra.*
Blacke Matfellon.

† 2 *Iacea maior.*
Great Matfellon.

4 The mountaine Knapweede of Narbone in France, hath a ſtrong ſtem of two cubits high, and is very plentifull about Couentrie among the hedges and buſhes: the leaues are very much iagged, in forme of *Lonchitis*, or Spleenewoort; the floures are like the reſt of the Knapweeds, of a purple colour.

3 *Iacea maior lutea.*
Yellow Knapweed.

4 *Iacea montana.*
Mountaine Knapweed.

5 *Iacea flore albo.*
White floured Knapweed.

6 *Iacea tuberoſa.*
Knobbed Knapweed.

‡ 7 *Iacea Auſtriaca villoſa.*
Rough headed Knapweed.

‡ 5 The white floured Knapweed hath creeping roots, which ſend vp pretty large whitiſh greene leaues, much diuided or cut in almoſt to the middle rib; from the midſt of which riſes vp a ſtalke ſome two foot high, ſet alſo with the like diuided leaues, but leſſer: the floures are like thoſe of the common ſort, but of a pleaſing white colour. I firſt found this growing wilde in a field nigh Martine Abbey in Surrey, and ſince in the Iſle Tenet. ‡

6 The tuberous or knobbie Knapweed being ſet forth by *Tabernam.* which and is a ſtranger in theſe parts, hath many leaues ſpred vpon the ground, rough, deeply gaſht or hackt about the edges, like thoſe of Sow-thiſtle: among which riſeth vp a ſtraight ſtalke, diuiding it ſelfe into other branches, whereon do grow the like leaues, but ſmaller: the knappie floures ſtand on the top of the branches, of a bright red colour, in ſhape like the other Knapweeds. The root is great, thicke and tuberous, conſiſting of many cloggie parcels, like thoſe of the Aſphodill.

‡ 7 This (ſaith *Cluſius*) is a comely plant, hauing broad and long leaues white, ſoft, and lightly ſnipt about the edges: the taſte is gummy, & not a little bitter: it ſends vp many creſted ſtalks from one root, ſome cubit high or more: at the toppes of them grow the heads ſome two or three together, conſiſting of many ſcales, whoſe ends are hairy, and they are ſet ſo orderly, that by this meanes the heads ſeeme as they were incloſed in little nets: the floures are purple, and like thoſe of the firſt deſcribed; the ſeede is ſmall and long, and of an aſh colour. This *Cluſius* calls *Iacea* 4. *Auſtriaca villoſo capite.*

Iacea capitulis hirſutis Boelij.

8 This hath many ſmall cornered ſtraked hairie trailing branches growing from the root, and thoſe again diuided into many other branches, trailing or ſpreading vpon the ground three or foure foot long, imploying or couering a good plot of ground, whereon grow hairy leaues diuided or iagged into many parts, like the leaues of *Iacea maior*, or Rocket, of a very bitter taſte: at the top of each branch groweth one ſcaly head, each ſcale ending with fiue, ſix, or ſeuen little weake prickles growing orderly like halfe the rowell of a ſpurre, but farre leſſer: the floures grow forth of the heads of a light purple colour, conſiſting of many ſmal floures, like thoſe of the common *Iacea*, the bordering floures, being bigger and larger than thoſe of the middle of the floure, each ſmall floure being diuided into fiue ſmall parts or leaues, not much vnlike thoſe of *Cyanus*: the ſeed is ſmall, and incloſed in downe. The root periſheth when the ſeed is ripe.

This plant hath not been hitherto written of that I can find. Seeds of it I receiued from M^r. *William Coys*, with whom alſo I obſerued the plant, October 10. 1621. he receiued it from *Boelius* a Low countrey man. *Iohn Goodyer.* ‡

¶ *The Place.*

The two firſt grow commonly in euery fertile paſture: the reſt grow in my garden.

¶ *The Time.*

They floure in Iune and Iuly.

¶ *The Names.*

The later age doth call it *Iacea nigra*, putting *nigra* for a difference betweene it and the Hearts-eaſe or Pancie, which is likewiſe called *Iacea*: it is called alſo *Materfillon*, and *Matrefillen*: in Engliſh, Matfellon, Bulweed, and Knapweed.

¶ *The Temperature and Vertues.*

A Theſe plants are of the nature of Scabious, whereof they be kindes, therefore their faculties are like, although not ſo proper to Phyſickes vſe.

B They be commended againſt the ſwellings of the Vvula, as is Diuels bit, but of leſſe force and vertue.

† The figure that was formerly in the ſecond place was of the *Iacea terria* of *Tabern.* which differs from that our Author meant and deſcribed, whoſe figure we haue giuen you in the place thereof.

Chap. 250. *Of Siluer Knapweed.*

¶ *The Deſcription.*

1 THe great Siluer Knapweed hath at his firſt comming vp diuers leaues ſpred vpon the ground, of a deepe greene colour, cut and iagged as are the other Knapweeds, ſtaked here and there with ſome ſiluer lines downe the ſame, whereof it tooke his ſurname, *Argentea*: among which leaues riſeth vp a ſtraight ſtalke, of the height of two or three cubits, ſomwhat rough and brittle, diuiding it ſelfe toward the top into other twiggie branches: on the tops whereof do grow floures ſet in ſcaly heads or knaps like the other Matfellons, of a gallant purple colour, conſiſting of a number of threds or thrums thicke thruſt together: after which the ſeedes appeare, ſlipperie, ſmooth at one end, and bearded with blacke haires at the other end, which maketh it to leap and skip away when a man doth but lightly touch it. The root is ſmall, ſingle, and periſheth when the ſeed is ripe. ‡ This is not ſtreaked with any lines, as our Author imagined, nor called *Argentea* by any but himſelfe, and that very vnfitly. ‡

† 1 *Stœbe argentea maior.*
Great Siluer Knapweed.

† 2 *Stœbe argentea minor.*
Little ſiluer Knapweed.

2 The ſecond agreeth with the firſt in each reſpect, ſauing that the leaues hereof are more iagged, and the ſiluer lines or ſtrakes are greater, and more in number, wherein conſiſteth the difference.

‡ 4 *Stœbe Roſmarini folio.*
Narrow leafed Knapweed.

‡ 5 *Stœbe ex Codice Cæſareo.*
Thornie Knapweed.

rence. ‡ The leaues of this are very much diuided and hoarie, the ſtalkes ſome two cubites high, ſet alſo with much diuided leaues, that end in ſoft harmleſſe prickles: at the tops of the branches ſtand the heads compoſed as it were of ſiluer ſcales (whence *Lobel* and others haue called this plant *Stœbe argentea*) and out of theſe ſiluer heads come floures like thoſe of the blew bottles, but of a light purple colour, the ſeed is ſmall, blackiſh, and hairy at the tops. ‡

‡ 3 There is another like this in each reſpect, but that the heads haue not ſo white a ſhining ſiluer colour: and this I haue alſo ſeene growing with Maſter *Iohn Tradeſcant* at South Lambeth. ‡

‡ 4 To theſe may be added that plant which *Pona* hath ſet forth by the name of *Stœbe capitata Roſmarini folio*. It hath a whitiſh wooddy root, from whence ariſe diuers branches ſet with long narrow leaues ſomewhat like thoſe of Roſemary, but liker thoſe of the Pine, of a greeniſh colour aboue, and whitiſh below: at the tops of the branches grow ſuch heads as in the firſt deſcribed *Stœbe*, with floures of ſomewhat a deeper purple colour: the ſeed is like that of *Carthamus*, but blackiſh. The root is not annuall, but laſts many yeares. ‡

‡ 5 Though theſe plants haue of late been vulgarly ſet forth by the name of *Stœbe's*, yet are they not iudged to bee the true *Stœbe* of *Dioſcorides* and the Antients, but rather another, whoſe figure which we here giue was by *Dodonæus* taken forth of a manuſcript in the Emperours Library, and he ſaith; *Paludanus* brought home ſome of the ſame out of Cyprus and Morea, as he returned from his journey out of Syria: the bottome leaues are ſaid to be much diuided; thoſe on the ſtalkes long, and onely ſnipt about the edges, and white: the floures white, and contained in ſcaly heads like the Blew-bottles, and the tops of the branches end in ſharpe prickles. ‡

¶ *The Place.*

Theſe doe grow of themſelues in fields neere common high waies, and in vntilled places, but they are ſtrangers in England, neuertheleſſe I haue them in my garden.

¶ *The*

¶ *The Time.*

They ſpring vp in April, they floure in Auguſt, and the ſeed is ripe in September.

¶ *The Names.*

Siluer Knapweed is called of *Lobel, Stæbe Salamantica*: of *Dodonæus, Aphyllanthes*, that is, without leaues, for the floures conſiſt onely of a number of threds without any leaues at all: in Engliſh, Siluer Knapweed, or Siluer Scabious, whereof doubtleſſe they be kindes.

¶ *The Temperature and Vertues.*

The faculties of theſe Matfellons are not as yet found out, neither are they vſed for meat or medicine.

‡ *The faculties of Stæbe out of Dioſcorides.*

A The ſeed and leaues are aſtringent, wherefore the decoction of them is caſt vp in Dyſenteries, and into purulent eares, and the leaues applied in manner of a pultis are good to hinder the blackneſſe of the eies occaſioned by a blow, and ſtop the flowing of bloud. ‡

† The figures were formerly tranſpoſed.

Chap. 251. *Of Blew Bottle, or Corne Floure.*

1 *Cyanus maior.*
Great blew Bottle.

2 *Cyanus vulgaris.*
Common blew Bottle.

¶ *The Deſcription.*

1 THe great blew Bottle hath long leaues, ſmooth, ſoft, downie, and ſharpe pointed: among the leaues riſe vp crooked, and prettie thicke branches, chamfered, furrowed, and garniſhed with ſuch leaues as are next the ground: on the toppes whereof ſtand faire blew floures tending to purple, conſiſting of diuers little floures, ſet in a ſcaly huske or knap like thoſe of the Knapweeds: the ſeed is rough or bearded at one end, ſmooth at the other, and ſhining. The root is tough, and long laſting (contrary to the reſt of the Corne floures) and groweth yearely into new ſhoots and ſprings, whereby it greatly increaſeth.

2 The

7 *Cyanus cæruleus multiflorus.*
Double Blew-Bottles.

8 *Cyanus purpureus multiflorus.*
Double Purple-Bottles.

‡ 9 *Cyanus repens latifolius.*
Broad leafed creeping Blew-Bottle.

‡ 10 *Cyanus repens anguſtifolius.*
Small creeping Blew-Bottle.

Chap. 248. *Of Diuels bit.*

Morſus Diaboli.
Diuels bit.

¶ *The Deſcription.*

Diuels bit hath ſmall vpright round ſtalks of a cubite high, beſet with long leaues ſomewhat broad, very little or nothing ſnipt about the edges, ſomewhat hairie and euen. The floures alſo are of a darke purple colour, faſhioned like the floures of Scabious, which being ripe are carried away with the winde. The root is blacke, thicke, hard and ſhort, with many threddie ſtrings faſtened thereto. The great part of the root ſeemeth to be bitten away: old fantaſticke charmers report, that the diuell did bite it for enuie, becauſe it is an herbe that hath ſo many good vertues, and is ſo beneficiall to mankinde.

¶ *The Place.*

Diuels bit groweth in drie medows and woods, and about waies ſides. I haue found great ſtore of it growing in Hampſtead wood neere London, at Lee in Eſſex, and at Raleigh in Eſſex, in a wood called Hammerell, and ſundrie other places.

¶ *The*

¶ *The Time.*

They ſpring vp in April, they floure in Auguſt, and the ſeed is ripe in September.

¶ *The Names.*

Siluer Knapweed is called of *Lobel, Stæbe Salamantica* : of *Dodonæus, Aphyllanthes*, that is, without leaues, for the floures conſiſt onely of a number of threds without any leaues at all: in Engliſh, Siluer Knapweed, or Siluer Scabious, whereof doubtleſſe they be kindes.

¶ *The Temperature and Vertues.*

The faculties of theſe Matfellons are not as yet found out, neither are they vſed for meat or medicine.

‡ *The faculties of Stæbe out of Dioſcorides.*

A The ſeed and leaues are aſtringent, wherefore the decoction of them is caſt vp in Dyſenteries, and into purulent eares, and the leaues applied in manner of a pultis are good to hinder the blacknes of the eies occaſioned by a blow, and ſtop the flowing of bloud. ‡

† The figures were formerly tranſpoſed.

Chap. 251. *Of Blew Bottle, or Corne Floure.*

1 *Cyanus maior.*
Great blew Bottle.

2 *Cyanus vulgaris.*
Common blew Bottle.

¶ *The Deſcription.*

1 THe great blew Bottle hath long leaues, ſmooth, ſoft, downie, and ſharpe pointed: among the leaues riſe vp crooked, and prettie thicke branches, chamfered, furrowed, and garniſhed with ſuch leaues as are next the ground : on the toppes whereof ſtand faire blew floures tending to purple, conſiſting of diuers little floures, ſet in a ſcaly huske or knap like thoſe of the Knapweeds : the ſeed is rough or bearded at one end, ſmooth at the other, and ſhining. The root is tough, and long laſting (contrary to the reſt of the Corne floures) and groweth yearely into new ſhoots and ſprings, whereby it greatly increaſeth.

2 The

7 *Cyanus cæruleus multiflorus.*
Double Blew-Bottles.

8 *Cyanus purpureus multiflorus.*
Double Purple-Bottles.

‡ 9 *Cyanus repens latifolius.*
Broad leafed creeping Blew-Bottle.

‡ 10 *Cyanus repens anguſtifolius.*
Small creeping Blew-Bottle.

2 The common Corne-floure hath leaues ſpred vpon the ground, of a whitiſh greene colour, ſomewhat hackt or cut in the edges like thoſe of Corne Scabious: among which riſeth vp a ſtalke diuided into diuers ſmall branches, whereon do grow long leaues of an ouerworne greene colour, with few cuts or none at all. The floures grow at the top of the ſtalkes, of a blew colour, conſiſting of many ſmall floures ſet in a ſcaly or chaffie head like thoſe of the Knapweeds: the ſeed is ſmooth, bright ſhining, and wrapped in a woolly or flocky matter. The root is ſmall and ſingle, and periſheth when it hath perfected his ſeed.

3 This Bottle is like the laſt deſcribed in each reſpect, ſauing in the colour of the floures, which are purple, wherein conſiſteth the difference.

4 The fourth Bottle is alſo like the precedent, not differing in any point but in the floures; for as the laſt before mentioned are of a purple colour, contrariwiſe theſe are of a milke white colour, which ſetteth forth the difference.

5 The Violet-coloured Bottle or Corne-floure is like the precedent, in ſtalkes, leaues, ſeeds, and roots: the onely difference is, that this bringeth floures of a violet colour, and the others not ſo.

6 Variable Corne-floure is ſo like the others in ſtalks, leaues, and proportion, that it cannot be diſtinguiſhed with words; onely the floures hereof are of two colours mixed together, that is, purple and white, wherein it differeth from the reſt.

7 There is no difference to be found in the leaues, ſtalkes, ſeed, or rootes of this Corne-floure from the other, but onely that the floures hereof are of a faire blew colour, and very double.

8 The eighth Corne-floure is like vnto the precedent, without any difference at all, ſauing in the colour of the floures, the which are of a bright purple colour, that ſetteth forth the difference.

‡ 9 This from a ſmall root ſends vp diuers creeping branches ſome foot long, ſet with long hoary narrow leaues: at the tops of the ſtalkes ſtand the floures in ſcaly heads, like as the other Blew-Bottles, but of a darke purple colour. The whole plant is very bitter and vngratefull to the taſte. *Lobel* calls this *Cyanus repens*.

10 This is like the laſt deſcribed, but that the leaues are much ſmaller or narrower, alſo the ſcaly heads of this are of a finer white ſiluer colour: and this plant is not poſſeſſed with ſuch bitterneſſe as the former. *Lobel* calls this *Cyanus minimus repens*. ‡

¶ *The Place.*

The firſt groweth in my garden, and in the gardens of Herbariſts, but not wilde that I know of. The others grow in corne fields among wheat, Rie, Barley, and other graine: it is ſowne in gardens, which by cunning looking to doth oft times become of other colours, and ſome alſo double, which hath beene touched in their ſeuerall deſcriptions. ‡ The two laſt grow wilde about Montpellier in France. ‡

¶ *The Time.*

They bring forth their floures from the beginning of May vnto the end of haruеſt.

¶ *The Names.*

The old Herbariſts called it *Cyanus flos*, of the blew colour which it naturally hath: moſt of the later ſort following the common Germane name, call it *Flos frumentorum*, for the Germans name it **Corn blumen**: in low-Dutch, **Corn bloemen**: in French, *Blaueole*, and *Bluet*: in Italian, *Fior campeſe*, and *Bladiſeris*, i. *Seris bladi*, and *Battiſecula*, or *Baptiſecula*, as though it ſhould be called *Blaptiſecula*, becauſe it hindereth and annoyeth the Reapers, by dulling and turning the edges of their ſickles in reaping of corne: in Engliſh it is called Blew-Bottle, Blew-Blow, Corne-floure, & hurt-Sickle. ‡ *Fabius Columna* would haue it to be the *Papauer ſpumeum*, or *Heracleum* of the Antients. ‡

¶ *The Temperature and Vertues.*

A The faculties of theſe floures are not yet ſufficiently knowne. Sith there is no vſe of them in phyſicke, we will leaue the reſt that might be ſaid to a further conſideration: notwithſtanding ſome haue thought the common Blew-Bottle to be of temperature ſomething cold, and therefore good againſt the inflammation of the eyes, as ſome thinke.

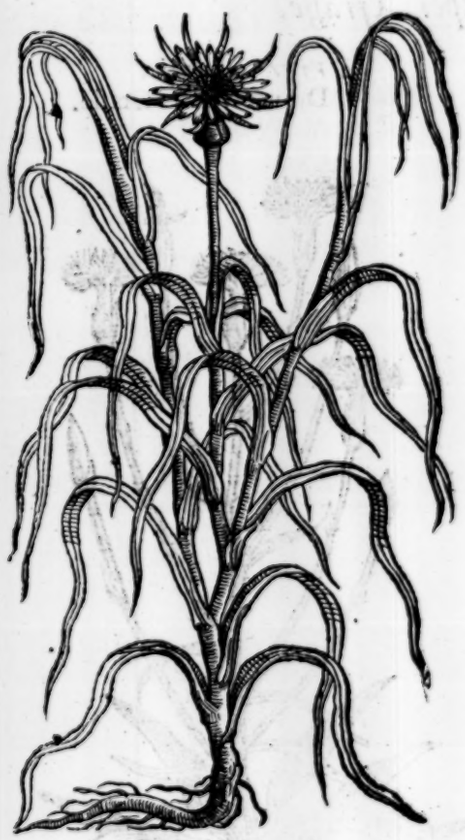
Chap. 252. *Of Goats Beard, or Go to bed at noone.*

¶ *The Deſcription.*

1 GOats-beard, or Go to bed at noone hoth hollow ſtalks, ſmooth, and of a whitiſh green colour, whereupon do grow long leaues creſted downe the middle with a ſwelling rib, ſharpe pointed, yeelding a milky iuyce when it is broken, in ſhape like thoſe of Garlick; from the boſome of which leaues thruſt forth ſmall tender ſtalks ſet with the like leaues but leſſer: the floures grow at the top of the ſtalkes, conſiſting of a number of purple leaues, daſht ouer as it were with a little yellow duſt, ſet about with nine or ten ſharpe pointed greene leaues: the whole floure reſembles a ſtarre when it is ſpred abroad; for it ſhutteth it ſelfe at twelue of the clocke, and ſheweth not his face open vntill the next dayes Sun doth make it floure anew, whereupon it was called Go to bed at noon: when theſe floures be come to their full maturitie and ripeneſſe, they grow into a downy Blow-ball like thoſe of Dandelion, which is carried away with the winde. The ſeed is long, hauing at the end one piece of that downie matter hanging at it. The root is long and ſingle, with ſome few threds thereto anexed, which periſheth when it hath perfected his ſeed, yeelding much quantitie of a milky iuyce when it is cut or broken, as doth all the reſt of the plant.

2 The yellow Goats beard hath the like leaues, ſtalkes, root, ſeed, and downie blow-balls that the other hath, and alſo yeeldeth the like quantitie of milke, inſomuch that if the pilling while it is greene be pulled from the ſtalkes, the milky iuyce followeth: but when it hath there remained a little while it waxeth yellow. The floures hereof are of a gold yellow colour, and haue not ſuch long greene leaues to garniſh it withall, wherein conſiſteth the difference.

1 *Tragopogon purpureum.*
Purple Goats-beard.



2 *Tragopogon luteum.*
Yellow Goats-beard.

3 There is another ſmall ſort of Goats-beard or Go to bed at noone, which hath a thicke root full of a milky ſap, from which riſe vp many leaues ſpred vpon the ground, very long, narrow, thin, and like vnto thoſe of graſſe, but thicker and groſſer: among which riſe vp tender ſtalkes, on the tops whereof do ſtand faire double yellow floures like the precedent, but leſſer. The whole plant

yeeldeth

yeeldeth a milkie ſap or iuyce as the others do: it periſheth like as the other when it hath perfected his ſeed. This may be called *Tragopogon minus anguſtifolium*, Little narrow leaued Goats-beard.

¶ *The Place.*

The firſt growes not wild in England that I could euer ſee or heare of, except in Lancaſhire vpon the banks of the riuer Chalder, neere to my Lady *Heskiths* houſe, two miles from Whawley: it is ſowen in gardens for the beauty of the floures almoſt euery where. The others grow in medows and fertil paſtures in moſt places of England. It growes plentifully in moſt of the fields about London, as at Iſlington, in the medowes by Redriffe, Detford, and Putney, and in diuers other places.

¶ *The Time.*

They floure and flouriſh from the beginning of Iune to the end of Auguſt.

¶ *The Names.*

Goats-beard is called in Greeke τραγοπώγων: in Latine, *Barba hirci*, and alſo *Coma*: in high-Dutch, **Boerbaert**: in low-Dutch, **Joſephes bloemen**: in French, *Barbe de bouc*, and *Saßify*: in Italian, *Saſſefrica*: in Spaniſh, *Barba Cabruna*: in Engliſh, Goats-beard, Ioſephs floure, Star of Ieruſalem, Noone-tide, and Go to bed at noone.

¶ *The Temperature.*

Theſe herbes are temperate betweene heate and moiſture.

¶ *The Vertues.*

A The roots of Goats-beard boyled in wine and drunke, aſſwageth the paine and pricking ſtitches of the ſides.

B The ſame boyled in water vntill they be tender, and buttered as parſeneps and carrots, are a moſt pleaſant and wholſome meate, in delicate taſte farre ſurpaſſing either Parſenep or Carrot: which meate procures appetite, warmeth the ſtomacke, preuaileth greatly in conſumptions, and ſtrengtheneth thoſe that haue been ſicke of a long lingring diſeaſe.

Chap. 253. *Of Vipers-Graſſe.*

1 *Viperaria, ſiue Scorzonera Hiſpanica.*
Common Vipers Graſſe.

2 *Viperaria humilis.*
Dwarfe Vipers Graſſe.

† 3 *Viperaria Pannonica.*
Auſtrian Vipers graſſe.

‡ 4 *Viperaria anguſtifolia elatior.*
Hungary Vipers graſſe.

5 *Viperaria Pannonica anguſtifolia.*
Narrow leafed Vipers graſſe.

¶ *The Deſcription.*

1 THe firſt of the Viper graſſes hath long broad leaues, fat, or ful bodied, vneuen about the edges, ſharpe pointed, with a high ſwolne ribbe downe the middle, and of an ouerworne colour, tending to the colour of Woade: among which riſeth vp a ſtiffe ſtalke, ſmooth and plaine, of two cubits high, whereon do grow ſuch leaues as thoſe next the ground. The flours ſtand on the top of the ſtalkes, conſiſting of many ſmall yellow leaues thicke thruſt together, very double, as are thoſe of Goates beard, whereof it is a kinde, as are all the reſt that doe follow in this preſent chapter: the root is long, thicke, very brittle, continuing many yeeres, yeelding great increaſe of roots, blacke without, white within, and yeelding a milkie juice, as doe the leaues alſo, like vnto the Goates beard.

2 The dwarfe Vipers graſſe differeth not from the precedent, ſauing that it is altogether leſſer, wherein eſpecially conſiſteth the difference.

† 3 The broad leafed Auſtrian Vipers-graſſe hath broad leaues ſharpe pointed, vneuen about the edges, of a blewiſh greene colour: the ſtalke riſeth vp to the height of a foot or better; on the top whereof do ſtand faire yellow floures, very double, greater and broader than any of the reſt

of a reſonable good ſmell. The ſeed followeth, long and ſharpe, like vnto thoſe of Goates-beard. The root is thicke, long, and full of a milkie juice, as are the leaues alſo.

4 The narrow leaued Hungary Vipers-graſſe hath long leaues like to thoſe of Goates-beard, but longer and narrower, among which riſeth vp a ſlender hollow ſtalke, ſtiffe and ſmooth, on the top whereof do ſtand faire double floures of a faire blew colour tending to purple, in ſhape like the other of his kinde, of a pleaſant ſweet ſmell, like the ſmell of ſweet balls made of *Benzoin*. The ſeed is conteined in ſmall cups like thoſe of Goates beard, wrapped in a downie matter, that is caried away with the winde. The root is not ſo thicke nor long as the others, very ſingle, bearded at the top, with certain hairy thrums yeelding a milkie juice of a reſinous taſte, and ſomewhat ſharpe withall. It endureth the winter euen as the others do.

‡ 5 This (whoſe figure was by our Authour put to the laſt deſcription) hath leaues like thoſe of Goates-beard, but ſtiffer and ſhorter, amongſt which there growes vp a ſhort hollow ſtalke ſome handfull high, ſet with a few ſhort leaues, bearing a yellow floure at the top, almoſt like that of the laſt ſaue one, but leſſe, the ſeed is conteined in ſuch cups as the common Vipers-graſſe, and being ripe is caried away with the leaſt winde. The root is blacke, with a wrinkled barke, and full of milke, hauing the head hairy, as alſo the laſt deſcribed hath. This by *Cluſius* is called *Scorſonera humilis anguſtifolia Pannonica*. ‡

¶ *The Place and Time.*

Moſt of theſe are ſtrangers in England. The two firſt deſcribed do grow in my garden. The reſt are touched in their ſeuerall titles.

They floure and flouriſh from May to the end of Iuly.

¶ *The Names.*

Vipers-graſſe is called of the Spaniards *Scorzonera*, which ſoundeth in Latine *Viperaria*, or *Viperina*, or *Serpentaria*, ſo called becauſe it is accounted to be of force and efficacy againſt the poiſons of Vipers and ſerpents, for *Vipera* or a viper is called in Spaniſh *Scurzo*: it hath no name either in the high or low Dutch, nor in any other, more than hath been ſaid, that I can reade: in Engliſh we may call it Scorzoner, after the Spaniſh name, or Vipers-graſſe.

¶ *The Temperature.*

They are hot and moiſt as are the Goates-beards.

¶ *The Vertues.*

A It is reported by thoſe of great iudgement, that Vipers-graſſe is moſt excellent againſt the infections of the plague, and all poiſons of venomous beaſts, and eſpecially to cure the bitings of vipers, (of which there be very many in Spaine and other hot countries, yet haue I heard that they haue been ſeen in England) if the juice or herbe be drunke.

B It helpeth the infirmities of the heart, and ſuch as vſe to ſwoune much: it cureth alſo them that haue the falling ſickeneſſe, and ſuch as are troubled with giddineſſe in the head.

C The root being eaten, either roſted in embers, ſodden, or raw, doth make a man merry, and remoueth all ſorrow.

D The root condited with ſugar, as are the roots of *Eringos* and ſuch like, worke the like effects: but more familiarly, being thus dreſſed.

† Formerly there were ſix figures in this chapter, whereof the firſt and fourth were both of one plant, and the fifth which was of the *Scorſonera Bermica* of *Matthiolus* did not much differ from them; if it differ at all. In the title and hiſtory of the third there ſhould haue been put *Pannonica* in ſtead of *Hiſpanica*; as now it is.

Chap. 254. *Of Marigolds.*

¶ *The Deſcription.*

1 THe greateſt double Marigold hath many large, fat, broad leaues, ſpringing immediately from a fibrous or threddy root; the vpper ſides of the leaues are of a deepe greene, and the lower ſide of a more light and ſhining greene: among which riſe vp ſtalkes ſomewhat hairie, and alſo ſomewhat jointed, and full of a ſpungious pith. The floures in the top are beautifull, round, very large and double, ſomething ſweet, with a certaine ſtrong ſmell, of a light ſaffron colour, or like pure gold: from the which follow a number of long crooked ſeeds, eſpecially the outmoſt, or thoſe that ſtand about the edges of the floure; which being ſowne commonly bring forth ſingle floures, whereas contrariwiſe thoſe ſeeds in the middle are leſſer, and for the moſt part bring forth ſuch floures as that was from whence it was taken.

2 The common double Marigold hath many fat, thicke, crumpled leaues ſet vpon a groſſe and ſpungious ſtalke: whereupon do grow faire double yellow floures, hauing for the moſt part in the middle a bunch of threddes thicke thruſt together: which being paſt there ſucceed ſuch crooked ſeeds as the firſt deſcribed. The root is thicke and hard, with ſome threds annexed thereto.

3 The

1. 2. *Calendula maior polyanthos.*
The greater double Marigold.

4 *Calendula multiflora orbiculata.*
Double globe Marigold.

6 *Calendula ſimplici flore.*
Single Marigold.

7 *Calendula prolifera.*
Fruitfull Marigold.

3 The ſmaller or finer leafed double Marigold groweth vpright, hauing for the moſt part one ſtem or fat ſpongeous ſtalke, garniſhed with ſmooth and fat leaues confuſedly. The floures grow at the top of the ſmall branches, very double, but leſſer than the other, conſiſting of more fine iaggedneſſe, and of a faire yellow gold colour. The root is like the precedent.

4 The Globe-flouring Marigold hath many large broad leaues riſing immediately forth of the ground; among which riſeth vp a ſtalke of the height of a cubit, diuiding it ſelfe toward the top into other ſmaller branches, ſet or garniſhed with the like leaues, but confuſedly, or without order. The floures grow at the top of the ſtalkes, very double; the ſmall leaues whereof are ſet in comely order by certaine rankes or rowes, as ſundry lines are in a Globe, trauerſing the whole compaſſe of the ſame; whereupon it tooke the name *Orbiculata*.

5 The fifth ſort of double Marigold differeth not from the laſt deſcribed, ſauing in the colour of the floures; for this plant bringeth forth floures of a ſtraw or light yellow colour, and the others not ſo, wherein conſiſteth the difference.

‡ All theſe fiue here deſcribed, and which formerly had ſo many figures, differ nothing but in the bigneſſe and littleneſſe of the plants and floures, and in the intenſeneſſe and remiſneſſe of their colour, which is either orange, yellow, or of a ſtraw colour. ‡

6 The Marigold with ſingle floures differeth not from thoſe with double floures, but in that it conſiſteth of fewer leaues, which we therefore terme Single, in compariſon of the reſt, and that maketh the difference.

7 This fruitfull or much bearing Marigold is likewiſe called of the vulgar ſort of women, Iacke-an-apes on horſebacke: it hath leaues, ſtalkes, and roots like the common ſort of Marigold, differing in the ſhape of his floures, for this plant doth bring forth at the top of the ſtalke one floure like the other Marigolds; from the which ſtart forth ſundry other ſmal floures, yellow likewiſe, and of the ſame faſhion as the firſt, which if I be not deceiued commeth to paſſe *per accidens*, or by chance, as Nature oftentimes liketh to play with other floures, or as children are borne with two thumbes on one hand, and ſuch like, which liuing to be men, do get children like vnto others; euen ſo is the ſeed of this Marigold, which if it be ſowen, it brings forth not one floure in a thouſand like the plant from whence it was taken.

8 The other fruitfull Marigold is doubtleſſe a degenerate kind, comming by chance from the ſeed of the double Marigold, whereas for the moſt part the other commeth of the ſeed of the ſingle floures, wherein conſiſteth the difference. ‡ The floure of this (wherein the onely difference conſiſts) you ſhall finde expreſt at the bottome of the fourth figure. ‡

9 *Calendula Alpina.*
Mountaine Marigold.

9 The Alpiſh or mountaine Marigold, which *Lobelius* ſetteth downe for *Nardus Celtica*, or *Plantago Alpina*, is called by *Tabernamontanus*, *Caltha*, or *Calendula Alpina*: and becauſe I ſee it rather reſembles a Marigold, than any other plant, I haue not thought it amiſſe to inſert it in this place, leauing the conſideration thereof vnto the friendly Reader, or to a further conſideration, becauſe it is a plant that I am not well acquainted withall; yet I doe reade that it hath a thicke root, growing aſlope vnder the vpper cruſt of the earth, of an aromaticall or ſpicie taſte, and ſomewhat biting, with many threddy ſtrings annexed thereto: from which riſe vp broad thicke and rough leaues of an ouerworn green colour, not vnlike to thoſe of Plantaine: among which there riſeth vp a rough and tender ſtalke ſet with the like leaues; on the top wherof commeth forth a ſingle yellow floure, paled about the edges with ſmall leaues of a light yellow, tending to a ſtraw colour; the middle of the floure is compoſed of a bundle of threds, thicke thruſt together, ſuch as is in the middle of the field Daiſie, of a deepe yellow colour.

‡ This Plant is all one with the two deſcribed in the next Chapter: they vary onely thus;

thus; the ſtalkes and leaues are ſometimes hairy, otherwhiles ſmooth; the floure is yellow, or elſe blew. I hauing three figures ready cut, thinke it not amiſſe to giue you one to expreſſe each varietie. ‡

10 The wilde Marigold is like vnto the ſingle garden Marigold, but altogether leſſer, and the whole plant periſheth at the firſt approch of Winter, and recouereth it ſelfe againe by falling of the ſeed.

¶ *The Place.*

Theſe Marigolds, with double floures eſpecially, are ſet and ſowen in gardens: the reſt, their titles do ſet forth their naturall being.

¶ *The Time.*

The Marigold floureth from Aprill or May euen vntill Winter, and in Winter alſo, if it be warme.

¶ *The Names.*

The Marigold is called *Calendula:* it is to be ſeene in floure in the Calends almoſt of euerie moneth: it is alſo called *Chryſanthemum*, of his golden colour: of ſome, *Caltha*, and *Caltha Poetarum:* whereof *Columella* and *Virgil* doe write, ſaying, That *Caltha* is a floure of a yellow colour: whereof *Virgil* in his Bucolickes, the ſecond Eclogue, writeth thus;

Tum Caſia atque alijs intexens ſuauibus herbis
Mollia Luteola pingit vaccinia Caltha.

And then ſhee'l Spike and ſuch ſweet herbes infold,
And paint the Iacinth with the Marigold.

Columella alſo in his tenth booke of Gardens hath theſe words;

Candida Leucoia & flauentia Lumina Caltha.

Stock-Gilloflours exceeding white,
And Marigolds moſt yellow bright.

It is thought to be *Gromphena Plinij:* in low-Dutch it is called **Goudt bloemen:** in high-Dutch, **Kingleblumen:** in French, *Souſij & Goude:* in Italian, *Fior d' ogni meſe:* in Engliſh, Marigolds, and Ruddes.

¶ *The Temperature and Vertues.*

The floure of the Marigold is of temperature hot, almoſt in the ſecond degree, eſpecially when it is dry: it is thought to ſtrengthen and comfort the heart very much, and alſo to withſtand poyſon, as alſo to be good againſt peſtilent Agues, being taken any way. *Fuchſius* hath written, That being drunke with wine it bringeth downe the termes, and that the fume thereof expelleth the ſecondine or after-birth A

But the leaues of the herbe are hotter; for there is in them a certain biting, but by reaſon of the moiſture ioyned with it, it doth not by and by ſhew it ſelfe; by meanes of which moiſture they mollifie the belly, and procure ſolubleneſſe if it be vſed as a pot-herbe. B

Fuchſius writeth, That if the mouth be waſhed with the iuyce it helpeth the tooth-ache. C

The floures and leaues of Marigolds being diſtilled, and the water dropped into red and watery eyes, ceaſeth the inflammation, and taketh away the paine. D

Conſerue made of the floures and ſugar taken in the morning faſting, cureth the trembling of the heart, and is alſo giuen in time of plague or peſtilence, or corruption of the aire. E

The yellow leaues of the floures are dried and kept throughout Dutchland againſt Winter, to put into broths, in phyſicall potions, and for diuers other purpoſes, in ſuch quantity, that in ſome Grocers or Spice-ſellers houſes are to be found barrels filled with them, and retailed by the penny more or leſſe, inſomuch that no broths are well made without dried Marigolds. F

Chap. 255. *Of Germane Marigolds.*

¶ *The Deſcription.*

1 GOlden Marigold with the broad leafe doth forthwith bring from the root long leaues ſpred vpon the ground, broad, greene, ſomething rough in the vpper part, vnderneath ſmooth, and of a light greene colour: among which ſpring vp ſlender ſtalks a cubit high,

high, ſomething hoarie, hauing three or foure ioynts, out of euery one whereof grow two leaues, ſet one right againſt another, and oftentimes little ſlender ſtems; on the tops whereof ſtand broad round floures like thoſe of Ox-eye, or the corne Marigold, hauing a round ball in the middle (ſuch as is in the middle of thoſe of Camomil) bordered about with a pale of bright yellow leaues. The whole floure turneth into downe that is carried away with the winde; among which down is found long blackiſh ſeed. The root conſiſteth of threddy ſtrings.

† 2. The leſſer ſort hath foure or fiue leaues ſpred vpon the ground like vnto thoſe of the laſt deſcribed, but altogether leſſer and ſhorter: among which riſeth vp a ſlender ſtalke two hands high; on the top whereof ſtand ſuch floures as the precedent, but not ſo large, and of a blew colour.

‡ Theſe two here deſcribed, and that deſcribed in the ninth place of the foregoing Chapter, are all but the varieties of one and the ſame plant, differing as I haue ſhewed in the foregoing Chapter. ‡

1 *Chryſanthemum latifolium.*
Golden Marigold with the broad leafe.

2 *Chryſanthemum latifolium minus.*
The leſſer Dutch Marigold.

¶ *The Place.*

They be found euery where in vntilled places of Germanie, and in woods, but are ſtrangers in England.

¶ *The Time.*

They are to be ſeene with their floures in Iune, in the gardens of the Low-countries.

¶ *The Names.*

Golden Marigold is called in high-Dutch **waldtblume.** There are that would haue it to be *Aliſma Dioſcoridis*; which is alſo called *Damaſonium*, but vnproperly; therefore we muſt rather call it *Chryſanthemum latifolium*, than raſhly attribute vnto it the name of *Aliſma*. ‡ This plant indeed is a *Doronicum*, and the figure in the precedent chapter by *Cluſius* is ſet forth by the name of *Doronicum 6. Pannonicum*: *Matthiolus* calls this plant *Aliſma*: *Geſner*, *Caltha Alpina*: *Dodonæus*, *Chryſanthemum latifolium*: *Pena* and *Lobel*, *Nardus Celtica altera*. Now in the *Hiſtoria Lugd.* it is ſet forth in in foure ſeuerall places by three of the former names; and *pag.* 1169. by the name of *Ptarmica montana Daleſchampij*.

¶ *The Temperature.*

It is hot and dry in the ſecond degree being greene, but in the third being dry.

¶ *The*

¶ *The Vertues.*

The women that liue about the Alps wonderfully commend the root of this plant againſt the ſuffocation of the mother, the ſtoppings of the courſes, and the green ſickneſſe and ſuch like affects in maids. *Hiſtor. Lugd.* ‡

CHAP. 256. *Of Corne-Marigold.*

¶ *The Deſcription.*

1 COrne Marigold or golden Corne floure hath a ſoft ſtalke, hollow, and of a greene colour, whereupon do grow great leaues, much hackt and cut into diuers ſections, and placed confuſedly or out of order: vpon the top of the branches ſtand faire ſtarlike floures, yellow in the middle, and ſuch likewiſe is the pale or border of leaues that compaſſeth the ſoft ball in the middle, like that in the middle of Camomill floures, of a reaſonable pleaſant ſmel. The roots are full of ſtrings.

† 1 *Chryſanthemum ſegetum.*
Corne Marigold.

2 *Chryſanthemum Valentinum.*
Corne Marigold of Valentia.

2 The golden floure of Valentia hath a thicke fat ſtalk, rough, vneuen, and ſomewhat crooked, whereupon do grow long leaues, conſiſting of a long middle rib, with diuers little fetherlike leaues ſet thereon without order. The floures grow at the top of the ſtalks, compoſed of a yellow thrummie matter, ſuch as in the middle of the Camomill floures, and is altogether like the Corne Marygold laſt deſcribed, ſauing it doth want that border or pale of little leaues that do compaſſe the ball or head: the root is thicke, tough, and diſperſeth it ſelfe far abroad.

‡ 3 To theſe may be added diuers other, as the *Chryſanthemum Alpina*, of *Cluſius*, & his *Chryſanthemum Creticum*, & others. The firſt of theſe ſmal mountain Marigolds of *Cluſius* his deſcription hath leaues like thoſe of white Wormewood, but greener and thicker: the ſtalks grow ſome handfull high, ſet with few and much diuided leaues; and at the tops, as in an vmbell, they carry ſome dozen

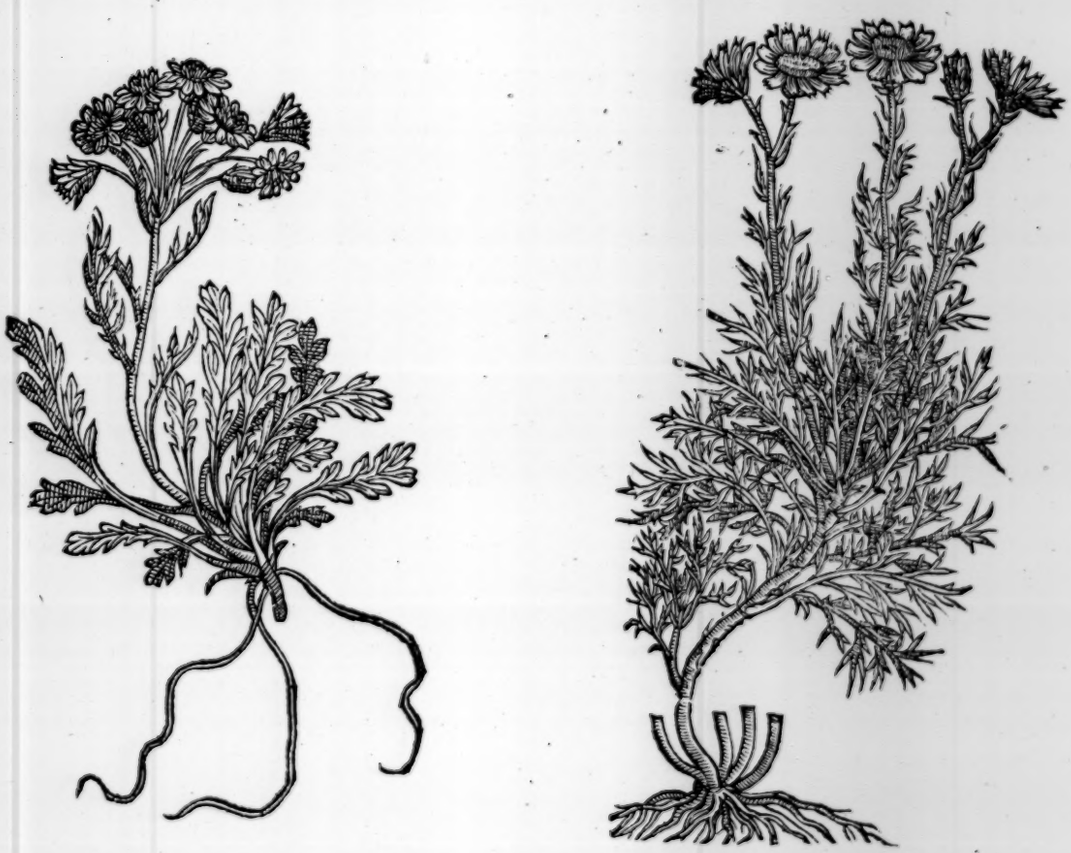
zen floures more or leſſe, not much vnlike in ſhape, colour, and ſmell, to thoſe of the common *Iacobæa*, or Ragwoort. The root is ſomewhat thicke, and puts forth many long white fibres. It floures in Iuly and Auguſt, and growes vpon the Alpes of Stiria. *Cluſius* calls it *Chryſanthemum Alpinum*. 1.

4 The ſecond of his deſcription hath many leaues at the root, like to the leaues of the male Sothernwood, but of a lighter and brighter greene, and of no vnpleaſant ſmell, though the taſte be bitteriſh and vngratefull: in the middeſt of the leaues grow vp ſtalkes ſome foot high, diuided at their tops into ſundry branches, which carry each of them two or three floures bigger than, yet like thoſe of the common Cammomill, but without ſmel, and wholly yellow: the root is fibrous, blackiſh, and much ſpreading. It floures in Auguſt, and growes in the like places as the former. *Bauhine* iudges this to be the *Achillæa montana Artemiſiæ tenuifoliæ facie* of the *Aduerſ.* and the *Ageratum ferulaceum* in the *Hiſt. Lugd.* But I cannot be of that opinion; yet I iudge the *Achillæa montana*, and *Ageratum ferulaceum* to be but of the ſame plant. But different from this, & that chiefely in that it hath many more, and thoſe much leſſe floures than thoſe of the plant here figured and deſcribed.

5 Now ſhould I haue giuen you the hiſtorie of the *Chryſanthemum Creticum* of the ſame Authour, but that my friend Mr. *Goodyer* hath ſaued me the labour, by ſending an exact deſcription thereof, together with one or two others of this kinde, which I thinke fit here to giue you.

‡ 3 *Chryſanthemum Alpinum* 1. *Cluſ.*
Small mountaine Marigold.

‡ 4 *Chryſanthemum Alpinum* 2. *Cluſ.*
The other Alpine Marigold.



Chryſanthemum Creticum primum Cluſij, pag. 334.

The ſtalkes are round, ſtraked, branched, hard, of a whitiſh greene, with a very little pith within; neere three foot high: the leaues grow out of order, diuided into many parts, and thoſe again ſnipt or diuided, of the colour of the ſtalkes: at the tops of the ſtalkes and branches grow great floures, bigger than any of the reſt of the Corne-floures, forth of ſcaly heads, conſiſting of twelue or more broad leaues apeece, notched at the top, of a ſhining golden colour at the firſt, which after turne to a pale, whitiſh, or very light yellow, and grow round about a large yellow ball, of ſmell ſomewhat ſweet. The floures paſt, there commeth abundance of ſeed cloſely compact or thruſt together, and it is ſhort, blunt at both ends, ſtraked, of a ſalue colour, ſomwhat flat, & of a reaſonable bignes. The root

‡ 5 *Chryſanthemum Creticum.*
Candy Corne Marigold.

root is whitiſh, neere a fingers bigneſſe, ſhort, with many threds hanging thereat, and periſheth when the ſeede is ripe; and at the Spring groweth vp againe by the falling of the ſeed.

Chryſanthemum Baticum Boelij, inſcriptum.

The ſtalks are round, ſtraked, reddiſh brown, diuided into branches, containing a ſpungious white pith within, a cubite high: the leaues grow out of order, without footſtalkes, about three inches long, and an inch broad, notched about the edges, not at all diuided, of a darke greene colour: the floures grow at the tops of the ſtalkes and branches, forth of great ſcaly heads, containing twentie leaues a piece or more, notched at the top, of a ſhining yellow colour, growing about a round yellow ball, of a reaſonable good ſmell, very like thoſe of the common *Chryſanthemum ſegetum*: the ſeede groweth like the other, and is very ſmall, long, round, crooked and whitiſh: the root is ſmall, whitiſh, threddie, and periſheth alſo when the ſeed is ripe.

Chryſanthemum tenuifolium Baticum Boelij.

The ſtalks are round, ſmall, ſtraked, reddiſh, ſomewhat hairie, branched, a cubit high, or higher: the leaues are ſmall, much diuided, iagged, and very like the leaues of *Cotula fœtida*: the floures are yellow, ſhining like gold, compoſed of thirteene or fourteene leaues a piece, notched at the top, ſet about a yellow ball, alſo like the common *Chryſanthemum ſegetum*: the ſeed groweth amongſt white flattiſh ſcales, which are cloſely compacted in a round head together, and are ſmall, flat, grayiſh, and broad at the top: the root is ſmall, whitiſh, with a few threds, and dyeth when the ſeed is ripe. Iuly 28. 1621. *Iohn Goodyer.* ‡

¶ *The Place.*

The firſt groweth among corne, and where corne hath been growing: it is found in ſome places with leaues more iagged, and in others leſſe.

The ſecond is a ſtranger in England.

¶ *The Time.*

They floure in Iuly and Auguſt.

¶ *The Names.*

Theſe plants are called by one name in Greeke, of the golden glittering colour, χρυσάνθεμον: in High Dutch, **Sant Johans blum**: in Low Dutch, **Uokelaer**: in Engliſh, Corne Marigold, yellow Corne floure, and golden Corne floure.

There be diuers other floures called *Chryſanthemum* alſo, as *Batrachion*, a kinde of yellow Crowfoot, *Heliochryſon*, but theſe golden floures differ from them.

¶ *The Temperature.*

They are thought to be of a meane temperature betweene heat and moiſture.

¶ *The Vertues.*

The ſtalks and leaues of Corne Marigold, as *Dioſcorides* ſaith, are eaten as other pot-herbes are. A

The floures mixed with wax, oile, roſine, and frankinſence, and made vp into a ſeare-cloth, waſteth away cold and hard ſwellings. B

The herbe it ſelfe drunke, after the comming forth of the bath, of them that haue the yellow iaundiſe, doth in ſhort time make them well coloured. C

‡ The figure that was in the firſt place was of the *Chryſanthemum* of *Matthiolus*, which is a ſtranger with vs, and the leaues of it are much like thoſe of Feuerfew, or Mugwoort, the floure is ſomewhat like, but larger than that of Feuerfew, and wholly yellow.

CHAP.

Chap. 257. *Of Oxe-Eie.*

¶ *The Deſcription.*

1 THe plant which wee haue called *Buphthalmum*, or Oxe-eie, hath ſlender ſtalks growing from the roots, three, foure, or more, a foot high, or higher, about which be green leaues finely iagged like to the leaues of Fenell, but much leſſer: the floures in the tops of the ſtalks are great, much like to Marigolds, of a light yellow colour, with yellow threds in the middle, after which commeth vp a little head or knap like to that of red Mathes before deſcribed, called *Adonis*, conſiſting of many ſeeds ſet together. The roots are ſlender, and nothing but ſtrings, like to the roots of blacke Ellebor, whereof it hath beene taken to be a kinde.

2 The Oxe-eie which is generally holden to be the true *Buphthalmum* hath many leaues ſpred vpon the ground, of a light greene colour, laied far abroad like wings, conſiſting of very many fine iags, ſet vpon a tender middle rib: among which ſpring vp diuers ſtalks, ſtiffe and brittle, vpon the top whereof do grow faire yellow leaues, ſet about a head or ball of thrummie matter, ſuch as in the middle of Cammomill, like a border or pale. The root is tough and thicke, with certaine ſtrings faſtned thereto.

3 The white Oxe-eie hath ſmall vpright ſtalks of a foot high, whereon do grow long leaues, compoſed of diuers ſmal leaues, and thoſe ſnipt about the edges like the teeth of a ſaw. The floures grow on the tops of the ſtalks, in ſhape like thoſe of the other Oxe-eie; the middle part whereof is likewiſe made of a yellow ſubſtance, but the pale or border of little leaues, are exceeding white, like thoſe of great Daſie, called *Conſolida media vulnerariorum*. The root is long, creeping alongſt vnder the vpper cruſt of the earth, whereby it greatly increaſeth. ‡ This by the common conſent of all writers that haue deliuered the hiſtorie thereof, hath not the pale or out leaues of the floure white, as our Author affirmes, but of a bright and perfect yellow colour. And this is the *Buphthalmum*, of *Tragus*, *Matthiolus*, *Lobel*, *Cluſius* and others. ‡

1 *Buphthalmum ſive Helleborus niger ferulaceus.*
Oxe-eie.

2 *Buphthalmum verum.*
The right Oxe-eie.

¶ *The*

3 *Buphthalmum vulgare.*
White Oxe-eie.

¶ *The Place.*

The two firſt growe of themſelues in Germany, Bohemia, and in the Gardens of the Low-countries; of the firſt I haue a plant in my garden. The laſt groweth in barren paſtures and fields almoſt euery where.

‡ The laſt is alſo a ſtranger with vs, for any thing that I know or can learne; neither can I coniecture what our Authour meant here: firſt in that he ſaid the floures of this were white, and ſecondly in that it grew in barren paſtures and fields almoſt euery where. ‡

¶ *The Time.*

They floure in May and Iune. The laſt in Auguſt.

¶ *The Names.*

Touching the naming of the firſt of thoſe plants the late writers are of diuers opinions: ſome would haue it to be a kind of *Veratrum nigrum*, blacke Hellebor: other ſome *Conſiligo*, or Bearefoot; and againe, others, *Seſamoides*; and ſome, *Elleboraſtrum*: But there be found two kindes of blacke Ellebor among the old writers, one with a leafe like vnto Laurel, with the fruit of *Seſamum*: the other with a leafe like that of the Plane tree, with the ſeed of *Carthamus* or Baſtard Saffron. But it is moſt euident, that this *Buphthalmum*, in Engliſh, Oxe-eie, which in this Chapter we in the firſt place haue deſcribed, doth agree with neither of theſe: what form *Conſiligo* is of, we finde not among the old writers. *Pliny* 26 *cap.* 7. ſaith, That in his time it was found amongſt the *Marſi*, and was a preſent remedy for the infirmitie of the lungs of ſwine, and of all kinde of cattell, though it were but drawne thorow the eare. *Columella* in his 6. booke, Chap. 5. doth alſo ſay, that in the mountaines called Marſi there is very great ſtore thereof, and that it is very helpfull to all kind of cattel, and he telleth how and in what manner it muſt be put into the eare; the roots alſo of our Oxe-eie are ſaid to cure certain infirmities of cattel, if they be put into the ſlit or bored eare: but it followeth not that for the ſame reaſon it ſhould be *Conſiligo*; and it is an ordinary thing to find out plants that are of a like force and qualitie: for *Pliny* doth teſtifie in his 25 booke, 5 chapter, That the roots alſo of blacke Ellebor can do the ſame: it cureth (ſaith he) the cough in cattel, if it be drawn thorow the eare, and taken out again the next day at the ſame houre: which is likewiſe moſt certaine by experiments of the countrey men of our age; who do cure the diſeaſes of their cattell with the roots of common black Ellebor. The roots of white Ellebor alſo do the like, as *Abſyrtus*, and after him *Hierocles* doth write: who notwithſtanding do not thruſt the roots of white Ellebor into the eare, but vnder the skin of the breſt called the dewlap: after which manner alſo *Vegetius Renatus* doth vſe *Conſiligo*, in his firſt booke of the curing of cattell, chapter 12. intituled, Of the cure of the infirmities vnder the skin: although in his 3. booke, 2. Chapter, *de Malleo*, he writeth, that they alſo muſt be faſtned thorow the eare: which things do ſufficiently declare, that ſundry plants haue oftentimes like faculties: and that it doth not at all follow by the ſame reaſon, that our Oxe eie is *Conſiligo*, becauſe it doth cure diſeaſes in Cattel as wel as *Conſiligo* doth. But if we muſt coniecture by the faculties, *Conſiligo* then ſhould bee White Ellebor: for *Vegetius* vſeth *Conſiligo* in the very ſame maner that *Abſyrtus* and *Hierocles* do vſe white Ellebor. This ſuſpition is made the greater, becauſe it is thought that *Vegetius* hath taken this manner of curing from the Grecians; for which cauſe alſo moſt doe take *Conſiligo* to be nothing elſe but white Ellebor: the which if it be ſo, then ſhall this preſent Oxe-eie much differ from *Conſiligo*; for it is nothing at all like to white Ellebor.

And that the ſame is not *Seſamoides*, either the firſt or the ſecond, it is better knowne, than needfull to be confuted.

This

This same also is vnproperly called *Helleboraſtrum*; for that may aptly bee called *Helleboraſtrum* which hath the forme and likeneſſe of Hellebor: and this Oxe eie is nothing at all like to Ellebore. For all which causes it seemeth that none of these names agree with this plant, but only the name *Buphthalmum*, with whose description which is extant in *Dioscorides* this plant doth most aptly agree. We take it to be the right Oxe eie; for Oxe eie bringeth forth slender soft stalks, and hath leaues of the likeneſſe or similitude of Fennell leaues: the floure is yellow, bigger than that of Cammomill, euen such an one is this present plant, which doth so exquisitly expreſſe that form or likeneſſe of Fennell leaues, both in slenderneſſe and manifold iaggedneſſe of the leaues, as no other little leafed herb can do better; so that without all doubt this plant seemeth to be the true and right Oxe eie. Oxe eie is called *Cachla*, or rather *Caltha*; but *Caltha* is *Calendula*, or Marigold, which we said that our Oxe eie in floure did neereſt repreſent. There are some that would haue *Buphthalmum* or Oxe eie to be *Chryſanthemum*, yellow Cammomil, & say that *Dioscorides* hath in sundry places, and by diuers names intreated of this herbe; but if those men had somewhat more diligently weighed *Dioscorides* his words, they would haue bin of another minde: for although descriptions of either of them do in many things agree, yet there is no property wanting that may shew the plants to differ. The leaues of *Chryſanthemum* are said to be diuided and cut into many fine iags: and the leaues of *Buphthalmum* to be like the leaues of Fennell: for all things that be finely iagged and cut into many parts haue not the likeneſſe of the leaues of Fennell. Moreouer, *Dioscorides* saith, that *Chryſanthemum* doth bring forth a floure much glittering, but he telleth not that the floure of *Buphthalmum*, or Oxe eie is much glittering, neither doth the floure of that which we haue set downe glitter, so that it can or ought not to be said to glitter much. Do not these things declare a manifest difference betweene *Buphthalmum* and *Chryſanthemum*, and confirme that which we haue set down to be the true and right Oxe eie? We are of that minde, let others thinke as they will: and they that would haue *Chryſanthemum* to be *Buphthalmum*, let them seeke out another, if they denie this to bee Oxe eie: for that which we and others haue described for *Chryſanthemum* cannot be the true *Buphthalmum* or Oxe eie; for the leaues of it are not like Fennell, such as those of the true *Buphthalmum* ought to be.

¶ *The Temperature.*

But concerning the faculties *Matthiolus* saith, that all the Physitions and Apothecaries in Bohemia, vse the roots of this Oxe eie in stead of those of blacke Ellebor, namely for diseases in cattel, but he doth not affirme that the roots hereof in medicines are substitutes, or *quid pro quo*; for, saith he, I do remember that I once saw the roots hereof in a sufficient big quantitie put by certain Physitions into decoctions which were made to purge by siege, but they purged no more than if they had not been put in at all: which thing maketh it most plaine, that it cannot be any of the Ellebors, although it hath been vsed to be fastned through the eares of cattell for certaine diseases, and doth cure them as Ellebor doth. The roots of *Gentian* do mightily open the orifices of Fistulaes, which be too narrow, so do the roots of *Ariſtolochia*, or Birthwoort, or Brionie, or pieces of spunges, which notwithstanding do much differ one from another in other operations: wherefore though the roots of Oxe eie can do something like vnto blacke Ellebor, yet for al that they cannot perform all those things that the same can. We know that thornes, stings, splinters of wood, and such like, bring pain, cause inflammations, draw vnto them humors from the parts neere adioining, if they be fastned in any part of the bodie; no part of the bodie is hurt without pain; the which is increased if any thing be thrust through, or put into the wound: peraduenture also if any other thing beside be put into the slit or bored eare, the same effect would follow which hapned by the root of this plant thrust in; notwithstanding we here affirme nothing, we onely make way for curious men to make more diligent search touching the operations hereof. ‡ *Cluſius* affirmes that when hee came to Vienna in Austria, this was vulgarly bought, sold, and vsed for the true blacke Ellebor, the ignorance of the Physitions and Apothecaries in the knowledge of simples was such to make vse of this so far different plant, when as they had the true blacke Hellebor growing plentifully wilde within seuen miles of the citie, the which afterward vpon his admonition, they made vse of. ‡

¶ *The Vertues.*

A *Dioscorides* saith, that the floures of Oxe eie made vp in a seare-cloth doe asswage and waste away cold hard swellings; and it is reported that if they be drunk by and by after bathing, they make them in short time well coloured that haue been troubled with the yellow iaundice.

Chap.

Chap. 258. *Of French Marigold, or African Marigold.*

¶ *The Deſcription.*

1 THe great double African Marigold hath a great long browne reddiſh ſtalke, creſted, furrowed and ſomewhat knobby, diuiding it ſelfe toward the top into other branches; whereupon do grow leaues compoſed of many ſmall leaues ſet vpon a middle rib by couples, much like vnto the leaues of wilde Valerian, bearing at the top very faire and beautifull double yellow floures, greater and more double than the greateſt Damaske Roſe, of a ſtrong ſmell, but not vnpleaſant. The floures being paſt, there ſucceedeth long blacke flat ſeed: the whole plant periſheth at the firſt approach of winter.

2 There is little difference betweene this and the precedent, or laſt deſcribed, ſauing that this plant is much leſſer, and bringeth forth more ſtore of floures, which maketh the difference. ‡ And we may therefore call it *Flos Aphricanus minor multiflorus*, The ſmall double Africane Marigold. ‡

1 *Flos Aphricanus maior Polyanthos.*
The great African double Marigold.

3 *Flos Aphricanus maior ſimplici flore.*
The great ſingle French Marigold.

3 The ſingle great Africane Marigold hath a thicke root, with ſome fibres annexed thereto; from which riſeth vp a thicke ſtalke chamfered and furrowed, of the height of two cubits, diuided into other ſmall branches; whereupon are ſet long leaues, compact or compoſed of many little leaues like thoſe or the Aſh tree, of a ſtrong ſmell, yet not very vnpleaſant: on the top of the branches do grow yellow ſingle floures, compoſed in the middle of a bundle of yellow thrummes hard thruſt together, paled about the edges with a border of yellow leaues; after which commeth long blacke ſeed. The whole plant periſheth with the firſt froſt, and muſt be ſowne yeerely as the other ſorts muſt be.

4 The common Africane or as they vulgarly terme it French Marigold hath ſmall weake and tender branches trailing vpon the ground, reeling and leaning this way and that way, beſet with leaues conſiſting of many particular leaues, indented about the edges, which being held vp againſt the ſunne, or to the light, are ſeene to be full of holes like a ſieue, euen as thoſe of Saint Iohns

woort: The floures ſtand at the top of the ſpringie branches forth of long cups or huskes, conſiſting of eight or ten ſmall leaues, yellow vnderneath, on the vpper ſide of a deeper yellow tending to the colour of a darke crimſon veluet, as alſo ſoft in handling: but to deſcribe the colour in words, it is not poſſible, but this way; lay vpon paper with a penſill a yellow colour called Maſticot, which being dry, lay the ſame ouer with a little ſaffron ſteeped in water or wine, which ſetteth forth moſt liuely the colour. The whole plant is of a moſt ranke and vnwholeſome ſmell, and periſheth at the firſt froſt.

4 *Flos Aphricanus minor ſimplici flore.* The ſmall French Marigold.

¶ *The Place.*

They are cheriſhed and ſowne in gardens euery yeere: they grow euery where almoſt in Africke of themſelues, from whence we firſt had them, and that was when *Charles* the fifth Emperour of Rome made a famous conqueſt of Tunis; whereupon it was called *Flos Aphricanus*, or *Flos Tunetanus*.

¶ *The Time.*

They are to be ſowne in the beginning of Aprill, if the ſeaſon fall out to be warme, otherwiſe they muſt be ſowne in a bed of dung, as ſhall be ſhewed in the chapter of Cucumbers. They bring forth their pleaſant floures very late, and therefore there is the more diligence to be vſed to ſow them very earely, becauſe they ſhall not be ouertaken with the froſt before their ſeed be ripe.

¶ *The Names.*

The Africane or French Marigold is called in Dutch, **Thunis bloemen**: in high Dutch, **Indianiſch negelin**, that is, the floure or Giloſloure of India: in Latine, *Cariophillus Indicus*; whereupon the French men call it *Oeillet d' Inde*. *Cordus* calleth it *Tanacetum Peruvianum*, of the likeneſſe the leaues haue with Tanſie, and of Peru a Prouince of America, from whence hee thought, it may be, it was firſt brought into Europe. *Geſner* calleth it *Caltha Aphricana*, and ſaith that it is called in the Carthagenian tongue, *Pedua*: ſome would haue it to be *Petilius flos Plinij*, but not properly: for *Petilius flos* is an Autumne floure growing among briers and brambles. *Andreas Lacuna* calleth it *Othonna*, which is a certaine herbe of the Troglodytes, growing in that part of Arabia which lieth toward Ægypt, hauing leaues full of holes as though they were eaten with mothes. *Galen* in his firſt booke of the faculties of Simple medicines, maketh mention of an herbe called *Lycoperſicum*, the juice whereof a certain Centurion did cary out of Barbarie all Ægypt ouer with ſo rancke a ſmell, and ſo lothſome, as *Galen* himſelfe durſt not ſo much as taſte of it, but conjectured it to be deadly; yet that Centurion did vſe it againſt the extreme paines of the joints, and it ſeemeth to the patients themſelues, to be of a very cold temperature; but doubtleſſe of a poiſonſome quality, very neere to that of hemlockes.

¶ *The Temperature and Vertues.*

A The vnpleaſant ſmell, eſpeciall that common ſort with ſingle floures (that ſtuffeth the head like to that of Hemlocke, ſuch as the juice of *Lycoperſium* had) doth ſhew that is of a poiſonſome and cooling qualitie; and alſo the ſame is manifeſted by diuers experiments: for I remember, ſaith *Dodonæus*, that I did ſee a boy whoſe lippes and mouth when he began to chew the floures did ſwell extremely; as it hath often happened vnto them, that playing or piping with quils or kexes of Hemlockes, do hold them a while between their lippes: likewiſe he ſaith, we gaue to a cat the floures with their cups, tempered with freſh cheeſe, ſhe forthwith mightely ſwelled, and a little while after died: alſo mice that haue eaten of the ſeed thereof haue been found dead. All which things do declare that this herbe is of a venomous and poiſonſome facultie, and that they are not

not to be hearkned vnto,that ſuppoſe this herbe to be an harmles plant:ſo to conclude,theſe plants are moſt venomous and full of poiſon, and therefore not to be touched or ſmelled vnto,much leſſe vſed in meat or medicine.

CHAP. 259. *Of the floure of the Sun,or the Marigold of Peru.*

¶ *The Deſcription.*

1 THe Indian Sun or the golden floure of Peru is a plant of ſuch ſtature and talneſſe that in one Sommer being ſowne of a ſeede in Aprill,it hath riſen vp to the height of fourteene foot in my garden,where one floure was in weight three pound and two ounces, and croſſe ouerthwart the floure by meaſure ſixteene inches broad. The ſtalkes are vpright and ſtraight,of the bigneſſe of a ſtrong mans arme, beſet with large leaues euen to the top, like vnto the great Clot Bur: at the top of the ſtalke commeth forth for the moſt part one floure, yet many times there ſpring out ſucking buds,which come to no perfection:this great floure is in ſhape like to the Cammomil floure,beſet round about with a pale or border of goodlyyellow leaues,in ſhape like the leaues of the floures of white Lillies: the middle part whereof is made as it were of vnthorn veluet,or ſome curious cloth wrought with the needle,which braue worke; if you do thorowly view and marke well,it ſeemeth to be an innumerable ſort of ſmall floures, reſembling the noſe or nozell of a candleſticke,broken from the foot thereof: from which ſmall nozell ſweateth forth excellent fine and cleere Turpentine,in ſight,ſubſtance,ſauour and taſte. The whole plant in like manner being broken,ſmelleth of Turpentine: when the plant groweth to maturitie,the floures fal away,in place whereof appeareth the ſeed,blacke, and large, much like the ſeed of Gourds, ſet as though a cunning workeman had of purpoſe placed them in very good order, much like the honiecombes of Bees: the root is white, compact of many ſtrings, which periſh at the firſt approch of winter,and muſt be ſet in moſt perfect dunged ground: the manner how,ſhall be ſhewed when vpon the like occaſion I ſhall ſpeake of Cucumbers and Melons.

1 *Flos Solis maior.*
The greater Sun floure.

2 *Flos Solis minor.*
The leſſer Sunne floure.

2 The other golden floure of Peru is like the former, ſauing that it is altogether lower, and the leaues more iagged, and very few in number.

3 The male floure of the Sun of the ſmaller ſort hath a thicke root, hard, and of a wooddy ſubſtance, with many threddie ſtrings annexed thereto, from which riſeth vp a gray or ruſſet ſtalke, to the height of fiue or ſix cubits, of the bigneſſe of ones arme, whereupon are ſet great broad leaues with long foot-ſtalkes, very fragill or eaſie to breake, of an ouerworne greene colour, ſharp pointed, and ſomewhat cut or hackt about the edges like a ſaw: the floure groweth at the top of the ſtalks, bordered about with a pale of yellow leaues: the thrummed middle part is blacker than that of the laſt deſcribed. The whole floure is compaſſed about likewiſe with diuers ſuch ruſſet leaues as thoſe are that do grow lower vpon the ſtalks, but leſſer and narrower. The plant and euery part thereof doth ſmell of Turpentine, and the floure yeeldeth forth moſt cleere Turpentine, as my ſelfe haue noted diuers yeares. The ſeed is alſo long and blacke, with certaine lines or ſtrakes of white running alongſt the ſame. The roote and euery part thereof periſheth when it hath perfected his ſeed.

4 The female or Marigold Sun floure hath a thicke and wooddie root, from which riſeth vp a ſtraight ſtem, diuiding it ſelfe into one or more branches, ſet with ſmooth leaues ſharpe pointed, ſleightly indented about the edges. The floures grow at the top of the branches, of a faint yellow colour, the middle part is of a deeper yellow tending to blackneſſe, of the forme and ſhape of a ſingle Marigold, whereupon I haue named it the Sunne Marigold. The ſeed as yet I haue not obſerued.

¶ *The Place.*

Theſe plants do grow of themſelues without ſetting or ſowing, in Peru, and in diuers other prouinces of America, from whence the ſeeds haue beene brought into theſe parts of Europe. There hath been ſeen in Spaine and other hot regions a plant ſowne and nouriſhed vp from ſeed, to attain to the height of 24. foot in one yeare.

¶ *The Time.*

The ſeed muſt be ſet or ſowne in the beginning of Aprill if the weather be temperate, in the moſt fertile ground that may be, and where the Sun hath moſt power the whole day.

¶ *The Names.*

The floure of the Sun is called in Latine *Flos Solis*, taking that name from thoſe that haue reported it to turne with the Sun, the which I could neuer obſerue, although I haue endeuored to finde out the truth of it; but I rather thinke it was ſo called becauſe it doth reſemble the radiant beames of the Sun, whereupon ſome haue called it *Corona Solis*, and *Sol Indianus*, the Indian Sunne floure: others haue called it *Chryſanthemum Peruuianum*, or the golden floure of Peru: in Engliſh, the floure of the Sun, or the Sun floure.

¶ *The Temperature.*

They are thought to be hot and dry of complexion.

¶ *The Vertues.*

A There hath not any thing been ſet downe either of the antient or later writers concerning the vertues of theſe plants, notwithſtanding we haue found by triall, that the buds before they be floured, boiled and eaten with butter, vineger, and pepper, after the manner of Artichokes, are exceeding pleaſant meat, ſurpaſſing the Artichoke far in procuring bodily luſt.

B The ſame buds with the ſtalks neere vnto the top (the hairineſſe being taken away) broiled vpon a gridiron, and afterward eaten with oile, vineger, and pepper, haue the like property.

Chap. 260. *Of Ieruſalem Artichoke.*

One may wel by the Engliſh name of this plant perceiue that thoſe that vulgarly impoſe names vpon plants haue little either iudgement or knowledge of them. For this plant hath no ſimilitude in leafe, ſtalke, root or manner of growing with an Artichoke, but onely a little ſimilitude of taſte in the dreſſed root; neither came it from Ieruſalem or out of Aſia, but out of America, whence *Fabius Columna* one of the firſt ſetters of it forth fitly uames it *Aſter Peruuianus tuberoſus*, and *Flos ſolis Farneſianus*, becauſe it ſo much reſembles the *Flos ſolis*, and for that he firſt obſerued it growing in the garden of Cardinall *Farneſius*, who had procured roots thereof from the Weſt Indies. *Pelliterius* calls this *Heliotropium Indicum tuberoſum*; and *Bauhinus* in his *Prodromus* ſets this forth by the name of *Chryſanthemum latifolium Braſilianum*: but in his *Pinax* he hath it by the name of

of *Helianthemum Indicum tuberoſum*. Alſo our Countreyman Mr. *Parkinſon* hath exactly deliuered the hiſtory of this by the name of *Battatas de Canada*, Engliſhing it Potatoes of Canada: now all theſe that haue written and mentioned it, bring it from America, but from far different places, as from Peru, Braſil, and Canada: but this is not much material, ſeeing it now grows ſo wel & plentifully in ſo many places of England. I will now deliuer you the Hiſtorie, as I haue receiued it from my oft mentioned friend Mr. *Goodyer*, who, as you may ſee by the date, took it preſently vpon the firſt arriuall into England.

‡ *Flos Solis Pyramidalis.*
Ieruſalem Artichoke.

¶ *The Deſcription.*

Flos ſolis Pyramidalis, parvo flore, tuberoſa radice. Heliotropium Indicum quorundam.

1 THis wonderfull increaſing plant hath growing vp from one root, one, ſometimes two, three or more round green rough hairy ſtraked ſtalks, commonly about twelue foot high, ſometimes ſixteene foot high or higher, as big as a childs arme, full of white ſpungious pith within. The leaues grow all alongſt the ſtalkes out of order, of a light green color, rough, ſharp pointed, about eight inches broad, and ten or eleuen inches long, deeply notched or indented about the edges, very like the leaues of the common *flos ſolis Peruanus*, but nothing crompled, and not ſo broad. The ſtalkes diuide themſelues into many long branches euen from the roots to their very tops, bearing leaues ſmaller and ſmaller toward the tops, making the herbe appeare like a little tree, narrower and ſlenderer toward the top, in faſhion of a ſteeple or Pyramide. The floures with vs grow onely at the toppes of the ſtalkes and branches, like thoſe of the ſaid *flos ſolis*, but no bigger than our common ſingle Marigold, conſiſting of twelue or thirteene ſtraked ſharpe pointed bright yellow bordering leaues, growing foorth of a ſcaly ſmall hairie head, with a ſmall yellow thrummie matter within. Theſe floures by reaſon of their late flouring, which is commonly two or three weeks after Michaelmas, neuer bring their ſeed to perfection, & it maketh ſhew of abundance of ſmall heads neere the tops of the ſtalkes and branches forth of the boſomes of the leaues, which neuer open and floure with vs, by reaſon they are deſtroyed with the froſts, which otherwiſe it ſeemes would be a goodly ſpectacle. The ſtalke ſendes foorth many ſmall creeping roots, whereby it is fed or nouriſhed, full of hairie threddes euen from the vpper part of the earth, ſpreading farre abroad: amongſt which from the maine root grow forth many tuberous roots, cluſtering together, ſometimes faſtened to the great root it ſelfe, ſometimes growing on long ſtrings a foot or more from the root, raiſing or heauing vp the earth aboue them, and ſometimes appearing aboue the earth, producing from the increaſe of one root, thirty, forty, or fifty in number, or more, making in all vſually aboue a pecke, many times neere halfe a buſhell, if the ſoile be good. Theſe tuberous roots are of a reddiſh colour without, of a ſoft white ſubſtance within, bunched or bumped out many waies, ſometimes as big as a mans fiſt, or not ſo big, with white noſes or peaks where they will ſprout or grow the next yeare. The ſtalkes bowed downe, and ſome part of them couered ouer with earth, ſend forth ſmal creeping threddie roots, and alſo tuberous roots like the former, which I haue found by experience. Theſe tuberous roots will abide aliue in the earth all winter,

though the ſtalkes and rootes by the which they were nouriſhed vtterly rot and periſh away, andwill beginne to ſpring vp againe at the beginning of May, ſeldome ſooner.

¶ *The Place.*

Where this plant groweth naturally I know not, in *Anno* 1617 I receiued two ſmall roots thereof from Maſter *Franqueuill* of London, no bigger than hens egges: the one I planted, and the other I gaue to a friend, mine brought mee a pecke of roots, wherewith I ſtored Hampſhire.

¶ *The Vertues.*

A Theſe rootes are dreſſed diuers waies; ſome boile them in water, and after ſtew them with ſacke and butter, adding a little Ginger: others bake them in pies, putting Marrow, Dates, Ginger, Raiſons of the Sun, Sacke, &c. Others ſome other way, as they are led by their skill in Cookerie. But in my iudgement, which way ſoeuer they be dreſt and eaten they ſtirre and cauſe a filthie loathſome ſtinking winde within the bodie, thereby cauſing the belly to bee pained and tormented, and are a meat more fit for ſwine, than men: yet ſome ſay they haue vſually eaten them, and haue found no ſuch windie qualitie in them. 17. Octob. 1621. *Iohn Goodyer.* ‡

Chap. 261. *Of Cammomill.*

1 *Chamæmelum.*
Cammomill.

2 *Chamæmelum nudum odoratum.*
Sweet naked Cammomill.

¶ *The*

¶ *The Deſcription.*

1 TO diſtinguiſh the kindes of Cammomils with ſundry deſcriptions would be but to enlarge the volume, and ſmall profit would thereby redound to the Reader, conſidering they are ſo well knowne to all: notwithſtanding it ſhall not be amiſſe to ſay ſomething of them, to keepe the order and method of the booke, hitherto obſerued. The common Cammomill hath many weake and feeble branches trailing vpon the ground, taking hold vpon the top of the earth, as it runneth, whereby it greatly encreaſeth. The leaues are very fine, and much iagged or deepely cut, of a ſtrong ſweet ſmell: among which come forth the floures like vnto the field Daiſie, bordered about the edge with a pale of white leaues: the middle part is yellow, compoſed of ſuch thrums cloſe thruſt together, as is that of the Daiſie. The root is very ſmall and threddy.

2 The ſecond kinde of Cammomill hath leaues, roots, ſtalks, and creeping branches like the precedent: the floures grow at the tops of ſmall tender ſtems, which are nothing elſe but ſuch yellow thrummie matter as is in the midſt of the reſt of the Cammomils, without any pale or border of white floures, as the others haue: the whole plant is of a pleaſing ſweet ſmell; whereupon ſome haue giuen it this addition, *Odoratum*.

3 This third Cammomil differeth not from the former, ſauing that the leaues hereof are very much doubled with white leaues, inſomuch that the yellow thrum in the middle is but little ſeen, and the other very ſingle, wherein conſiſteth the difference.

3 *Chamæmelum Anglicum flore multiplici.*
Double floured Cammomill.

4 *Chamæmelum Romanum.*
Romane Cammomil.

4 Romane Cammomill hath many ſlender ſtalkes, yet ſtiffer and ſtronger than any of the others, by reaſon whereof it ſtandeth more vpright, and doth not creepe vpon the earth as the others doe. The leaues are of a more whitiſh colour, tending to the colour of the leaues of Woad. The floures be likewiſe yellow in the middle, and paled about with a border of ſmall white floures.

¶ *The Place.*

Theſe plants are ſet in gardens both for pleaſure and alſo profit.

¶ *The Time.*

They floure moſt part of all the Sommer.

¶ *The*

¶ *The Names.*

Cammomill is called *Chamæmelum:* of ſome, *Anthemis*, and *Leucanthemis*, and alſo *Leucanthemon*, eſpecially that double floured Cammomill: which Greeke name is taken from the whitenes of his floure: in Engliſh, Cammomill: it is called Cammomil, becauſe the floures haue the ſmel of μῆλον, an apple, which is plainly perceiued in common Cammomill.

¶ *The Temperature.*

Cammomill, ſaith *Galen*, is hot and dry in the firſt degree, and is of thinne parts: it is of force to digeſt, ſlacken, and rarifie; alſo it is thought to be like the Roſe in thinneſſe of parts, comming to the operation of oyle in heate, which are to man familiar and temperate: wherefore it is a ſpeciall helpe againſt wearieſomeneſſe; it eaſeth and mitigateth paine, it mollifieth and ſuppleth, and all theſe operations are in our vulgar Cammomill, as common experience teacheth, for it heateth moderately, and drieth little.

¶ *The Vertues.*

A Cammomill is good againſt the collicke and ſtone; it prouoketh vrine, and is moſt ſingular in Clyſters which are made againſt the foreſaid diſeaſes.

B Oile of Cammomill is exceeding good againſt all manner of ache and paine, bruiſings, ſhrinking of ſinewes, hardneſſe, and cold ſwellings.

C The decoction of Cammomill made in wine and drunke, is good againſt coldneſſe in the ſtomacke, ſoure belchings, voideth winde, and mightily bringeth downe the monethly courſes.

D The Egyptians haue vſed it for a remedie againſt all cold agues; and they did therefore conſecrate it (as *Galen* ſaith) to their Deities.

E The decoction made in white wine and drunk, expelleth the dead child, and ſecondine or afterbirth, ſpeedily, and clenſeth thoſe parts.

F The herbe boyled in poſſet Ale, and giuen to drinke, eaſeth the paine of the cheſt comming of winde, and expelleth tough and clammy flegme, and helpeth children of the Ague.

G The herbe vſed in baths prouoketh ſweat, rarifieth the skinne, and openeth the pores: briefely, it mitigateth gripings and gnawings of the belly; it alayeth the paines of the ſides, mollifies hard ſwellings, and waſteth away raw and vndigeſted humors.

H The oyle compounded of the floures performeth the ſame, and is a remedie againſt all wearieſomeneſſe, and is with good ſucceſſe mixed with all thoſe things that are applied to mitigate paine.

Chap. 262.

Of May-weed, or wilde Cammomill.

¶ *The Kindes.*

THere be three kindes of wilde Cammomill, which are generally called in Latine *Cotulæ*; one ſtinking, and two other not ſtinking: the one hath his floure all white throughout the compaſſe, and alſo in the middle; and the other yellow. Beſides theſe there is another with verie faire double floures voyd of ſmell, which a Kentiſh Gentleman called M^r. *Bartholmew Lane* found growing wilde in a field in the Iſle of Thanet, neere vnto a houſe called Queakes, ſometime the houſe of Sir *Henry Criſpe*. Likewiſe M^r. *Hesketh*, before remembred, found it in the garden of his Inne at Barnet, if my memorie faile me not, at the ſigne of the red Lyon, or neere vnto it, and in a poore womans garden as he was riding into Lancaſhire.

‡ The double floured May-weed, the laſt yeare, being 1632. I (being in company with M^r. *William Broad*, M^r. *Iames Clarke*, and ſome other London Apothecaries in the Iſle of Thanet) found it growing wild vpon the cliffe ſide, cloſe by the towne of Margate, and in ſome other places of the Iſland. ‡

¶ *The Deſcription.*

1 MAy-weed bringeth forth round ſtalkes, greene, brittle, and full of iuyce, parted into many branches thicker and higher than thoſe of Cammomil, the leaues in like maner are broader, and of a blackiſh greene colour. The floures are like in forme and colour, yet commonly larger, and of a ranke and naughty ſmell: the root is wooddy, and periſheth when the ſeed is ripe. The whole plant ſtinketh, and giueth a ranke ſmell.

‡ This

‡ This herbe varies, in that it is found ſometimes with narrower, and otherwhiles with broader leaues; as alſo with a ſtrong vnpleaſant ſmell, or without any ſmell at all: the floures alſo are ſingle, or elſe (which is ſeldome found) very double. ‡

2 The yellow May-weed hath a ſmall and tender root, from which riſeth vp a feeble ſtalke diuiding it ſelfe into many other branches, whereupon do grow leaues not vnlike to Cammomill, but thinner, and fewer in number. The floures grow at the top of the ſtalkes, of a gold yellow colour, ‡ This I take to be no other than the *Buphthalmum verum* of our Author, formerly deſcribed in the ſecond place of the 257. chapter.

3 This mountaine Cammomill hath leaues ſomewhat deepely cut in almoſt to the middle rib, thicke alſo and iuycie, of a bitteriſh taſte, and of no pleaſant ſmell: the ſtalkes are weake, and ſome foot high, carrying at their tops ſingle floures, bigger, yet like thoſe of Cammomill, yellow in the middle, with a border of twenty or more long white leaues, encompaſſing it. It increaſeth much, as Cammomill doth, and hath creeping roots. It is found vpon the Stirian Alpes, and floureth in Iuly and Auguſt. *Cluſius* hath ſet this forth by the name of *Leucanthemum Alpinum*. ‡

1 *Cotula fœtida.*
May-weed.

‡ 3 *Leucanthemum Alpinum Cluſij.*
Wilde Mountaine Cammomill.

¶ *The Place.*

They grow in Corne fields neere vnto path wayes, and in the borders of fields.

¶ *The Time.*

Thee floure in Iuly and Auguſt.

¶ *The Names.*

May-weed is called in ſhops *Cotula fœtida*: of *Leonhartus Fuchſius*, *Parthenium*, and *Virginea*, but not truly: of others, Κυνοσμὶς: in high-Dutch, **Krotendill**: in low-Dutch, **Paddebloemen**: in French, *Eſpargoutte*: in Engliſh, May-weed, wilde Cammomill, and ſtinking Mathes.

¶ *The Temperature and Vertues.*

May-weed is not vſed for meate nor medicine, and therefore the faculties are vnknowne; yet all of them are thought to be hot and dry, and like after a ſort in operation to Cammomill, but nothing at all agreeing with mans nature; notwithſtanding it is commended againſt the infirmities of the mother, ſeeing all ſtinking things are good againſt thoſe diſeaſes. A

It is

It is an vnprofitable weed among corne, and raiſeth bliſters vpon the hands of the weeders and reapers.

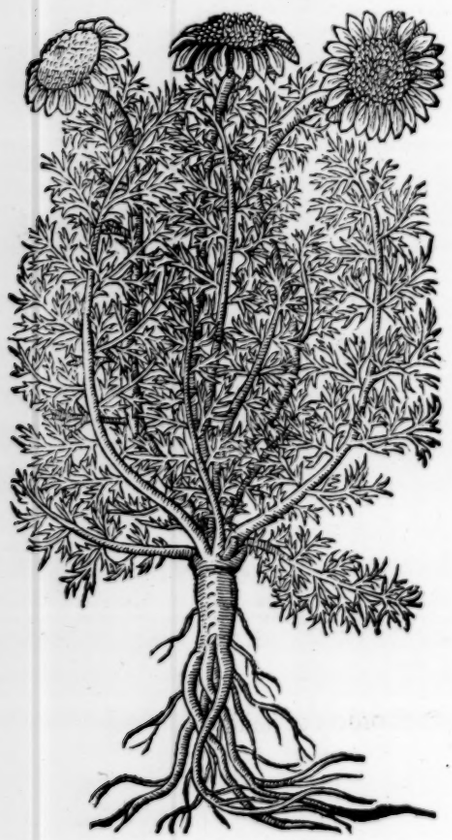
Chap. 263. *Of Pellitorie of Spaine.*

¶ *The Deſcription.*

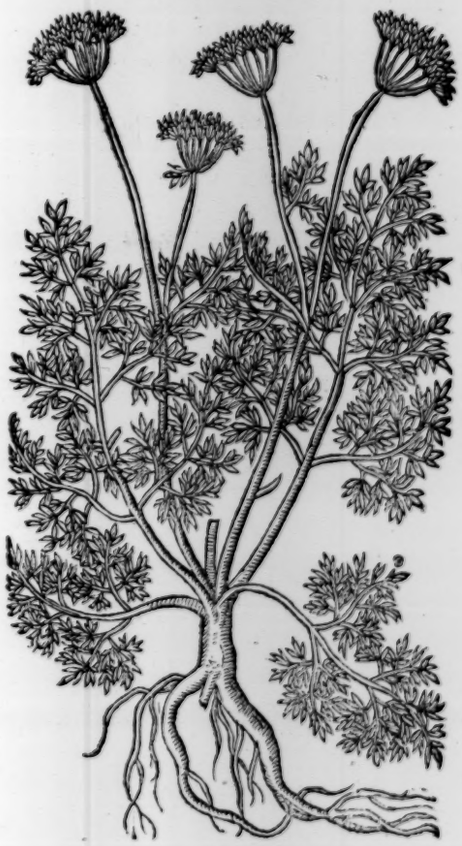
1 *Pyrethrum*, in Engliſh, Pellitorie of Spaine (by the name whereof ſome doe vnproperly call another plant, which is indeed the true *Imperatoria*, or Maſter-wort, and not Pellitorie) hath great and fat leaues like vnto Fennell, trailing vpon the ground: amongſt which, immediately from the root riſeth vp a fat great ſtem, bearing at the top a goodly floure, faſhioned like the great ſingle white Daiſie, whoſe bunch or knob in the midſt is yellow like that of the Daiſie, and bordered about with a pale of ſmall leaues, exceeding white on the vpper ſide, and vnder of a faire purple colour: the root is long, of the bigneſſe of a finger, very hot, and of a burning taſte.

2 The wilde Pellitorie groweth vp like vnto wilde Cheruile, reſembling the leaues of *Caucalis*, of a quicke and nipping taſte, like the leaues of Dittander, or Pepper-wort: the floures grow at the top of ſlender ſtalkes, in ſmall tufts or ſpoky vmbels, of a white colour: the root is tough, and of the bigneſſe of a little finger, with ſome threds thereto belonging, and of a quicke biting taſte.

1 *Pyrethrum officinarum.*
Pellitorie of Spaine.



2 *Pyrethrum ſylueſtre.*
Wilde Pellitorie.



¶ *The Place.*

It groweth in my garden very plentifully.

¶ *The Time.*

It floureth and ſeedeth in Iuly and Auguſt.

¶ *The Names.*

Pellitorie of Spaine is called in Greeke πύρεθρον, by reaſon of his hot and fierie taſte: in ſhops alſo *Pyrethrum*: in Latine, *Saliuaris*: in Italian, *Pyrethro*: in Spaniſh, *Pelitre*: in French, *Pied d' Alexandre*,

Alexandre, that is to ſay, *Pes Alexandrinus*, or Alexanders foot: in high and low Dutch, Bertram: in Engliſh, Pellitorie of Spaine; and of ſome, Bertram, after the Dutch name: and this is the right *Pyrethrum*, or Pellitorie of Spaine; for that which diuers here in England take to be the right, is not ſo, as I haue before noted.

¶ *The Temperature and Vertues.*

The root of Pellitorie of Spaine is very hot and burning, by reaſon whereof it taketh away the cold ſhiuering of Agues, that haue been of long continuance, and is good for thoſe that are taken with a dead palſie, as *Dioſcorides* writeth. A

The ſame is with good ſucceſſe mixed with Antidotes or counterpoyſons which ſerue againſt the megrim or continuall paine of the head, the dizzineſſe called *Vertigo*, the apoplexie, the falling ſickneſſe, the trembling of the ſinewes, and palſies, for it is a ſingular good and effectuall remedy for all cold and continuall infirmities of the head and ſinewes. B

Pyrethrum taken with honey is good againſt all cold diſeaſes of the braine. C

The root chewed in the mouth draweth forth great ſtore of rheume, ſlime, and filthy wateriſh humors, and eaſeth the paine of the teeth, eſpecially if it be ſtamped with a little Stauef-acre, and tied in a ſmall bag, and put into the mouth, and there ſuffered to remaine a certaine ſpace. D

If it be boyled in Vineger, and kept warme in the mouth it hath the ſame effect. E

The oyle wherein Pellitorie hath been boyled is good to anoint the body to procure ſweating, and is excellent good to anoint any part that is bruiſed and blacke, although the member be declining to mortification: it is good alſo for ſuch as are ſtricken with the palſie. F

It is moſt ſingular for the Surgeons of the Hoſpitals to put into their vnctions *contra Neapolitanum morbum*, and ſuch other diſeaſes that be couſin germanes thereunto. G

Chap. 264. *Of Leopards bane.*

† 1 *Doronicum minus officinarum.*
Small Leopards bane.

† 2 *Doronicum maius Officinarum.*
Great Leopards bane.

¶ *The Deſcription.*

1 OF this Plant *Doronicum* there be ſundry kindes, whereof I will onely touch foure: *Dodonaus* vnproperly calleth it *Aconitum pardalianches*, which hath hapned through the negligence

negligence of *Dioſcorides* and *Theophraſtus*, who in deſcribing *Doronicum*, haue not onely omitted the floures thereof, but haue committed that negligence in many and diuers other plants, leauing out in many plants which they haue deſcribed, the ſpecial accidents; which hath not a little troubled the ſtudy and determination of the beſt herbariſts of late yeares, not knowing certainely what to determine and ſet downe in ſo ambiguous a matter, ſome taking it one way, and ſome another, and ſome eſteeming it to be *Aconitum*. But for the better vnderſtanding hereof, know that this word *Aconitum*, as it is a name attributed to diuers plants, ſo it is to be conſidered, that all plants called by this name are malignant and venomous, as with the iuyce and root whereof ſuch as hunted after wilde and noyſome beaſts were wont to embrue and dip their arrowes, the ſooner and more ſurely to diſpatch and ſlay the beaſt in chaſe. But for the proofe of the goodneſſe of this *Doronicum* and the reſt of his kind, know alſo, That *Lobel* writeth of one called *Iohn de Vroede*, who ate very many of the roots at ſundry times, and found them very pleaſant in taſt, and very comfortable. But to leaue controuerſies, circumſtances, and obiections which here might be brought in and alledged, aſſure your ſelues that this plant *Doronicum minus Officinarum* (whoſe roots *Pena* reporteth to haue found plentifully growing vpon the Pede-mountaine hills and certaine high places in France) hath many leaues ſpred vpon the ground, ſomewhat like Plantaine: among which riſe vp many tender hairy ſtalks ſome handfull and an halfe high, bearing at the top certain ſingle yellow floures, which when they fade change into downe, and are caried away with the winde. The roots are thicke and many, very crookedly croſſing and tangling one within another, reſembling a Scorpion, and in ſome yeares do grow in our Engliſh gardens into infinite numbers.

3 *Doronicum radice repente.*
Cray-fiſh Wolfes bane.

4 *Doronicum brachiata radice.*
Winged Wolfes bane.

2 The ſecond kinde of *Doronicum* hath larger leaues than the former, but round, and broader, almoſt like the ſmall leaues of the Clot or Burre; among which riſeth vp a ſtalke ſcarſe a cubit high: the floures are like the former: the root is longer and bigger than the former, barred ouer with many ſcaly barks, in colour white, and ſhining like white marble, hauing on each ſide one arme or finne, not vnlike to the ſea Shrimpe called *Squilla marina*, or rather like the ribbes or ſcales of a Scorpions body, and is ſweet in taſte.

3 The third kinde of *Doronicum*, growing naturally in great aboundance in the mountaines

of

of France, is alſo brought into and acquainted with our Engliſh grounds, bearing very large leaues of a light yellowiſh greene, and hairy like *Piloſella*, or *Cucumis agreſtis*. The ſtalkes are a cubit high, hauing at the top yellow floures like *Buphthalmum*, or *Conſolida media vulnerariorum*: all the root is barred and welted ouer with ſcales like the taile of a Scorpion, white of colour, and in taſte ſweet, with ſome bitterneſſe, yeelding forth much clammineſſe, which is very aſtringent.

4 The fourth kinde hereof is found in the wooddy mountaines about Turin and Sauoy, very like vnto the former, ſauing that the leaues are ſomwhat rougher, the floures greater, and the ſtalks higher. But to be ſhort, each of theſe kindes are ſo like one another, that in ſhew, taſte, ſmell, and manner of growing they ſeeme to be as it were all one: therefore it were ſuperfluous to ſtand vpon their varietie of names, *Pardalianches*, *Myoctonum*, *Thelyphonum*, *Camorum*, and ſuch like, of *Theophraſtus*, *Dioſcorides*, *Pliny*, or any of the new Writers, which names they haue giuen vnto *Doronicum*; for by the opinion of the moſt skilfull in plants, they are but Synonimies of one kinde of plant. And though theſe old writers ſpeake of the hurtfull qualities of theſe plants; yet experience teacheth vs that they haue written what they haue heard and read, and not what they haue knowne and proued; for it is apparant, that *Doronicum* (by the conſent of the old and new writers) is vſed as an antidote or certaine treacle, as well in the confections *de Gemmis Meſuæ*, as in *Electuario Aromatum*. And though *Matthiolus* diſclaimeth againſt the vſe thereof, and calleth it *Pardalianches*, that is, Wolfes bane; yet let the Learned know, that *quantitas, non qualitas, nocet*: for though Saffron be comfortable to the heart, yet if you giue thereof, or of muske, or any ſuch cordial thing, too great a quantitie, it killeth the party which receiueth it.

‡ 5 *Doronicum anguſtifolium Auſtriacum.*
Narrow leaued Wolfes bane.

‡ 6 *Doronicum Stiriacum flore amplo.*
Large floured Wolfes bane.

‡ 5 To theſe foure formerly intended by our Author, may we fitly adde ſome others out of *Cluſius*. The firſt of theſe hath a ſtalke ſome foot high, ſoft, rough, and creſted: the leaues are few, thicke, narrow, long, very greene and ſhining, yet hairy on their vpper ſides, but ſmooth on the lower ſides, and of a lighter greene; yet thoſe that adorne the ſtalke are narrower: there groweth commonly at the top of the ſtalke one ſingle floure of the ſhape and bigneſſe of the common *Doronicum* deſcribed in the ſecond place, but of a brighter yellow: the ſeed is little and blackiſh, and is carried away with the winde: the root is ſmall, blackiſh, and ioynted, hauing ſomewhat thicke

white fibres, and an aromaticke taste. This floures in Iuly and August, and growes in rockie places vpon the higheſt Alpes. *Cluſius* (the firſt and onely deſcriber thereof) calls it *Doronicum* 2. *ſiue Auſtriacum* 1.

6 This growes ſomewhat higher than the laſt deſcribed, and hath much broader and rounder leaues, and thoſe full of veines, and ſnipt about the edges. The knots and off-ſets of the roots deſcend not down, but run on the ſurface of the ground, and ſo ſend forth fibres on each ſide, to faſten them and attract nouriſhment. The floure is like that of the former, but much larger. This groweth in the high mountainous places of Stiria, and floures at the ſame time as the former. *Cluſius* calls this *Doronicum* 4. *Stiriacum*.

7 This is the largeſt of all the reſt, and hath a ſtalke two cubits or more high, of the thickneſſe of ones little finger, creſted, rough, and towards the top diuided into ſundry branches. The leaues next to the root are round, wrinkled, hairy, and faſtned to a long ſtalke: thoſe towards the top of the ſtalke are longer and narrower, and ingirt the ſtalke at their ſetting on. The floures are large and yellow, like to the other plants of this kinde: the ſeed alſo is carried away with the winde, and is longiſh, and of a greeniſh colour: the root is knotty or ioynted like to a little Shrimpe, and of a whitiſh greene colour. This floures in Iune or Iuly, and growes vpon the like places as the former. *Cluſius* calls this *Doronicum* 7. *Auſtriacum* 3. ‡

‡ 7 *Doronicum maximum.*
The greateſt Wolfe-bane.

¶ *The Place.*

The place is ſufficiently ſet forth in the deſcription; yet you ſhall vnderſtand, that I haue the two firſt in my garden; the ſecond hath beene found and gathered in the cold mountaines of Northumberland, by Dr. *Penny* lately of London deceaſed, a man of much experience and knowledge in Simples, whoſe death my ſelfe and many others do greatly bewaile.

¶ *The Time.*

They floure in the months of Iune and Iuly.

¶ *The Names.*

Concerning their names I haue already ſpoken; yet ſith I would be glad that our Engliſh women may know how to call it, they may terme *Doronicum* by this name, Cray-fiſh Piſſe-a-bed, becauſe the floure is like Dandelion, which is called Piſſe-a-bed.

‡ Our Author certainly at the beginning of this chapter did not well vnderſtand what he ſaid, when he affirmes, That the reaſon of the not wel knowing the *Doronicum* of the Antients was, [through the negligence of *Dioſcorides* and *Theophraſtus*, who in deſcribing *Doronicum*, &c.] Now it is manifeſt, that neither of theſe Authors, nor any of the antient Greekes euer ſo much as named *Doronicum*: but that which he ſhould haue ſaid, was, That the want of exact deſcribing the *Aconitum thelyphonon* in *Theophraſtus*, and *Aconitum Pardalianches* in *Dioſcorides*, (which are iudged to be the ſame plant and all one with our *Doronicum*) hath beene the cauſe, that the controuerſie which *Matthiolus* and others haue of late raiſed cannot be fully determined; which is, Whether that the vulgar *Doronicum*, vſed in ſhops, and deſcribed in this chapter, be the *Aconitum Pardalianches*? *Matthiolus* affirmes it is, and much and vehemently exclaimes againſt the vſe thereof in cordiall Electuaries, as that which is of a moſt pernitious and deadly qualitie, becauſe that (as he affirmes) it will kill dogs: now *Dodonæus* alſo ſeems to incline to his opinion: but others (and not without good reaſon) deny it; as *Geſner* in his Epiſtles, who made often triall of it vpon himſelfe: part of his words are ſet downe hereafter by our Author (being tranſlated out of *Dodonæus*) and ſome part alſo you ſhall finde added in the end of the vertues: and theſe are other ſome; *Plura alia nunc omitto, quibus oſtendere liquido poſſem, nec Doronicum noſtrum, nec Aconitum*

Aconitum vllo modo eſſe venenatum homini. Canibus autem letiferum eſſe ſcio, non ſolum ſi drachmarum 4. ſed etiam ſi vnius pondere ſumant. And before he ſaid, *quaſi non alia multa canibus ſint venena, quæ homini ſalubria ſunt; vt de aſparago fertur.* Of the ſame opinion with *Geſner* is *Pena* and *Lobel*, who, *Aduerſ. p.* 290, & 291. do largely handle this matter, & exceedingly deride and ſcoffe at *Matthiolus*, for his vehement declaiming againſt the vſe thereof. Now briefely my opinion is this, That the *Doronicum* here mentioned is not that mentioned and written of by *Serapio* and the Arabians; neither is it the *Aconitum Pardalianches* of *Dioſcorides*, nor of ſo malignant a qualitie as *Matthiolus* would haue it; for I my ſelfe alſo haue often eaten of it, and that in a pretty quantitie, without the leaſt offence. ‡

¶ *The Nature and Vertues.*

I haue ſufficiently ſpoken of that for which I haue warrant to write, both touching their natures A
and vertues; for the matter hath continued ſo ambiguous and ſo doubtfull, yea, and ſo ful of controuerſies, that I dare not commit that to the world which I haue read: theſe few lines therefore ſhall ſuffice for this preſent; the reſt which might be ſaid I referre to the great and learned Doctors, and to your owne conſideration.
